THat we may attain unto this third ſcope, it is requiſite we handle as gently and without pain, as we may, the broken, or diſlocated member; we drive away the defluxion ready to fall down upon the part, by medicines, repelling the humour, and ſtrengthning the part; we, by appointing a good diet, hinder the begetting of excrements in the body, and divert them by purging and phlebotomy: But if theſe accidents be already preſent, we muſt cure them, according to the kind and nature of each of them; for they are various: Amongſt which is reckoned itching, which in the beginning torments the Patient: This ariſeth from a collection and ſuppreſſion of ſubacrid vapours, ariſing from the blood, and other humors under the skin: Whence a light biting, which cauſeth a ſimple itch, or elſe a more grievous and acrid one, from whence (in *Galen*'s opinion) proceeds a painful itching. Wherefore ſuch matter, as the cauſe, being evacuated, all itching ceaſeth: But this cannot eaſily and freely be evacuated and breathed out, becauſe the pores of the part are ſhut up, and, as it were oppreſſed with the burthen of the emplaſters, boulſters and ligatures, which are put about the part. Hereunto may be added, that the part it ſelf doth not ſo perfectly perform and enjoy its wonted faculties and actions: By which it cometh to paſs, that the heat thereof is more languid than may ſuffice to diſcuſs the fuliginous matter there collected. Wherefore it will be convenient to looſe the ligatures every third day, that as by looſing their ties, their ſanious and fuliginous excrements, ſhut up under the skin, may freely paſs forth, leſt in continuance they ſhould fret and ulcerate it; as it happens to moſt of thoſe who provide not for it by looſing their ligatures. Beſides alſo, the part muſt be long fomented with hot water alone, or elſe with a decoction, of Sage, Chamomil, Roſes, and Melilot made in Wine and water: For long fomenting attenuates and evacuates; but ſhorter fills and mollifies, as it is delivered by *Hippocrates*. Alſo gentle frictions, performed with your hand, or a warm linnen cloth upwards, to the right ſide and left, and circularly to every ſide, are good. But if the skin be already riſen into bliſters, they muſt be cut, leſt the matter contained thereunder may corrode and ulcerate the skin: Then muſt the skin be anointed with ſome cooling and drying medicine; as, *Ung. album Camphoratum Rhaſis, Deſiccativum rubrum, unguentum roſatum ſine aceto*; adding thereto the powder of a rotten poſt, or prepared *Tutia*, or the like. Other accidents more grievous then theſe, do often happen, but we will treat of them hereafter: But if the ſcales of the bone underneath, be quite ſevered from the whole, then muſt they be preſently taken forth, eſpecially if they prick the muſcles: But if the bone be broken into ſplinters, and ſo prominent out of the wounded fleſh that it cannot be reſtored into its ſeat, it muſt be cut off with your Cutting-mallets, or Parrats-beak, as occaſion ſhall offer it ſelf: In the interim you muſt have a care that the part enjoy perſpiration, and by change of place and riſing, now and then it may be, as it were ventilated: Alſo you muſt ſee that it be not over-burthened, neither too ſtrait bound, otherwiſe it will

The cauſes and differences of itching.

Ad ſen. 4. ſec. 2. de fract.

Remedies againſt the itching.

Hipp. ſent. 46. ſect. 3. de fract.

will be apt to inflammation. Thus much concerning fractures and diſlocations in general: Now we muſt deſcend to particulars, beginning with the fracture of the noſe.

CHAP. VI.

Of the Fracture of the Noſe.

THe noſe is griſtly in its lower part, but bony in the upper. Wherefore it ſuffers no fracture in the griſtly part (unleſs peradventure a *Sedes*) but only a depreſſion, diſtortion or contuſion. But a fracture often happens to the bony part, and ſo great a depreſſion to the inner ſide, that unleſs it be provided for by diligent reſtoring it, the noſe will become flat, or wreſted aſide, whence there will be difficulty of breathing. That this kind of fracture may be reſtored, that bone which ſtands too far out, muſt be preſſed down; but that which is depreſt, muſt be lifted up with a ſpathern, or little ſtick handſomely faſhioned and wrapped about with cotten or a linnen rag, ſo to avoid pain: Therefore you ſhall hold the ſpathern in one hand, and reduce and order it with the other. The bone being reſtored, directories or tents of a convenient bigneſs ſhall be put into the noſe; which tents ſhall be mad of ſpunge, or flax, or a piece of a beaſts or ſheeps lungs: For theſe things are ſoft, and do not only hinder the bones of the noſe that they fall no more, but alſo lift them up higher: And then the noſe ſhall be in ſome ſort ſtayed with boulſters on each ſide, even until the perfect agglutination of the bones, leſt the figure and ſtraitneſs ſhould be vitiated and ſpoiled. I have oft-times put golden, ſilver and leaden pipes into fractured noſes, and faſtned them with a thred to the Patients night-cap, which, by one and the ſame means, kept the bones from being again depreſt, gave the matter free paſſage forth, and nothing hindred the breathing. In the mean time we muſt ſee that we do not preſs the noſe with too ſtrait binding, unleſs peradventure ſome other thing perſwade; leſt they become either too wide, too flat, or crooked. If any wound accompany the fracture, that ſhall be cured after the ſame manner as the wounds of the head. The fracture reſtored, the following medicine, which hath a faculty to repel and repreſs the defluxion, to ſtrengthen and keep the part in its due poſture, and to dry up and waſte the matter which hath already fallen down, ſhall be applied to the noſe, and all the other dry parts.

Hipp. ſent. 46. ſect. 2. de art.

How to reduce the noſe into its natural figure.

℞ *Thuris, maſtiches, boli armeniæ, ſanguinis draconis, an.* ℥ ß. *Aluminis rochæ, reſinæ pini, an.* ℥ ij. *Pulveriſentur ſubtiliſſime:* Or elſe, ℞ *Farinæ volatilis* ℥ij ß. *Albuminum ovorum quantum ſufficit, incorporentur ſimul, & fiat medicamentum.*

A fit aſtringent and drying medicine.

Neither ſhall you uſe any other art to cure the cartilaginous part of the noſe being fractured: Wherefore *Hippocrates* terms that ſolution of continuity that there happens, a fracture, as if it were in a bone; becauſe he could find no other name more fitly to expreſs it; for a griſtle, next to a bone, is the hardeſt of all the parts of our body. A *Callus* uſes to grow in fractured noſes, unleſs ſomething hinder, within the ſpace of twelve or fifteen days.

Sent. 47. ſect. 2. de art. & Gal. in Com.

CHAP. VII.

Of the Fracture of the lower Jaw.

THe lower jaw runs into two, as it were, horns or tops: The one whereof ends ſharp, and receives a tendon from the temporal muſcle; the other ends blunt and round under the mammillary proceſs, and it is there implanted in a ſmall cavity; it is joyned together in the middle of the chin by *Symphyſis*, and is marrowy within: The fracture, which happens thereto, is reſtored by putting your fingers into the Patients mouth, and preſſing them on the inſide and outſide, that ſo the fractured bones put together may be ſmoothed and united: But if they be brokrn wholly athwart, ſo that the bones lye over each other, extenſion muſt be made on both ſides on contrary parts, upwards and downwards, whereby the bones may be compoſed, and joyned more eaſily to one another: The teeth in the mean while, if they be either ſhaken or removed out of their ſockets, muſt be reſtored to their former places, and tied with a Gold or Silver wyer, or elſe an ordinary thred, to the next firm teeth, until ſuch time as they ſhall be faſtened, and the bones perfectly knit by a *Callus:* To which purpoſe, the ordered fragments of the fractured bone ſhall be ſtayed, by putting a ſplint on the outſide, made of ſuch leather as ſhooe-ſoals are made; the midſt thereof being divided at the chin, and of ſuch length and breadth as may ſerve the jaw: Then you ſhall make ligation with a ligature two fingers broad, and of ſuch length as ſhall be ſufficient, divided at both the ends, and cut long-ways in the midſt thereof; that ſo it may engirt the chin on both ſides. Then there will be four heads of ſuch a ligature ſo divided at the ends; the two lower whereof being brought to the crown of the head, ſhall be there faſtned, and ſowed to the Patients night-cap. The two upper drawn athwart, ſhall likewiſe be ſowed as artificially as may be, to the cap in the nape of the neck. It is a moſt certain ſign, that the jaw is reſtored and well ſet, if the teeth faſtned therein ſtand in their due rank and order. The Patient ſhall not lye down upon his broken jaw, leſt the fragments of the bones ſhould again fall out, and cauſe a greater defluxion. Unleſs inflammation, or ſome other grievous ſymptom ſhall happen, it is ſtrengthened with a *Callus* within twenty days; for that it is ſpongious, hollow, and full of marrow, eſpecially in the midſt thereof: Yet ſometimes it heals more ſlowly, according as the temper of the Patient is, which takes alſo place in other fractured bones. The agglutinating and repelling medicine, deſcribed in the former Chapter, ſhall be uſed, as alſo others, as occaſion ſhall offer it ſelf.

A deſcription of the lower jaw.

The manner of reſtoring a broken jaw.

The deſcription of a fit ligature for the under-jaw.

In what time it may be healed.

The

The Patient muſt be fed with liquid meats, which ſtand not in need of chewing, until ſuch time as the *Callus* ſhall grow hard, leſt the ſcarce or ill-joynted fragments ſhould fly in ſunder with the labour of chewing. Therefore ſhall he be nouriſhed with Water-grewel, Ponado's, Cullaſſes, Barley-creams, Gellies, Broths, Rear-eggs, Reſtaurative Liquors, and other things of the like nature.

CHAP. VIII.

Of the Fracture of the Clavicle or Collar-bone.

Hipp. ſent. 63. ſect. 1. de art.

AS the nature and kind of the fractured Clavicle ſhall be, ſo muſt the cure and reſtoring thereof be performed: But howſoever this bone ſhall be broken, always the end faſtned to the ſhoulder and ſhoulder-blade, is lower than that which is joyned to the cheſt; for that the arm draws it downwards. The collar-bone, if broken athwart, is more eaſily reſtored and healed, than if it be cloven long-ways: For, every bone broken athwart doth more eaſily return into its former ſtate or ſeat, whiles you lift it up on this or that ſide with your fingers: But that which is broken *ſchidacidon*, or into ſplinters, or long-ways, is more difficultly joyned and united to the ends and fragments; for thoſe pieces, which were ſet, will be plucked aſunder, even by the leaſt motion of the arms; and that which was knit with the ſhoulder, will fall down to the lower part of the breaſt: The reaſon of which is, the collar-bone is not moved of its ſelf, but conſents in motion with the arm. In reſtoring this or any other fracture, you muſt have a care that the bones ride not one over another, neither be drawn nor depart too far in ſunder: Therefore it will be here convenient, that one ſervant draw the arm backwards, and another pull the ſhoulder towards him the contrary way; for ſo there will be made, as I may ſo term it, a counter-extenſion: While which is in doing, the Surgeon with his fingers ſhall reſtore the fracture, preſſing down that which ſtood up too high, and lifting up that which is preſſed down too low. Some, that they may more eaſily reſtore this kind of fracture, put a clew of yarn under the Patients arm-pit; ſo to fill up the cavity thereof: Then they forcibly preſs the elbow to the ribs, and then force the bone into its former ſeat: But if it happen, that the ends of the broken bones ſhall be ſo depreſt, that they cannot be drawn upwards by the fore-mentioned means; then muſt the Patient be laid with his back, juſt between the ſhoulders, upon a pillow hard ſtuffed, or a tray turned with the bottom upwards, and covered with a rug or ſome ſuch thing: Then the ſervant ſhall ſo long preſs down the Patients ſhoulders with his hands, until the ends of the bones, lying hid and preſſed down, fly out and ſhew themſelves: Which being done, the Surgeon may eaſily reſtore or ſet the fractured bone. But if the bone be ſo broken into ſplinters that it cannot be reſtored, and any of the ſplinters prick and wound the fleſh, and ſo cauſe difficulty of breathing, you then muſt cut the skin even againſt them, and with your Inſtrument lift up all the depreſſed ſplinters, and cut off their ſharp points; ſo to prevent all deadly accidents, which thereupon may be feared. If there be any fragments, they, after they are ſet, ſhall be covered with a knitting medicine made of Wheat-flour, Frankincenſe, Bole-armeniack, *Sanguis draconis*, *Reſini pini*, made into powder, and mixed with the whites of Eggs, putting upon it ſplints covered with ſoft, worn linnen rags; covered over likewiſe with the ſame medicine, and then three boulſters dipped in the ſame; two whereof ſhall be laid upon the ſides; but the third and thickeſt upon the prominent fracture, ſo to repreſs it and hold it in: For thus the fragments ſhall not be able to ſtir or lift themſelves up further than they ſhould, either to the right ſide or left. Now theſe boulſters muſt be of a convenient thickneſs and breadth, ſufficient to fill up the cavities which are above and below that bone: Then ſhall you make fit ligation with a rowler, having a double head caſt croſs-wiſe, of a hands breadth, and ſome two ells and half long, more or leſs, according to the Patients body. Now he ſhall be ſo rowled up, as it may draw his arm ſomewhat backwards, and in the interim his arm-pits ſhall be filled with boulſters, eſpecially that next the broken bone; for ſo the Patient may more eaſily ſuffer the binding. Alſo you ſhall wiſh the Patient, that he of himſelf bend his arm backwards, and ſet his hand upon his hip, as the Country Clowns uſe to do, when they play at Leap-frog. But how great diligence ſoever you uſe in curing this ſort of fracture, yet can it ſcarce be ſo performed, but that there will ſome deformity remain in the part: For that a ligature cannot be rowled about the collar-bone, as it may about a leg or an arm. A *Callus* oft-times grows on this bone, within the ſpace of twenty days becauſe it is rare and ſpongious.

How to reſtore the fractured Clavicle.

The firſt way.

The ſecond way.

The third way.

How to bind up the fractured clavicle.

It is a difficult matter perfectly to reſtore a fractured clavicle.

CHAP. IX.

Of the Fracture of the Shoulder-blade.

An anatomical deſcription of the ſhoulder-blade.

THE Greeks call that *Omoplata*, which the Latins term *Scapula*, or *Scapulæ patella*, that is, the ſhoulder-blade. It is faſtned on the back to the ribs, nowl, the *Vertebræ* of the cheſt and neck; but not by articulation, but only by the interpoſition of muſcles, of which we have ſpoken in our Anatomy: But on the forepart it is articulated after the manner of other bones, with the collar-bone, the ſhoulder, or arm-bone: For with its proceſs, which repreſents a prick or thorn, and by ſome, for that it is more long and prominent, is called *Acromion*; (that is, as you would ſay, the top or ſpire of the ſaid ſhoulder-blade) it receives the collar-bone. Therefore ſome Anatomiſts, according to *Hippocrates*, as they ſuppoſe, call all this articulation of the collar-bone, with the hollowed proceſs of the ſhoulder-blade, *Acromion*. There is another proceſs of the ſaid blade-bone, called *Cervix omoplatæ*, or the neck of the ſhoulder-blade; this truly is very ſhort, but ending in a broad inſinuated head, provided for the receiving of the ſhoulder

or

or arm-bone. Not far from this proceſs is another, called *Coracoides*, for that the end thereof is crooked like a Crows-beak. This keeps the ſhoulder-bone in its place, and conduces to the ſtrength of that part. The ſhoulder-blade may be fractured in any part thereof, that is, either on the ridge, which runs like a hill, alongſt the midſt thereof for its ſafety, as we ſee in the *Vertebræ* of the back: So alſo in the broader part thereof, it may be thruſt in and depreſt; and alſo in that articulation, whereby the top of the ſhoulder is knit to it. According to this variety of theſe fractured parts, the happning accidents are more grievous or gentle. How many ways the ſhoulder-blade may be broken.

We know the ſpine or ridge of the ſhoulder-blade to be broken, when a dolorifick inequality is perceived, by touching or feeling it: But you may know, that the broader or thinner part thereof, is depreſſed, if you feel a cavity, and a pricking pain moleſt the part, and if a numneſs trouble the arm, being ſtretched forth. The fragments, if they yet ſtick to their bones and do not prick the fleſh, must be reſtored to their ſtate and place, and there kept with agglutinative medicines, and ſuch as generate a *Callus*, as alſo with boulſters and rowlers fitted to the place: But if they do not adhere to the bone, or prick the fleſh lying under them, then muſt you make inciſion in the fleſh over againſt them, that ſo you may take them out with your Crows-beak: But although they ſtir up and down, yet if they ſtill adhere to the *Perioſteum* and ligaments, (if ſo be that they trouble not the muſcles by pricking them) then muſt they not be taken forth: For I have oftner than once obſerved, that that they have within ſome ſhort time after grown to the adjacent bones. But if they, being wholly ſeparated, do not ſo much as adhere to the *Perioſteum*, then muſt they neceſſarily be plucked away; otherwiſe within ſome ſhort ſpace after, they will be driven forth by the ſtrength of Nature, for that they participate not any more in life with the whole: For that which is quick, ſaith *Hippocrates*, uſes to expel that which is dead far from it. The truth whereof was manifeſted in the Marqueſs of *Villars*, who at the Battel of *Dreux*, was wounded in his ſhoulder with a Piſtol-bullet, certain ſplinters of the broken bone were plucked forth with the pieces of his harneſs, and of the leaden bullet; and within ſome ſhort ſpace after, the wound was cicatrized, and fully and perfectly healed: But more than ſeven years after, a defluxion and inflammation ariſing in that place by reaſon of his labour in Arms, and the heavineſs of his Armour at the Battel of *Mont-contour*, the wound broke open again: ſo that many ſhivers of the bone, with the reſidue of the leaden bullet, came forth of themſelves. But if the fracture ſhall happen in the neck of the ſhoulder-blade, or dearticulation of the ſhoulder, there is ſcarce any hope of recovery; as I have obſerved in *Anthony* of *Bourbon*, King of *Navarre*; *Francis* of *Lorrain*, Duke of *Guiſe*; the Count *Rhingrave Philipbert*, and many other in theſe late Civil Wars: For there are many large veſſels about this dearticulation, to wit, the axillary vein and artery, the nerves ariſing from the *Vertebræ* of the neck, which are thence diſſeminated into all the muſcles of the arm. Beſides, alſo inflammation and putrefaction ariſing there, are eaſily communicated by reaſon of their neighbourhood to the heart and other principal parts, whence grievous ſymptoms, and oft-times death it ſelf enſues. The cure. *Lib. de vul. capitis.* A Hiſtory. Nature of its own accord makes it ſelf way to caſt forth ſtrange bodies and matters. Why a fracture in the joynt of the ſhoulder is deadly.

CHAP. X.

Of the Fracture and Depreſſion of the Sternon *or Breaſt-bone.*

THe *Sternum* is ſometimes broken, other whiles only thruſt in without a fracture. The inequality perceivable by your feeling, ſhews a fracture, as alſo the going in with a thruſt with your finger, and the ſound or noiſe of the bones crackling under your fingers. But a manifeſt cavity in the part, a cough, ſpitting of blood, and difficulty of breathing by compreſſion of the membrane inveſting the ribs and the lungs, argue the depreſſion thereof. For the reſtoring of this bone, whether broken or depreſt, the Patient muſt be laid on his back with a cuſhion ſtuffed with tow or hay under the *Vertebræ* of the back, as we ſet down in the ſetting of the collar-bone: Then a ſervant ſhall lie ſtrongly with both his hands on his ſhoulders, as if he would preſs them down, whilſt the Surgeon, in the mean time preſſing the ribs on each ſide, ſhall reſtore and ſet the bone with his hand; and then the formerly deſcribed medicines ſhall be applied for to hinder inflammation, and aſſwage pain; boulſters ſhall be fitted thereto, and a ligature ſhall be made croſs-ways above the ſhoulders; but that not too ſtrait, leſt it hinder the Patients breathing. I by theſe means, at the appointment of *Anthony* of *Burbon* King of *Navar*, cured *Anthony Benand* a Knight of the Order, who had his breaſt-plate bended and driven in, with an iron bullet ſhot out of a Field-piece, as alſo his *ſternum* together therewith, and he fell down as dead with the blow; he did ſpit blood for three months after I had ſet the bone, yet for all this he lives at this day in perfect health. Signs that the *ſternum* is broken. Signs that it is depreſt. The cure. A Hiſtory.

CHAP. XI.

Of the Fracture of the Ribs.

THe true ribs, for that they are bony, may be broken in any part of them; but the baſtard ribs cannot be truly broken, unleſs at the back-bone, becauſe they are only bony in that part, but griſtly on the foreſide toward the breaſt-bone: Wherefore there they can only be folded or crooked in. Theſe which are ſubject to fractures, may be broken inwards and outwards. But oft-times it comes to paſs, that they are not abſolutely broken, but cleft into ſplinters, and that ſometimes inwards, but not outwards. Thus the fiſſure doth oft-times not exceed the middle ſubſtance of the rib; but ſometimes it ſo breaks through it all, that the fragments and ſplinters do prick and wound the membrane, which inveſts and lines them on the inſide, and then there is great danger. But when the fracture is ſimple without a wound, compreſſion, puncture of the membrane, In what place the ſhort ribs may be broken.

Sent. 56. ſect. 3. de art. membrane, and laſtly, without any other ſymptom, then the danger is leſs: Therefore *Hippocrates* wiſheth, that thoſe, who are thus affected, fill themſelves more freely with meat; for that moderate repletion of the belly, is (as it were) a certain prop or ſtay for the ribs, keeping them well in their place and ſtate; which rule chiefly takes place in fractures of the baſtard ribs. For ſuch as have them broken, uſually feel themſelves better after, than before meat. For emptineſs of meat, or of the ſtomach, makes a ſuſpenſion of the ribs, as not under-propped by the meat. Now

Why an internal fracture of the ribs is deadly. that fracture which is outwardly, is far more eaſie to heal, than that which is inwardly; for that this pricketh the membrane or *Pleura*, and cauſeth inflammation, which may eaſily end in an *Empyema*. Add hereunto, that this is not ſo eaſily to be handled or dealt withal, as the other; whereby it cometh to paſs, that it cannot be ſo eaſily reſtored, for that theſe things cannot be ſo fully and freely performed in this kind of fracture, which are neceſſary to the ſetting of the bone, as to draw it out, hold it and joyn it together. It is therefore healed within twenty days, if nothing elſe hinder.

The ſigns. The ſigns of fractured ribs are not obſcure; for by feeling the grieved part with your fingers, you may eaſily perceive the fracture by the inequality of the bones, and their noiſe or crackling, eſpecially if they be quite broke aſunder.

The cauſe of ſpitting blood when the ribs are broken. But if a rib be broken on the inſide, a pricking pain, far more grievous than in a pleuriſie, troubles the Patient; becauſe the ſharp ſplinters prick the Coſtal membrane: Whence great difficulty in breathing, a cough, and ſpitting of blood enſue. For blood, flowing from the veſſels broken by the violence of the thing cauſing the fracture, is (as it were) ſucked up by the lungs, and ſo by a dry cough carried into the weazon, and at length ſpit out of the mouth. Some, to pull up the bone that is quite broken and depreſt, apply a Cupping-

Sent. 15. ſect. 3. de art. Paulus lib. 6. cap. 96. Avicen. 4. glaſs, and that is ill done; for there is cauſed greater attraction of humours, and exceſs of pain by the preſſure and contraction of the adjacent parts, by the Cupping-glaſs; wherefore *Hippocrates* alſo forbids it: Therefore it is better to endeavour to reſtore it after this following manner. Let the Patient lye upon his ſound ſide, and let there be laid upon the fractured ſide an emplaſter made of

The cure. Turpentine, Roſin, Black-pitch, Wheat-flour, Maſtich and Aloes, and ſpread upon a ſtrong and new cloth. When it hath ſtuck there ſome time, then pluck it ſuddenly with great violence from below upwards; for ſo the rib will follow together therewith, and be plucked and drawn upwards. It is not ſufficient to have done this once, but you muſt do it often, until ſuch time as the Patient ſhall find himſelf better, and to breathe more eaſily. There will be much more hope of reſtitution, if, whilſt the Surgeon do this diligently, the Patient forbear coughing, and hold his breath: Otherwiſe, if neceſſity urge, as if ſharp ſplinters with moſt bitter tormenting pain prick the Coſtal membrane, overſpread with many nerves, veins and arteries, which run under the ribs, whence difficulty of breathing, ſpitting of blood, a cough and feaver enſue; then the only way to deliver the Patient from danger of imminent death, is to make inciſion on the part where the rib is broken, that ſo laying it bare, you may diſcern the pricking fragments, and take them out with your Inſtrument, or elſe cut them off. And if you make a great wound by inciſion, then ſhall

A ſimple fracture may be cured only by Surgery. you ſew it up, and cure it according to the common rules of curing wounds. Now Diet, Phlebotomy and Purgation, which (as *Hippocrates* ſaith) are not very needful in a ſimple fracture, for that there are no ſymptoms which may require ſuch remedies; yet, they, by reaſon of the complicated ſymptoms, as a convulſion, feaver, *Empyema*, and the like, muſt here be preſcribed by the advice of the Phyſician which overſees the cure. A Cerate, and other remedies fitting the occaſion, ſhall be applied to the grieved part: No other ligatures can be uſed, than ſuch as are fit to hold faſt and ſtay the local medicines. There is no other rule of ſite and lying, than ſuch as is taken from the will and content of the Patient.

CHAP. XII.

Of certain preternatural affects which enſue upon broken Ribs.

MAny ſymptoms enſue upon fractured and contuſed ribs; but amongſt the reſt, there are two which are not common, whereof we will treat in this place. The firſt is, the inflamation, or riſing up of the contuſed fleſh, which alſo enſues upon light affects of the bone, which have been neglected at the beginning. But the fleſh is not merely puffed up of it ſelf, but alſo within a certain phlegmatick, glutinous and viſcous humour gathering thereinto.

The cauſe. The cauſe hereof is, the weakneſs of the digeſtive faculty of the part, occaſioned by the ſtroke and diſtemper; which therefore cannot aſſimilate the nouriſhment flowing more plentifully than it was wont, either drawn thither by means of the pain, or ſent thither by a blind violence of nature, ſtirred thereto by a deſire of its own preſervation. Wherefore this half crude humour remaining there, raiſeth much flatuling from its ſelf, or elſe wrought upon by the weaker heat,

The ſigns. it is reſolved into cloudy vapours; whence it cometh to paſs, that the fleſh is ſwoln up in that place, and the skin on the contrary grows ſoft, as if it were blown up with a quill: Therefore laying your hand thereon, you may hear the noiſe of the wind going forth thereof, and ſee a cavity left in the part, as it is uſually ſeen in œdematous tumors. Unleſs you remedy this inflation, there will enſue an imflammation, feaver, abſceſs, difficulty of breathing; and laſtly, that ſecond kind of affect whereof we have determined to treat in this Chapter, to wit, the putrefaction, corruption, or blaſting of the ribs. An abſceſs, and the ſeparation of the fleſh from the bone is the cauſe hereof: For hence it cometh to paſs, that the bone, deſpoiled of its natural and fleſhly cloathing wherewith it was cheriſhed, is eaſily offended by the touch of the entring air, which it never formerly felt, and ſo at length it becometh (as it were) blaſted: Which when it

The cure. happens, they ſpit up filth, and ſo fall into a Conſumption, and at length die. To withſtand all theſe inconveniencies, you muſt as ſpeedily as you can, reſtore the fractured bones by the former delivered means: And then this mucous tumor muſt be reſolved by proper heating and diſcuſſing medicines,

medicines, and kept down by boulſters and rowlers; that ſo the fleſh may touch the bone, and cover it as it uſually did. But the ligature ſhall not be made ſo ſtrait, as to hinder the ribs from their wonted motion in expiration and inſpiration. If the tumor degenerate into an abſceſs, it ſhall be ſpeedily opened, leſt the matter, kept in too long, corrupt the bone which lies under it, by the contagion of its putrefaction. The Ulcer being opened, the matter ſhall be evacuated by putting a Pipe into the Ulcer; the end whereof ſhall be bound about with a thred, leſt it fall into the capacity of the cheſt, and that it may be drawn forth at your pleaſure.

CHAP. XIII.

Of the Fracture of the Vertebræ, *or Rack-bones of the Back, and of their Proceſſes.*

The affect of the *Vertebræ.*

THe *Vertebræ* are ſomewhiles broken, otherwhiles bruiſed or ſtrained on the inſide, whereby it cometh to paſs, that the membranes which inveſt the ſpinal marrow, as alſo the ſpinal marrow it ſelf, are compreſſed and ſtraitned, which cauſe many malign accidents; which, whether they be curable or not, may be certainly foretold by their magnitude. Amongſt theſe ſymptoms, are the ſtupidity, or numneſs and palſie of the arms, legs, fundament and bladder, which diminiſh, or elſe take away from them the faculty of ſenſe and motion: ſo that their urine and excrements come from them againſt their wills and knowledge, or elſe are wholly ſuppreſt. Which when they happen (ſaith *Hippocrates*) you may foretel that death is at hand, by reaſon that the ſpinal marrow is hurt. Having made ſuch a Prognoſtick, you may make an inciſion, ſo to take forth the ſplinters of the broken *Vertebræ*, which driven in, preſs the ſpinal marrow, and the nerves thereof. If you cannot do this, at leaſt you ſhall apply ſuch medicines as may aſſwage pain, and hinder inflammation; and then the broken bones ſhall be reſtored to their places, and contained therein by thoſe means which we ſhall mention, when we come to treat of the luxation of the ſpine. But if that the Proceſſes only of the *Vertebræ* be broken, the fragments ſhall be put in their places, unleſs they be quite ſevered from their *Perioſteum*. But if they be ſevered, you ſhall open the skin and take them forth, and then dreſs the wound as is fit. We underſtand that only the proceſſes of the *Vertebræ* are broken, if in the abſence of the forementioned ſymptoms of numneſs and the palſie, you laying your finger upon the grieved part, feel ſomething, as a bony fragment, ſhaking and moving thereunder, with a certain crackling noiſe, cavity and depreſſion; and then, if when the Patient holds down his head, and bends his back, he feel far more pain, than when he ſtands up ſtrait on his feet: For in ſtooping, the skin of the back is ſomewhat ſtretched forth and extended, and alſo forced upon the ſharp ſplinters of the fragments, whence proceeds a dolorifick ſolution of continuity, and a pricking: In ſtanding ſtrait up, on the contrary, the ſtretched skin is relaxed, and conſequently leſt moleſted by the ſharp fragments. The fractured proceſſes of the *Vertebræ* eaſily heal, unleſs they be aſſociated with ſome other more grievous ſymptom which may hinder; ſuch as is a certain great contuſion, and the like: For as we formerly ſaid out of *Hippocrates*, all rare and ſpongy bones are knit by a *Callus* within a few days.

Sect. 2. Proth.

The cure of fractured *Vertebræ.*

The cure of the proceſſes.

Signs that only the proceſſes are fractured.

CHAP. XIV.

Of the Fracture of the Holy-bone.

What fracture of the holy-bone curable, and what not.

ALſo the Holy-bone in a certain part thereof, which may eaſily be healed, may be broken by the blow of bruiſing things, as by a bullet ſhot out of a muſket, as I have obſerved in many: But if the fracture violate, together with the *Vertebræ* thereof, the ſpinal marrow contained therein, then the Patient can ſcarce ſcape death, for the reaſons ſhewed in the former Chapter.

CHAP. XV.

Of the Fracture of the Rump.

The deſcription of the rump.

THe Rump is compoſed of four bones; the firſt whereof hath a cavity, wherein it receives the loweſt *Vertebræ* of the holy-bone; the other three are joyned together by *Symphyſis* or Coalition; at the end of theſe hangs a certain ſmall griſtle. The fracture of theſe bones ſhall be cured by putting your finger into the Patients fundament, and ſo thruſting it even to the fractured place: For, thus you may thruſt the fragments forth, and fit and reſtore it to the reſt of the bones by your other hand lying upon the back: But that it may be the ſooner healed, it is fit the Patient keep his bed, during all the time of the cure: But if there be a neceſſity to riſe, he ſhall ſo ſit in a perforated ſeat, that there may be nothing which may preſs the broken part; and fitting remedies for healing fractures ſhall be applied as occaſion ſhall offer it ſelf.

The cure.

CHAP.

CHAP. XVI.

Of the Fracture of the Hip, or Os Ilium.

The deſcription of the hip.

THe hip conſiſts of three bones: The firſt is named *Os Ilium*, the haunch-bone; the other, *Os Iſchion*, the huckle-bone; the third, *Os pubis*, the ſhare-bone. Theſe three bones in men of full growth, are ſo faſt knit and joyned together, that they can by no means be ſeparated; but in children they may be ſeparated without much ado. This bone may be broken in any part thereof, either by a ſtroke, or by a fall from high upon any hard body. You ſhall know the fracture by the ſame kind of ſigns, as you know others, to wit, pain, pricking, a depreſſed cavity, and inequality, and alſo a numneſs of the leg of the ſame ſide. The ſplinters of the bones (if quite broke off) muſt by making inciſion, be taken away at the firſt dreſſing; in performance of which operation, you muſt have a care that you hurt not with your Inſtrument the heads of the muſcles, nor any veſſels, eſpecially which are great; nor laſtly, that large nerve which is ſent into the muſcles of the thigh and leg. On the contrary, ſuch fragments as are not broken or ſevered from their *Perioſteum*, ſhall be ſmoothed and ſet in order with your fingers, as is fitting. Other things ſhall be done acording as art and neceſſity ſhall perſwade and require.

The ſigns.

The cure.

CHAP. XVI.

Of the Fracture of the Shoulder or Arm-bone.

The deſcription of the arm, or ſhoulder-bone.

THe arm-bone is round, hollow, full of marrow, riſing up with an indifferent neck, and ending on the upper part into ſomewhat a thick head. On the lower part it hath two proceſſes, the one before, the other behind; between which there is (as it were) an half-circle, or the cavity of a pully, each end whereof leads into its cavity, of which one is interior, another exterior; that by theſe (as it were) hollow ſtops, the bending and extenſion of the arm might be limited, leſt that the bone of the cubit, if the circle ſhould have been perfect, ſliding equally this way and that way, might, by its turning, have gone quite round, as a rope runs in a pulley; which thing would much have confuſed the motion of the cubit: For ſo the extenſion or bending it back, would have been equal to the neceſſary bending it inwards. It is very expedient that a Surgeon know theſe things, that ſo he may the better know how to reſtore the fractures and luxations of this part. If one of the fragments of this broken bone ſhall lye much over the other, and the Patient have a good ſtrong body, then the arm ſhall be much extended, the Patient being ſo ſet upon a low ſeat, that he may not riſe when the fracture ſhall be a ſetting, and ſo hinder the begun work; and alſo, that ſo the Surgeon may there more eaſily perform his operation upon the Patient ſeated under him; yet *Hippocrates* regarding another thing, would have the Patient to ſit higher: But you muſt have a care that the ſhoulder-bone it ſelf be drawn directly downwards, and the cubit ſo bended, as when you put it into a ſcarf. For if any one ſet this bone, lifting the arm upwards, or otherwiſe, extending it, then muſt it be kept in that poſture; for otherwiſe, if the figure be changed, the ſetting will quickly be ſpoiled, when as you come to put the arm in a ſcarf: Wherefore the Surgeon muſt diligently and carefully obſerve, that in ſetting a broken arm, he put it in ſuch a poſture, that reſting on the breaſt, it look down toward the girdle. You muſt have a care in laying the ſplints, and rowling your ligatures, that they hurt not, nor preſs too hard upon the joynts. For, in the opinion of *Hippocrates*, by the preſſure of parts which are nervous, fleſhleſs, and conſequently endued with exquiſite ſenſe, by the ſplints there is danger of moſt grievous pain, inflammation, denudation both of the bone and nerve; but chiefly, if ſuch compreſſion hurt the inner part, towards which the arm is bended; wherefore the ſplints made for this place muſt be the ſhorter: Therefore after the arm-bone is ſet, the arm ſhall be laid upon the breaſt in a right angle, and there bound up in a ſcarf, leſt that the Patient, when he hath need to ſtir, ſpoil and undo the ſetting, and figure of the broken bone: But the arm muſt be kept in quiet, until ſuch time as the fragments ſhall be confirmed with a *Callus*, which uſually is in forty days, ſooner or later, according to the different conſtitutions of bodies.

The cure.

How the arm muſt be placed when the bone is ſet. *Sect. 3. offic. ſect. 1. de fract.*

In what time it will knit.

CHAP. XVIII.

Of the Fracture of the Cubit, or the Ell and Wand.

The differences

IT ſometimes happeneth, that the cubit and wand are broken together and at once, and at otherwhiles that but the one of them is fractured. Now they are broken either in their midſt or ends; their ends (I ſay) which are either towards the elbow, or elſe towards the wriſt. That fracture is worſt of all, wherein both the bones are broken, for then the member is made wholly impotent to perform any ſort of action, and the cure is alſo more difficult; for the member cannot ſo eaſily be contained in its ſtate: For that bone which remains whole, ſerves for a ſtay to the arm, and hinders the muſcles from being drawn back, which uſually draw back and ſhrink up themſelves, whenſoever both bones are broken: Hence it is, that that fracture is judged the worſt, wherein the cubit or ell-bone is broken: But that is eaſieſt of all, wherein only the wand is broken, for ſo the fractured part is ſuſtained by the ell-bone: When both the bones are broken, there muſt be made a ſtronger extenſion, for that the muſcles are the more contracted: Therefore, whenſoever either of them remains whole, it doth more ſervice in ſuſtaining the other, than any either ligatures or ſplints, for that it keeps the muſcles right in their places:

The cure.

Wherefore,

Wherefore after the bones ſhall be ſet and rowled up with ligatures and ſplints, the arm muſt be ſo carried up in a ſcarf put about the neck, that the hand may not be much higher than the elbow, leſt the bloud and other humours may fall down thereinto: But the hand ſhall be ſet in that poſture which is between prone and ſupine, for ſo the Wand ſhall lie directly under the Ell, as we have read it obſerved by *Hippocrates:* The reaſon is, for that by a ſupine figure or ſituation, both the bone and muſcles are perverted: for firſt, for the bone, the *Apophyſis*, *Styloides* and *Olecranum* of the cubit, ought to be in an equal plain, and to be ſeated each againſt other; which is not ſo in a ſupine figure, as wherein the *Proceſſus ſtyloides* of the cubit is ſet againſt the inner proceſs of the arm-bone. But in muſcles, for that, like as the inſertion and ſite of the head of a muſcle is, ſuch alſo is the ſite of the belly thereof: and laſtly, ſuch the inſertion of the tail thereof; but by a ſupine figure, the muſcles ariſing from the inner proceſs of the arm-bone, and bending the cubit, ſhall have the tail placed in an higher and more exteriour ſite. In the *interim*, you muſt not omit, but that the Patients Arm may with as little pain as poſſible you can, be bended and extended now and then, leſt by the too long reſt of the tied up part, and the intermiſſion of its proper function, the bones of the joint may be ſoldered together by the interpoſition, and as it were glue of the defluxion which falls abundantly into the joint of the elbow, and neighbouring parts, whence the ſtiffneſs and unmovableneſs thereof, as if there were a *Callus* grown there: from whence it may happen that the Arm thereafter may neither be bended nor extended, which I have obſerved to have happened to many: Whereof alſo *Galen* makes mention, and calls this kind of vitiated conformation *Aneyle* and *Aneyloſis*. If a Wound alſo aſſociate a fracture of the arm, then ſee that you put about it Plates of Lattin, or Paſt-board, and make a convenient ligature and that the fragments of the bones be kept in the ſame ſtate wherein they were ſet and reſtored: Moreover, let him lay his arm upon a ſoft pillow, or cuſhion, as the precedent Figure ſhews you.

Sent. 3. ſect. 2. de Fract.

Com. in lib. de Art.

The Figure of a fractured Arm, with a wound bound up, and ſeated, as is fit.

CHAP. XIX.

Of the Fracture of a Hand.

THe Bones of the Wriſt and After-wriſt, may be broken: but, in *Hippocrates* opinion, chiefly by that kind of Fracture which is called a *Sedes*; now if they ſhall happen to be broken, this ſhall be the manner of reſtoring them: Let the Patient lay forth his hand upon ſome even and ſmooth Table; then let your Servant ſtretch forth the broken bones, and the Work-maſter reſtore them thus extended, and put them in their proper ſeats. But being reſtored, they muſt be kept in their places by ſuch remedies as are uſed in other Fractures; to wit, cerates, compreſſes, linnen cloths, and ſplints. Now the fractured fingers ſhall be tied or bound to their neighbours, that ſo they may the more eaſily, as bound to a ſtake, be kept in that ſtate wherein they have been put by the hand of the Workman: But theſe bones, ſeeing they are of a rare and ſpongy nature, are in a ſhort time and eaſily ſtrengthened, or knit by a *Callus*. Theſe things being done, the hollowneſs or palm of the hand ſhall be filled with a Tennis-ball, for thus the broken bones ſhall not onely be more eaſily kept in their places, but alſo the fingers themſelves ſhall be kept in a middle poſture, that is, not wholly open, nor quite ſhut. If they be kept in any other figure, the enſuing *Callus* will either deprave or quite aboliſh that action of the hand, whereby we take hold of any thing. The caſe ſtands otherwiſe with the fractured Toes; for they ſhall be kept ſtrait and even out, leſt they ſhould hinder our going or ſtanding.

Sect. 2. de fract. ſent. 9.

The cure.

To what purpoſe the carrying of a ball in a fractured hand ſerves.

CHAP. XX.

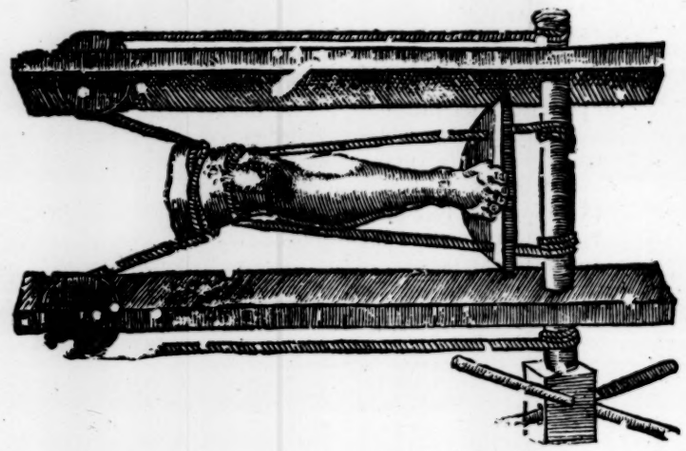
Of the Fracture of the Thigh.

IT is a hard thing to bring the fragments of the broken Thigh together to be ſet, by reaſon of the large and ſtrong Muſcles of that part; which whileſt they are drawn back towards their original, by a motion both natural and convulſive, they carry together with them the fragment of the bone, whereinto they are inſerted: Therefore, when as the Fracture of this bone ſhall be reſtored, the Patient muſt lie upon his back with his Leg ſtretched forth, and the Surgeon muſt ſtrongly and with great force extend the thigh; but if he alone ſhall not be able ſufficiently to extend it, he ſhall imploy two other ſtrong attendants, by whoſe joint-help the fragments may be fitted and ſet each againſt other. For this purpoſe, when as the ſtrength of the hand was not ſufficient, the Ancients uſed an Inſtrument called a *Gloſſocomium*, whereof this is the Figure.

Why the bone of the Thigh is more difficultly ſet.

Sect. 67, & 68. Sect. 2. de Fract.

The Figure of a Gloſſocomium, *or Extender.*



In ſtead of this *Gloſſocomium*, you may make uſe of my Pulley; for *Hippocrates*, in this bone when it is broken, doth approve of extenſion ſo much, that although by the greatneſs of the extenſion the ends of the fragments be ſomewhat diſtant aſunder, an empty ſpace being left between; yet notwithſtanding would he have a ligature made: For it is not here as it is in the extenſions of other bones, whereas the caſting about of Ligatures keeps the muſcles unmovable: but here, in the extended thighs, the deligation is not of ſuch force as that it may ſtay and keep the bones and muſcles in that ſtate wherein the Surgeon hath placed them: For, ſeeing that the muſcles of the thigh are large and ſtrong, they overcome the ligation, and are not kept under by it. The Surgeon in ſetting it ſhall alſo conſider, that the thigh-bone is hollowed on the inner-ſide, but gibbous on the out-ſide, therefore it muſt be ſet in its native figure: Otherwiſe, if any, unmindful of this conſideration, would have it ſtraight, he ſhall make his Patient halt all his life after: wherefore this inner and native hollowneſs muſt be filled up and preſerved by putting in a compreſs or boulſter ſpread over with *Unguentum roſatum*, or the like glutinous thing that it may not fall off: for thus alſo the ligation ſhall the more faithfully keep the fragments of the bone in their places. Moreover, Compreſſes ſhall be applied to the more ſlender and leſs protuberating parts of the thigh, as thoſe which are next the ham and knee, that ſo the whole ligation may be alike, and conſequently the more firm. Now ligatures, as we formerly noted, are ordained for three things: The firſt is, that the bones may be kept in that ſtate wherein they were ſet, until they be ſtrengthened by a *Callus*: The ſecond is, to hinder defluxion, which eaſily falls into the broken and luxated parts, both by reaſon of pain, as alſo by weakneſs: The third is, to ſtay and hold faſt the ſplints and medicins which are applied. Inflammation is hindered by repreſſing and hindering the bloud and other humours, ready to flow down, from entering into the part, and by preſſing thoſe humours which are preternaturally contained in the part, into the neighbouring parts above and below: Wherefore there muſt no ſmall care be had of preparing ligatures, to wit, that they be made of choice and well woven cloth, yet not coarſe or rough; and let them be of ſuch length and bredth as the Surgeon, perſuaded by an artificial conjecture, ſhall judge to be fit for the thickneſs and length of the member and greatneſs of the fracture: for ligatures ought to be of bredth to involve and cover all the fractured part, and a great part of that which is ſound: But ſeeing that in my Book of Bandages, I have ſeemed chiefly to ſet down and approve the manner of binding uſed by *Hippocrates*, now I think good here in this place to deſcribe that which is in common uſe amongſt our Surgeons. Our Surgeons therefore at this day require three ligatures for Fractures, the firſt whereof they preſently caſt upon the hurt part, whether broken or diſlocated, or onely ſtrained, making the firſt wrappings upon it; ſo that they moſt and ſtraitlieſt bind it there, but leſs and more looſly on both ſides thereof: Such circumvolutions, or wrappings, are drawn upwards, and there ended. They muſt be rowled thick, and not wide; for ſo if they preſently follow, and lie one upon another, they will hold the bones more firmly, and more far and wide preſs forth and repreſs the ſuperfluous bloud from the ſound part. They preſently in like ſort caſt the ſecond ligature upon the very Fracture, giving it two wraps, then going downwards; yet ſo, as that they are opener or wider, and farther diſtant each from other, and not ſo cloſe together, as the circumvolutions of the firſt ligature; that ſo they may preſs the humours the leſs to the extremities of the part, as thoſe which cannot receive and bear, without inflammation and danger of a Gangrene, ſuch abundance of humours, for that they are not ſufficiently ſpacious; as alſo more remote from the fountain of native heat, which is greater in the center than in the circumference. At the lower end of the hurt part the circumvolutions either end, or elſe are twined thence back again: They caſt on the third ligature in that lower end of the hurt part, and rowl it ſmoothly and gently upwards, the windings being made contrary to the windings of the firſt and ſecond ligatures; that they may ſo draw back into their natural ſtate the muſcles, which peradventure have been drawn aſide by the force of the former wrappings. Theſe ligations finiſhed, they apply three ſplints of Paſt-board, or ſome ſuch matter; the firſt below the Fracture, and that truly more broad, and of ſufficient length; and then two others, one on each ſide, diſtant each from other ſome fingers bredth, to the end to keep the bone that it do not ſtir to this ſide or that, being wrapped about with Tow or Cotton: Then they think of placing or laying the part, to which purpoſe they propound to themſelves three ſcopes. The firſt is, that the part may lie ſoft; the ſecond, ſmooth and even; the third, ſomewhat high. The hurt part ought truly to lie ſoft, for that hard lying preſſes it, and cauſes pain and inflammation; which whiles the Patient cannot patiently endure, he is forced to change his place, whileſt he every way ſeeks eaſe for his pain; and thus he now and then moves the fractured part, which ought to be kept quiet without any motion. It muſt lie ſmooth or even, becauſe an unequal or uneven

The natural and internal crookedneſs muſt be preſerved in ſetting the bone.

The part to be bound up, muſt be made plain either by Nature or Art.

The manner of binding uſed by Surgeons at this day.

Why the winding of the upper ligatures muſt be thicker and ſtraiter than the lower.

Why the third ligature muſt be rowled contrary to the two firſt.

The Surgeon muſt be mindful of three things in placing the member.

uneven ſite diſtorts or draws awry the part, whileſt one portion of the hurt part is born up, and ſuſtained by that which lies under it; but the other hanging down hath nothing thereunder, whereupon it may reſt: Therefore *Hippocrates* bids us diligently to take heed that the heel do not hang down, nor the foot remain without a pillow, for hence pain and defluxion of humours is to be feared. *Sect. 2. de fract.* But the part ought to lie ſomewhat high, that the defluxion may be hindered, which is eaſily ſtirred up by a prone and declining ſite: for if the foot ſhall be placed in a lower figure, the bloud which flows thither from the leg, will cauſe inflammation. But on the contrary, if it be higher, nothing can flow down thereinto: Therefore abſolutely not onely the foot, but alſo the thigh and leg are to be placed higher than the reſt of the body; yet keeping ſuch a mean, that the part may not be too much diſtended, as *Hippocrates* admoniſheth us. *Sent. 33, & 56. ſect. 2. de fract.* In the mean time, this hurt leg or ſide ought to be of equal length with the ſound, and for that purpoſe it muſt be ſtaid on both ſides with Junks, as we ſhall ſhew you hereafter, when we come to ſpeak of a broken leg. The bandage being performed, as we have ſaid, the following night, and the next day the Patient feels the member more ſtraitly bound, than when it was at firſt wrapped; yea, verily the Knee is lifted up into a ſoft tumor by the expreſſion of the humour from the wounded part: but on the contrary, the enſuing day the ligation is ſlackned and relaxed, ſome portion of the humour contained in the part being digeſted. Alſo the next day all things are perceived more looſe, there being made a larger reſolution of the humour: Then therefore the bandages muſt be looſed, and that not onely, leſt that the fragments of the bones ſhould fall forth of their place, but alſo that we may gratifie the Patient by that alteration or change of place, and beſides that we may avoid itching, which uſually happens to parts too long bound up, by reaſon of the ſuppreſſion of acrid and fuliginous excrements, which uſe to be gathered in great quantity in a part at reſt and bound up, both from the excrementitious humours, wherewith the part is moiſtned, and the alimentary humours, in a part which is idle and at quiet; by reaſon the diffliation and tranſpiration are hindered by want of exerciſe, and the pores of the skin ſhut up by the abundance of the ligatures: ſo that by the ſuppreſſion thereof, many have not onely an itching, but alſo the skin being broke by the acrimony of theſe, as well vapours as humours, which are kept ſhut and pent up, have Ulcers break forth: Therefore when ſuch accidents ſhall be feared, the part ſhall ſo long be fomented with warm Water and Oil, as you ſhall think fit: for, ſuch fomenting aſſwageth pain, relaxeth that which was too much ſtraitned by the binding, and amends the refrigeration of the part, cauſed by the repercuſſion and expreſſion of the bloud and ſpirits, the native and internal heat being by this means revived. If, together with the tumour there be a contuſion and fugillation, it muſt be the longer fomented, that the excrementitious humour reſiding in the part may be digeſted. But if this quantity of time ſhall not ſuffice, then muſt you uſe ſtronger digeſtives: yet have a care you uſe them not too long; for ſo you ſhould hinder the generation of a *Callus*. Therefore that ſaying of *Hippocrates* muſt here be remembred, which ſaith, That a weak fomentation, and the ſhort time of uſing one, doth attract, but not diſcuſs; but a longer and ſtronger waſtes the fleſh. *Sent. 15. ſect. 3. de offic.* Beſides alſo you muſt have regard to the temper and habit of the Patient; for fomentations uſed to plethorick bodies, draw ſuperfluous humours to the part. The Ancients bid, that the ligatures be looſed every third day until their ſeventh day; but after the ſeventh, on every ſeventh day: but hereof nothing can be certainly and perpetually decreed: For, according to the accidents the Patients muſt be dreſſed ſooner or later, more often or ſeldom; renewing the ligatures, and the reſt of the dreſſing. Therefore, if no ſymptom urge, I would have none of theſe things which are done to the Patient at the firſt dreſſing, to be moved, unleſs as ſlowly and ſeldom as you may: For you hinder the knitting of the bone, if you never ſo little move the ends of the fragments thereof: for, as you ſee Wood is joined together by Glue, and Pewter with Solder; ſo the fragments of bones are, by a providence of Nature, glued and ſoldred together by a *Callus*. Wherefore broken bones have very much need of reſt, to the generating of a *Callus*; otherwiſe, the matter thereof flowing down, quickly flows away, and nothing is done. You may much help forwards the generation of a *Callus*, which is begun about the thirteenth or fifteenth day, by applying an emplaiſter made with the white of an Egg, having the Powder of red Roſe-leaves, and Wheat-flour mixed therewith, and catagmatick Plaſters, which ſhall hereafter be deſcribed in ſpeaking of the Fracture of a Leg.

When the firſt ligation muſt be looſed.

Reſt neceſſary for the knitting of fet bones.

CHAP. XXI.

Of the Fracture of the Thigh nigh to the Joint, or the upper or lower head of the bone.

A Fracture ſometimes happens at the joint of the hip in the neck of the thigh-bone, as I once obſerved in an honeſt Matron. I being called to her, when I had obſerved the hurt thigh to be ſhorter than the whole, with the outward prominency of the *Iſchium*, which at the firſt ſight I ſuppoſed to proceed from the head of the thigh-bone, I preſently perſwaded my ſelf it was a Diſlocation and no Fracture; I then therefore extended the bone, and forced (as I thought) the head thereof into its cavity. The equality of both the legs in bigneſs which followed upon this extenſion, increaſed my perſuaſion that it was a diſlocation. The next day I viſited her the ſecond time, and found her in great pain, her hurt leg the ſhorter, and her foot wreſted inwards. Then I looſed all her ligatures, and perceived ſuch a prominency as I did formerly: Wherefore I endeavoured again to force in the head of the bone, as I formerly did; but as I was buſied therein, I heard a little crackling, and alſo I conſidered that there was no cavity nor depreſſion in the joint, by which ſigns I certainly perſuaded my ſelf that the bone was broken, and not diſlocated. Neither onely ſuch kind of Fractures, but alſo the ſeparation of the *appendix* or head of this bone from its place, may induce one to think it a diſlocation; which thing hath ſometimes deceived ſome heedleſs Surgeons, who have not dreamt of the divulſion or ſeparation of the *appendix*

A Hiſtory.

Another Fracture of the Thigh, reſembling a luxation.

appendix from the top of the thigh-bone, but have judged it onely a diſlocation. Then therefore (that I may return to my former narration) I ſet the bone, and joined the fragments together, laid thereupon ſplints with compreſſes, made ligations with a rowler, having two heads wrapped about the joint, and the body croſs-wiſe, and I defended her foot with a caſe, that none of the cloths might preſs it: I faſtned a rope to a poſt, and ſo let it come down into the midſt of the Bed, and tied many knots thereon, for the better taking hold and lifting up her ſelf; the which thing you muſt always do in Fractures and Diſlocations of the Thigh and Leg, that ſo your Patients may have ſome ſtay, whereby they may ſuccour themſelves with their hands as oft as they deſire to riſe or lift themſelves up in their Beds, or go to ſtool; as alſo, that they may give perſpiration, and as it were ventilation to the loins, buttocks, rump, and other parts, compreſſed and wearied with long lying, for want whereof they are moleſted with heat and pain, whence Ulcers ariſe, which oft-times torment the Patient with ſuch tormenting heat and pain, that he is even conſumed by a Fever, watchings, and want of reſt. This opportunity of raiſing the body out of the Bed, is by ſo much the more needful in this place, by how much the Fracture is nearer the joint; for there it is more dangerous than in the midſt of the thigh, and conſequently more difficult to dreſs and heal, for that the part is bloudleſs, and by reaſon of the multitudes of the Nerves, Tendons, and Ligaments, which are obnoxious to many malign ſymptoms: But the Surgeon muſt have diligent care in this kind of Fracture, and muſt look often that the bone which is ſet do not fall forth again, which eaſily happens here by any light ſtirring of the body, and the like occaſion, for that the thigh hath but one onely bone: Therefore as oft as the Bandages ſhall be looſed, and the Fracture dreſſed, he ſhall attentively view the figure of the bone, and the magnitude of the affected part, comparing it with the ſound; for the ſet and compoſed fragments of the broken bone can ſcarce fall aſunder, but that the one muſt lie upon the other. But before it be knit the part muſt be extended and reſtored to its ſtate, that ſo the Patient may not halt during the reſidue of his life: For I have read it written in *Avicen*, that ſcarce any do ſo well recover a fractured thigh, that they do not halt thereof; therefore the Patient muſt be careful that he move himſelf or his body as little as he can. Many of the Ancients have ſet down the time of the conſolidation of this bone to be fifty days: but (as I formerly ſaid) there can be no certain or determinate time hereof. But in what time ſoever this bone ſhall be knit the Patient muſt not ſtand or go thereon preſently upon it, for that there remains a weakneſs in the part a long time after, ſo that the Patients are forced to uſe Crutches to go withall, in the mean ſpace while they recover more ſtrength.

Why the Fracture of a bone near a joint is more dangerous.

Lib. 3. ſent. 6. tract. 1. c. 14.

In what ſpace the thigh-bone may be knit.

CHAP. XXII.

Of the Fracture of the Patella, *or Whirl-bone of the Knee.*

The Differences.

THe Whirl-bone of the Knee is oft-times contuſed, but not ſo frequently broken; yet when that happens, it goes into two or three pieces, ſometimes long-wiſe, ſometimes athwart; ſometimes it is broken in the midſt, and ſomewhiles ſhivered into many ſplinters, and all theſe either with or without a wound.

Signs.

The ſigns are, impotency in going, a hollowneſs in that place, and a ſenſible ſeparation of the fragments of the hurt part, and the crackling of theſe parts under your hand.

Cure.

It is ſet after this manner; wiſh the Patient to ſtretch forth his leg, yea, he muſt keep it extended all the while until it be knit; and therefore leſt he ſhould bend it unawares, the hollowneſs of the ham ſhall be filled with a boulſter; for by bending of the Knee the ſet fragments of the Whirl-bone would again fly in ſunder. This being done, the fragments ſhall by the hand of the Surgeon be ſet as is fitting, and be kept ſo ſet by the application of convenient remedies, making ligatures, and applying junks, as we ſaid muſt be done in the fracture of the thigh-bone. And laſtly, you muſt obſerve and do in this as in the fracture of a leg. For the Prognoſtick, this I affirm, that I have ſeen none of thoſe who have had this bone fractured who have not halted during the reſt of their lives. The cauſe hereof is, the knitting by the concretion of a *Callus* hinders the free bending of the Knee; going, eſpecially on even ground, is more eaſie to the Patient, but an aſcent is far more difficult, and abſolutely painful. The Patient muſt neceſſarily for this kind of Fracture lie or keep his Bed, at the leaſt for forty days.

Why thoſe halt who have had this bone fractured.

CHAP. XXIII.

Of a broken Leg.

Sent. 65. ſect. 2. de Fract.

THis kind of Fracture is cured after the ſame manner as that of the arm or cubit. *Hippocrates* admoniſheth us, that the *Tibia*, or leg-bone is more dangerous to be broken, and more difficult and ſlow to be healed than the *Fibula*, or ſhin-bone; becauſe that is the thicker, and as it were the upholder of the whole bulk of the body; but this other is but as it were a certain additament or aſſiſtant, provided for the ſtaying or bearing up of the muſcles of the leg, by which the foot is moved. The leg-bone being only broken, the ſigns thereof are perceived only in the inner part of the leg; for that the ſhin-bone being whole, ſuffers it not to throw or caſt forth it ſelf. On the contrary, when the ſhin-bone only is broken, the ſigns thereof appear only in the external part of the leg; becauſe the leg-bone being oppoſed thereto, doth not ſuffer it to caſt in it ſelf, and with its fragments to turn inwards: But when both the bones are broken, the ſigns of the Fracture may equally appear both here and there. But when only one of theſe bones are broken, the Fracture is far more eaſie to dreſs and heal, becauſe that which remains whole, is a much more firm ſtay to that which is hurt than any ſplints can be. But that I may the better inſtruct and make ready the Surgeon for the reſtoring

Sign that both the bones are broken.

of

of this Fracture, I will illuſtrate the matter by an example from my ſelf. *John Neſtor*, Doctor of Phyſick, *Richard Hubert*, and I, went together to viſit a Patient at the place of the Frier Minorites. Wherefore, intending to paſs over the *Sein* within ſight of the place, I endeavoured to make my horſe take boat, and therefore ſwitched him over the buttocks: The Jade, madded herewith, ſo ſtruck at me with his heels that he brake both the bones of my left leg, ſome four fingers bredth above my ankle. Then I, fearing ſome worſe miſchief, and leſt the Jade ſhould double his blow, flew back; and as I fled back, the broken bones flew in ſunder; and breaking through the fleſh, ſtocking, and boot, ſhewed themſelves, whereby I felt as much pain as it is credible a man was able to endure; wherefore I was preſently carried into the Boat, that ſo I might be carried to the other ſide of the Water to be dreſſed; but the ſtirring of the Boat as they rowed, almoſt killed me with bitterneſs of pain, for that the ſharp fragments of the bones were rubbed againſt the fleſh which lay next them. Being ferried over, as I was conveyed into the next houſes, my pain was much increaſed, whileſt lifted by the hands of divers perſons, one while up another down, ſometimes to the left ſide, other whiles to the right with my whole body, and all the parts thereof. When at the length I was laid upon a bed, I was ſomewhat freed from the bitterneſs of my pain, and had time to wipe off the ſweat which ran down over all my body. Then was I dreſſed with ſuch a Medicin as the time and place would afford, we compoſed it of the White of Egg, Wheat-flour, Soot of a Chimney, and melted Butter. For the reſt, I entreated *Richard Hubert* that he would handle me as if he knew me not, neither that moved for love of me, he ſhould remit any thing of the ſeverity of Art, but chiefly, that he would ſtretch my foot ſtraight out, and if the wound were not ſufficiently wide, that he would enlarge it with his Inciſion-knife, that ſo he might the more eaſily ſet the broken bones in their due place; that he would with his fingers (whoſe judgment is far more certain than the beſt made inſtruments) ſearch, whether the ſplinters which were in the wound were quite ſevered from the bone, and therefore to be taken forth; that he would with his hand preſs forth the bloud, and the clods of bloud which were in a great quantity concrete at the mouth of the wound; that he would bind up and place my leg in that ſite and manner as he thought beſt; which is, that he would have three rowlers in a readineſs, the firſt whereof he ſhould caſt directly upon the wound, ſo that he ſhould begin his ligation at the wound: alſo he ſhould put ſplints about it, ſome three, but others two fingers bredth, of the length of half a foot, ſomewhat depreſſed and hollowed, whereby they might be the more eaſily put about the leg, more ſtraitly at their ends, and a fingers diſtance each from other, which at the laſt he ſhould bind with fillets, like thoſe wherewith Women uſe to bind up their hair; yet ſo that the binding might be more ſtraight upon the wound; and that he would fill the cavity of the ham and of the ankles with bouſters made of flax wrapped in linnen cloths: that he would fortifie the ſides of my leg with Junks made of bents or little ſticks, and lined with linnen cloth, ſtretched from my heel to my groin, and bound over in four places; ſo that the ſtraight figure of the leg might ſcarcely be perverted by any force: that he would gently and ſmoothly lift up my leg to an indifferent height: and laſtly, that he ſhould arm it from the violence of external injuries, by putting it in a Box or Caſe. But you muſt note, that the fit placing or laying of the Leg is a matter of ſuch moment, that if any errour be here committed, it will cauſe no leſs then lameneſs: For if it be lifted up higher than is fit, the *Callus* will be hollow on the foreſide; if lower, then it will be gibbous or bunching forth. Neither alſo do they commit a ſmall errour, who do not fill up the cavities at the ancles after the afore-mentioned manner: for, hereupon the heel will be much afflicted, whileſt it is forced to ſuſtain a tedious and painful compreſſion, which at length brings a hot diſtemper, becauſe the ſpirits cannot freely flow thereto; which I finding by experience, not knowing the cauſe, wiſhed them ever now and then to lift up my heel, whereby it might enjoy the benefit of perſpiration, and the ſpirits have free entrance thereinto, and the contained vapours paſſing forth. To conclude, my hurt leg was laid upon a cuſhion, after the manner you ſee here deſcribed.

A Hiſtory.

A ſoon made Medicin.

What to do when the Leg is broken.

The figure of a Leg fractured with a Wound, and bound up.

CHAP. XXIV.

Of ſome things to be obſerved in Ligation, when a Fracture is aſſociated with a Wound.

THis taken out of the doctrine of the Ancients, ought to be kept firm and ratified; that ligation muſt be made upon the Wound, otherwiſe the wounded part will preſently lift it ſelf up into a great tumor, receiving the humours preſſed thither by the force of the ligation made on this and that ſide, above and below, whence enſue many malign ſymptoms. You may make trial hereof upon a ſound fleſhy part; for if you bind it above and below, not touching that which is in the midſt, it will be lifted up into a great tumor, and change the flouriſhing and native colour into a livid or blackiſh hue, by reaſon of the flowing and abundance of the humours preſſed forth on every ſide from the neighbouring parts. Therefore ſuch things will happen much the rather in a wounded or ulcerated part: But for this cauſe the Ulcer will remain unſuppurated and weeping, crude and liquid *Sanies* flowing there-hence, like unto that which uſually flows from inflamed Eyes: Such *Sanies*, if it fall upon the bones, and make any ſtay there, it, with the touch thereof, burns and corrupts them, and ſo much the more, if they be rare and ſoft. Theſe will be the ſigns

That the ligation muſt be moſt ſtrait upon the wound.

What ſymtoms enſue the want of binding upon the wounded part

Signs of the corruption of the bones.

of ſuch corruption of the bones; if a greater quantity, and that more filthy *ſanies* flow from the Ulcer than was accuſtomed, or the nature of a ſimple Ulcer requires; if the lips of the Ulcer be inverted, if the fleſh be more ſoft and flaccid about them, if a ſorrowful ſenſe of a beating, and alſo deep pain torment the Patient by fits; if, by ſearching with your probe, you perceive the bone to be ſpoiled of its *periſteum*; and laſtly, if you find it ſcaly and rough; or alſo, if your probe be put down ſomewhat hard, it run into the ſubſtance of the bone. But we have treated ſufficiently hereof in our particular Treatiſe of the rottenneſs of the bones; but certainly ſuch rottenneſs will never happen to the bone, if the hurt part be bound up as is fit, and according to Art. Wherefore I judge it not amiſs again to admoniſh the Chirurgeon of this, that as far as the thing ſhall ſuffer, he make his rowlings upon the wound, unleſs by chance there be ſuch exceſſive pain and great inflammation, that through occaſion of ſuch ſymptoms and accidents, he be diverted from this proper and legitimate cure of the diſeaſe: Therefore then, becauſe nothing more can be done, let him onely do this which may be done without offence; that is, let him ſupply the defect of ligation and rowlers, with a linnen cloth, not too weak, nor too much worn, being twice or thrice doubled, and which may ſerve to compaſs the wound and neighbouring parts once about: let him ſew the edges thereof at the ſides of the wound, leſt he be forced to ſtir the fragments of the bones (which once ſet ought to be kept unmoved) as often as the wound comes to be dreſſed. For, broken bones do not require ſuch frequent dreſſing as Wounds and Ulcers do. By this it appears, that as want of binding, and too much looſneſs in abſence of pain and a phlegmon, ſo alſo too ſtrait ligation when pain is preſent, brings a phlegmon and abſceſs to the Wound: Therefore let all things here, according to the forementioned rules and circumſtances be indifferent. I have for this purpoſe thought good to reiterate theſe things, becauſe you ſhall as yet find many, who follow the practice of *Paulus*, and make many circumvolutions here and there, above and below the wound, which preſently they carry croſs-wiſe. But this croſs or Lattice-like kind of ligation is wholly to be diſliked, and that onely to be uſed which we have deſcribed, according to the mind of *Hippocrates*. Now it is time that I return to the former Hiſtory of my miſhap, and declare what was done to me after that firſt dreſſing, which I have formerly mentioned.

When the wounded part muſt be omitted in ligation

Lattice-like binding to be ſhunned.

CHAP. XXV.

What was uſed to the Authors Leg after the firſt dreſſing.

I Being brought home to mine own houſe in *Paris* in the afternoon, they took from me, out of the Baſilica of the left arm, ſome ſix ounces of bloud: And then at the ſecond dreſſing the lips or edges of the wound and places thereabout were anointed with *unguentum roſatum*, which by a joint conſent of the Ancients, is much commended in the beginnings of fractures; for it will aſſwage pain, and hinder inflammation, by repelling the humours far from the wounded part: for it is cold, aſtringent and repelling, as the compoſition thereof ſhews; for it is made *ex oleo omphacino, aqua roſacea, pauco aceto, & cera alba.* Therefore I uſed this ointment for ſix days; I dipped the compreſſes and rowlers ſomewhiles in Oxycrate, otherwiles in thick and aſtringent red Wine, for the ſtrengthening of the part, and repreſſing the humours; which two things we muſt have a care of in *Hippocrates* opinion, in Fractures eſpecially with a wound: Wherefore if at any time the compreſſes or rowlers ſeemed to dry, I now and then moiſtned them with the Oxycrate or Roſe Vinegar: for, by their too much dryneſs, pain and inflammation happen; and if they bind the part ſomewhat more ſtrait, they hurt it alſo by their hardneſs. You ſhall ſee many Surgeons, who in this kind of affect, from the beginning to the end, uſe onely aſtringent and emplaſtick Medicins, wholly contrary to the method ſet down by *Hippocrates*, and commended by *Galen:* For, by the continued uſe of ſuch things, the pores and breathing-places of the skin are ſhut up; whence the fuliginous excrement being ſuppreſt, the external heat is increaſed, and itching cauſed, and at length an Ulcer by the fretting of the acrid and ſerous humour long ſuppreſt: Whereby you may learn, that aſtringent and emplaſtick Medicins muſt not be uſed above ſix days: In ſtead hereof you ſhall uſe the emplaiſters, which I ſhall preſently deſcribe. In the beginning of my diſeaſe I uſed ſo ſpare a diet, that for nine days I ate nothing each day but twelve ſtewed Prunes, and ſix morſels of bread, and drank a *Paris* pint of ſugred Water, of which Water this was the compoſition. ℞ *Sacc. albiſ.* ʒ xij. *aquæ font.* ℔ xij. *cinam.* ʒ iij. *bulliant ſimul ſecundum artem:* Otherwiles I uſed Syrup of Maidens-hair with boiled Water: Otherwiles, the divine drink (as they term it) whereof this is the compoſition. ℞ *Aquæ cochæ* ℔ vj. *ſacc. albiſ.* ℥ iv. *ſucc. lim.* ℥ j. *agitentur & tranſvaſentur ſæpius in vaſis vitreis:* I was purged when need required with a bole of *Caſſia* with Rubarb: I uſed alſo Suppoſitories of Caſtle-Soap to make me go to ſtool; for, if at any time I wanted due evacuation, a preternatural heat preſently ſeized upon my kidnies: With this, though exquiſite manner of diet, I could not prevail, but that a Fever took me upon the eleventh day of my diſeaſe, and a defluxion, which turned into an abſceſs, long flowing with much matter: I think the occaſion hereof was ſome portion of the humour ſuppreſt in the bottom of the wound; as alſo by too looſe binding, by reaſon that I could not endure juſt or more ſtrait binding; and laſtly, ſcales or ſhivers of bones quite broke off, and therefore unapt to be agglutinated: for theſe therefore putrefying, drew by conſent the proper nouriſhment of the part into putrefaction, and by the putredinous heat thence ariſing, did plentifully adminiſter the material and efficient cauſe to the defluxion and inflammation. I was moved to think they were ſcales ſevered from their bone by the thin and crude *ſanies* flowing from the wound, the much ſwoln ſides of the wound, and the more looſe and ſpongy fleſh thereabouts. To theſe cauſes this alſo did accrew, one night amongſt the reſt, as I ſlept, the muſcles ſo contracted themſelves by a violent motion, that they drew my whole leg upwards; ſo that the bones, by the vehemency of the convulſion, were diſplaced, and preſſed the ſides of the wound; neither could they be perfectly compoſed or ſet, unleſs

Unguentum Roſatum, wherefore good in Fractures.

You muſt have a care that the compreſſes and rowlers grow not hard by drineſs.

The cauſes of a Fever and Abſceſs, enſuing upon a Fracture.

Signs of ſcales ſevered from their bones.

unleſs by a new extenſion and impulſion, which was much more painful to me than the former. My Fever when it had laſted me ſeven days, at length enjoyed a *criſis* and end, partly by the eruption of matter, and partly by ſweat, flowing from me in a plenteous manner.

CHAP. XXVI.

What may be the cauſe of the convulſive twitching of broken Members.

Why the extreme parts are cold when we ſleep.

THis contraction, and (as it were) convulſive twitching, uſually happens to fractured members in the time of ſleep. I think the cauſe thereof is, for that the native heat withdraws it ſelf while we ſleep, into the center of the body; whereby it cometh to paſs, that the extreme parts grow cold. In the mean while Nature by its accuſtomed providence, ſends ſpirits to the ſupply of the hurt part: But becauſe they are not received of the part evil affected and unapt thereto, they betake themſelves together, and ſuddenly, according to their wonted celerity, thither from whence they came, the muſcles follow their motion; with the muſcles the bones whereinto they are inſerted, are together drawn; whereby it comes to paſs, that they are again diſplaced, and with great torment of pain, fall from their former ſeat. This contraction of the Muſcles is towards their original.

CHAP. XXVII.

Certain documents concerning the parts whereon the Patient muſt neceſſarily reſt whileſt he lies in his Bed.

The natural faculties languiſh in the parts by idleneſs, but are ſtrengthened by action.

How and what Ulcers happen upon the fracture of the leg, to the rump and heel.

THoſe who have their leg or the like bone broken, becauſe they are hindered by the bitterneſs of pain, and alſo wiſh for their cure or conſolidation, are forced to keep themſelves without ſtirring, and upon their backs in their beds for a long time together. In the mean ſpace the parts whereupon they muſt neceſſarily lie, as the heel, back, holy-bone, rump, the muſcles of the broken thigh or leg, remain ſtretched forth and unmovable, ſet at liberty from their uſual functions: Whereby it comes to paſs that all their ſtrength decayes, and grows dull by little. Moreover alſo, by the ſuppreſſion of the fuliginous and acrid excrements, and want of perſpiration, they grow preternaturally hot; whence defluxion, an abſceſs and ulcer happen to them, but principally to the holy-bone, the rump, and heel: to the former, for that they are defended with ſmall ſtore of fleſh; to the latter, for that it is of more exquiſite ſenſe. Now the Ulcers of theſe parts are difficultly healed, yea, and oft-times they cauſe a gangrene in the fleſh, and a rottenneſs and mortification in the bones thereunder, and for the moſt part a continued Fever, *delirium*, convulſion, and (by that ſympathy which generally accompanies ſuch affects) a hicketing: For the heel and ſtomach are two very nervous parts, the latter in the whole body thereof, and by a large portion of the Nerves of the ſixt conjugation; but the other by the great tendon paſſing under it, the which is produced by the meeting, and as it were growing together of the three muſcles of the calf of the leg. All which are deadly both by diſſipation of the native heat by the feveriſh, and that which is preternatural; as alſo by the infection of the noble parts, whoſe uſe the life cannot want, by carrion-like vapors. When as I conſidered all theſe things with my ſelf, and (become more skilful by the example of others) underſtood how dangerous they were, I wiſhed them now and then to lift my heel out of the bed; and taking hold of the rope which hung over my head, I heaved up my ſelf, that ſo the parts preſſed with continual lying, might tranſpire and be ventilated. Moreover alſo I reſted theſe parts upon a round cuſhion, being open in the middle, and ſtuffed with ſoft feathers, and laid under my rump and heel, that they might be refreſhed by the benefit and gentle breathing of the air: and I did oft-times apply linnen cloths ſpred over with *unguentum roſatum*, for the aſſwaging of the pain and heat: Beſides alſo, I deviſed

The Figure of a Caſſe.

Remedies for the prevention of the aforeſaid Ulcers.

The uſe of a Lattin Caſſe.

deviſed a Caſſe of Lattin, wherein the broken Leg being laid, is kept in its place, far more ſurely and certainly than by any Junks; and moreover alſo it may all be moved to and again at the Patients pleaſure. This Caſſe will alſo hinder the heel from lying with all its body and weight upon the Bed, putting a ſoft and thick boulſter under the calf, in that place where the Caſſe is hollow: beſides alſo, it arms and defends it againſt the falling down and weight of the bed-cloths, having a little arch made over and above of the ſame matter: All which ſhall be made manifeſt unto you by the precedent figure. Now it remains that I tell you what remedies I applied to the abſceſs which happened upon my wound. When therefore I perceived an abſceſs to breed, I compoſed a ſuppurative Medicin of the yolks of Eggs, common Oil, Turpentine, and a little Wheat-flour, and I uſed it till it was opened; then to cleanſe it I uſed this following remedy. ℞ *Syrupi roſati & terebinth. venetæ, an.* ℥ ij. *pulveris radicis ireos florentiæ, aloes, maſtiches, farinæ hordei, an.* ʒ ß. *incorporentur omnia ſimul, & fiat mundificativum:* but I had a care that the place whereat I conjectured the quite ſevered ſcales of the bones muſt break forth, ſhould be filled with tents made of ſponge or flax, that ſo by this means I might keep the Ulcer open at my pleaſure: But I put into the bottom of the Ulcer catagmatick and cephalick Powders, with a little burnt alum, to procure the egreſs of the formerly mentioned ſcales. Theſe at length caſt forth, I cicatrized the Ulcer with burnt alum; For, this having a drying and aſtringent faculty, confirms and hardens the fleſh, which is looſe and ſpongy, and flowing with liquid *ſanies*, and helps forward Natures endeavour in cicatrization. For, the fragments of the bones, they by reaſon of their natural drineſs and hardneſs, cannot be joined and knit together by themſelves without a *medium:* but they need a certain ſubſtance, which thickning and concreting at their ends, doth at length glue them together, and (as it were) faſten them with ſoder. This ſubſtance hath its matter of the proper ſubſtance and marrow of the bones; but the former from the native heat, and emplaſtick Medicins, which moderately heat. For on the contrary, theſe Medicins, which by their too much heat, do diſcuſs and attenuate, do (as it were) melt and diſſolve the matter of the *Callus*, and ſo hinder the knitting: Wherefore for this purpoſe, I would wiſh you to make uſe of the following emplaſters, of whoſe efficacy I have had experience; for, hence they are called knitting or conſolidating plaſters. ℞ *Olei myrtil. & roſarum omphac. an.* ℔ ß. *rad. altheæ* ℔ ij. *rad. fraxini, & fol. ejuſd. rad. conſolidæ majoris & fol. ejuſd. fol. ſalicis, an.* m. j. *fiat decoctio in ſufficiente quant. vini nigri, & aquæ fabrorum, ad medietatis conſumptionem, adde in colatura pulveris myrrhæ & thuris an.* ℥ ſ. *adipis hirci,* ℔ ß. *terebinth. lotæ* ℥ iv. *maſtiches,* ʒ iij. *litharg. auri & argenti, an.* ℥ ij. *boli armeniæ, & terræ ſigillatæ an.* ℥ j. ſ. *minii* ʒ vj. *ceræ albæ quantum ſufficit: fiat emplaſtrum, ut artis eſt.* Inſtead hereof you may uſe the black emplaſter, whereof this is the deſcription. ℞ *Litharg. auri* ℔ j. *olei & aceti* ℔ ij. *coquantur ſimul lento igne donec nigrum & ſplendens reddatur emplaſtrum, & non adhæreat digitis.* Or elſe, ℞ *Olei roſat. & myrtil. an.* ℥ ij. *nucum cupreſſi, boli armen. ſanguinis drac. pulveriſatorum an.* ℥ ß. *emplaſt. diacalcitheos* ℥ iv. *liquefaciant ſimul & fiat emplaſtrum ſecundum artem.* In defect of theſe, you may uſe a Cerecloth, or *Tela Gualteri*, whereof this is the deſcription. ℞ *Pulveris thuris, farinæ volatilis, maſtiches, boli arm. reſinæ pini, nucum cupreſſi, rubiæ tinctorum, an.* ℥ ij. *ſevi arietini & ceræ albæ, an.* ℔ ſ. *fiat emplaſtrum:* into which (whileſt it is hot) dip a warm linnen cloth, for the forementioned uſe. *Emplaſtrum Diacalcitheos*, by the common conſent of all the Ancients, is much commended for Fractures; but it muſt undergo different preparations, according to the condition of the time, for in the Summer it muſt be diſſolved in the juice of Plantain and Nightſhade, leſt it ſhould heat more than is fit. It is convenient in the interim to have regard to the temper of the affected bodies; for neither are the bodies of children to be ſo much dried as theſe of old men: otherwiſe if ſuch drying Medicins ſhould be applied to young bodies as to old, the matter of the *Callus* would be diſſolved, it would be ſo far from concreting; wherefore the Surgeon muſt take great heed in the choice of his Medicins: For often-times remedies good of themſelves, are by uſe made not good, becauſe they are uſed and applied without judgment; which is the cauſe that oft-times pernicious accidents happen, or elſe the *Callus* becomes more ſoft, hard, ſlender, crooked; or laſtly, concretes more ſlowly by the great errour, and to the great ſhame of the Surgeon.

CHAP. XXVIII.

By what means we may know the Callus is a breeding.

When the *Callus* is breeding the Ulcer muſt be ſeldom dreſt.

THen I knew that my Leg begun to knit, when as leſs matter than was uſual came from the Ulcer, when the pain ſlackned, and laſtly, when as the convulſive twitchings ceaſed; which cauſed me to judge it fit to dreſs it ſeldomer than I was uſed to do: For, by the frequent deterſion in dreſſing an Ulcer, whileſt a *Callus* is breeding, the matters whereof it is to be made, are drawn away and ſpent, which are (as they term them) *Ros*, *Cambium*, and *Gluten*, which are the proper and genuine nouriſhments both of the bony, as alſo of the fleſhy ſubſtance. I by other ſigns alſo conjectured the breeding of the *Callus*, to wit, by the ſweating of a certain dewy bloud out of the edges and pores of the wounds, which gently died and bedewed the boulſters and ligatures, proceeding from the efflux of the ſubtler and gentler portion of that matter, which plenteouſly flowed down for the breeding of a *Callus*. As alſo by a tickling and pleaſing ſenſe of a certain vapour continually creeping, with a moderate and gentle heat, from the upper parts even to the place of the wound. Wherefore thenceforwards I ſomewhat looſened the ligation, leſt by keeping it too ſtrait, I ſhould hinder from entering to the fragments of the bones, the matter of the *Callus*, which is a portion of the bloud, temperate in quality, and moderate in quantity. Then therefore I thought good to uſe nouriſhments fit to generate more groſs, thick, and tenacious bloud, and ſufficient for generating a *Callus*; ſuch as are the extremities, tendinous, and griſly parts of Beaſts, as the heads, feet, legs, and ears of Hogs, Oxen, Sheep, Kids; all which I boiled with Rice, French Barley, and the like, uſing ſomewhiles one, ſomewhiles another, to pleaſe my ſtomach and palate. I alſo ſometimes fed upon Frumity,

Hipp. ſent 43. ſect. 1. de fract.

Meats fit for generating a *Callus*.

mity, or Wheat ſodden in Capon broth with the yolks of Eggs; I drank red, thick and aſtringent Wine, indifferently tempered with Water. For my ſecond courſe, I ate Cheſnuts and Medlars. Neither do I without ſome reaſon, thus particularize my diet; for that groſs nouriſhments, eſpecially if they be friable and fragil, as Beef is, are alike hurtful (for as much as pertains to the generating of a *Callus*) as light meats are; for that makes the *Callus* too dry, theſe too tender. Wherefore *Galen* pronounces thoſe meats onely fit for generating a *Callus*, which are neither fragil nor friable, neither ſerous and thin, nor too dry; but indifferent groſs, and alſo viſcid, fat and tough. Theſe meats digeſted by the ſtomach into *chylus*, are ſent into the Guts, and from hence, by the meſaraick veins into the gate vein, and the hollow part of the Liver, thence into the hollow-vein, and ſo into the veins diſperſed over all the body and parts thereof. There are alſo ſome of theſe veins which carry bloud into the bones, but in the large cavities of the bones is marrow contained, as in the ſmall, a certain marrowy ſubſtance, proportionable thereto, being their proper nouriſhment. The generation of marrow is from the groſſer portion of the bloud, which flows into the greater cavities of the bones by larger Veins and Arteries, but into the leſs by leſſer, which end in their pores and ſmall paſſages: For in large bones you may obſerve large and apparent paſſages, by which the Veins and Arteries enter for the fore-mentioned uſe. By the ſame ways the Nerves alſo inſinuate themſelves, from whence proceeds a membrane which involves the marrow of the bones, the which by that means is indued with moſt exquiſite ſenſe, as experience teacheth; which is the cauſe that makes many believe that the marrow hath ſenſe of feeling, becauſe the membranes thereof being hurt cauſe moſt bitter pain. Therefore out of the marrow and the proper ſubſtance of the bone, there ſweats a certain groſs and terreſtrial juice, whereof by the power of the aſſimilating faculty, which ſerves in ſtead of the formative, a *Callus* grows and knits. Simple fractures of the leg are uſually knit in fifty days, but through the occaſion of the Wound, and the ſcales quite broke off, and other accidents which befel me, it was three whole Moneths before the fragments of the bones were perfectly knit, and it was alſo another Moneth before I could go upon my Leg without the help of a Crutch. Going was painful to me for ſome few days, becauſe the *Callus* had taken up ſome place of the muſcles: for before my former freedom of motion could return again to the broken and knit part, it was neceſſary that the tendons and membranes ſhould ſeparate themſelves by little and little from the ſcar. In the performance of all theſe things, I had the diligent and faithful aſſiſtance amongſt the Surgeons, to omit Phyſicians, of *Anthony Portal* the Kings Surgeon.

Lib.6.Meth.c.5.

Why the marrow may ſeem to have ſenſe of feeling.

In what ſpace the Leg is uſually knit.

CHAP. XXIX.

Of thoſe things which may hinder the generation of a Callus, *and how to correct the faults thereof, if it be ill-formed.*

HAving already ſpoken of the ſigns of a *Callus* beginning to concrete, of its generation and the manner thereof: it now remains that we treat of thoſe things which hinder the generation thereof; and what on the contrary help forwards the conformation and concretion thereof. Now theſe things which either wholly hinder, or elſe retard the generation of a *Callus*, have a ſtrong and powerful diſcuſſive and attenuating faculty; or elſe they are unctuous, oily, and moiſt,: For by ſuch, the juice, whereof the *Callus* ought to be, is either melted and conſumed, or elſe grows ſoft, and is relaxed. But on the contrary, thoſe things which help forwards a *Callus*, muſt be drying, incraſſating, thickning, hardning, and emplaſtick, moderately hot and aſtringent: But for moiſt and relaxing Medicins, they ought to have no place here, unleſs when it happens that the *Callus* is ill formed, that is, too thick, or crooked, or otherwiſe ill ſhapen, whereby it may be waſted and broken, ſo to be reſtored again after a better manner. Yet notwithſtanding, ſuch things are not to be attempted, unleſs when the *Callus* is yet green, and ſo depraved that the fault thereof doth very much pervert the native conformation of the part, and exceedingly offend the action: Then therefore in ſuch caſe the place muſt be fomented with a decoction of a Sheeps-head and guts, wherein ſhall be boiled the roots of Marſh-mallows, of Briony, the ſeeds of Line, Fænugreek, Pigeons-dung, Bay-berries, and the like. You ſhall alſo uſe this following Ointment and Plaſter. ℞ *Unguenti de Althæa* ℥ iv. *olei liliorum, & axungiæ anſeris, an.* ℥ j. *aquæ vitæ parum, liquefiant ſimul, fiat linimentum, quo linatur pars.* Then apply this following Emplaſter. ℞ *Emplaſt. de Vigo cum Mercurio, cerati æſypati, deſcriptione Phylagrii, an.* ℥ iij. *olei anethini & liliorum, an.* ℥ j. *liquefiant omnia ſimul, fiat emplaſtrum*; let it be ſpread upon leather for the aforeſaid uſe. When by this means the *Callus* ſhall ſeem to be ſufficiently mollified, it ſhall be broken, and the bones reſtored to their natural ſtate, and the cure of the Fracture to be followed as at the beginning. If the *Callus* be become too hard through age, it is better not to break it, but to let it alone, leſt ſome worſe accident befall the Patient: For it may ſo fall out, that by your labouring to break it, the bone may break in ſome other part, before it break in that which is knit by the *Callus*; therefore the diſcreet Patient had rather live lame, than for eſchewing it, to undergo the hazard of his life. If the *Callus* be too groſs, it ſhall be diminiſhed (if it be as yet freſh) with emollient, reſolving, and powerfully aſtringent Medicins, which have force to diſſolve, dry and exhauſt. It will alſo be good ſtrongly to rub the *Callus* with Oil of Bays, wherein Salt-petre, or ſome other kind of Salt hath been diſſolved, then wrap it about with a rowler to bind it very ſtraitly, putting a leaden plate thereon, whereby the flowing down of the nouriſhing humour into the part, may be forbidden, that thus by little and little the *Callus* may decay and diminiſh. If on the contrary it any ways happen that the *Callus* be more thin and ſlender, and grows more ſlowly, for that it is too ſtraitly bound, or becauſe the idle part is longer kept in quiet than is fit, without exerciſing of its proper function, (which cauſe is to be reckoned amongſt the chief cauſes of the leanneſs, even for this reaſon, for that exerciſe ſtirs up the native heat of the part, the worker of digeſtion and nutrition) or elſe for that they feed upon ſuch nouriſhments as offend in quality or quantity,

Diſcuſſing and unctuous Medicins hinder the generation of a *Callus*. What helps forward the generation thereof.

What *Callus* muſt not be broken, though diſtort, or otherwiſe ill-conformed.

The cauſes of too ſlender a *Callus*.

Remedies therefore

quantity, or both; or for that the ligature uſed to the part is too often looſed, or becauſe the part it ſelf is too haſtily, and before the time put to undergo ſolid offices and motions. According to the variety of cauſes medicins ſhall be applied; for if the ligature of the part be too ſtrait, it ſhall be looſed, yea, verily the fractured place, the ligature being taken away, ſhall be quite freed from ligation, and a new kind of ligature muſt be made, which muſt be rowled down from the root of the Veſſels, that is, from the arm-pits, if the arm; or from the groin, if the leg be broken, to the fracture; yet ſo, as that you may leave it untouched or taken in, for thus the bloud is preſſed from the fountain and ſpring, and forced into the affected part, by a way quite contrary to that whereby we have formerly taught, in fear of inflammation, to hinder it from entrance into the affected part: Alſo gentle frictions and fomentations with warm water may be profitably made, from which you muſt then deſiſt, when the part ſhall begin to grow hot and ſwell. If any too long continue theſe frictions and fomentations, he ſhall reſolve that which he hath drawn thither: For this we have oftentimes obſerved, that frictions and fomentations have contrary effects, according to the ſhortneſs and continuance of time. Pications will alſo conduce to this purpoſe, and other things which cuſtomarily are uſed to members troubled with an *atrophia*, or want of nouriſhment.

When we muſt deſiſt from fomenting and frictions.

CHAP. XXX.

Of fomentations which be uſed to broken bones.

Warm Water. The effects thereof.

Divers fomentations are uſed to broken bones for ſeveral cauſes. When we uſe warm water for a fomentation, we mean that which is juſt between hot and cold, that is, which feels lukewarm to the hand of the Phyſician and Patient. A fomentation of ſuch water uſed for ſome ſhort ſpace, doth moderately heat, attenuate, and prepare for reſolution, the humour which is in the ſurface of the body, it draws bloud and an alimentary humour to the part labouring of an *atrophia*, it aſſwages pain, relaxes that which is too much extended, and moderately heats the member refrigerated through occaſion of too ſtrait binding, or by any other means: On the contrary, too hot fomenting cools by accident, digeſting, and diſcuſſing the hot humour which was contained in the member. We mean a ſhort time is ſpent in fomenting, when the part begins to grow red and ſwell; a juſt ſpace, when the part is manifeſtly red and ſwollen: but we conjecture, that much or too much time is ſpent thereon, if the redneſs which formerly appeared go away, and the tumor which lifted up the part, ſubſide. Alſo in fomenting, you muſt have regard to the body whereto it is uſed: For if it be plethorick, an indifferent fomentation will diſtend the part with plenty of ſuperfluous humours; but if it be lean and ſpare, it will make the part more fleſhy and ſucculent. Now it remains that we ſay ſomewhat of the fracture of the bones of the Feet.

Notes of ſhort, juſt, and too long fomenting.

Fomentations hurt plethorick bodies.

CHAP. XXXI.

Of the Fracture of the bones of the Feet.

Why the fractured bones of the foot muſt be kept in a ſtrait poſture.

The bones of the inſtep, back and toes of the Feet, may be fractured as the bones of the hands may: Wherefore theſe ſhall be cured like them, but that the bones of the toes muſt not be kept in a crooked poſture, as the bones of the fingers muſt, leſt their action ſhould periſh or be depraved; for as we uſe our legs to walk, ſo we uſe our feet to ſtand: beſides alſo the Patient ſhall keep his bed until they be knit.

The End of the Fifteenth Book.

BOOK XVI.

Of DISLOCATIONS or LUXATIONS.

CHAP. I.

Of the Kinds and Manners of Diſlocations.

What a Luxation properly ſo called is. What a Luxation not properly ſo called is.

A Diſlocation is the departure or falling out of the head of a bone from its proper cavity into an accuſtomed place beſides nature, hindring voluntary motion. There is another kind of Luxation, which is cauſed by a violent diſtention, and as it were a certain divarication, and dilatation, or extenſion into length and bredth of the ligaments, and all the nervous bodies, which contain, ſtrengthen, and bind together the joints. Thus thoſe who have been tormented and racked, have that thick ligament which is in the inner cavity of the huckle bone too violently extended. Thoſe who have ſuffered the Strappado, have the ligaments encompaſſing the articulation of the arm-bone, with the ſhoulder blade, forcibly and violently diſtended. Such alſo is their affect, whoſe foot is ſtrained by ſlipping. There is a third kind of Luxation, when as thoſe bones which are joined contiguous, and one (as it were) bound to the ſides of another, gape or fly aſunder: as in the arm, when the Ell parts from the Wand; in the leg, when the one Focile flies from

The third kind of diſlocation.

from the other: yet this may be referred to the ſecond ſort of Diſlocations, becauſe it happens not without dilatation, or elſe the breaking of the ligaments. There is alſo a fourth added to theſe, as when the *Epiphyſes* and heads of bones are plucked from the bone whereon they were placed or faſtned; which unproperly called kind of Luxation, hath place chiefly in the bones of young people, and it is known by the impotency of the part, and by the noiſe and grating together of the crackling bones when they are handled. Now the bones of young folks are alſo incident to another caſualty; for as the bones of old people are broken by violence, by reaſon of their drineſs and hardneſs, thus the bones of children are bended or crooked in by reaſon of their natural ſoftneſs and humidity. The fourth.

CHAP. II.

Of the Differences of Diſlocations.

SOme Diſlocations are ſimple, others compound: We term them ſimple which have no other preternatural affect joined with them; and ſuch compound, as are complicated with one or more preternatural affects; as when a diſlocation is aſſociated with a wound, fracture, great pain, inflammation, and an abſceſs: For, through occaſion of theſe we are often compelled ſo long to let alone the luxation until theſe be remitted of themſelves, or by our Art. Some diſlocations are compleat and perfect, as when the bone wholly falls out of its cavity; other ſome are unperfect, as when it is onely lightly moved, and not wholly fallen out; wherefore we onely call them ſubluxations or ſtrains. Differences of Luxations are alſo drawn from the place; for ſometimes the bone is wreſted forwards, otherwhiles backwards, upwards, downwards; ſomewhiles it may be wreſted according to all theſe differences of ſite, and otherwhiles onely according to ſome of them. Differences are alſo taken from the condition of the diſlocated Joint in greatneſs and littleneſs, from the ſuperficiary or deep excavation of the *ſinus* or hollowneſs; and laſtly, from the time, as if it be lately done, or of ſome long continuance. I have judged it fit to ſet down all theſe, for that there are ſeveral Indications of curing, according to the variety of each of theſe, as we ſhall teach hereafter. What Luxations are ſimple. What compound. What a compleat Luxation is.

CHAP. III.

Of the Cauſes of Diſlocations.

THere are three general cauſes of Luxations, internal, external, and hereditary: The internal, are excrementitious humours and flatulencies, which ſetling into the joints with great force and plenty, do ſo make ſlippery, ſoften and relax the ligaments which bind together the bones, that they eaſily fall out of their cavities, or elſe they ſo fill and diſtend theſe ligaments, and make them ſo ſhort, that being contracted, they alſo contract the *appendices* of the bones from whence they ariſe, and ſo pluck them from the bone whereon they are placed, or elſe draw the heads of the bones out of their cavities, chiefly if the violence of a noxious humour doth alſo concur, which poſſeſſing and filling up the cavities of the joints, puts them from their ſeats, as it oft-times happens to the joint of the hip by Sciaticaes, and to the *Vertebræ* of the ſpine, by whoſe Luxation people become gibbous, or otherwiſe crooked. But external cauſes of Diſlocations are falls from high, bruiſing and heavy blows, the Rack, Strappado, ſlipping in going, and all ſuch like things, which may force the heads of the bones to fly out of their ſeats or cavities, which alſo happens ſometimes to Infants in their birth, when as they are too careleſly and violently drawn forth by the Midwife, ſo that either their arms or legs are put out of joint. Hereditary cauſes are ſuch as the Parents transfuſe into their off-ſpring: hence it is, that crooked not neceſſarily, but often-times are generated by crooked, and lame by lame. The truth whereof is evident by daily experience: Beſides alſo *Hippocrates* himſelf avers, that Infants in the very Womb may have their joints diſlocated by a fall, blow, and compreſſion, and by the too much humidity and looſneſs of the joints: whence alſo we ſee many crook-legged and footed from their nativity, ſo that none need marvel or make any doubt hereof. We have read it obſerved by *Galen*, *In Libro de Artic.* that children may have impoſthumes in their Mothers Wombs, which may caſt forth quitture, the Ulcers being opened of their own accord, and be cicatrized by the onely benefit of Nature. It alſo happens to many from their firſt conformation, that the cavities of their joints are leſs depreſſed than they ſhould be, and that their verges are more dilated than they ought to be; whereby it happens that the heads of the bones can the leſs enter into them. It falls out that otherſome have the ligaments appointed by Nature for faſtning together the bones of the joint, whether inſerted or placed about, ſo weak, that from their firſt original they are not of ſufficient ſtrength, or elſe abound with much phlegm, either bred together with them, or flowing from ſome other place; ſo that by their too much ſlipperineſs they leſs faithfully contain the knittings or articulations of the bones. In all theſe, as the bones are eaſily diſlocated, ſo they may preſently be eaſily reſtored, without the aſſiſtance of a Surgeon, as I have oft-times obſerved in ſome. What a ſubluxation or ſtrain. Internal cauſes of diſlocations. External cauſes. Hereditary cauſes. *Sect.* 3. *ſent.* 88. & 94. *ſect.* 82. 4. *ſent.* 3, & 4. *lib. de art.* Children may have Impoſthumes in their Mothers Wombs.

CHAP. IV.

The ſigns of Diſlocations.

SOme of the ſigns whereby we come to the knowledge of a luxated bone, are common to all diſlocations; others are proper onely to ſeveral Luxations. It is a common ſign that there is always a tumor in that part whereto the bone runs, and a hollowneſs on that ſide from whence it is flown. Now the proper ſigns ſhall be ſhewed, when as we come to treat of the particular The common ſign of all diſlocations.

ticular kinds of Luxations. We know a perfect Diſlocation by the loſt action of the part, that is, to ſay, the loſt motion; pain alſo breeds a ſuſpition of a diſlocation; for the head of the bone, which (moved out of its place) is forced into another, preſſes the fleſh, and diſtends the nerves alſo moved out of their place. Hereto alſo conduces the comparing of the ſound joint with that which is hurt, in which collation it is fit the ſound part, which is compared with the hurt, be no ways, neither by Nature or any accident, wronged, nor deformed, nor withered or decayed, nor ſwollen above meaſure, otherwiſe it may cozen and deceive you, if you be leſs wary. Labour and difficulty of action in moving, is a ſign of an uncompleat Luxation, or ſtrain. Now we thus know that the ligaments ſerving to the connexion of the articulations, are extended and relaxed, if the head of the bone, preſſed with your fingers, be eaſily driven to the contrary part, and ſuddenly fly thence back again; if thruſting your finger into the Joint, it eaſily enter, nothing reſiſting it, as though all were empty within; if the motion be difficult, or none at all.

Signs of an imperfect diſlocation.

CHAP. V.

Of Prognoſticks to be made upon Luxations.

What luxations be uncurable.

ALl Joints may be perverted and luxated, but all of them cannot in like manner be reſtord; For the head may be diſlocated, but thereupon preſent death enſues, by reaſon of the compreſſion of the whole ſpinal marrow preſently at the original thereof; ſuch alſo is the diſlocation of a *vertebra* of the ſpine, and of the Jaw-bone, which, ſlipped forth on both ſides, hath cauſed inflammation, and a great tumor before it be ſet. The bones of other Joints, as they are more or leſs diſlocated, and moved out of their ſeats, ſo may they be more eaſily or difficultly reſtored: For, by how much they are the leſs moved out of their places, by ſo much they are the more quickly, and by how much they are the further by ſo much they are the more ſlowly and difficultly ſet. Alſo an indication taken from the figure of the luxated bone, gives a ſign of the eaſie or hard reſtoring of the diſlocation; as in the arm, by how much the bones be the more eaſily diſlocated, by ſo much once laxated they are the more eaſily reſtored. Bones do not eaſily fall out of joint in fleſhy bodies; but when they chance to be put out, they are not eaſily got in again: For in ſuch, the articulation is ſtraitly on every ſide held in by the thickneſs of the muſcles and the plenty of the fat lying thereabouts. On the contrary, ſuch as are lean, eſpecially thoſe who formerly have been more fat, have their joints more lax, whereby it comes to paſs, that their bones may eaſily be put forth of joint: beſides alſo, through the default of the digeſtive faculty, they have their joints replete with mucous humours; whence it is, that the heads of the bones, as ſtanding in a ſlippery place, are the leſs ſtable, as it is recorded by *Hippocrates*: But ſlender bodies, which are naturally dry, compact and denſe, have their muſcles and ligaments more ſtrong and dry; wherefore their bones are the more difficultly diſplaced; and diſplaced, the more difficultly ſet. Some bones, joined amongſt themſelves, do ſometimes fly aſunder, as when the ſhoulder-blade flies from the collar-bone at the *Acromium*, and in the Arm, the Ell from the Wand; and in the Leg, the one ſocile from the other, and the Heel-bone from the Ancle. Bones thus ſeparated will never be joined together again, will never recover their former comely figure, never their ſtrength of action: For then it moſt uſually happens that the ligaments are either broke aſunder, or elſe reſolved and become lax. Thoſe whoſe bones are diſlocated by an external cauſe, they, after they be ſet, may eaſily fall out again, for that the ligaments, moiſtned and bedewed with an excrementitious humour, cannot firmly hold them: oft-times the ligaments are not wholly broken, but onely in ſome portion thereof; and hence the action of the part either periſhes, or is debilitated: Alſo that diſlocation is uncurable, when as the ligaments, ſteeped and ſwollen up with an excrementitious humidity, are ſo much ſhortned and contracted in their length, as they have acquired in their breadth: and thus they draw away and pluck off the *appendices* of the bones from whence they ariſe, and by reaſon the bone and the *appendix* do enter and receive each other by many cavities and prominencies, therefore they cannot, by how skilful hand ſoever they be handled, be again fitly placed and put together. Old and inveterate diſlocations, wherein a tough humour poſſeſſing the cavity is concrete in ſtead of the head of the bone, are not to be reſtored; as neither when the heads of the luxated bones have by continual attrition made themſelves a new cavity in the neighbouring bone: neither if they be reſtored, is the reſtitution firm and of continuance, becauſe the natural cavity is poſſeſſed by another matter, and the new made near thereto cannot well and faithfully contain the received head of the bone. Thoſe who have their ſhoulder diſlocated, may uſe their hand for many actions, as well as the oppoſite ſound hand, for the weight of the body is not ſuſtained by the hands as it is by the legs: and by how much the hand is the more exerciſed, by ſo much the arm becomes the more corpulent. Contrarily, if the thigh-bone be diſlocated, eſpecially if it be wreſted inwards, the whole leg quickly decays by an *atrophia*, becauſe the part doth abſolutely loſe all motion: for by the opinion of *Hippocrates*, the performance of the proper action increaſes ſtrength, and makes the part in better plight; but idleneſs debilitates and makes it lean. If a great wound and fracture be joined with a luxation, there is danger, leſt while we uſe extention for reſtoring the part, we draw the nerves too violently, and ſo break the nerves, veins, and arteries, whence would enſue fear of inflammation, convulſion, and other malign ſymptoms. Wherefore *Hippocrates* judges it better in ſuch a concourſe and complication of preternatural affects, abſolutely not to meddle at all with the ſetting of the diſlocated bone: for, by attempting the reſtitution, certain death; but by omitting it, onely lameneſs is to be feared. Every diſlocation muſt be reſtored before inflammation come; but if it be already preſent, you muſt preſently be careful to take it away: For other things, let the Patient reſt, leſt if the affect be irritated, the increaſe and acceſs of pain cauſe a convulſion, gangrene, and laſtly death, as I remember I have ſometimes obſerved. Therefore when inflammation, and other malign ſymptoms ſhall be mitigated and

Why thoſe bones which are hardly diſlocated, are hard to be ſet.

Sect.1. de Art. ſent.29. Celſus lib.8. cap.11.

Why the plucking of an *appendix* from a bone is uncurable.

You muſt not endeavour to ſet an inflamed joint.

and corrected, then may you endeavour to reſtore the luxation, eſpecially if the habit of the body and member affected may admit it. For if the body be ſlender, delicate and tender, then the reſtitution will be more ſpeedy and facile. But on the contrary, more difficult if it be groſs and compact. And let thus much ſuffice for Prognoſticks in Luxations.

CHAP. VI.

Of the general cure of Diſlocations.

FOr all that I have heretofore delivered the general method of curing Fractures and Diſlocations, yet it ſhall not be unprofitable to repeat here in this place thoſe things which may be accommodated to this Treatiſe of curing Luxations. Now he that will cure Diſlocations, muſt have regard to five intentions, which it will be fitting to perform in order. The firſt is, of holding; the ſecond, of drawing or extending; the third, of forcing in; the fourth, of placing in convenient figure and ſite; the fifth, of correcting the concomitant, or following ſymptoms. *Five inventions in curing Diſlocations.*

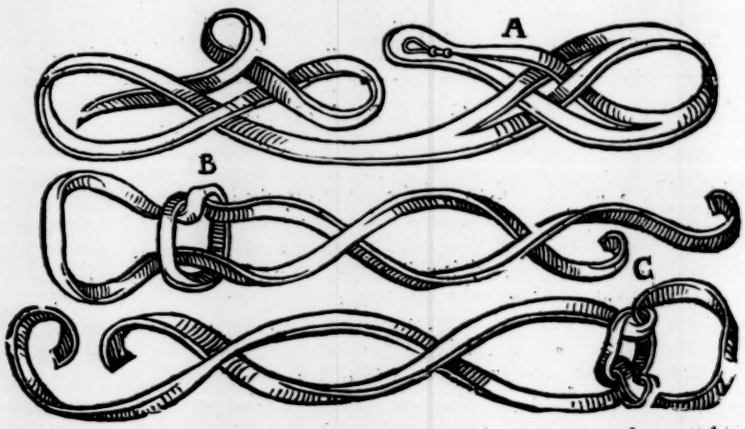
The firſt ſcope, which we ſaid was of holding, is meant either of the whole body, or elſe of ſome part thereof onely. The whole body muſt be holden by the ſtrong embracement of your Servant or Attendant, when as the ſhoulder, the *vertebræ*, or the thigh-bones are diſlocated. But in the diſlocation of the Collar-bone, Elbow, Hand, Knee, or Foot and Leg, it is ſufficient onely to hold the part ſtraitly in your hands. There is neceſſity of holding either the body, or elſe ſome part thereof, leſt while the diſlocated bone is extended, the whole body follow by continuance of parts, if there be nothing which may hinder: for if the body ſhould follow him that draws or extends, all the Work-maſters labour and endeavour to reſtore it is to no purpoſe. *The benefit of holding the member in Diſlocations.* The uſe of the ſecond ſcope, that is, of drawing or extending, is, that there may be a free ſpace and diſtance between the luxated bones, by which diſtance the diſlocated bone may the more freely be forced into its cavity. But the manner of drawing or extending is different in quantity and manner, according to the various ſtrength of the muſcles and ligaments, and diſlocation of the bones to this or that part. Therefore this work is almoſt always performed by the hands, which when they cannot ſuffice, we muſt have the aſſiſtance of Inſtruments and Engines, whoſe figures you ſhall ſee hereafter delineated: But that you may not do amiſs, you may ſo far uſe extenſion, until the head of the bone be brought juſt againſt its cavity. *The uſe of extenſion.* When the Surgeon hath brought it to this paſs, then muſt he haſten to the third intention, which is, to put the head of the bone firſt moved and gently bended, into its cavity: For he muſt have a ſpecial care that he force it no other way than into its proper cavity; for it would be dangerous, leſt he ſhould turn it from one extreme into another, and the bone, for example ſake, of the thigh, which was diſlocated into the fore-part by too violent forcing, by exceeding the middle cavity, may be driven and diſlocated into the hinder part. To ſhun this, the bone ſhall be put back the ſame way that it fell out, which may eaſily be done in freſh and late happening diſlocations. *The manner of ſetting it, or putting it into its place.* We underſtand that the bone is ſet by the noiſe, or as it were a pop or ſound like that, which ſolid and ſounding bodies, being fully and forcibly thruſt into their cavities, do make; by the ſimilitude and conſent in figure, magnitude, and all conformation of the affected part with the ſound; and laſtly, by the mitigation of the pain. *Signs that the bone is ſet.* The fourth ſcope, which is of the convenient ſite of the part, muſt be ſo fulfilled, that the bone after it is ſet may be kept in its cavity, and not fly forth again: Wherefore if the arm be diſlocated it ſhall be carried bound up in a ſcarf; if the thigh, knee leg, or foot be luxated, they ſhall be fitly laid in a bed; but in the *interim* the Surgeon, preſently after he hath ſet them, ſhall have a care that the affected joint be wrapped about with ſtoups and cloths, or compreſſes ſteeped in Roſe Vinegar, and ſpred with convenient Medicins; then let it be bound with an artincial deligation, rowling the ligatures unto the part contrary to that whereto the diſlocated bone flew. *The benefit of fit placing the member.* For the which purpoſe thicker boulſters ſhall be there applied whence the bone came out, otherwiſe there will be ſome danger leſt it ſhould be again diſplaced: when theſe things are done, he ſhall for four or five days ſpace meddle with nothing about the diſlocation, unleſs pain, or ſome ſuch like ſymptom happen. For then the fifth ſcope will call us from that ceſſation and reſt, which is, to correct the ſymptoms and complicate affections, as pain, inflammation, a wound, fracture, and others, whereof we have ſpoken abundantly in our Treatiſe of Fractures. *The manner of binding up the ſet joint.* Before we attempt to ſet inveterate Diſlocations, we muſt endeavour to humect the ligaments, tendons, and muſcles, by fomentations, cataplaſms, emplaſters, liniments, and other remedies, that ſo theſe parts may be more obedient to the Surgeons hand; then muſt the diſlocated bones be moved with a gentle motion up and down, to and again, that by this means the excrementitious humour, which by continuance of time hath flowed down, may wax hot, be attenuated, reſolved or made ſlippery, and alſo the fibres of the muſcles, ligaments, and nervous bodies, placed about the joint for the defence thereof, may be looſed, that ſo they may preſently be more freely extended: But if a great ſwelling, pain, and inflammation urge, we muſt firſt think of aſſwaging and curing them; then of the reſtoring the Diſlocation. *The cure of inveterate luxations.*

CHAP. VII.

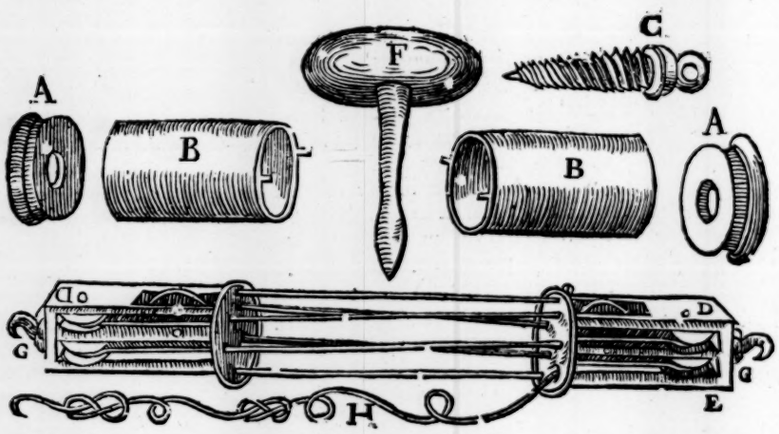
The deſcription of certain Engines ſerving for the reſtoring of Diſlocations.

BEfore I come to the particular kinds of Diſlocations, I think it not amiſs to deſcribe three ſorts of Bandages, and give you their Figures, as thoſe which are moſt fit to hold and extend diſlocations. The firſt ligature, deſigned by this letter *A*, is made for holding the member. The ſecond, marked with the letter *B*, is fit for drawing or extenſion, and conſiſts of one knot. The third, whereto the letter *C* is put, conſiſting of two knots, is to hold or bind more ſtraightly. *Theſe ligatures are not for deligation, but extenſion.*

The delineation of the three Ligatures.



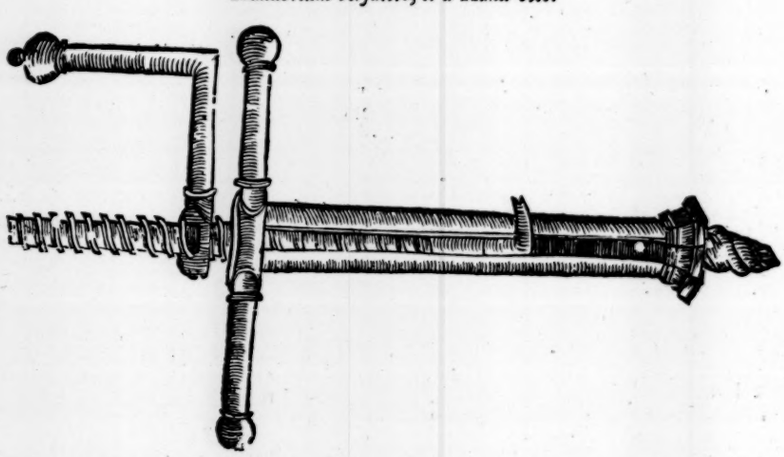
I have thought good alſo to delineate the following Engine, made for to draw and extend more powerfully, when the hand will not ſerve. It is made like a Pulley, marked with theſe Letters *D D.* Within this there lie hid three Wheels, through whoſe furrows runs the rope which is to be drawn, marked with this Letter *H.* At the ends of the Pulley are hooks faſtned, the one of which is to faſten the Pulley to a Poſt, the other is to draw the ligature faſtned to the part. The Boxes or Caſes wherein the Pulley is kept, is marked with *B B.* Their Covers are marked with *A A.*



A Screw-pin which may be twined, and ſo faſtned to a Poſt, that ſo one of the ends of the Pulley may be hooked thereto, is ſigned with *C.* A Gimlet (marked by *F*) to make a hole in a Poſt, ſo to let in the Screw-pin. You may ſee all theſe things expreſt in this Figure.

Some Practitioners in ſtead of this Pulley, make uſe of this deſcribed Inſtrument, which they term *Manubrium verſatile*, or a Hand-vice. The end thereof is faſhioned like a Gimblet, and is to be twined into a Poſt. Within that handle lies a Screw with a hooked end, whereto the ſtring or ligature muſt be faſtned. Now the Screw-rod or Male-ſcrew runs into the Female by twining about of

Manubrium verſatile, or a Hand-vice.



the handle; and thus the ligature is drawn as much as will ſuffice, for the ſetting the diſlocated bone. Having delivered theſe things thus in general, now I come to treat of the Luxations of each part, from the Jaw-bone even to the Toes of the Feet.

CHAP.

CHAP. VIII.

Of the Diſlocation of a Jaw-bone.

THE Jaw bone is diſlocated by many occaſions, and not ſeldom by yawning, and other more ſtrong openings of the mouth. It is more frequently luxated into the fore, than into the hinder part, by reaſon of the mamillary additaments, which hinder it from falling backwards. The diſlocation is ſometimes but on one ſide, otherwhiles on both. If the one ſide onely be luxated, it (together with the chin) is drawn awry unto the contrary ſide, which is not diſlocated; the place is hollow from whence it is flown, but ſwollen whither it is gone; the Patient cannot ſhut his mouth, but is forced to gape, ſo that he cannot eat; the Jaw, together with the teeth therein, hangs ſomewhat forwards; neither do the teeth anſwer fitly to one another, but the dog teeth are under the ſhearers. But if both ſides be diſlocated, all the Jaw and Chin hang forwards and towards the Breſt; beſides alſo, the temporal muſcles appear diſtended, ſpittle runs out of the Patients mouth againſt his will, the lower teeth ſtand further forth than the upper, which is the occaſion that the mouth cannot be ſhut, neither the tongue have free volubility to ſpeak, the Patient ſtammering in his ſpeech. When it is diſlocated on both ſides, it is more difficultly reſtored, and all the ſymptoms are more vehement; wherefore it muſt be ſet with all ſpeed, otherwiſe the Patient will preſently have grievous pain about his throat, inflammation, a fever, whereupon oft-times death enſues within ten days, by reaſon of the five branches of nerves, which ariſing from the ſecond and fifth conjugation of the brain, are diſtributed into the moving muſcles thereof, which too violently extended, brings the fore-mentioned ſymptoms. Practitioners affirm, that the Jaw twelve days after it is ſet, is free from the danger of relapſe. If it have been diſlocated ſome few days before you go about to reſtore it, you muſt uſe ſoftning and relaxing Medicins to it; but when it is put in the joint, apply a Medicin made of the Whites of Eggs and Oil of Roſes to aſſwage the pain, and apply cloths dipped in oxycrate. At the ſecond dreſſing you ſhall apply ſuch things as have power to agglutinate and ſtrengthen the ligaments and other relaxed parts, and alſo to keep it being reſtored in its place. This ſhall be the form of ſuch a Medicin: ℞ *Pulv. boli armeni. ſang. draconis, farinæ volat. maſtich. picis, reſinæ, an.* ʒ ß. *albuminis ovorum q. ſ. fiat medicamentum*; afterwards you may uſe *Emplaſt. Diacalcitheos* diſſolved in Oil of Roſes and Vinegar, and other things, as occaſion ſhall be.

Prognoſticks. Why death quickly enſues upon the diſlocation of both ſides of the Jaw.

An aſtringent Medicin.

CHAP. IX.

How to ſet the Jaw diſlocated forwards on both ſides.

FIrſt of all the Patient muſt be placed upon the ground or ſome low ſeat, with his face upwards, and his head muſt be firmly held by your Servant, that ſo it may be the more immovable: then the Surgeon ſhall put both his thumbs, wrapped in cloths (leſt he hurt them by rubbing them upon the Patients teeth, as alſo to keep them from ſlipping) into the Patients mouth, and preſs with them the larger teeth of the luxated jaw, but put his other fingers without under his chin, and ſo lift up the whole jaw with them. But if the operation cannot be thus done, for that the mouth on the inſide is ſo ſhut and cloſed, that the thumbs cannot be put thereinto, then muſt you thruſt in wooden wedges made of ſoft wood, as hazle or fir, being cut ſquare, and of ſome fingers thickneſs. Theſe ſhall be wedged in on each ſide above the grinders; then caſt a ligature under his chin, whoſe ends your ſervant ſhall hold in his hands, and ſetting his knees upon the Patients ſhoulders, ſhall pull them upwards; then at the ſame time the Surgeon ſhall preſs downwards the wooden wedges. The Jaw bones thus reſtored, ſhall be kept ſo by convenient ligation, and dreſſed with medicins, as it is fitting; and in the mean ſpace you muſt forbid the Patient to ſpeak, or needleſſly to open his mouth. Wherefore he muſt abſtain from hard meats, and ſuch as require much chewing, until his pain be quite paſſed, and uſe onely ſpoon-meats, as Barley Creams, Panadoes, Jellies, Cullaſſes, Broths, and the like.

The firſt manner of ſetting a Jaw-bone.

Another.

Diet.

CHAP. X.

Of reſtoring the Jaw diſlocated forwards but on one ſide.

THE Patient muſt be placed on a low ſeat, ſo that he may be under the Surgeon; then your Servant, ſtanding at his back, ſhall hold his head firm and ſteddy, that it may not follow the Surgeon, drawing, extending, and doing other things neceſſary for reſtoring it. Then the Surgeon putting his thumb between the grinders, ſhall preſs down the Jaw, and gently drawing it aſide, force it into its cavity; in the mean while alſo the Patient, as much as in him lies, ſhall help forwards the Surgeons endeavour, in opening his mouth as little as he can, leſt the muſcles ſhould be extended; and he ſhall onely gape ſo wide as to admit the Surgeons thumb, for ſo the temporal muſcles ſhall be reſtored to their place and favour the reſtitution. If he open his mouth as wide as he can, they will be extended after a convulſive manner; if on the contrary he ſhut his teeth too cloſe, there will be no paſſage for the Surgeons thumb unto his grinding teeth. Some there be which affirm, that the Jaw bone may ſometimes be diſlocated towards the hind part, and that then the mouth is ſo cloſe ſhut, that the Patient cannot open it nor gape, and that the lower rank of teeth ſtands further in, and nearer the throat than the upper. Now for reſtoring it, the Patients head muſt be ſtraightly holden behind, whileſt the Surgeon, the mean while putting both his thumbs into the Patients mouth, holding his other fingers without under the Patients chin, he ſhall by

The Cure.

ſhaking it, draw it to him, or forwards, and ſo reſtore it to its place. For my own part, I confeſs I never ſaw this kind of Luxation, and I eaſily perſuade my ſelf that it can ſcarce ever happen, for the reaſon I gave in the former Chapter. But nevertheleſs, if it by any means chance to happen, yet can it not be a perfect luxation, but an imperfect one; the jaw being onely but a little thruſt back to the throat to thoſe mamillary additaments; and then it may eaſily be reſtored by lifting or drawing forth the jaw, and ſuddenly forcing it from below upwards.

CHAP. XI.

Of the luxation of the Collar-bone.

Differences of the luxated collar-bones.

AS the Collar-bones may be broken, wreſted, and crooked, ſo alſo they may be diſlocated. Now they are diſlocated, either againſt the *ſternum*, or againſt the ſhoulder blade, or *acromion* thereof: yet both theſe kinds of diſlocations are very rare, by reaſon of the ſtrait and firm connexion which the collar-bone hath with the foreſaid parts; but chiefly where it is joined to the *ſternum* it can ſcarcely be depreſt, for that it is as it were underpropt with the firſt rib: But it may be diſlocated inwardly, outwardly, and ſide-wiſe, and according to this variety there muſt be divers ways to reſtore it; yet generally the Collar-bone is put into its place by moving or extending the arm: But if need require, the Patient ſhall be laid upon the ground with his face upwards, a Tray with the bottom upwards, a hard ſtuffed cuſhion, or the like thing being put under his ſhoulders; for thus it will ſo come to paſs, that the ſhoulder and cheſt will ſtand ſo forth, that preſently by lifting up, by preſſing down, or drawing forth the arm forwards or backwards, as the bone ſhall be flown out to this or that part, you may reſtore it; for thus the prominency may be forced into its cavity. But it will be requiſite to bind it up and lay boulſters thereon, and to give it reſt, as if it were fractured. *Galen* writes, that when he was five and thirty years old, whileſt he exerciſed himſelf in the place of exerciſe, his Collar bone was ſo far ſeparated from the *Acromion*, that there was the ſpace of three fingers between them. And that this luxation was reſtored in forty days ſpace, by ſo ſtrait and ſtrong a ligation, that he perceived the motion of the beating arteries under the bone. But you ſhall find very few who will ſuffer ſuch ſtrait ligation ſo long, though it be never ſo neceſſary. Verily, this kind of luxation is hard to be known, but far more difficult to be healed. I have known many Surgeons deceived, who have taken the luxation of the Collar-bone for the diſlocation of the top of the ſhoulder: for then the *Epomis*, or top of the ſhoulder ſwells, and the place from whence the collar bone is flown, is depreſſed with a manifeſt cavity, with vehement pain, inflammation and impotency of lifting up, or otherwiſe moving the arm, or performing other actions which are done by the help of the ſhoulder. Certainly if this bone when it is diſlocated, be not ſet, the Patient ſhall be lame during his life, ſo that he ſhall not be able, neither to put his hand to his head nor mouth.

Com. ad ſent. 62. ſect. 1. de art.

The Cure.

CHAP. XII.

Of the luxation of the Spine, or Back-bone.

An anatomical deſcription of the Spine.

THE Back bone conſiſts of many bony *Vertebræ*, like rowls or wheels mutually jointed or knit together, by their ſmoothneſs and circular form conſpiring to an aptneſs of moving or bending forwards. For if it ſhould conſiſt of one bone, we ſhould ſtand continually with the trunk of our bodies immovable, as thruſt through with a ſtake. The *Vertebræ* have a hole paſſing through the midſt of them, whereby the marrow paſſing this way out from the brain as by a pipe, may ſerve for the generation of the ſenſitive and motive nerves, and their diſtribution into all parts beneath the head. For which purpoſe it is perforated with many holes on the ſides, through each whereof certain conjugations of the nerves paſs forth into the reſt of the body, and veins and arteries paſs in for the propagation of nouriſhment and life. The whole exteriour face of the ſpine is rough, and as it were armed with four ſorts of *apophyſes* or proceſſes, whereof ſome ſtand up, others down; ſome direct, others tranſverſe: Wherefore from theſe thorny and ſharp proceſſes, the whole hath acquired the name of the *Spina*. The *Vertebræ* the further from the neck they are, the greater they grow, ſo that thoſe which are the loweſt, are the largeſt; for it is agreeable to reaſon, that that which bears ſhould be greater than that which is born. Hence we ſee, that the holy bone is placed under the reſt as a foundation. The ſide proceſſes of the Rack bones of the cheſt, beſides the benefit of defending the ſpinal marrow ſhut up therein from external injuries, have alſo another, which is, they firm and faſten the bones of the ribs by a ſtrong tie. There lies a griſle, and a tough, and (as it were) albuminous humour between the *Vertebræ*, which makes them, as alſo all the other joints of the body ſlippery and fit for motion: the ſpine is flexible with notable agility forwards onely, but not backwards, for that ſo there would be continual danger of breaking the hollow aſcendent vein, and the great deſcending artery running thereunder: Therefore the dearticulations of the *Vertebræ*, mutually ſtrengthened with ſtrong ligaments, do look more backwards. I have thought good to premiſe theſe things of the nature of the ſpine, before I come to diſlocations happening thereto. I willingly omit divers other things which are moſt copiouſly delivered by *Galen*; content onely to add thus much, that there is nothing to be found in the whole ſtructure of mans bones, which more clearly manifeſts the induſtry of Gods great workmanſhip, than this compoſure of the Spine and the *Vertebræ* thereof.

The variety of the proceſſes of the Spine.

Gal. cap. 7. lib. 13. de uſu partium.

Lib. 13. de uſu partium.

CHAP.

CHAP. XIII.

Of the Diſlocation of the Head.

THe Head ſtands upon the Neck knit by dearticulation to the firſt *Vertebra* thereof, by the interpoſition of two proceſſes which ariſe from the *baſis* thereof, near the hole through which which the marrow of the brain paſſes down into the back-bone; and they are received by fit cavities, hollowed in this firſt *Vertebra*. Theſe proceſſes ſometimes fall out of their cavities, and cauſe a diſlocation behind, whereby the ſpinal marrow is too violently and hard compreſſed, bruiſed and extended, the chin is faſtned to the breſt, and the Patient can neither drink nor ſpeak: wherefore death ſpeedily follows upon this kind of luxation, not through any fault of the Surgeon, but by the greatneſs of the diſeaſe, refuſing all cure.

The connexion of the head with the firſt Rack-bone of the Neck. Prognoſticks.

CHAP. XIV.

Of the Diſlocation of the Vertebræ, *or Rack-bones of the Neck.*

THe other *Vertebræ* of the Neck may be both diſlocated and ſtrained. Diſlocation verily, unleſs it be ſpeedily helped, brings ſudden death: for, by this means the ſpinal marrow is preſently oppreſſed at the very original thereof, and the nerves therehence ariſing, ſuffer alſo together therewith, and principally thoſe which ſerve for reſpiration; whereby it cometh to paſs, that the animal ſpirit cannot come and diſperſe it ſelf into the reſt of the body lying thereunder; hence proceed ſudden inflammation, the ſquinſie, and a difficulty, or rather a defect of breathing. But a ſtrain or incompleat luxation brings not the like calamity: by this the *Vertebræ*, a little moved out of their ſeats, are turned a little to the hind or fore-part; then the Neck is wreſted aſide, the Face looks black, and there is difficulty of ſpeaking and breathing. Such, whether Diſlocation or ſtrain, is thus reſtored. The Patient muſt be ſet upon a low ſeat, and then one muſt lean and lie with his whole weight upon his ſhoulders; and the mean while the Surgeon muſt take the Patients head, about his ears, betwixt his hands, and ſo ſhake and move it to every part, until the *Vertebra* be reſtored to its place. We may know it is ſet by the ſudden ceaſing of the pain, which before grievouſly afflicted the Patient, and by the free turning and moving his head and neck every way. After the reſtoring it, the Head muſt be inclined to the part oppoſite to the Luxation, and the Neck muſt be bound up about the dearticulation of the Shoulder; but yet ſo, that the ligature be not too ſtrait, leſt by preſſing the Weazon and Gullet, it ſtraiten the paſſages of breathing and ſwallowing.

The danger hereof. Signs and ſymptoms of their ſubluxation. The Cure. Signs of their reſtitution.

CHAP. XV.

Of the Diſlocated Vertebræ *of the Back.*

THe Rack-bones of the Back may be diſlocated inwards, outwards, to the right ſide, and to the left. We know they are diſlocated inwards, when as they leave a depreſſed cavity in the ſpine; outwardly, when they make a bunch on the back; and we know they are luxated to the right or left ſide, when as they obliquely bunch forth to this or that ſide. The *Vertebræ* are diſlocated by a cauſe either internal or external, as is common to all other Luxations; the internal is either the defluxion of humours from the whole body, or any part to them and their ligaments; or elſe a congeſtion proceeding from the proper and native weakneſs of theſe parts; or an attraction ariſing from pain and heat. The external is a fall from high upon ſome hard body, a heavy and bruiſing blow, much and often ſtooping, as in Dreſſers and Lookers to Vineyards, and Paviers, decrepit Old Men; and alſo ſuch as through an incurable diſlocation of the thigh-bone are forced in walking to ſtoop down and hold their hand upon their thigh. But a *Vertebra* cannot be forced or thruſt inwards, unleſs by a great deal of violence; and if it at any time happen, it is not but with the breaking of the ties and ligaments, for they will break rather than ſuffer ſo great extenſion. Such a Diſlocation is deadly, for that the ſpinal marrow is exceedingly violated by too ſtrait compreſſion, whence proceeds dulneſs, and loſs of ſenſe in the members lying thereunder. Neither is reſtitution to be hoped for, becauſe we cannot through the belly force it into its place: the Urine is then ſuppreſt, as alſo the excrements of the belly; ſometimes on the contrary, both of them break forth againſt the Patients mind, the knees and legs grow cold, their ſenſe and motion being loſt. Such things happen more frequently when the ſpine is luxated inwards than when it is diſlocated outwards, for that the Nerves thence ariſing, run and are carried more inwardly into the body. Beſides the preſſed ſpinal marrow becomes inflamed, and that being inflamed, the parts of the ſame kind, and ſuch as are joined thereto, are alſo inflamed by conſent, whence it happeneth that the bladder cannot caſt forth the Urine. Now where the ſinews are preſſed, they can no more receive the irradiation of the animal faculty. Hence follows the deprivation of the ſenſe and motion in the parts whereto they are carried, therefore the contained excrements do no more provoke to expulſion by their troubleſom ſenſe, neither are preſſed to keep them in: thence proceeds their ſuppreſſion, and hence their breaking forth againſt their wills. But the ſpine outwardly diſlocated, ſcarce cauſes any compreſſion of the marrow or nerves.

Differences and ſigns. Cauſes. The danger of a *Vertebra* diſlocated inwards. *Hipp. ſent. 51. ſect. 3. de art. & Gal. in com.*

CHAP. XVI.

How to reſtore the Spine outwardly diſlocated.

The Cure.

THe *Vertebræ* outwardly diſlocated, when as they ſtand bunching forth, then it is fit to lay and ſtretch forth the Patient upon a Table with his face downwards, and ſtraitly to bind him about with Towels under the arm-pits, and about the flanks and thighs; and then to draw and extend, as much as we can, upwards and downwards, yet without violence: for unleſs ſuch extenſion be made, reſtitution is not to be hoped for, by reaſon of the proceſſes and hollowed cavities of the *Vertebræ*, whereby, for the faſter knitting, they mutually receive each other. Then muſt you lie with your hands upon the extuberancies, & force in the prominent *vertebra*. But if it cannot be thus reſtored, then will it be convenient to wrap two pieces of wood, of four fingers long, and one thick, more or leſs, in linnen cloths, and ſo to apply one on each ſide of the diſlocated *Vertebræ*, and ſo with your hands to preſs them againſt the bunching forth *Vertebræ*, until you force them back into their ſeats, juſt after the manner you ſee it before delineated.

Another manner of cure.

How to keep the reſtored *Vertebræ* in their places.

In the mean while have a care that you touch not the proceſſes which ſtand up in the ridge of the Spine, for they are eaſily broken. You may know that the *Vertebræ* are reſtored by the equal ſmoothneſs of the whole Spine. It is fit, after you have reſtored it, to bind up the part, and lay ſplints or plates of Lead neatly made for that purpoſe upon it; but ſo, that they may not preſs the criſts or middle proceſſes of the *Vertebræ*, which I formerly mentioned, but onely the ſides: then the Patient ſhall be laid upon his back in his bed, and the ſplints long kept on, leſt the *Vertebræ* ſhould fall out again.

CHAP. XVII.

A more particular enquiry of the diſlocation of the Vertebræ, *proceeding from an internal cauſe.*

THe *Vertebræ* are in like ſort luxated by the antecedent cauſe, as we have formerly ſaid, which is cauſed by the natural imbecillity of the parts, principally of the nervous ligament, by which all the *Vertebræ* are bound each to other; this ligament comes not to the ſpinal marrow, but onely binds together the *Vertebræ* on their out-ſides: For, beſides the two membranes proceeding from the two *Meninges* of the Brain, wherewith the marrow is covered, there is a third ſtrong and nervous coat put upon it, leſt while the ſpine is diverſly bended, the bended marrow ſhould be broken. This third coat ariſes from the *Pericranium*, as ſoon as it arrives at the firſt *Vertebra* of the neck. Now that ligament, wherewith we ſaid the Joints of the *Vertebræ* were mutually knit and faſtned, is encompaſſed with a tough and glutinous humour for the freer motion of the *Vertebræ*. Sometimes another cold, crude, groſs and viſcid humour, confuſed and mixed herewith by great defluxions and catarrhs, begets a tumour, which doth not onely diſtend the Nerves proceeding forth of the holes of the *Vertebræ*, but alſo diſtends the ligaments wherewith they are bound together: which ſo diſtended, and (as it were) drawn aſide, do draw together with them the *Vertebræ*, one while towards the right ſide, another while to the left, ſomewhiles inwards, otherwhiles outwards, and thus move them out of their ſeats, and diſlocate them. A diſlocated *Vertebra*, ſtanding forth and making a bunch is termed in Greek *Cyphoſis*, (Thoſe thus affected we may call *Bunch-backt:*) But when it is depreſſed, it is named *Lordoſis*, (Such we may term *Saddle-backt:*) But when the ſame is luxated to the right or left ſide, it maketh a *Scolioſis* (or *Crookedneſs*,) which wreſting the ſpine, draws it into the ſimilitude of this letter *S*. *Galen* adds a fourth default of the *Vertebræ*, which is, when their joints are moved by reaſon of the looſneſs of their ligaments, the *Vertebræ* yet remaining in their places, and he calls it a *Seiſis*, or ſhaking. They alſo note another defect peculiar to the ſpinal marrow, which is, when as it (the *Vertebræ* being not moved whereto it adheres) is plucked and ſevered from them: this diſeaſe is occaſioned by a fall from on high, by a great ſtroak, and by all occaſions which may much ſhake, and conſequently depreſs the ſpinal marrow, or by any other means remove, or put it forth of its place. Scarce any recovers of this diſeaſe, for many reaſons, which

Cyphoſis. Lordoſis. Scolioſis. Com. ad Sent. 2. ſect. 3. l. de art. Seiſis.

The ſeparation of the ſpinal marrow from the encompaſſing *Vertebræ*.

which any exerciſed in the Art, may eaſily think upon: But let us return to the internal cauſe of Luxations. Fluid and ſoft bodies, ſuch as Childrens, uſually are very ſubject to generate this internal cauſe of defluxion. If external occaſions ſhall concur with theſe internal cauſes, the *Vertebræ* will ſooner be diſlocated: Thus Nurſes, whileſt they too ſtraitly lace the breſts and ſides of Girls, ſo to make them ſlender, cauſe the breſt-bone to caſt it ſelf in forwards or backwards, or elſe the one ſhoulder to be bigger or fuller, the other more ſpare and lean. The ſame errour is committed if they lay children more frequently and long upon their ſides, than upon their backs; or if, taking them up when they wake, they take them onely by the feet or legs, and never put their other hand under their backs, never ſo much as thinking that children grow moſt towards their heads.

The errour of Nurſes in ſwadding and lacing of Children.

CHAP. XVIII.

Prognoſticks of the diſlocated Vertebræ *of the Back.*

IF in Infancy it happen that the *Vertebræ* of the back ſhall be diſlocated, the ribs will grow little or nothing in bredth, but run outwards before; therefore the Cheſt loſeth its natural latitude, and ſtands out with a ſharp point. Hence they become aſthmatick, the lungs and muſcles which ſerve for breathing, being preſſed together and ſtraitned; and that they may the eaſilier breathe, they are forced to hold up their heads, whence alſo they ſeem to have great throats. Now becauſe the Weazon being thus preſſed, the breath is carried through a ſtrait paſſage, therefore they wheaze as they breathe, and ſnort in their ſleep, for that their lungs, which receive and ſend forth the breath or air, be of leſs bigneſs: beſides alſo they are ſubject to great diſtillations upon their lungs, whereby it cometh to paſs that they are ſhorter lived. But ſuch as are bunch-backed below the midriff, are incident to diſeaſes of the Kidneys and Bladder, and have ſmaller and ſlenderer thighs and legs, and they more ſlowly and ſparingly caſt forth hair and have Beards: to conclude, they are leſs fruitful, and more ſubject to barrenneſs, than ſuch as have their crookedneſs above their midriff. The bunches which proceed from external cauſes are oft-times curable; but ſuch as have their original from an inward cauſe, are abſolutely uncurable, unleſs they be withſtood at the firſt with great care and induſtry. Wherefore ſuch as have it by kind, never are helped. Such as, whilſt they are yet children, before their bodies be come to perfect growth, have their ſpine crooked and bunching out, their bodies uſe not to grow at the ſpine, but their legs and arms come to their perfect and full growth; yet the parts belonging to their breſt and back, become more ſlender: Neither is it any wonder, for ſeeing the Veins, Arteries, and Nerves are not in their places, the ſpirits do neither freely, nor the alimentary juices plenteouſly flow by theſe ſtraitned paſſages, whence leanneſs muſt needs enſue: but the limbs ſhall thence have no wrong, for that not the whole body, but the neighbouring parts onely are infected with the contagion of this evil. When divers *Vertebræ*, following each other in order, are together and at one time diſlocated, the diſlocation is leſs dangerous, than if one alone were luxated: For, when one onely *Vertebra* is diſlocated, it carries the ſpinal marrow ſo away with it, that it forces it almoſt into a ſharp angle; wherefore being more ſtraitly preſſed, it muſt neceſſarily be either broken or hurt, which is abſolutely deadly, for that it is the brains ſubſtitute. But when divers *Vertebræ* are diſlocated at once, it muſt of neceſſity be forced onely into an obtuſe angle, or rather a ſemicircle; by which compreſſion it certainly ſuffers, but not ſo, as that death muſt neceſſarily enſue thereon. Hereto may ſeem to belong that which is pronounced by *Hippocrates*; a circular moving of the *Vertebræ* out of their places is leſs dangerous than an angular.

Hipp. ſent. 6. ſect. 3. de art.

Why when the ſpine is luxated, the parts belonging to the cheſt are nouriſhed and grow the leſs.

Why the luxation of one *Vertebra* is more dangerous than of many.

Sent. 51. ſect. 3. lib. de art.

CHAP. XIX.

Of the diſlocation of the Rump.

THE Rump oft-times is after a ſort diſlocated inwards by a violent fall upon the buttocks, or a great blow; in this affect the Patient cannot bring his heel to his buttocks, neither unleſs with much force, bend his Knee; Going to ſtool is painful to him, neither can he ſit unleſs in a hollow chair; That this (as it were) diſlocation may be reſtored, you muſt thruſt your finger in by the Fundament, even to the place affected, as we have ſaid in a Fracture; then muſt you ſtrongly raiſe up the bone, and with your other hand at the ſame time join it rightly on the outſide with the neighbouring parts: Laſtly it muſt be ſtrengthened with the formerly mentioned remedies, and kept in its place. Now it will be recovered about the twentieth day after it is ſet. During all which time the Patient muſt not go to ſtool, unleſs ſitting upon a hollow ſeat, leſt the bone, as yet ſcarce well recovered, ſhould fall again out of its place.

The Signs.

The Cure.

CHAP. XX.

Of the Luxation of the Ribs.

THE Ribs may by a great and bruiſing ſtroak be diſlocated, and fall from the *Vertebra* whereto they are articulated, and they may be driven inwards, or ſide-ways. Of which kind of luxation, though there be no particular mention made by the Ancients, yet they confeſs that all the bones may fall, or be removed from their ſeats or cavities, wherein they are received and articulated. The ſign of a rib diſlocated and ſlipped on one ſide, is a manifeſt inequality, which here makes a hollowneſs, and there a bunching forth; but it is a ſign that it is driven in, when as there

Cauſes.

Signs.

there is onely a depreſſed cavity where it is knit and faſtned to the *Vertebræ*. Such diſlocations cauſe divers ſymptoms, as difficulty of breathing, the hurt rib hindering the free moving of the cheſt; a painfulneſs in bowing down or lifting up the body, occaſioned by a pain, counterfeiting a pleuriſie; the riſing or puffing up of the muſculous fleſh about the rib, by a mucous and flatulent humour there generated: the reaſons whereof we formerly mentioned in our Treatiſe of Fractures. To withſtand all theſe, the diſlocation muſt be forthwith reſtored, then the puffing up of the fleſh muſt be helped. Wherefore, if the diſlocated rib ſhall fall upon the upper ſide of the *Vertebra*, the Patient ſhall be ſet upright, hanging by his arms upon the top of ſome high door or window: then the head of the rib, where it ſtands forth, ſhall be preſſed down until it be put into its cavity. Again, if the rib ſhall fall out upon the lower ſide of the *Vertebra*, it will be requiſite that the Patient bend his face downwards, ſetting his hands upon his knees; then the diſlocation may be reſtored by preſſing or thruſting in the knot or bunch which ſtands forth. But if the luxated rib fall inwards, it can no more be reſtored or drawn forth by the hand of the Surgeon, than a *Vertebra* which is diſlocated towards the inſide, for the reaſons formerly delivered.

Gal. com. ad ſen. 3. ſect. 1. de art.

CHAP. XXI.

Of a diſlocated ſhoulder.

THe ſhoulder is eaſily diſlocated, beauſe the ligaments of its dearticulation are ſoft and looſe; as alſo for that the cavity of the ſhoulder-blade is not very deep; and beſides it is every where ſmooth and polite, no otherwiſe than that of the ſhoulder-bone, for that it is herein received. Add hereunto, that there is no internal ligament from bone to bone, which may ſtrengthen that dearticulation, as is in the leg and knee. Wherein notwithſtanding, we muſt not think Nature defective, but rather admire Gods providence in this thing; for that this articulation ſerves not onely for extenſion and bending, as that of the elbow, but beſides, for a round or circular motion, as that which carries the arm round about, now up then down, according to each difference of ſite. The ſhoulder-bone, which *Hippocrates* calls the arm-bone, may be diſlocated four manner of ways, upwards, downwards, or into the arm-pit, forwards and outwards, but never backwards, or to the hinder part: For, ſeeing that there the cavity of the blade-bone, which receives the head of the arm-bone, which *Hippocrates* calls a joint, lies and ſtands againſt it; who is it that can but imagine any ſuch diſlocation? In like ſort it is never diſlocated inwardly, for on this part it hath the fleſh of a ſtrong muſcle, termed *Deltoides*, lying over it, beſides alſo the back and *acromion* of the blade; and laſtly, the Anchor-like, or beak-like proceſs, all which four hinder this joint from ſlipping inwards. Now *Hippocrates* ſaith, that he hath onely ſeen one kind of diſlocation of this bone, to wit, that which is downwards or to the arm-pit; and certainly it is the moſt uſual and frequent; wherefore we intend to handle it in the firſt place. When the ſhoulder is diſlocated downwards into the arm-pit, a depreſſed cavity may be perceived in the upper part of the joint; the *acromion* of the blade ſhews more ſharp and ſtanding forth than ordinary, for that the head of the ſhoulder-bone is ſlipt down and hid under the arm-pit, cauſing a ſwelling forth in that place; the elbow alſo caſts it ſelf (as it were) outwards, and ſtands further off from the ribs, and though you force it, yet can you not make it to touch them; the Patient cannot lift up his hand to his ear on that ſide, neither to his mouth nor ſhoulder. Which ſign is not peculiar to the luxated ſhoulder, but common to it, affected with a contuſion, fracture, inflammation, wound, abſceſs, *ſchirrus*, or any defluxion upon the Nerves, ariſing out of the *Vertebræ* of the neck, and ſent into the arm; alſo this arm is longer than the other. Laſtly, (which alſo is common to each difference of a luxated ſhoulder) the Patient can move his arm by no kind of motion without ſenſe of pain, by reaſon of the extended and preſſed muſcles, ſome alſo of their fibres being broken. There are ſix ways to reſtore the ſhoulder luxated downwards into the arm-pit: The firſt is, when it is performed with ones fiſt, or a towel; the ſecond with a clew of yarn, which put under the arm-pit, ſhall be thruſt up with ones heel; the third, with ones ſhoulder put under the arm-hole; which manner, together with the firſt, is moſt fit for new and eaſily to be reſtored luxations, as in thoſe who have looſe fleſh, and effeminate perſons, as children, eunuchs, and women; the fourth, with a ball put under the armpit, and then the arm caſt over a piece of wood held upon two mens ſhoulders, or two ſtanding poſts; the fifth, with a Ladder; the ſixth, with an inſtrument called an *Ambi*. We will deſcribe theſe ſix ways, and preſent them to your view.

Why there is no internal ligament from the arm-bone to the ſhoulder-blade.

Differences of a luxated ſhoulder. *Sent. 1. ſect. 1. lib. de art.*

Signs of the ſhoulder diſlocated downwards.

The ways to reſtore it.

CHAP. XXII.

Of the firſt manner of ſetting a Shoulder, which is with ones Fiſt.

FIrſt, let one of ſufficient ſtrength, placed on the oppoſite ſide, firmly hold the Patient upon the joint of the ſhoulder, leſt he move up and down with his whole body, at the neceſſary extenſion, working and putting it in: then let another, taking hold of his arm above the elbow, ſo draw and extend it downwards, that the head thereof may be ſet juſt againſt its cavity, hollowed in the blade-bone: Then at laſt let the Surgeon lift and force up with his fiſt the head of the bone into its cavity. Here this is chiefly to be obſerved, that in freſh luxations, eſpecially in a body ſoft, effeminate, moiſt, and not over corpulent, that it ſometimes comes to paſs, that by the onely means of juſt extenſion, the head of the bone freed from the muſcles and other particles wherewith it was, as it were, entangled, will betake it ſelf into its proper cavity; the muſcles being by this means reſtored their place and figure, and drawing the bone with them, as they draw themſelves towards their heads, as it were with a ſudden gird or twitch: wherefore in many, whileſt we thought

Gal. com. ad ſent. 23. ſect. 1. de art.

An Expreſſion of the firſt manner of putting a Shoulder into joint.

thought no ſuch thing, it ſufficed or reſtitution only to have extended the arm. But if the luxation be inveterate, and the hand cannot ſerve, then muſt the Patients ſhoulder be faſtned to a poſt with the forementioned ligature, or elſe committed to ones charge, who may ſtand at his back and hold him faſt: Then the arm ſhall preſently be tied about, a little above the elbow with a fillet, whereto a cord ſhall be faſtned; which being put or faſtned to the pulley, ſhall be drawn or ſtretched forth as much as need ſhall require. Laſtly, the Surgeon, with a towel, or ſuch like ligature, faſtned about his neck and hanging down, and ſo put under the Patients arm-pit, near to the luxation, ſhall, raiſing himſelf upon his feet with the whole ſtrength of his neck, lift up the ſhoulder, and alſo at the ſame time bringing his arm to the Patients breſt, ſhall ſet the head of the ſhoulder-bone, forced with both his hands into its cavity, as you may ſee by the precedent Figure. Then muſt you cover all the adjacent parts with a Medicin made *ex farina volatili, bolo armenio, myrtillis, pice, reſina & alumine*, beaten into Powder, and mixed with the white of an Egg. Then muſt the hollowneſs under the arm be filled with a clew of woollen or cotten yarn, or a linnen cloth ſpred over with a little Oil of Roſes or Myrtles, a little Vinegar, and *unguentum roſatum*, or *refrigerans Galeni*, leſt it ſtick to the hairs, if there be any there. The part muſt afterwards be bound up with a ligature, conſiſting of two heads, of ſome five fingers bredth, and two ells long; more or leſs, according as the body ſhall require. The midſt thereof ſhall be put immediately under the arm-pit, and then croſſed over the lame ſhoulder, and ſo croſſing it as much as ſhall be fit, it ſhall be wrapped under the oppoſite arm. And laſtly, the arm ſhall be laid upon the breſt, and put in a ſcarf, in a middle figure almoſt to right angles, ſo that by litting up the hand he may almoſt touch his ſound ſhoulder, leſt the bone newly ſet, may fall out again: neither ſhall the firſt dreſſing be ſtirred, untill four or five days be paſt, unleſs the greatneſs of ſome happening ſymptom divert us from this our purpoſe.

A perfect ſetting the luxated ſhoulder by extenſion onely.

CHAP. XXIII.

Of the ſecond manner of reſtoring a Shoulder, that is, with the heel, when as the Patient by reaſon of pain, can neither ſit nor ſtand.

THe Patient muſt be laid with his back on the ground upon a coverlid, or mat, and a clew of yarn, or leathern ball, ſtuffed with Tow or Cotton, of ſuch bigneſs as may ſerve to fill up the cavity, muſt be put under his arm-pit, that ſo the bone may ſtraight-ways the more eaſily be forced by the heel into its cavity. Then let the Surgeon ſit beſide him, even over againſt the luxated ſhoulder; and if his right ſhoulder be luxated, he ſhall put his right heel to the ball, which filled up the arm-pit; but if the left, then the left heel; then let him forth-with draw towards him the Patients arm, taking hold thereof with both his hands, and at the ſame inſtant of time ſtrongly preſs the arm-pit with his heel. Whileſt this is in doing, one

Hipp. ſent. 12. ſect. 1. de art.

The expreſſion of the ſecond manner of reſtoring a Shoulder.

one ſhall ſtand at the Patients back, who ſhall lift up his ſhoulder with a towel, or ſome ſuch thing fitted for that purpoſe, and alſo with his heel preſs down the top of the ſhoulder blade: another alſo ſhall ſit on the other ſide of the Patient, who holding him, ſhall hinder him from ſtirring this way or that way at the neceſſary extenſion in ſetting it, as you may ſee it expreſſed by the precedent figure.

CHAP. XXXIV.

The third manner of reſtoring a Shoulder.

SOme one who is of a competent height and ſtrength, ſhall put the ſharp part of the top of his ſhoulder under the Patients arm-pit, and alſo at the ſame time, ſhall ſomewhat violently draw his arm towards his own breſt, ſo that the Patients whole body may (as it were) hang thereby. In the mean time another, for the greater impreſſion, ſhall lay his weight on the luxated ſhoulder, ſhaking it with his whole body. Thus the ſhoulder, drawn downwards by the one which ſtands under the arm-hole, and moved and ſhaken by the other, who hangs upon it, may be reſtored into its ſeat, by the help of the Surgeon concurring therewith, and with his hand governing theſe violent motions, as this Figure ſhews.

The Figure of the third manner of putting a Shoulder into joint.

CHAP. XXV.

Of the fourth manner of reſtoring a diſlocated ſhoulder.

The Figure of the fourth manner of reſtoring the ſhoulder.

YOu muſt take a Perch, or piece of wood (ſomewhat reſembling that which the Water-bearers of *Paris* uſe to put on their ſhoulders) ſome two inches broad, and ſome ſix foot long; in the midſt hereof let there be faſtned a clew of Yarn, or ball of ſufficient bigneſs to fill up the cavity of the arm-hole: Let there be two pins put in, one on each ſide of the ball, each alike diſtant therefrom, with which, as with ſtays, the ſhoulder may be kept in, and upon the ball, that it ſlip not away from it: Let two ſtrong men, taller than the Patient, either by Nature or Art, put this Perch upon their ſhoulders; then let the Patient put his arm-pit upon that place where the ball ſtands up; the Surgeon muſt be ready to pull his hanging arm downwards. Thus the Patient ſhall (as it were) hang on the Perch with his ſhoulder, and ſo the head of the bone ſhall be forced into its cavity, as this figure declares; wherein you may ſee the Perch or Yoak, with the two wooden Pins and Ball faſtned in the midſt, delineated by it ſelf.

CHAP.

CHAP. XXVI.

Of the fifth manner of putting the ſhoulder into joint, which is performed by a Ladder.

The delineation of the fifth manner of reſtoring a ſhoulder.

YOu may alſo reſtore a ſhoulder diſlocated into the arm-pit, by the help of a Ladder, after this manner. Let ſome round body, as a Ball or Clew of Yarn, which (as we formerly ſaid) may ſerve to fill the arm-pit, be faſtned upon one of the upper ſteps of a Ladder; at the foot of the Ladder ſet a low ſtool, whereupon let the Patient mount; then bind both his legs, and alſo his ſound arm behind his back, leſt, when you are about your operation, he hinder and ſpoil all you do, by laying his hand, or ſetting his foot upon the Ladder: Then let his arm be preſently put over the ſtep of the Ladder, and his arm-pit put upon the there faſtned ball, the Patient in the mean while being wiſhed to come with his whole body as near unto the ſteps of the Ladder as he is able; for otherwiſe, beſides that there is no other hope of reſtoring the luxation, there would be no ſmall danger of breaking the ſhoulder-bone: Alſo let him take heed that he put not his head between the ſteps. Then his arm, bound above the Elbow with filleting, or ſome other ligature fit for that purpoſe, ſhall be drawn down by the hand of ſome that aſſiſt you, and at the ſame time let the ſtool be plucked from under his feet, ſo that he may hang upon the Ladder. Thus by this means the head of the ſhoulder will be reſtored by it ſelf, the endeavour of the Surgeon aſſiſting, and preſſing down the ſhoulder-blade, and moving it to and again. The bone being ſet, the ſtool, which a little before was plucked from under the Patients feet, ſhall be put there again, that he may with the more eaſe and leſs pain, pull back his arm from the ſtep of the Ladder; for if he ſhould lift it high up to draw it over, there would be danger, leſt being newly ſet, and not well ſtaid, the head of the bone might fall out again. I have thought good to have all theſe things here expreſſed, that you may learn this operation, as if you ſee it done before you. I have

Another Figure expreſſing the fourth manner of reſtoring a diſlocated ſhoulder.

Another Figure to the ſame purpoſe.

not

not thought fit in this place to omit the induſtry of *Nicholas Picart*, the Duke of *Guiſe* his Surgeon, who being called to a certain Country man to ſet his ſhoulder being out of joint, and finding none in the place beſides the Patient and his wife, who might aſſiſt him in this work, he put the Patient, bound after the aforementioned manner, to a Ladder; then immediately he tied a ſtaff at the lower end of the ligature, which was faſtned about the Patients arm above his elbow; then put it ſo tied under one of the ſteps of the Ladder, as low as he could, and got aſtride thereupon, and ſate thereon with his whole weight, and at the ſame inſtant made his Wife to pluck the ſtool from under his feet: which being done, the bone preſently came into its place, as you may ſee by the foregoing figure.

If you have never a Ladder, you may uſe a piece of Wood laid acroſs upon two Poſts. Alſo you may uſe a Door, as the other Figure ſhews, wherein you muſt obſerve a flat piece of Wood or *ſpatula*, with ſtrings thereat, whoſe uſe ſhall be ſhewn in the following Chapter.

CHAP. XXVII.

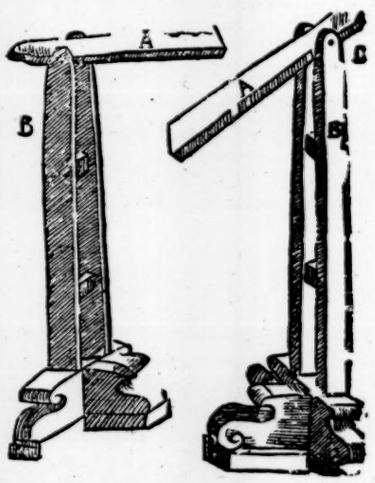
The ſixth manner of reſtoring a ſhoulder luxated into the arm-pit.

Sect.1.lib.1.de art.ſent.19. HIppocrates writes, that this is the beſt way of all to reſtore a diſlocated ſhoulder. You muſt take a woodden *ſpatula* of ſome four or five fingers breadth, and ſome two fingers thickneſs or leſs, but ſome yard or thereupon long; the one end thereof muſt be narrow and thin, with a round head ſtanding up and lightly hollowed, that put under the arm-pit, it may receive part of the head of the ſhoulder. This upper part of the *ſpatula* muſt be wrapped about with a linnen or woollen rag, or ſome ſuch ſoft thing, that it may be the ſofter and hurt the leſs; and then it muſt be ſo thruſt under the arm-pit, that it may throughly penetrate into the inner part between the ribs, and the head of the ſhoulder-bone. There muſt, beſides in this *ſpatula*, be two holes in three ſeveral places, each alike diſtant from other, through which let ſoft ſtrings be put, whereby it may be tied to the arm, ſtretched all the length thereof even to the fingers, in one place a little below the head of the ſhoulder-bone, in another a little above the elbow, and the third at the wriſt, that ſo they may hold it firm: Therefore let the diſtances of the holes be fitted to this purpoſe; but principally you muſt have a care of this, that the upper part of the *ſpatula*, reaching beyond the head of the arm, enter even to the innermoſt cavity of the arm-pit; then a croſs pin or piece of wood muſt be made faſt through two Poſts or a Frame, and well faſtned thereto, and thereupon the Arm with the *ſpatula* muſt be ſo put over, that the pin may be under the arm-pit, the body weighing one way, and the arm another: which being done, the arm muſt be drawn down one way, and the body another about the pin. Now this croſs pin muſt be put on ſuch a height that the Patient may ſtand on tip-toes Now this is the very beſt way of reſtoring a ſhoulder. In ſtead of two Poſts or a Frame, you may make ſhift with a Ladder, Door, Bed-poſts, and ſuch like things as ſhall be there preſent. I have heard *Henry Arvet*, a very good Surgeon of *Orleans* ſay, that he never attempted this manner of putting into joint a ſhoulder diſlocated into the arm-pit without good ſucceſs, unleſs by chance (which alſo is noted by *Hippocrates*) that the fleſh is grown into the cavity, and the head of the bone hath made it ſelf another cavity in the place whereinto it is fallen, for in this caſe the bone will either not be reſtored, or elſe not remain in its place, but fall back notwithſtanding into the new hollowed cavity, which ſerves it in ſtead of its natural ſocket or cavity. But I muſt here admoniſh young Surgeons, that if the bone be not reſtored at the firſt endeavour and on-ſet, that they do not deſpair and preſently deſiſt from their intended operation, but they muſt winde about, and gently move the joint: for ſo at the length it will be more eaſily moved, and enter into the natural cavity: When it is in, it muſt be bound up with compreſſes and rowlers after the fore-mentioned manner.

The deſcription of the *Gloſſocomium*, termed *Ambi.*

Sect.1. de art. ſent.21.

Hippocrates *his* Gloſſocomium *termed* Ambi.



Hippo ſent.64. 4. de artic. To the former Figures I have thought good to add this, which expreſſeth the manner of reſtoring a ſhoulder luxated into the arm-pit, with a *ſpatula* after the manner of *Hippocrates*. This *ſpatula* faſtned with an iron pin to the ſtanding Frame, may be turned, lifted up, and preſſed down at your pleaſure. *A* Shews the wooden *ſpatula*. *B* The frame or ſtanding poſts.

How to make uſe of the *Ambi.* For the more certain uſe of this Inſtrument the Patient muſt ſit upon a ſeat which muſt be ſomewhat lower than the ſtanding Frame, that ſo the *ſpatula* which is thruſt into the arm-pit may be the more forcibly depreſt, ſo to force in the head of the ſhoulder-bone; the Patients feet muſt alſo be tied, that he may not raiſe himſelf up whileſt the Surgeon endeavours to reſtore it. Now he ſhall then endeavour to reſtore it when he ſhall have bound the ſtretched forth arm of the diſlocated ſhoulder unto the *ſpatula*, and thruſt the one end thereof under the ſlipped forth head of the ſhoulder-bone, as we have formerly ſhewed, for then by preſſing down the other end of the *ſpatula* which goes to the hand, the bone is forced into its cavity. You muſt diligently obſerve the wooden *ſpatula*, which therefore I have cauſed to be expreſſed by it ſelf, which *Hippocrates* calleth *Ambi*, whoſe head is a little hollowed, where it is noted with this letter *B*. The whole *ſpatula* is marked with this letter *A*. with three

three ſtrings hanging thereat, provided for the binding of the arm, that it may be kept ſteddy, as you may perceive by the annexed figure.

There are other additions to this *Ambi*, whoſe figure I now exhibited to your view, by the invention of *Nicholas Picart* the Duke of *Lorrain*'s Surgeon, the uſe and knowledge whereof, beſtowed upon me by the inventor himſelf, I would not envy the ſtudious Reader.

CHAP. XXVIII.

How to reſtore a Shoulder diſlocated forwards.

IT is ſeldom that the ſhoulder is luxated towards the foreſide; yet there is nothing ſo ſtable and firm in our bodies which may not be violated by a violent aſſault; ſo that thoſe bones do alſo fall out of joynt, whoſe articulations are ſtrengthned for the firmer connexion with fleſhy, nervous, griſtly and bony ſtays, or bars: This you may perceive by this kind of diſlocated ſhoulder, ſtrengthned, as it were, with a ſtrong wall on every hand; to wit, the *Acromium* and the end of the collar-bone, ſeeming to hinder it, as alſo the great and ſtrong muſcles, *Epomis*, and *Biceps*. *Hippocrates*, ſhut up within the ſtrait bounds of the leſſer *Aſia*, never ſaw this kind of diſlocation, which was obſerved five times by *Galen*: I profeſs I have ſeen it but once, and that was in a certain Nun, which weary of the Nunnery, caſt her ſelf down out of a window, and bore the fall and weight of her body upon her elbow, ſo that her ſhoulder was diſlocated forwards. This kind of diſlocation is known by the depravation of the conformation or figure of the member, by the head

Com. ad ſent. 22. & 23. ſect. 1 de articulis.

Signs.

Cure. of the ſhoulder wreſted out towards the breaſt, as alſo the Patient cannot bend his elbow: It is reſtored by the ſame means as other luxations of other parts, to wit, by ſtrait holding, extending and forcing in: Therefore the Patient muſt be placed upon the ground with his face upwards, and then you muſt extend the ſhoulder otherwiſe than you do when it is luxated into the arm-pit; for when it falleth into the arm-hole, it is firſt drawn forwards, then forced upwards, until it be brought juſt againſt the cavity whereinto it muſt enter: But in this kind of luxation, becauſe the top of the ſhoulder is in the foreparts of the dearticulation ſhut up with muſcles, opened both to the outer, as alſo the inner part, you muſt work to the contrary; to wit, to the hind part: But firſt of all you muſt place a ſervant at the back of the Patient, who may draw back a ſtrong and broad Bandage caſt about the arm-pit (ſuch as is the *Carchefius*, which conſiſts of two contrary and continued ſtrings) leſt that when the arm ſhall be extended, the ſhoulder follow: Alſo you muſt *Sent. 23. fol. 1. de art.* put a clew of yarn to fill up the arm-pit; then muſt you extend the arm, caſting another ligature a little above the elbow, and in the interim have a care that the head thereof fall not into the arm-pit, which may be done both by putting the fore-mentioned clew under the arm, and drawing the head another way; then muſt you perm it, by ſlacking your extenſion, the joynt from the encompaſſing muſcles, to be drawn and forced into its cavity by the muſcles forcible recoiling, as with an unanimous conſent, into themſelves and their originals, for thus it will eaſily be reſtored, and ſuch extenſion only is ſufficient thereto.

CHAP. XXIX.

Of the ſhoulder luxated outwardly.

Signs. THe diſlocation alſo of the ſhoulder to the outward parts ſeldom happens; but yet, if it may at any time happen, the extenſion of the arm will be very difficult, but yet more difficult towards the outward part than towards the inward: There is a depreſſed cavity perceived towards the cheſt; but externally a bunching forth, to wit, in that part from whence the The cure. head of the ſhoulder-bone is fled: For the reſtoring hereof, the Patient muſt be laid flat on his belly, and the elbow muſt be forcibly drawn contrary to that whereto it is fled, to wit, inwardly to the breaſt; and alſo the ſtanding-forth head of the arm-bone muſt be forced into its cavity, for thus it ſhall be eaſily reſtored: But into what part ſoever the ſhoulder-bone is diſlocated, the arm muſt be extended and drawn directly downwards. After the reſtitution fitting medicines What to be done to hold in the ſhoulder after it is reſtored. ſhall be put about the joynt. Let there be ſomewhat put into the arm-pit which may fill it up, and let compreſſes or boulſters be applied to that part to which the luxated bone fell; then all theſe things ſhall be ſtrengthened and held faſt with a ſtrong and broad two headed ligature put under the arm-pit, and ſo brought acroſs upon the joynt of the ſhoulder, and thence carried unto the oppoſite arm-pit by ſo many windings as ſhall be judged requiſite: Then the arm muſt be put and carried in a ſcarf to right angles, which figure muſt be obſerved not only in every luxation of the ſhoulder, but in each fracture of the arm alſo, for that it is leſs painful, and conſequently, ſuch as the arm may ſtand the longeſt therein without moving.

CHAP. XXX.

Of the Shoulder diſlocated upwards.

Signs. THe head of the ſhoulder alſo may ſometimes be luxated into the upper part: Which when it happens, it ſhews it ſelf by bunching forth at the end of the collar-bone, the hollowneſs of the arm-pit is found larger than uſual, the elbow flies further from the ribs than Cure. when it fell downwards, now the arm is wholly unable to perform the uſual actions. It is fit for the reſtitution of ſuch a luxation, that the Surgeon ſtoop down, and put his ſhoulder under the Patients arm, and then ſtand up as high as he can upon his feet, and therewithal preſs down the head of the ſhoulder-bone into the cavity, or elſe make ſome other to do it. Otherwiſe it is fit to lay the Patient upon his back on the ground, and whilſt ſome one extends the affected arm by drawing it downwards, the Surgeon with his own hand may force down the head of the bone into its cavity. The operation performed, the ſame things ſhall be done as in other luxations, compreſſes being applied to that part whereto the bone flew, and it being alſo bound up with ligatures. Now you may underſtand in theſe four fore-mentioned kinds of diſlocations, that the bone which was luxated is reſtored, by the ſound which ſhall be heard as you force it in, by the reſtitution of the accuſtomed actions, which are perceived by the bending, extending and lifting it up, by the mitigation of the pain, and laſtly, by the collation and comparing of the affected arm with the ſound, and by its ſimilitude and equality therewith.

CHAP.

CHAP. XXXI.

Of the Diſlocation of the Elbow.

THe elbow may alſo be four manner of ways diſlocated; to wit, inwardly, outwardly, upwards and downwards. By the part which is inwards, I mean that which looks towards the center of the body, when as the arm is placed in a natural ſite, to wit, in a middle figure between prone and ſupine; I make the outward part, that which is contrary thereto. By the upper part I mean that which is towards the heaven, and by the lower that which is next to the earth: And by how much the joynt of the elbow conſiſts of more heads and cavities than that of the ſhoulder, by ſo much when it is luxated it is the more difficultly ſet, and is alſo more ſubject to inflammation, and to grow hard thereupon, as *Hippocrates* ſaith. Now the joynt of the elbow is more difficultly diſlocated than that of the ſhoulder, and more hardly ſet, for that the bones of the cubit and arm do receive and enter each other by that manner of articulation which is termed *Ginglymus*, as we have formerly more at large treated in our Anatomy, and a little before in our Treatiſe of Fractures. The elbow is therefore diſlocated, for that the proceſſes thereof are not turned about the ſhoulder-bone in a full orb, and by an abſolute turning. Wherefore if at any time the cubit be bended more ſtraitly and cloſely than that the inner proceſs can retain its place and ſtation in the bottom of its *ſinus*, the hind-proceſs fal'eth out and is diſlocated backwards: But when as the fore-proceſs is extended more violently, and forced againſt the bottom of its cavity, it flies and departs out of its place as beaten or forced thence, and this kind of luxation is far more difficultly reſtored than the former: Add hereunto, that the utter extremity of the cubit, which is called *Olecranum*, is the higher, but the other inner is the lower; whence it is that every one can better and more eaſily bend than extend their cubits: Therefore ſuch a diſlocation is cauſed by a more violent force, than that which is made to the inner ſide. * The ſign of this luxation is, the arm remains extended, neither can it be bended, for the inner proceſs ſtays in the external cavity which is hollowed in the bottom of the ſhoulder-bone, which formerly was poſſeſſed by the inner part of the *Olecranum*; which thing makes the reſtitution difficult, for that this proceſs is kept, as it were, impriſoned there: But when it falleth out diſlocated to the fore-part, the arm is crooked, neither is it extended, and it is alſo ſhorter than the other. But if the elbow be fallen out of its place according to the other manner of diſlocations, to wit, upwards or downwards, the natural figure thereof is perverted, for the arm is ſtretched forth, but little notwithſtanding bended towards that part from whence the bone went, that is, figured after a middle manner between bending and extending thereof. What kind ſoever of diſlocation ſhall befal it, the action of the elbow will either not be at all, or certainly not well, until that it be reſtored to its former place; there is a ſwelling in the part whereinto it is flown, and a cavity there from whence it is fled, which alſo happens in the diſlocations of all other parts. Furthermore, one diſlocation of the elbow is complete and perfect, another imperfect. The later as it eaſily happens, and through a ſmall occaſion, ſo it is eaſily reſtored; but on the contrary a perfect, as it hardly happens, and not unleſs with great violence, ſo it is not ſo eaſily reſtored again, eſpecially if that you do not prevent inflammation, for being inflamed it makes the reſtitution either difficult, or wholly impoſſible, principally that which falleth outwards.

The Author ſeems not to agree with *Hip. Sent. ult. ſect. 3. fract.* and *Celſus* in the ſetting down the kinds of a diſlocated elbow.

* The Author doth not agree with *Hippocr.* and *Celſus*, in ſetting down the notes of theſe diſlocations: for thoſe notes which are here attributed to an outward and inward luxation, theſe *Celſus* hath given to an elbow diſlocated towards the fore and out-part; and thoſe which are here attributed to the elbow, diſlocated upwards and downwards; thoſe *Celſus* hath attributed to a diſlocation to the out and infides.

Inflammation hinders repoſition.

CHAP. XXXII.

How to reſtore the Elbow, diſlocated outwardly.

YOu may know that the elbow is diſlocated outwardly, if at any time you ſhall obſerve the arm to be diſtended, and not able to be bended. Wherefore you muſt forthwith undertake the reſtitution thereof, for fear of defluxion and inflammation which the bitterneſs of pain uſually cauſeth, upon what part ſoever the luxation happens. There is one manner of reſtoring it, which is, you muſt cauſe one to hold hard and ſteddy the Patients arm a little under the joynt of the ſhoulder, and in the mean while let the Surgeon draw the arm, taking hold thereof with his hand, and alſo force the ſhoulder-bone outwards, and the eminence of the cubit inwards, but let him by little and little draw and extend the arm, wreſting it gently this way and that way, that he may bring back the bone which fell out into its cavity. I have thus expreſly delivered this, that the young Surgeon may underſtand, that the arm muſt not be bended for the reſtoring of this kind of diſlocation; for reſtitution cannot ſo be hoped for, becauſe by this kind of luxation the inner proceſs of the cubit poſſeſſeth the place of the exterior proceſs in the cavity of the ſhoulder-bone. Wherefore whilſt the arm is bended or crooked, the cubit is only lifted up, and not drawn into its ſeat. But if we cannot attain to the reſtitution thereof with our hands alone, you muſt cauſe the diſlocated arm, lightly bended, to embrace a poſt, then muſt the end of cubit called *Olecranum* be tied or bound about with a ſtrong ligature or line, and then reſted into its cavity by putting a battoon or ſtaff into the ligature, as is demonſtrated by this enſuing figure.

Sign.

Cure.

A Caution.

A Figure which ſhews the way how to reſtore the Elbow by putting it about a poſt, with a batton.

A Figure which ſhews how to reſtore the Elbow by only caſting a line about it.

Thereis alſo another more exquiſite way of reſtoring it, which is expreſſed by the latter figure wherein a line of ſome inch breadth is caſt about the *Olecranum* of the arm, embracing a poſt or pillar, and it is drawn ſo long, until the diſlocated bone be brought into its ſeat. Now we know that the bone is returned into its place, and reſtored, when the pain ceaſeth, and the figure and whole natural conformation is reſtored to the arm, and the bending and extending thereof is eaſie, and not painful.

CHAP. XXXIII.

Of the Diſlocation of the Elbow to the inſide, and of a complete and uncomplete Luxation.

The cure.

IF the elbow be diſlocated to the inner part, the arm muſt be ſtrongly and powerfully extended, then bended quickly, and with ſudden violence, ſo that his hand may ſmite upon his ſhoulder. Some put ſome round thing into the bout of the elbow, and upon that do ſuddenly force the elbow to the ſhoulder, as we have formerly ſaid. If the cubit-bone be only lightly moved out of its place into the upper or lower place, it is eaſily reſtored by drawing and forcing it into its cavity, after this following manner. Let two extend the arm, taking hold thereof at the ſhoulder and wriſt, and each draw towards himſelf: And alſo the Surgeon (who ſhall there be preſent) ſhall force the bone which is diſlocated from that part whereunto it is bended, unto the contrary: After he ſhall thus have reſtored it, he ſhall lay the arm in a ſtrait angle, and ſo bind it up, and apply fit medicines formerly mentioned, and ſo let him carry it in a ſcarf put about his neck, as we ſaid in the diſlocation of the ſhoulder. *Hippocrates* bids, that the Patient, after it is ſet, ſhall often endeavour to bend his hand upwards and downwards, and alſo extend and bend his arm, yea, and alſo to attempt to lift up ſome heavy thing with his hand; for ſo it will come to paſs, that the ligaments of this joynt may become more ſoft, ready and able to perform their accuſtomed functions, and alſo the bones of the cubit and ſhoulder ſhall be freed from the affect termed *Ancyloſis*, whereto they are incident by the luxations of this part. Now *Ancyloſis* is a certain preternatural agglutination, coagmentation, and, as it were, union of ſundry and ſeveral bones in the ſame joynt, which afterwards hinders the bending and extenſion thereof. Now a *Callus* is generated in the elbow ſooner than in any other articulation, whether it remaineth out, or be put into joynt, by reaſon that by reſt and ceſſation from the accuſtomed actions, a viſcid humor which is placed naturally in the joynts, as alſo another which is preternatural drawn thither by pain, floweth down, and is hardned, and gleweth the bones together, as I have obſerved in many, by reaſon of the idleneſs and too long reſt of this part: Wherefore that we may withſtand this affect, the whole ligation muſt be looſed ſooner and oftner than otherwiſe, that is to ſay, every third day, and then the Patients arm muſt be gently moved every way. Within the ſpace of twenty, or twenty five days, theſe reſtored Bones recover their ſtrength, ſooner or later, according to the hapning accidents. It is neceſſary alſo that the Surgeon know that the *Radius*, or wand, ſometimes falleth out, when the cubit or ell is wholly diſlocated; wherefore he muſt be mindful in ſetting the cubit, that he alſo reſtore

Sent. 63. ſect. 3. de fract.

Why the elbow is moſt ſubject to *Ancyloſis.*

the

the wand to its place; in the upper part it hath a round proceſs lightly hollowed, wherein it receiveth the ſhoulder-bone: it hath alſo an eminency which admitteth the two headed muſcle.

CHAP. XXXIV.

Of the Diſlocation of the Styliformis, or bodkin-like proceſs of the Cubit or Ell.

THe proceſs of the Ell called *Styloides*, being articulated to the wriſt by *Diarthroſis*, by which it is received in a ſmall cavity, is diſlocated, and falleth out ſometimes inwards, ſomewhiles outwards: The cauſe uſually is the falling of the body from high upon the hands: It is reſtored, if that you force it into its ſeat, diligently bind it, and apply thereto very aſtringent and drying medicines: But yet, though you ſhall diligently perform all things which may be done in diſlocations, yet you ſhall never ſo bring it to paſs that this bone ſhall be perfectly reſtored, and abſolutely put into the place where-hence it went: Which thing we have read, obſerved by *Hippocrates*; When (ſaith he) the greater bone, to wit, the Ell, is removed from the other, that is, the Wand, it is not eaſily reſtored to its own nature again; for that, ſeeing that neither any other common connexion of two bones, which they call *Symphyſis* or union, when it is drawn aſunder and deſtroyed, may be reduced into its former nature, by reaſon theſe ligaments wherewith they were formerly contained, and as it were continued, are too violently diſtended and relaxed, whence it happens, that I have in theſe caſes often obſerved, that the diligence and care of the Surgeon hath nothing availed.

CHAP. XXXV.

Of the Diſlocation of the Wriſt.

WE underſtand by the wriſt, a certain bony body, conſiſting of a compoſure of eight bones knit to the whole cubit by *Diarthroſis*: For the wriſt conſidered wholly in its ſelf, is knit and articulated with the ell and wand: With that, againſt the little finger; with this, againſt the thumb: For thus, as it were, by two connexions the joynt is made more firm; yet may it be diſlocated inwardly, outwardly, and towards the ſides. We ſay it is luxated inwardly when the hand ſtands upwards, but outwardly, when it is crook'd in and cannot be extended: But if it chance to be diſlocated ſide-ways, it ſtands awry either towards the little finger, or elſe towards the thumb, as the luxation befals to this or that ſide. The cauſe hereof may ſeem to depend upon the different dearticulation of the ell and wand with the hand or wriſt: For the wand, which is articulated on the lower part with the wriſt at the thumb, by its upper part, whilſt it receives the outward ſwelling or condyle of the ell in its cavity, performs the circular motions of the hands: But the cubit or ell, which in like ſort is connected on the lower part by *Diarthroſis* at the little finger with the wriſt, being articulated on the upper part with the ſhoulder-bone, bends and extends, or ſtretches forth the hand. There is one way to reſtore the formerly mentioned diſlocations: The arm on one ſide and the hand on another muſt be extended upon a hard reſiſting and ſmooth place, ſo that it may lie flat; and you muſt have a care that the part whence the diſlocated bone fell, be the lower in its ſite and place, and the part whither it is gone, the higher: Then to conclude, the prominencies of the bones muſt be preſſed down by the hand of the Surgeon, until by the force of compreſſion and ſite the luxated bones be thruſt and forced into their places and cavities.

Here, as before *chap.* 31. the Author diſſents from *Celſus* and *Hippocrat.* in expreſſing the names and ſigns of theſe diſlocations.

CHAP. XXXVI.

Of the diſlocated bones of the Wriſt.

THe wriſt conſiſts of eight bones, which cannot, unleſs by extraordinary violence, be put or fall out of their places. Yet if they ſhall at anytime fall out, they will ſhew it by the tumor of the part whereto they are gone, and by the depreſſion of that wherefrom they are fled: They may be reſtored, if the diſeaſed hand be extended upon a table; and if the bones ſhall be diſlocated inwards, the hand ſhall be placed with the palm upwards, then the Surgeon ſhall, with the palm of his hand, preſs down the eminencies of the bones, and force each bone into its place: But if the luxation be outwards, he ſhall lay the palm next to the table, and preſs it after the ſame manner. To conclude, if the luxation ſhall be toward either ſide, the luxated bones ſhall be thruſt towards the contrary, and the reſtored bones ſhall be preſently contained in their places with fit remedies, binding, rowling, and carrying the hand in a ſcarf.

CHAP. XXXVII.

Of the diſlocated bones of the After-wriſt.

THere are four bones in the palm or after-wriſt, the two middlemoſt whereof cannot be diſlocated ſide-ways, becauſe they are hindred and kept from falling aſide by the oppoſition of the parts, as it were reſiſting them. Neither can that which anſwereth to the little finger, nor that whereon the fore-fingers reſt, be diſlocated towards that ſide which is next the middle bones, whereof we now ſpake, but only on the other ſide, freed for the neighbour-hood of the bones: But all of them may be diſlocated inwardly and outwardly. They may be reſtored as thoſe of the wriſt.

Celſus lib. 8. *cap.* 18.

CHAP. XXXVIII.

Of the diſlocated Finger.

Why the diſlocated fingers may be eaſily reſtored.

ALſo the bones of the fingers may be four ſeveral ways diſlocated, inwardly, outwardly, and at each ſide. To reſtore them, they muſt be laid ſtrait upon a table, and ſo put into joynt again. For thus they may be eaſily reſtored, by reaſon their ſockets are not deep, and their joints are ſhorter, and ligaments leſs ſtrong. In twelve days ſpace they will recover their ſtrength, as alſo thoſe diſlocations that happen to the wriſt and after-wriſt.

CHAP. XXXIX.

Of a diſlocated Thigh or Hip.

Hipp. ſent. 68. ſect. 3. de art.

THe thigh or hip may be diſlocated, and fall forth towards all the four parts, but moſt frequently inwards, next to that outwards, but very ſeldom either forwards or backwards. A ſubluxation cannot happen in this joynt, as neither in the ſhoulder, eſpecially from an external cauſe, contrary to which it uſually happens in the elbow, hand, knee, and foot. The cauſe hereof is, for that the heads of thigh and ſhoulder-bone are exactly round, and the ſockets which receive them have certain borders and edges encompaſſing them. Hereunto may be added, that ſtrong muſcles encompaſs each dearticulation, ſo that it cannot come to paſs that part of the heads of ſuch bones may be contained in the cavity, and other parts ſtand or fall forth, but that they will quickly be reſtored to their places by the motion and wheeling about of the joynt, and the ſtrength of the encompaſſing muſcles. But a ſubluxatio may ſeem to happen in theſe parts from an internal cauſe. For then the ligaments and ties being ſoftned and relaxed, cannot draw and carry back the head of the bone ſtanding forth ſo far as the edges of the ſocket. If the hip be diſlocated towards the inner part, that leg becomes longer and larger than the other, but the knee appears ſomewhat lower, and looks outwardly with the whole foot, neither can the Patient ſtand upon his leg. To conclude, the head of the thigh-bone bewrays it ſelf lying in the groin, with a ſwelling manifeſt both to the eye and hand; now the leg is longer than that which is ſound, for that the head of the thigh is out of its ſocket or cavity, and ſituated lowered, to wit, in the groin, therefore the leg is made by ſo much the larger. Now the knee ſtands forth, becauſe neceſſarily the lower head of the thigh-bone ſtands contrary to the ſocket. For this is common to all diſlocated bones, that when as the diſlocation happens to the one ſide, the other end of the bone flies out to the contrary. Whence it is, that if the upper-head of the thigh-bone ſhall fall inwards, then the other head, which is at the knee, muſt neceſſarily look outwards. The like happens in other diſlocations. The leg cannot be bended towards the groin, for that the diſlocated bone holds the extending muſcles of the ſame part ſo ſtiffly ſtretched out, that they cannot yield, or apply themſelves to the benders. For flexion or bending ought to precede extenſion, and extenſion, flexion.

Gal. com. ad ſent. 47 ſect. 4. de art.

A ſubluxation may befal the thigh from an internal cauſe.

CHAP. XL.

Prognoſticks belonging to a diſlocated Hip.

Why the thigh bone diſlocated, is difficultly reſtored, or reſtored, eaſily falls out again.

THere is this danger in the diſlocation of the hip, that either the bone cannot be put into the place again, at leaſt unleſs with very much trouble, or elſe being put in, that it may preſently fall out again. For if the tendons of the muſcles, the ligaments, and other nervous parts of the member be hard and ſtrong, they, by reaſon of their contumacy and ſtiffneſs will hardly ſuffer the bone to return to its place. If that they be ſoft, looſe, effeminate and weak, they will not contain the reſtored bone in its place. Neither will it be any better contained, if that ſhort, but yet ſtrong and round ligament, which faſtens the head of the thigh-bone on the inſide in the ſocket or cavity of the huckle-bone, be broken or relaxed. Now it may be broken by ſome violent ſhock or accident, it may be relaxed by the congeſtion and long ſtay of ſome excrementitious, tough and viſcous humour lying about the joynt, through which means it waxeth ſoft. But if it be broken, how often ſoever the bone be reſtored, it will preſently fall out again. If it be relaxed, there is only this hope to contain the reſtored bone, that is, To conſume and draw away the heaped up humidity by application of Medicines and Cauteries of both kinds, for which purpoſe thoſe are more effectual which do actually burn, for that they dry and ſtrengthen more powerfully. Leanneſs of the body, and the want of *Aponeuroſes*, that is, of broad tendons, and external ligaments, whereof many encompaſs the knee, increaſes the difficulty of containing it in the place. But the parts adjoyning to the diſlocated and not-ſet bone fall away by little and little, and conſume with an *Atrophia* or want of nouriſhment; both becauſe the part it ſelf is forced to deſiſt from the accuſtomed actions and functions, as alſo for that the veins, arteries and nerves being more ſtraitned and put out of their places, hinder the ſpirits and nouriſhment frow flowing ſo freely as they ought, to the part: Whence it comes to paſs, that the part it ſelf is made more weak, the native heat being debilitated through idleneſs, it can neither attract the alimentary juice, neither can it digeſt and aſſimilate that little thereof which flows and falleth thereto. Verily the thigh-bone, as long as it is forth of the cavity, grows no more after the manner as the other bones of the body do, and therefore in ſome ſpace of time you may perceive it to be ſhorter than the ſound bone. Notwithſtanding the bones of the leg and foot are not hindred of their growth,

The breaking and relaxation of the internal ligament.

Gal. com. ad ſent. 42. ſect. 4. de art.

growth, for they are not out of their proper places. Now for that the whole leg appears more ſlender, you muſt think that happens only by the extenuation and leanneſs of the proper muſcles thereof. The ſame thing happens to the whole hand, in the largeſt acception, when as the ſhoulder is out of joynt, unleſs that the calamity and loſs hereof is the leſs. For the ſhoulder being forth of joynt you may do ſomething with your hand, whereby it will come to paſs that no ſmall portion of nouriſhment may flow down into theſe parts. But the thigh-bone being diſlocated, eſpecially inwards in a child unborn, or an infant, much leſs alimentary nouriſhment flows to that part, becauſe it can much leſs uſe the foot and leg by reaſon of the diſlocation of the hip, than it can do the hand by a luxation of the ſhoulder. But now we muſt thus underſtand that which is ſaid by *Hippocrates*, That diſlocated bones, and not reſtored, do decreaſe or are hindred from their juſt growth, to be only in thoſe who have not yet attained to their full and naturally appointed growth in every dimenſion. For in men of full growth, the bones which are not reſtored, become more ſlender, but yet no ſhorter, as appears by that which he hath delivered of the ſhoulder.

Hippocrates explained *ſect.* 1. & 3. *lib. de art.*

CHAP. XLI.

Of the ſigns of the Hip diſlocated outwardly or inwardly.

THe thigh-bone or hip when it is diſlocated outwardly, and not reſtored, after ſome time the pain is aſſwaged, and fleſh grows about it, the head of the bone wears it ſelf a new cavity in the adjoyning hip, whereinto it betakes it ſelf, ſo that at the length the Patients may go without a ſtaff, neither ſo deformed a leanneſs will waſte their leg. But if the luxation happen inwards, a greater leanneſs will befal them, by reaſon that the veſſels naturally run more inwardly as *Galen* obſerves in the diſlocation of the *Vertebræ* to the inſide; therefore it comes to paſs that they are more grievouſly oppreſſed: Beſides, the thigh-bone cannot wag or once ſtir againſt the ſhare-bone; wherefore if the bone thus diſlocated be not reſtored to its joynt again, then they muſt caſt their leg about as they walk, juſt as we ſee Oxen do. Wherefore the ſound leg whilſt they go, takes much leſs ſpace than the lame, becauſe this, whilſt it ſtirreth or moveth, muſt neceſſarily fetch a compaſs about, but that performeth its motion in a right line. Beſides, whilſt the Patients ſtand upon their lame leg to put forwards the ſound, they are forced to ſtand crooked, whereupon they are forced to ſtay themſelves with a ſtaff that they fall not.

Al ſent. 51. *ſect.* 3. *de art.*

Furthermore thoſe who have this bone diſlocated either backwards or outwards, ſo that it cannot be reſtored, have the part it ſelf grow ſtiff and hard; which is the cauſe why the ham may be bended without great pain, and they may ſtand, and go upon the tops of their toes; beſides alſo, when they deſire to go faſter, they are forced to ſtoop, and ſtrengthen themſelves by laying their hand on their lame thigh at every ſtep, both for that their lame leg is the ſhorter, as alſo becauſe the whole weight of the body ſhould not lie wholly or perpendicularly upon the joynt or head of the thigh-bone. Yet in continuance of time, when they are uſed to it, they may go without any ſtaff in their hands. Yet in the interim, the ſound leg becomes more deformed in the compoſure and figure, becauſe, whilſt it ſuccours the oppoſite and lame leg by the ham ſtanding on the ground, it bears the weight of the whole body, in performance whereof the ham muſt neceſſarily now and then bend. But on the contrary, when as the head of the thigh being diſlocated inwards is not put into the joynt, if the Patient be arrived at his full growth, after that the head of the bone hath made it ſelf a cavity in the neighbouring bone wherein it may reſt, he may be able to walk without a ſtaff, becauſe the diſlocated leg cannot eaſily be bended toward the groin or ham, and he will ſooner reſt upon his heel than upon his toes. This kind of diſlocation if it be inveterate, can never be reſtored. And theſe things happen, when as the thigh-bone is diſlocated inwards, or when the internal ligament which faſtens the dearticulation ſhall be broken or relaxed. But the contrary ſhall plainly appear if the diſlocation ſhall happen to be outwards; for then the lame leg becomes the ſhorter, becauſe the head of the thigh flies into a place higher than its cavity, and the muſcles of that part are contracted towards their original, and convulſively draw the bone upwards together with them. The whole leg, together with the knee and foot looketh inwards, they cannot go upon their heels, but upon the ſetting on of the toes. The leg may be bended, which it cannot be in a diſlocation of the thigh inwards, as *Paulus* ſhews. Therefore we muſt diligently obſerve that ſentence of *Hippocrates* which is read with a negative, in theſe words, *Sed neque conflectere quemadmodum ſanum crus poſſunt*, that they ought to be read with an affirmative after this manner, *Sed conflectere, &c. quin & crus ipſum, &c.* But now the lame leg will better ſuſtain the weight of the body in an external, than in an internal diſlocation; for then the head of the thigh is more perpendicularly ſubject to the whole weight of the body. Therefore when in the ſucceſs of time it ſhall by wearing have made it ſelf a cavity in the neighbouring bone, which in time will be confirmed, ſo that there will remain no hope of reſtoring the diſlocation, nevertheleſs the Patient ſhall be able to go without a ſtaff, for that then no ſenſe of pain will trouble him; whence it follows, that the whole leg alſo will become leſs lean, for that going is leſs painful, neither are the veſſels ſo much preſſed as in that diſlocation which is made inwardly.

Signs of the thigh-bone diſlocated outwards.

Paul. Æg. l. 6. c. 8. Hip ſent. 91. ſect. 3. lib. de artic.

CHAP.

CHAP. XLII.

Of the Thigh-bone diſlocated forwards.

IT ſeldom hapneth that the thigh is diſlocated forwards; yet when as it ſhall happen, it is by theſe ſigns. The head of the thigh lieth towards the ſhare; whence the groins ſwell up, and the buttock on the contrary is wrinkled and extenuated by reaſon of the contraction of the muſcles; the Patient cannot extend his leg without pain, no verily, not ſo much as bend it towards the groin, for for the fore-muſcle which ariſeth from the hanch bone is ſo preſſed by the head of the thigh, that it cannot be diſtended; neither can the ham be bended without very much pain, But the ſame leg is equal at the heel with the other leg, yet the Patient cannot ſtand upon the ſetting on of the toes; therefore when he is forced to go, he toucheth the ground with his heel only, yea verily the ſole of his foot is leſs inclined to the foreſide, neither doth it ſeldom happen, that the urine, by this accident, is ſuppreſt; becauſe the head of the thigh oppreſſes the greater nerves from whence thoſe ariſe which are carried to the bladder, which through the occaſion of this compreſſion is pained and inflamed by conſent: Now when inflammation ſhall ſeize upon the *Spinti*-muſcle, the urine can ſcarcely flow out, for that it is hindred by the ſwelling.

Stopping of urine by reaſon of an internal diſlocation of the thigh-bone.

CHAP. XLIII.

Of the Thigh-bone diſlocated backwards.

SEldom alſo is the thigh-bone diſlocated backwards, becauſe the hind-part of the cavity of the huckle-bone is deeper and more depreſſed than the force; whence it is that the diſlocation of the thigh to the inner part is more frequent than the reſt. The Patient can neither extend nor bend his leg by reaſon of the much compreſſion and tention of the muſcles which encompaſs the head of the thigh by this kind of luxation. But the pain is increaſed when he would bend his ham, for that then the muſcles are more ſtrongly extended. The lame leg is ſhorter than the ſound: When the buttocks are preſſed, the head of the thigh is perceived hid amongſt the muſcles of that part, but the oppoſite groin is lax, ſoft, and depreſt with a manifeſt cavity. The heel touches not the ground, for that the head of the thigh is plucked back again by the muſcles of the buttocks, amongſt which it lieth hid: But principally by that which is the larger, and which is ſaid to make, as it were the pillow or cuſhion of the buttocks; for this is much more preſſed in this kind of diſlocation than the reſt: Whence it is, that the Patient cannot bend his knee, becauſe the extention of the nervous production or large tendon which covers the knee is ſo great. But if the Patient will ſtand upon the foot of his luxated leg without a ſtaff, he ſhall fall down backwards, for that the body is inclined to that part, the head of the thigh being not directly underneath for the propping or bearing up of the body; wherefore he is forced to ſuſtain himſelf upon a crutch on his lame ſide. Having promiſed theſe things of the differences, ſigns, ſymptoms and prognoſticks, it now remaineth, that we briefly deſcribe the different ways of reſtoring them, according to the difference of the parts whither it is fallen. Firſt, you muſt place the Patient upon a bench or table, groveling, or with his face upwards, or upon one ſide, laying ſome ſoft quilt or coverlid under him, that he may lie the eaſier. Now you muſt place him ſo, that the part unto which the bone is flown, may be higher, but from whence it is fled, the lower. For if the thigh-bone be diſlocated outwards or backwards, then muſt the Patient be laid groveling; if inwardly, upon his back; if forwards, then upon his ſide. Then muſt extenſion and impulſion be made towards the cavity, that ſo it may be forced thereinto: But if the diſlocation be freſh, and in a ſoft body, as a woman, child, and ſuch like, whoſe joynts are more lax, it ſhall not be any ways needful to make great extenſion with ſtrong ligatures for the reſtoring it; the Surgeons hand ſhall ſuffice, or a liſt or towel caſt about it. In the interim the bone ſhall be kept faſt with compreſſes applied about the joynt: Then the Surgeon ſhall extend the thigh, taking hold thereof above the knee, in a ſtrait line, and ſo ſet it directly againſt the cavity, and then preſently thruſt it thereinto. For thus ſhall he reſtore it, if ſo be that in thruſting it he lift up the head thereof ſomewhat higher, leſt the lips of the cavity force it back, and hinder it from entring. Now becauſe unleſs there be juſt extenſion, there can be no reſtitution hoped for, it is far better in that part, that is, to extend in ſomewhat more than is neceſſary, yet ſo, that you do not endanger the breaking of any muſcles, tendon or other nervous body. For that as *Hippocrates* writes, when as the muſcles are ſtrong and large, you may ſafely extend them, if ſo be that you diſplace nothing by the force of the extenſion. If your hand will not ſuffice to make juſt extenſion, you muſt uſe the help of an Engine, ſuch as is our Pulley, faſtned to two poſts, ſo much of the rope being let forth and drawn up again as ſhall ſuffice for the buſineſs in hand; in the performance whereof, it is fit that the Patients friends abſent themſelves from this ſad ſpectacle, and that the Surgeon be reſolute, and not deterred from his buſineſs by the lamentation, neither of the Patient nor his friends. But for that we write theſe things chiefly for the benefit of young Practicioners, it ſeemeth meet, that having delivered theſe things in general, of reſtoring the thigh-bone, that we run over theſe generalities in each particular, beginning with that diſlocation which is made inwardly.

Signs.

The general cure.

Sect. 2. lib. de fract.

CHAP.

CHAP. XLIV.

Of reſtoring the Thigh-bone diſlocated inwards.

IT is fit to place the Patient after the foreſaid manner, upon a table or bench, in the midſt whereof ſhall ſtand faſtned a wooden pin of a foots length, and as thick as the handle of a ſpade uſeth to be; but it muſt be wrapped about with ſome ſoft cloth, leſt the hardneſs hurt the buttocks, betwixt which it muſt ſtand, as we read that *Hippocrates* did in the extenſion of a broken leg. The wooden pin hath this uſe, to hold the body that it may not follow him that draweth or extendeth it; and that the extenſion being made as much as is requiſite, it may go between the *Peritonæum* and the head of the diſlocated thigh. For thus there is no great need of counter-extenſion towards the upward parts; and beſides it helpeth to force back the bone into its cavity, the help of the Surgeon concurring, who twining ſomewhiles to this, and otherwhiles to that ſide, doth direct the whole work. But when the extenſion hath need of counter-extenſion, then it is needful you have ſuch ligatures at hand, as we have mentioned in the reſtoring of a diſlocated ſhoulder, to be drawn above the ſhoulder. One of theſe ſhall be faſtned above the joynt of the hip, and extended by a ſtrong man; another ſhall be caſt above the knee by another with the like force. But if you cannot have a wooden pin, another ſtrong and like ligature ſhall be put upon the joynt directly at the hip, and held ſtiff by the hands of a ſtrong man, yet ſo that it may not touch the head of the thigh by preſſing it, for ſo it would hinder the reſtoring thereof. This manner of extenſion is common to four kinds of luxation of the thigh-bone. But the manner of forcing the bone into its cavity muſt be varied in each, according to the different condition of the parts whereunto the head inclineth; to wit, it muſt be forced outwards if it be fallen inwards, and contrary in the reſt, as the kind of the diſlocation ſhall be. Some too clowniſh and ignorant knot-knitters faſten the lower ligature below the ankle, and thus the joynts of the foot and knee are more extended than that of hip or huckle-bone, for they are nearer to the ligature, and conſequently to the active force: But they ought to do otherwiſe; therefore in a diſlocated ſhoulder you ſhall not faſten the ligatures to the hand or wriſt, but above the elbow. But if the hands ſhall not be ſufficient for this work, then muſt you make uſe of engines. Wherefore then the Patient being placed as is fit, and the affected part firmly held, ſome round thing ſhall be put into the groin, and the Patients knee, together with his whole leg, ſhall be drawn violently inwards, towards the other leg. And in the mean while the head of the thigh ſhall be ſtrongly forced towards the cavity of the huckle-bone, and ſo at length reſtored, as the following figure ſhews:

Sect. 2. lib. de fract.

How to make extenſion and counter-extenſion in this kind of fracture.

Ligatures made for extenſion muſt be faſtned near the part to be extended.

A Figure which manifeſteth the way of reſtoring the Thigh-bone diſlocated inwards.

When the head of the thigh by juſt extenſion is freed from the muſcles wherewith it was infolded, and the muſcles alſo extended that they may give way and yield themſelves more pliant, then muſt the rope be ſomewhat ſlacked, and then you muſt alſo deſiſt from tending, otherwiſe the reſtitution cannot be performed, for that the ſtronger extenſion of the engine will reſiſt the hand of the Surgeon, thruſting and forcing it into the cavity. This precept muſt be obſerved in the reſtoring of this and other diſlocations. You ſhall know that the thigh is reſtored by the equality of the legs, by the free and painleſs extenſion and inflection of the lame leg. Laſtly, by the application of agglutinative medicines (whereof we have formerly ſpoken) the reſtored bone ſhall be confirmed in its place; to which purpoſe ligation ſhall be made, the ligature being firſt caſt upon the place whereinto the head of the thigh fell, and thence brought to the oppoſite or ſound ſide by the belly and loyns. In the mean while the cavity of the groin muſt be filled with ſomewhat a thick boulſter, which may keep the head of the bone in the cavity. Neither muſt you omit junks ſtretched down even to the ankles, as we have obſerved in the fracture of the thigh. Then muſt both the thighs be bound together, whereby the diſlocated member may be unmoveable, and more and more ſtrengthned. Neither muſt this dreſſing be looſed until four or five days be paſſed, unleſs peradventure the ſudden happening

A general precept.

ning of ſome other more grievous ſymptom ſhall perſwade otherwiſe. To conclude, the Patient muſt be kept in his bed for the ſpace of a month, that the relaxed muſcles, nerves and ligaments may have ſpace to recover their former ſtrength, otherwiſe there is danger leſt the bone may again fall out by the too forward and ſpeedy walking upon it. For the ſite of the thigh it muſt be placed and kept in a middle figure, yet this middle figure conſiſts in the extenſion, not in the flexion, as it is demonſtrated by *Hippocrates*, for that ſuch a figure is accuſtomable to the leg.

Sect. 2. lib. de fract.

CHAP. XLV.

Of reſtoring the Thigh diſlocated outwardly.

THe Patient muſt be placed groveling upon a table in this kind of diſlocation alſo, and ligatures as before, caſt upon the hip and lower part of the thigh, then extenſion muſt be made downwards, and counter-extenſion upwards; then preſently the head of the bone muſt be forced by the hand of the Surgeon into its place. If the hand be not ſufficient for this purpoſe, our Pulley muſt be uſed, as the following figure ſheweth.

A Figure which expreſſeth the manner of reſtoring the Thigh luxated outwards.

When it is that only extenſion ſerves for the reſtoring the diſlocated thigh.

This kind of diſlocation is the eaſilieſt reſtored of all thoſe which happen in the thigh or hip, ſo that I have divers times obſerved the head of the thigh to have been drawn back into its cavity, by the only regreſs of the extended muſcles into themſelves towards their originals, ſomewhiles with a noiſe or pop, otherwhiles without; which being done, laying a compreſs upon the joynt, you ſhall perform all other circumſtances as before, in an internal diſlocation.

CHAP. XLVI.

Of reſtoring the Thigh diſlocated forwards.

WHen the thigh is luxated forwards, the Patient muſt be laid upon his ſound ſide, and tied as we have formerly delivered. Then the Surgeon ſhall lay a boulſter upon the prominent head of the bone, and have a care that his ſervant firmly hold it: Then immediately juſt extenſion being made, he ſhall with his hand force the bone into the cavity; but if his hand will not ſerve, he ſhall attempt it with his knee. Then to conclude, he ſhall uſe the reſt of the things formerly mentioned to contain the reſtored bone.

CHAP. XLVII.

Of reſtoring the Thigh diſlocated backwards.

THe Patient ſhall be placed groveling upon a table or bench, and the member extended, as in the reſt, one ligature ſtretched from the groin, another from the knee; then the Surgeon ſhall endeavour to force back with his hand that which ſtands up, and alſo to draw away the knee from the ſound leg. The bone thus placed and reſtored, the cure requires nothing elſe than to be bound up and kept long in bed, leſt that the thigh, if it ſhould be moved, the nerves being yet more looſe, might again fall out: For the thigh is in great danger of relapſe, for that the cavity of the huckle-bone is only depreſt, as far as it goes in, and the burthen of the hanging or adjoyning thigh is heavy.

CHAP.

CHAP. XLVIII.

Of the diſlocation of the Whirl-bone of the Knee.

THe Whirl-bone of the knee may fall forth into the inner, outer, upper and lower part; but never to the hind-part, becauſe the bones which it covers do not ſuffer it. To reſtore it, the Patient muſt ſtand with his foot firmly upon ſome even place, and then the Surgeon muſt force and reduce it with his hands from the part into which it is preternaturally ſlidden. When it ſhall be reſtored, the cavity of the ham ſhall be filled up with boulſters ſo that he may not bend his leg, for if it be bended, there is no ſmall danger of the falling back of the whirl-bone. Then a caſe or box ſhall be put about it, on the ſide eſpecially whereto it fell, being made ſomewhat flat and round, reſembling the whirl-bone it ſelf, and it ſhall be bound on with ligatures and medicines ſo faſt, that it may not ſtir a jot. After the part ſhall ſeem to have had ſufficient reſt, it is fit that the Patient try and accuſtom by little and little to bend his knee, until at length he ſhall find that he may eaſily and ſafely move that joynt.

CHAP. XLIX.

Of the diſlocated Knee.

THe knee alſo may be diſlocated three manner of ways, that is, into the inner, outer and hind-part, but very ſeldom towards the fore-ſide, and that not without ſome grievous and forcible violence; for the whirl-bone lying upon it, hinders it from ſlipping out, and holds it in. The other ways are eaſie, becauſe the cavity of the leg-bone is ſuperficiary and very ſmooth, but the cavity of the lower end of the thigh-bone is made in the manner of a ſpout or gutter, and beſides, the head thereof is very ſmooth and ſlippery; but the whole joynt is much more lax than the joynt of the elbow: So that as it may be the more eaſily diſlocated, ſo may it the better be reſtored; and as it may be the more eaſily, ſo may it be the more ſafely diſlocated, for that inflammation is leſs to be feared here, as it is obſerved by *Hippocrates*. Falls from high, leaping, and too violent running are the cauſes of this diſlocation. The ſign thereof is the diſability of bending or liſting up the leg to the thigh, ſo that the Patient cannot touch his buttock with his heel. The diſlocation of the knee which is inwardly and outwardly, is reſtored with indifferent extenſion and forcing of the bones into their ſeats from thoſe parts whereunto they have fallen. But to reſtore a diſlocation made backwards, the Patient ſhall be placed upon a bench of an indifferent height, ſo that the Surgeon may be behind him, who may bend with both his hands and bring to his buttocks the Patients leg put between his legs. But if the reſtitution do not thus ſucceed, you muſt make a clew of yarn, and faſten it upon the midſt of a ſtaff, let one put this into the cavity of the ham, upon the place whereas the bone ſtands out, and ſo force it forwards; then let another caſt a ligature of ſome three fingers breadth upon his knee, and draw it upward with his hands, then preſently and at once they ſhall ſo bend and crook the lame leg, that the heel thereof may touch his buttocks.

The differences.

Ad finem ſect. 3. de fract.

How to reſtore a knee diſlocated backwards.

CHAP. L.

Of a Knee diſlocated forwards.

BUt if the knee be diſlocated forwards (which ſeldom happens) the Patient ſhall be placed upon a table, and a convenient ligation made above, and another cloſe beneath the knee. Then the Surgeon ſhall ſo long preſs down with both his hands the bone which is out of joynt, until it ſhall return to its place gain. To which purpoſe if the ſtrength of the hand will not ſerve to make juſt extenſion each way, you may make uſe of our engine, as you may perceive by this following figure.

The cure.

A Figure ſhewing the manner of reſtoring a Knee diſlocated forwards.

You

You ſhall know that the bone is reſtored by the free and painleſs extenſion of the leg; then will there be place for medicines, boulſters and ſtrengthening ligatures. In the mean ſpace the Patient ſhall forbear going ſo long as the part ſhall ſeem to require.

CHAP. LI.

Of the ſeparation of the greater and leſſer Focile.

The joyning of the leg and ſhin-bones.

THe *Fibula* or leſſer Focile is faſtned and adheres to the *Tibia*, leg-bone, or greater Focile without any cavity, above at the knee, and below at the ankle. But it may be pluck'd or drawn aſide three manner of ways, that is, forwards, and to each ſide: This chance happens when in going we take no ſure footing, ſo that we ſlip with our feet this and that way as in a ſlippery place, and ſo wreſt it inwards or outwards; for then the weight of our body lying open upon it, draws the leg, as it were, in ſunder, ſo that the one Focile is diſlocated or ſeparated from the other. The ſame may happen by a fall from an high place, or ſome grievous and bruiſing blow: Beſides alſo, their appendices are ſometimes ſeparated from them. For the reſtoring of all theſe into their proper places, it is fit they be drawn and forced by the hand of the Surgeon into their ſeats: Then ſhall they be ſtraitly bound up, putting compreſſes to that part unto which the *Fibula* flew; beginning alſo your ligation at the very luxation, for the fore-mentioned reaſons. The Patient ſhall reſt forty days, to wit, as long as ſhall be ſufficient for the ſtrengthening of the ligaments.

The cure.

CHAP. LII.

Of the Leg-bone or greater Focile diſlocated and divided from the Paſtern-bone.

Differences and ſigns.

ALſo the Leg-bone is ſometimes diſlocated and divided from the Paſtern-bone, as well inwardly, as outwardly; which may be known by the ſwelling out of the bone to this or that part; if it be only a ſubluxation or ſtrain, it may be eaſily reſtored by gently forcing it into the place again. After the bone ſhall be reſtored, it ſhall be kept ſo by compreſſes and fit deligation, by croſs and contrary binding to the ſide oppoſite to that towards which the bone fell, that ſo alſo in ſome meaſure it may be more and more forced into its place. In the mean time you muſt have a care that you do not too ſtraitly preſs the great and large tendon which is at the heel. This kind of diſlocation is reſtored in forty days, unleſs ſome accident happen which may hinder it.

CHAP. LIII.

Of the diſlocation of the Heel.

Cauſes and differences.

WHoſoever leaping from an high place have fallen very heavy upon their heel, have their heel diſlocated and divided from the Paſtern-bone. This diſlocation happens more frequently inwardly than outwardly, becauſe the prominency of the leſſer Focile embraces the Paſtern-bone; whence it is that there it is more ſtraitly and firmly knit. It is reſtored by extenſion and forcing it in, which will be no very difficult matter, unleſs ſome great defluxion or inflammation hinder it. For the binding up it muſt be ſtraiteſt in the part affected, that ſo the blood may be preſſed from thence into the neighbouring parts; yet uſing ſuch a moderation, that it may not be painful, nor preſs more ſtraitly than is fit, the nerves and groſs tendons which runs to the heel. This diſlocation is not confirmed before the fortieth day, though nothing happen which may hinder it. Yet uſually it happeneth that many ſymptoms enſue by the vehemency of the contuſion. Wherefore it will not be amiſs to handle them in a particular Chapter.

The cure.

CHAP. LIV.

Of the Symptoms which follow upon the contuſion of the Heel.

Why bloodletting neceſſary in the fracture of a heel. *Hip. ſect. 3. de fracturis.*

IT happenth by the vehemency of this contuſion, that the veins and arteries do, as it were, vomit up the blood both through the ſecret paſſages of their coats, as alſo by their ends or orifices, whence an *Ecchymoſis* or blackneſs over all the heel, pain, ſwelling, and other the like enſue, which implore remedies and the Surgeons help, to wit, convenient diet, and drawing of blood by opening a vein, (of which though *Hippocrates* makes no mention, yet it is here requiſite by reaſon of the feaver and inflammation) and if need require, purgation; principally ſuch as may divert the matter by cauſing vomit; and laſtly, the application of local medicines, chiefly ſuch as may ſoften and rarifie the skin under the heel, otherwiſe uſually hard and thick (ſuch as are fomentations of warm water and oyl) ſo that divers times we are forced to ſcarifie it with a lancet, ſhunning the quick fleſh. For ſo at length the blood poured forth into the part, and there heaped up, is more eaſily attenuated, and at length reſolved. But theſe things muſt all be performed before the inflammation ſeize upon the part, otherwiſe there will be danger of a convulſion. For the blood, when it falls out of the veſſels, readily putrifies, by reaſon the denſity of this part hinders it from ventilation and diſperſing to the adjacent parts. Hereto may be added, that the large and great tendon which covers the heel, is endued with exquiſite ſenſe, and alſo the part it ſelf is on every ſide ſpread over with

Why the heel is ſubject to inflammation.

with many nerves. Beſides alſo there is further danger of inflammation by lying upon the back and heel, as we before admoniſhed you in the fracture of a leg. Therefore I would have the Surgeon to be here moſt attentive and diligent to perform theſe things which we have mentioned, leſt by inflammation a Gangrene and Mortification (for here the ſanious fleſh preſently falls upon the bone) happen together with a continued and ſharp Feaver, with trembling, hicketting and raving. For the corruption of this part firſt by contagion aſſails the next, and thence a Feaver aſſails the heart by the arteries preſſed and growing hot by the putrid heat, and by the nerves and that great and notable tendon made by the concourſe of the three muſcles of the calf of the leg, the muſcles, brain and ſtomach are evilly affected and drawn into conſent; and ſo cauſe convulſions, raving and a deadly hicketting. *Gal. ad ſent. 23. ſect. 2. lib. de fract.*

CHAP. LV.

Of the diſlocated Paſtern, or Ancle-bone.

THe *Aſtragalus* or paſtern bone may be diſlocated and fall out of its place to every ſide. Wherefore when it falls out towards the inner part, the ſoal of the foot is turned outwards, when it flies out to the contrary, the ſign is alſo contrary; if it be diſlocated to to the foreſide, on the hind ſide the broad tendon coming under the heel is hardned and diſtended; but if it be luxated backwards, the whole heel is, as it were, hid in the foot: neither doth this kind of diſlocation happen without much violence. It is reſtored by extending it with the hands, and forcing it into the contrary part to that from whence it fell. Being reſtored, it is kept ſo by application of medicines and fit ligation. The Patient muſt keep his bed long in this caſe, leſt that bone which ſuſtains and bears up the whole body, may again ſink under the burthen, and break out, the ſinews being not well knit and ſtrengthned. **Sign.** **Cure.**

CHAP. LVI.

Of the diſlocation of the In-ſtep and back of the Foot.

THe bones alſo of the In-ſtep and back of the foot may be luxated, and that either upwards or downwards, or to one ſide, though ſeldom ſide-wiſe, for the reaſon formerly rendred, ſpeaking of the diſlocation of the like bones of the hand. If that they ſtand upwards, then muſt the Patient tread hard upon ſome plain or even place, and then the Surgeon by preſſing them with his hand ſhall force them into their places; on the contrary, if they ſtand out of the ſoal of the foot, then muſt you preſs them thence upwards, and reſtore each bone to its place. They may be reſtored after the ſame manner if they be flown out to either ſide. But you muſt note, that although the ligatures conſiſt but of one head in other diſlocations, yet here *Hippocrates* would have ſuch uſed as have two heads, for that the diſlocation happens more from below upwards, or frome above downwards than ſide-wiſe. **Cure.** *Sent. 14. ſect. 2. lib. de fract.*

CHAP. LVII.

Of the diſlocation of the Toes.

NOw the toes may be four ways diſlocated, even as the fingers of the hand; and they may be reſtored juſt after the ſame manner, that is, extend them directly forth, and then force each joynt into its place, and laſtly, bind them up as is fitting. The reſtitution of all them is eaſie, for that they cannot far tranſgreſs their bounds. To conclude, the bones of the feet are diſlocated and reſtored by the ſame means as thoſe of the hands, but that when as any thing is diſlocated in the foot, the Patient muſt keep his bed; but when any thing is amiſs in the hand, he muſt carry it in a ſcarf. The Patient muſt reſt twenty days, that is, until he can firmly ſtand upon his feet. **The differences.** **Cure.**

CHAP. LVIII.

Of the ſymptoms and other accidents which may befal a broken or diſlocated member.

MAny things may befal broken or diſlocated members by the means of the fracture or diſlocation; ſuch as are bruiſes, great pain, inflammation, a Feaver, Impoſtume, Gangrene, Mortification, Ulcer, *Fiſtula* and *Atrophia*, all which require a skilful and diligent Surgeon for their cure. A contuſion happens by the fall of ſome heavy thing upon the part, or by a fall from high, whence follows the effuſion of blood poured out under the skin: Which if it be poured forth in great plenty, muſt be ſpeedily evacuated by ſcarification, and the part eaſed of that burthen, leſt it ſhould thence gangrenate. And by how much the blood ſhall appear more thick, and the skin more denſe, by ſo much the ſcarification ſhall be made more deep. You may alſo for the ſame purpoſe apply Leeches. **Remedies for a contuſion.**

Concerning pain we formerly ſaid, that it uſually happens by reaſon that the bones are moved out of their places, whence it hapneth that they become troubleſom to the muſcles and nerves, by pricking and preſſing them. Hence enſue inflammations, as alſo impoſtumation and a feaver, oft-times a gangrene, and in concluſion a mortification, corrupting and rotting the bones; otherwhiles a ſinuous ulcer or *fiſtula*. But an *Atrophia* and leanneſs ariſeth by the ſloth and idleneſs of the member decaying all the ſtrength thereof, and by too ſtrait ligation intercepting the paſſages of the blood, otherwiſe ready to fall and flow thither. **What may happen by pain.**

Remedies for the leanneſs or *Atrophia* of any member.

Now the leanneſs which is occaſioned by too ſtrait ligation receives cure by the ſlackning of the ligatures wherewith the member was bound. That which proceeds from idleneſs, is helped by moderate exerciſe, by extending, bending, lifting up, and depreſſing the member, if ſo be that he can away with exerciſe. Otherwiſe he ſhall uſe frictions and fomentations with warm water. The frictions muſt be moderate in hardneſs and gentleneſs, in length and ſhortneſs. The ſame moderation ſhall be obſerved in the warmneſs of the water, and in the time of fomenting. For too long fomenting reſolves the blood that is drawn. But that which is too little or ſhort a ſpace draws little or nothing at all: After the fomentation, hot and emplaſtick medicines made of Pitch, Turpentine, *Euphorbium*, Pellitory of Spain, Sulphur, and the like, ſhall be applied. They ſhall be renewed every day more often or ſeldom, as the thing it ſelf ſhall ſeem to require.

What meaſure to be uſed in fomenting.

A *dropax.*

Theſe medicines are termed *Dropaces*, whoſe form is thus: ℞ *Picis nigræ, ammoniaci, bdelii gummi elemi in aqua vitæ diſſolutorum an.* ℥ ii. *Olei laurini* ʒ i *pulveris piperis, zinziberis, granorum paradiſi, bacacrum lauri & juniperi, an.* ʒ ii. *Fiat emplaſtrum ſecundum artem, extendatur ſuper alutam.* It is alſo good to bind about the oppoſite ſound part with a ligature, yet without pain: As if the right arm ſhall decay for want of nouriſhment, the left ſhall be bound, beginning your ligation at the hand, and continuing it up to the arm-pit. If this miſchance ſhall ſeize upon the right leg, then the left ſhall be ſwathed up from the ſole of the foot to the groin. For thus a great portion of the blood is forced back into the *vena cava*, or hollow vein, and from this being diſtended and over full, into the part affected and gaping with the veſſels almoſt empty; beſide alſo it is convenient to keep the ſound part in reſt, that ſo it may draw the leſs nouriſhment, and by that means there will be more ſtore to refreſh the weak part.

Binding of the ſound part oppoſite to the emaciated.

How to bind up the emaciated part.

Some wiſh alſo to bind up the decaying member with moderate ligation; for thus, ſay they, the blood is drawn thither: for when as we intend to let blood by opening a vein with a lancet, we bind the arm. Alſo it is good to dip it into water ſomewhat more than warm, and hold it there until it grow red, and ſwell; for thus blood is drawn into the veins, as they find, which uſe to draw blood of the *Saphena* and *Salvatella*. Now, if when as theſe things and the like be done, the lame part grows hot, red and ſwoln, then know that health is to be hoped for; but if the contrary happen, the caſe is deſperate: Wherefore you need attempt nothing further.

Signs that an *Atrophia* is curable.

Furthermore, there is ſometimes hardneſs left in the joynts, after fractures and diſlocations are reſtored. It is fit to ſoften this, by reſolving the contained humor, by Fomentations, Liniments, Cataplaſms, emplaſters made of the roots of Marſh-mallows, Briony, Lilies, Line-ſeed, Fenugreek-ſeed, and the like, and alſo of Gums diſſolved in ſtrong Vinegar; as, *Ammoniacum, bdelium, opopanax, labdanum, ſagapenum, ſtyrax liquida*, and *adeps anſerinus, gallinaceus, humanus, oleum liliorum*, and the like. Alſo you muſt wiſh the Patient to move the part ever now and then, every day; yet ſo, that it be not painful to him, that ſo the pent up humor may grow hot, be attenuated, and at length diſcuſſed, and laſtly the part it ſelf reſtored as far as Art can perform it; for oft-times it cannot be helped any thing at all. For if the member be weak and lame, by reaſon that the fracture hapned near the joynt, for the reſidue of his life the motion thereof uſeth to be painful and difficult, and oft-times none at all, eſpecially if the *callus*, which grows there, be ſomewhat thick and great; and laſtly, if the joynt it ſelf ſhall be contuſed and broken by the ſtroke, as it oft-times happens in wounds made by Gunſhot.

BOOK XVII.

Of divers other Preternatural Affects, whoſe cure is commonly performed by Surgery.

CHAP. I.

Of an Alopecia, *or the falling away of the hairs of the head.*

Gal. c.2. l.1. de comp. med. ſecun. locos.

The cauſe.

AN *Alopecia* is the falling away of the hair of the head, and ſometimes alſo of the eye-brows, chin and other parts; the French commonly call it the *Pelade*: Phyſicians term it the *Alopecia*, for old Foxes (ſubject, by reaſon of their age to have the ſcab) are troubled oft-times with this diſeaſe. This affect is cauſed either through defect of nouriſhment fit to nouriſh the hairs, as in old age through want of the radical humidity, or by the corruption of the alimentary matter of the ſame, as after long Feavers, in the *Lues venerea*, Leproſie, the corruption of the whole body and all the humors, whence follows a corruption of the vapors and fuliginous excrements; or elſe by the vicious conſtitution of pores in the skin in rarity, and conſtriction or denſity, as by too much uſe of hot ointments made for colouring the hair, or ſuch as are uſed to take off hair, therefore called *Depilatoria*, or by the burning of the skin, or loſs thereof, having a ſcar inſtead thereof, by reaſon of whoſe denſity the hair cannot ſpring out; as by too much laxity the fuliginous matter of the hair ſtays not, but preſently vaniſheth away. The *Alopecia* which comes by old Age, a Conſumption, Burn-baldneſs, Leproſie, a Scald head, is incurable: That which admits of cure, the cauſe being taken away, is helped. Wherefore if it proceed from the corruption of humors, let a Phyſician be called, who, as he ſhall think fit, ſhall appoint diet, purging and phlebotomy. Then the Surgeon ſhall ſhave off the hair which is remaining, and ſhall firſt uſe reſolving Fomentations, apply Leeches and Horns to digeſt the vicious humour which is under the skin,

What *Alopecia* uncurable.

What curable, and how.

skin, then shall he wash the head to take way the filth with a Lee wherein the roots of Orris and Aloes have been boiled. Lastly, he shall use both attractive fomentations and medicines for to draw forth the humor which is become laudable in the whole body by the benefit of diet fitly appointed. But if the *Alopecia* shall happen through defect of nourishment, the part shall be rubbed so long with a coarse linnen cloth, or fig-leaf, or onions until it wax red; besides also the skin shall be pricked in many places with a needle, and then ointments applied made of *Labdanum*, Pigeons dung, Staves-acre, Oyl of Bays, Turpentine and Wax, to draw the blood and matter of the hairs. If the hair be lost by the *Lues venerea*, the Patient shall be anointed with Quick-silver to sufficient salivation. To conclude, as the causes of this disease shall be, so must the remedies be fitted which are used. Σταφὶς ἀγρία.

CHAP. II.

Of the Tinea, *or Scald-head.*

THe *Tinea* (let me so term it in Latine, whil'st a fitter word may be found) or a Scald-head, is a disease possessing the musculous skin of the head or the hairy scalp, and eating thereinto like a Moth. There are three differences thereof; the first is called by *Galen*, *Scaly or bran-like*, for that whilst it is scratched it casts many bran-like scales: Some Practicioners term it, *A dry scall*, because of the great adustion of the humor causing it. Another is called, *Ficosa*, *a fig-like scall*, because when it is despoiled of the crust or scab which is yellow, there appear grains of quick and red flesh, like to the inner seeds or grains of figs, and casting out a bloody matter. *Galen* names the third *Achor*, and it is also vulgarly termed, the *Corrosive*, or *Ulcerous scall*, for that the many ulcers wherewith it abounds are open with many small holes flowing with liquid *sanies* like the washing of flesh, stinking, corrupt and Carrion-like, somewhiles livid, somewhiles yellowish. These holes, if they be somewhat larger, make another difference, which is called *Cerion* or *Favosa*, (that is, like a honey-comb) because as *Galen* thinks, the matter which floweth from these, resembleth honey in colour and consistence. They all proceed of an humor which is more or less vicious, for a less corrupt humor causeth a scaly, a more corrupt the fig-like, but the most corrupt produceth the ulcerous. If it shall happen to an Infant by reason of the fault and contagion of the Nurse, or else presently after it is born, it scarce admits of cure; neither must we attempt that, before the child come that to age that he may be able to endure the cure and medicines. But you may in the mean while apply the leaves of Colworts or Beets besmeared with fresh butter, or other gentle medicine having a faculty to mollifie and open the passage for the shut-up matter. Those who are of sufficient age to away with medicine, may bleed, purge, bathe, according to art by the advice of a Physician. For local medicines in a scaly scall, softning and discussing fomentations shall be appointed, made of the roots of Marsh-mallows, Lilies, Docks, Sorrel boiled in Lee with a little Vineger added thereto. The head shall be twice in a day fomented with such a decoction, and on the sixth day, the hair being shaven off, it shall be scarified, and then Leeches and Horns put to it so scarified. Then it shall be forthwith anointed with Oyl of Staves-acre mixed with black-sope, both to draw and repress the malignity of the humor impact in the part. You may also use the following medicine even to the perfect cure of the disease, as that which is much commended in this kind of disease by *Vigo*, *Gordonius* and *Guido*; it is thus made. ℞ *Elleb. albi & nigri, atrament. auripigmenti, litharg yri auri, calcis vivæ, vitriol. alum. galla. fulg. ciner. fæcis vini usti, an,* ʒ ß. *Argenti vivi extincti,* ʒ iij. *æruginis æris* ʒ ii. *Fiat pulvis qui incorporetur cum succo boraginis, scabiosæ, fumariæ, oxylapathi, aceti, an. quart.* i. *Olei antiqui lib.* i. *bulliant usque ad consumpt. succorum in fine decoctionis cineres ponantur, addendo picis liquidæ* ʒ ß. *Ceræ quantum sufficit, fiat unguentum*: These Authors testifie that this will heal any kind of scall. Certainly none can disallow of it, who well considereth the ingredients and composure thereof. *Lib.* 1. *de comp. med. sect. locos.* *Cap.* 8. *lib. citat.* The cure. For a scaly scall. An ointment for a scalled head.

A crusty also or fig-like scall may be so long fomented with the prescribed fomentation, until the crusts or scabs fall off, yet there is nothing so good and effectual as Cresses beaten or fried with Hogs suet. For it will make it fall off in the space of four and twenty hours, besides if it be continued, it will heal them throughly, as I have known by experience, and reason also stands therewith; for according to *Galen*, Cresses are hot and dry. When the crusts shall be fallen away, the parts affected shall be anointed with the formerly prescribed ointment. I have cured many with a little Oyl of Vitriol, and sometimes also with *Ægyptiacum* made somewhat more strong than ordinary. But if the root of the hairs appear rotten, they shall be plucked out one by one; yet if such putrefaction shall possess the whole hairy scalp, and trouble all the roots of the hair, that you may pluck them out the more readily, and with less pain, you may besmear a cotten-cloth on the rougher side with this following medicine. ℞ *Picis nigræ* ʒ vi. *Picis res.* ʒ ii. *Pul. viridis æris, & vitriol. Rom. an.* ʒ i. *vel* ʒ ß. *Sulphuris viv.* ʒ ß *coquantur omnia simul in aceti acerrimi quantitate sufficiente, fiat medicamentum ad usum*: Let it be applied to the head and remain on for two days, then let it be quickly and forcibly plucked away against the hair, that so the hairs sticking to the plaster may by that means be plucked away therewith: You shall use this medicine so long as need shall seem to require. The cure for a crusty scall. A poultis of Cresses. *Lib.* 7. *simp.* A plaster to pluck away the hair at once.

For the third kind of scall which is termed a Corrosive or Ulcerous, the first indication is to cleanse the ulcers with this following ointment. ℞ *Unguenti enulati cum mercurio duplicato, ægyptiaci, an.* ʒ iij. *vitriol. albi in pulverem redacti* ʒ i. *incorporentur simul, fiat unguentum ad usum*; also you may use the formerly described oyntment. But if any other pain or accident fall out, you must withstand it by the assistance and direction of some good Physician; verily these following medicines against all kinds of scalls have been found out by reason, and approved by use. ℞ *Camphur.* ʒ ß. *Alum. roch. vitriol vir. æris, sulp. vivi, fulig. forn. an.* ʒ vi. *Olei amygd. dulcium & axungiæ porci, an.* ʒ ij. *Incorporentur simul in mortario, fiat unguentum.* Some take the dung which lieth rotting in a sheep-fold; they use that which is liquid, and rub it upon the ulcerated places, and lay a double cloth dipped in that liquor upon it. But if the Patient cannot be cured with all these medicines, and that you find his body in some parts thereof The cure of an ulcerous scall.

troubled in like ſort with cruſty ulcers, I would wiſh that his head might be anointed with an ointment made of *Axungia*, *argentum vivum*, and a little *Sulphur*, and then fit ſome *emplaſtrum Vigonis cum mercurio* into the faſhion of a cap; alſo ſome plaiſters of the ſame may be applied to the ſhoulders, thighs and legs, and ſo let him be kept in a very warm chamber, and all things done as if he had the *Lues venerea*. This kind of cure was firſt (that I know of) attempted by *Simon Blanch* the King's Surgeon, upon a certain young man, when as he in vain had diligently tried all other uſual medicines. A ſcalled head oft-times appeareth very loathſom to the eye, caſting forth virulent and ſtinking *ſanies*; at the firſt it is hardly cured, but being old, far more difficultly. For divers times it breaketh out afreſh, when you think it kill'd, by reaſon of the impreſſion of the malign putrefaction remaining in the part, which wholly corrupts the temper thereof. Moreover, oft-times being healed, it hath left an *Alopecia* behind it, a great ſhame to the Surgeons. Which is the reaſon that moſt of them judg it beſt to leave the cure thereof to Empericks and Women.

A contumacious ſcall muſt be cured as we cure the *Lues venera.*

CHAP. III.

Of the Vertigo, *or Giddineſs.*

THe *Vertigo* is a ſudden darkning of the eyes and ſight by a vaporous and hot ſpirit, which aſcendeth to the head by the ſleepy arteries, and fills the brain, diſturbing the humors and ſpirits which are contained there, and toſſing them unequally, as if one run round, or had drunk too much Wine. This hot ſpirit oft-times riſeth from the heart upwards by the internal ſleepy arteries to the *Rete mirabile*, or wonderful net; otherwhiles it is generated in the brain it ſelf, being more hot than is fitting; alſo it oft-times ariſeth from the ſtomach, ſpleen, liver, and other entrails being too hot. The ſign of this diſeaſe is the ſudden darkning of the ſight, and the cloſing up, as it were, of the eyes, the body being lightly turned about, or by looking upon wheels running round, or whirl-pits in waters, or by looking down any deep or ſteep places. If the original of the diſeaſe proceed from the brain, the Patients are troubled with the head-ach, heavineſs of the head, and noiſe in the ears, and oft-times they loſe their ſmell. *Paulus Ægineta* for the cure bids us to open the arteries of the temples. But if the matter of the diſeaſe ariſe from ſome other place, as from ſome of the lower entrails, ſuch opening of an artery little availeth. Wherefore then ſome skilful Phyſician muſt be conſulted with, who may give directions for Phlebotomy, if the original of the diſeaſe proceed from the heat of the entrails; by purging, if occaſioned by the foulneſs of the ſtomach, But if ſuch a *Vertigo* be a critical ſymptom of ſome acute diſeaſe affecting the *Criſis* by vomit or bleeding, then the whole buſineſs of freeing the Patient thereof muſt be committed to nature.

What the *Vertigo* is, and the cauſes thereof

The ſigns.

Lib. 6.

A critical *Vertigo.*

CHAP. IV.

Of the Hemicrania, *or Megrim.*

THe *Megrim* is properly a diſeaſe affecting the one ſide of the head, right or left. It ſometimes paſſeth no higher than the temporal muſcles, otherwhiles it reacheth to the top of the crown. The cauſe of ſuch pain proceedeth either from the veins and external arteries, or from the *Meninges*, or from the very ſubſtance of the brain, or from the *Pericranium*, or the hairy ſcalp covering the *Pericranium*, or laſtly, from putrid vapours ariſing to the head from the ventricle, womb, or other inferior member. Yet an external cauſe may bring this affect, to wit, the too hot or cold conſtitution of the encompaſſing air, drunkenneſs, gluttony, the uſe of hot and vaporous meats, ſome noiſom vapour or ſmoak, as of Antimony, Quick-ſilver, or the like, drawn up by the noſe, which is the reaſon that Gold-ſmiths, and ſuch as gild Metals are commonly troubled with this diſeaſe. But whenceſoever the cauſe of the evil proceedeth, it is either a ſimple diſtemper, or with matter: With matter, I ſay, which again is either ſimple or compound. Now, this affect is either alone or accompanied with other affects, as inflammation and tenſion. The heavineſs of head argues plenty of humor; pricking, beating, and tenſion ſhews that there is a plenty of vapours mixed with the humors, and ſhut up in the nervous, arterious, or membranous body of the head. If the pain proceed from the inflamed *Meninges*, a Feaver followeth thereon, eſpecially, if the humor cauſing pain do putrefie. If the pain be ſuperficiary, it is ſeated in the *Pericranium*. If profound, deep and piercing to the bottom of the eyes, it is an argument that the *Meninges* are affected, and a Feaver enſues, if there be inflammation, and the matter putrefie; and then oft-times the tormenting pain is ſo great and grievous, that the Patient is afraid to have his head touched, if it be but with your finger, neither can he away with any noiſe, or ſmall murmuring, nor light, nor ſmells however ſweet, no nor the fume of Wine. The pain is ſometimes continual, otherwhiles by fits. If the cauſe of the pain proceed from hot, thin and vaporous blood, which will yield to no medicines, a very neceſſary, profitable and ſpeedy remedy may be had by opening an artery in the temples, whether the diſeaſe proceed from the internal or external veſſels. For, hence always enſueth an evacution of the conjunct matter, blood and ſpirits. I have experimented this in many, but eſpecially in the Prince de la *Roche-ſur-yon*. His Phyſicians when he was troubled with this grievous *Megrim*, were *Chaplain*, the Kings, and *Caſtellane* the Queens chief Phyſicians, and *Lewes Duret*, who notwithſtanding could help him nothing by blood-letting, cupping, bathes, frictions, diet or any other kind of remedy either taken inwardly or applied outwardly. I being called, ſaid, that there was only hope one way to recover his health, which was to open the artery of the temple in the ſame ſide that the pain was; for I thought it probable, that the cauſe of his pain was not contained in the veins, but in the arteries, in which caſe by the teſtimony of the Ancients, there was nothing better than the opening or bleeding of an artery,

The differences.

In what kind of *Megrim* the opening of an Artery is good.

A Hiſtory.

artery, whereof I have made trial upon my self to my great good. When as the Physicians had approved of this my advice, I presently betake my self to the work, and chose out the artery in the pained temple, which was both the more swoln and beat more vehemently than the rest. I open this, as we use to do in the bleeding of a vein, with one incision, and take more than two sawcers of blood flying out with great violence and leaping; the pain presently ceased, neither did it ever molest him again. Yet this opening of an artery is suspected by many, for that it is troublesome to stay the gushing forth blood, and cicatrize the place, by reason of the density, hardness, and continual pulsation of the artery; and lastly, for that when it is cicatrized, there may be danger of an *Aneurisma*. Wherefore they think it better first to divide the skin, then to separate the artery from all the adjacent particles, and then to bind it in two places; and lastly, divide it, as we have formerly told you must be done in *Varices*. But this is the opinion of men who fear all things where there is no cause; for I have learn'd by frequent experience, that the apertion of an artery, which is performed with a Lancet, as we do in opening a vein, is not at all dangerous; and the consolidation or healing is somewhat slower than in a vein, but yet will be done at length, but that no flux of blood will happen, if so be that the ligation be fitly performed, and remain so for four days with fitting pledgets.

No danger in opening an artery.

CHAP. V.

Of certain affects of the Eyes, and first of staying up the upper Eye-lid when it is too Lax.

OF the diseases which befal the eyes, some possess the whole substance thereof, as the *Ophthalmia*, a *Phlegmon* thereof: Others are proper and peculiar to some parts thereof, as that which is termed *Gutta serena* to the optick nerve. Whence *Galen* made a threefold difference of the diseases of the eyes, as that some happened to the eye by hurting or offending the chief organ thereof; that is, the crystalline humor; others by hindring the animal faculty, the chief causer of sight, from entring into them; and lastly, other some by offending the parts subservient to the prime organ or instrument. Now of all these diseases, the eye hath some of them common with the other parts of the body, such as are an ulcer, wound, *Phlegmon*, contusion, and the like: Other some are peculiar and proper to the eye, such as are the *Egilops*, *Cataracta*, *Glaucoma*, and divers others of this kind. Some have their upper eye-lid fall down, by reason that the upper skin thereof is relaxed more than is sufficient to cover the eye, the gristle in the mean while not relaxing it self together therewith. Hence proceeds a double trouble; the first, for that the eye cannot be easily opened; the other, because the hairs of the relaxed eye-lid run in towards the eye, and become troublesome thereto by pricking it. The cause of such relaxation is either a particular palsie of that part, which is frequent in old people, or the defluxion or falling down of a waterish humor, and not acrid or biting; which appears by this, that those who are thus affected have a rank of hairs growing under the natural rank, by reason of abundance of heaped-up humor, as it is most probable. For thus a wet and marish ground hath the greatest plenty of grass. Now if this same humor were acrid, it would cause an itching, and consequently become troublesome to the Patient, and it would also fret in sunder and destroy the roots of the other hairs, so far it is from yielding matter for the preternatural generation of new. It is fit before you do any thing for the cure, that you mark with ink the portion thereof which is superfluous, and therefore to be cut away, lest if you should cut off more than is requisite, the eye-lid should remain turned up, and so cause another kind of affect, which the Ancients have called *Ectropion*. Then the eye being covered, take and lift up with your fingers the middle part of the skin of the eye-lid, not taking hold of the gristle beneath it, and then cut it athwart, taking away just so much as shall be necessary to make it, as it were, natural; lastly, joyn the lips of the wound together with a simple suture of three or four stitches, that so it may be cicatrized; for the cicatrization restrains the eye-lid from falling down so loosly, at least some part thereof being taken away. There ought to be some measure and heed taken in the amputation, otherwise you must necessarily run into the one or other inconvenience, as if too much be cut away, then the eye will not be covered; if too little, then you have done nothing, and the Patient is troubled to no purpose. If there shall be many hairs grown preternaturally, you shall pluck them away with an Instrument made for same purpose; then their roots shall be burned with a gentle cautery, the eye being left untouch'd, for a scar presently arising will hinder them from growing again.

Differences.

Paul. Ægin. 8. cap. 6.

The cause.

The cure.

CHAP. VI.

Of Lagophthalmus, *or the Hare-eye.*

SUch as have their eye-lids too short, sleep with their eyes open, for that they cannot be covered by the too short skin of the eye-lids: The Greeks term this affect, Λαγόφθαλμος. The cause is either internal or external: Internal, as by a Carbuncle, Impostume or Ulcer; external, as by a wound made by a sword, burn, fall, and the like. If this mishap proceed by reason of a cicatrization, it is curable, if so that the short eye-lid be of an indifferent thickness. But if it have been from the first conformation, or by some other means, whereby much of the substance is lost, as that which happens by burning, and a carbuncle, then it is uncurable. For the cure, you shall use relaxing and emollient fomentations, then the skin shall be divided above the whole scar, in figure of an Half-moon, with the horns looking downwards. Then the edges of the incision shall be opened, and lint put into the middle thereof, that so it may hinder the lips from joyning together again. Then shall you apply a plaster upon the lint, and so bind up the part with a fitting ligature, that may somewhat press upon the whole eye, lest it should lift it self somewhat upwards again, and so return into its ancient, but not natural figure. But in cutting the skin, you

Paulus Ægin. l. 6. cap. 10.

The cure.

must take care that your inciſion harm not the griſtle; for if it be cut, the eye-lid falls down, neither can it be afterwards lifted up. But now for the lower eye-lid: it is ſubject to ſundry diſeaſes, amongſt which there is one which anſwereth in proportion to that, which we late mentioned, which is, when as it is lifted upwards little or nothing, but hangs and gapes, and cannot be joyned with the upper, and therefore it doth not cover the eye, which affect is familiar to old people; it is called *Ectropion*, and it may be helped by means formerly delivered.

Ectropion, or the turning up, or out of the eye-lid.

CHAP. VII.

Of the Chalazion, *or Hail-ſtone, and the* Hordeolum, *or Barly-corn of the Eye-lids.*

Paul. cap. 6. lib. 6.

THe *Chalazion* is a round and clear pimple, which grows upon the upper eye-lid; it is alſo moveable, and may be ſtirred this way and that way with your fingers. The Latins call it *Grando*, for that it reſembles a hail-ſtone. Another pimple not much like this grows ſometimes upon the verges of the eye-lids above the place of the hairs. It is termed *Hordeolum*, by reaſon of the ſimilitude it hath with a barly-corn. The matter of theſe is contained in its proper ciſt or skin, and therefore is hardly brought to ſuppuration. At the firſt beginning it may be reſolved and diſcuſſed: But when as it is once grown and concrete into a plaſter or ſtone-like hardneſs, it is ſcarce curable. Wherefore it is beſt to perform the cure by opening them, that ſo the contained matter may flow or be preſſed forth. If the pimple or ſwelling be ſmall, then thruſt it through with a needle and thread, and leave the thread therein of ſuch length, that you may faſten the ends thereof with a little of the emplaſter called *Gratia Dei*, like glue to the forehead, if it be on the upper eye-lid; or to the cheeks, if on the lower. You muſt draw through a freſh one every ſecond day, as is uſually done in chirurgical ſetons: For thus at length the ſwelling will be deſtroyed, and made plain.

The cure.

CHAP. VIII.

Of the Hydatis, *or fatneſs of the Eye-lids.*

What *Hydatis* is.

THe *Hydatis* is a certain fatty ſubſtance, like a piece of fat, ſeated and lying under the skin of the upper eye-lid. It is a diſeaſe incident to children, who are of a more humid nature: Wherefore it is a ſoft and looſe tumor, making the whole eye-lid, which it poſſeſſeth, œdematous; ſo that as if depreſſed with a weight, it cannot be lifted up. It hath its name, for that it hath, as it were, a bladder diſtended with a wheyiſh humor, which kind of fault is obſerved by *Galen* in the liver, Thoſe who are thus affected, have their eyes look red, and flow with tears, neither can they behold the Sun, or endure the light. The cure is performed by cutting off the ſuperfluous ſubſtance, not hurting the neighbouring parts; and then preſently put ſome ſalt into the place whence it was taken out (unleſs the vehemency of pain hinder) that ſo the place may be dried and ſtrengthned, and the reſt of the matter (if any ſuch be) may be conſumed, and hindred from growing again. Laſtly, you ſhall cover the whole eye with the white of an egg diſſolved in Roſe-water, or ſome other repercuſſive.

Com. ad aphor. 55. ſect. 7.

The cure.

CHAP. IX.

Of the Eye-lids faſtened or glued together.

Paulus cap. 15. lib. 6.

SOmetimes it cometh to paſs that the upper-eye-lid is glued or faſtened to the under, ſo that the eye cannot be opened, or ſo that the one of them may ſtick or be faſtned to the white coat of the eye, or to the horny. This fault is ſometimes drawn from the firſt original, that is, by the default of the forming faculty in the womb (for thus many Infants are born with their fingers faſtned together, with their fundaments, privities and ears unperforated) the eye in all other reſpects being well compoſed. The cauſe of this affect ſometimes proceeds from a wound, otherwhiles from a burn, ſcald, or impoſtumation, as the breaking of the Small-pox. It is cured by putting in a fit inſtrument, and ſo opening them; but with ſuch moderation, that you touch not the horny coat, for otherwiſe it would fall out. Therefore you muſt put the end or point of your probe under the eye-lids, and ſo lifting them up (that you hurt not the ſubſtance of the eye) divide them with a crooked Inciſion-knife.

The cauſe.

The cure.

The inciſion made, let the white of an egg beaten with ſome Roſe-water be put into the eye, let the eye-lids be kept open; yea, let the Patient himſelf be careful that he often turn it upwards, and lift it up with his fingers, not only that the medicine may be applied to the ulcer, but alſo that they may not grow together again. In the night time let a little pledget dipped in water, and that either ſimple, or wherein ſome vitriol hath been diſſolved, be laid thereon. For thus you ſhall hinder the eye-lids from joyning together again. Then on the third day the parts or edges of the eye-lids ſhall be touched with waters drying without biting or acrimony, that ſo they may be cicatrized. But if the eye-lid adhere to the horny-coat at the *pupilla* or apple of the eye, the Patient will either be quite blind, or very ill of ſight. For the ſcar which enſues will hinder the ſhapes of things from entring to the cryſtalline humor, and the viſive ſpirits from paſſing forth to the objects. For prognoſticks you may learn out of *Celſus*, that this cure is ſubject to a relapſe, ſo that it may be ſhunned neither by diligence nor induſtry, but that the eye-lid will always adhere and cleave to the eye.

A diſeaſe ſubject to relapſe.

CHAP.

CHAP. X.

Of the itching of the Eye-lids.

MAny have their eye-lids itch vehemently by reason of salt phlegm, which oftentime excoriating and ulcerating the parts themselves, yields a *sanies*, which joyns together the eye-lids in the night time, as if they were glued together, and makes them watry and bleared. This affect doth so torment the Patients, that it oft-times makes them require the Physicians help. Wherefore general medicines being premised, the ulcers shall be washed with the following *Collyrium:* ℞ *Aquæ mellis in balneo mariæ distillatæ* ʒ iij. *Sacchari candi* ʒ i. *Aloes lotæ & in pollinem redactæ* ʒ ß. *Fiat Collyrium.* Which if it do no good, you may use this which follows: ℞ *Ung. Ægyptiac.* ʒ i. *Dissolve in aquæ plantaginis quantitate sufficienti.* Let the ulcerated eye-lids be touched with a soft linnen rag dipped therein, but with care that none thereof fall upon the eye. But when the Patient goes to bed, let him cause them to be anointed with the following ointment, very effectual in this case: ℞ *Axungiæ porci & butyri recentis, an.* ʒ ß. *Tut. præpar.* ʒ ß. *Antimon. in aqua euphrasiæ præparati,* ℈ ij. *Camphoræ gra.* iv. *Misce, & in mortario plumbeo ducantur per tres horas, conflatum inde unguentum, servetur in pyxide plumbea.* Some commend and use certain waters fit to cleanse, dry, bind, strengthen, and absolutely free the eye-lids from itching and redness; of which this is one.

A detergent *Collyrium.*

℞ *Aquæ euphrag. fœniculi, chelidon. an.* ʒ ß. *Sarcocol. nutritæ* ℈ ij. *Vitriol. rom.* ʒ i. *Misceantur simul, & bulliant unica ebullitione; postea coletur liquor, & servetur ad usum dictum.* Or else, ℞ *Aquæ ros. & vini alb. boni an.* ʒ iv. *Tut. præpar. aloes an.* ʒ i. *Flor. æni* ℈ ii. *Camphor. gra.* ij. Let them be boiled according to art, and kept in a glass to wash the eye-lids. Or else, ℞ *vini albi* ℔ ß *salis com.* ʒ i. Let them be put into a clean Barbers bason and covered, and kept there five or six days, and be stirred once a day, and let the eye-lids be touched with this liquor. Some wish that the Patients urine be kept all night in a Barbers bason, and so the Patients eye-lids be washed therewith. Verily in this affect we must not fear the use of acrid medicines, for I once saw a woman of fifty years of age, who washed her eye-lids when they itched, with the sharpest vinegar she could get, and affirmed that she found better success of this than of any other medicine. *Vigo* prescribes a water, whose efficacy above other medicines in this affect, he saith, hath been proved; and that it is to be esteemed more worth than gold, the description thereof is thus: ℞ *Aq. ros. vini albi odoriferi mediocris vinositatis, an.* ʒ iv. *Myrobalan. citrini trit.* ʒ i ß. *Thuris* ʒ ij. *Bulliant omnia simul usque ad consumptionem tertiæ partis; deinde immediate addantur flores æris* ℈ ij. *Camph. gr.* ij. Let the liquor be kept in a glass well stopped for the foresaid use.

You need not fear to use acrid medicines in the itching of the eye-lids. *Lib. 2. cap. 9. tract. 3.*

CHAP. XI.

Of Lippitudo, *or Blear-eyes.*

THere are many whose eyes are never dry, but always flow with a thin, acrid, and hot humor which causeth roughness, and upon small occasions, inflammations, blear or blood-shot eyes, and at length also *Strabismus* or squinting. *Lippitudo* is nothing else but a certain white filth flowing from the eyes, which oft-times agglutinates or joyns together the eye-lids. This disease often troubles all the life time, and is to be cured by no remedy; in some it is curable. Such as have this disease from their infancy, are not to be cured, for it remains with them till their dying day. For large heads, and such as are repleat with acrid or much excrementitious phlegm, scarce yield to medicines. There is much difference whether the phlegm flown down by the internal vessels under the skull; or by the external, which are between the skull and the skin, or by both. For if the internal veins cast forth this matter, it will be difficultly cured, if it be cured at all. But if the external vessels cast forth, that cure is not unprofitable, which having used medicines respecting the whole body, applies astringent medicines to the shaved crown, as, *Empl. contra rupturam,* which may straiten the veins, and, as it were, suspend the phlegm, useth cupping, and commands frictions to be made towards the hind-part of the head, and lastly, maketh a seton in the neck. There are some who cauterize the top of the crown with an hot iron, even to the bone, so that it may cast a scale, thus to divert and stay the defluxion. For local medicines, a *Collyrium* made with a good quantity of Rose-water, with a little vitriol dissolved therein may serve for all.

What *Lippitudo* is.

A *Collyrium* of vitriol to stay the defluxions of the eyes.

CHAP. XII.

Of the Ophthalmia, *or inflammation of the Eyes.*

AN *Ophthalmia* is an inflammation of the coat *Adnata*, and consequently of the whole eye, being troublesome by the heat, redness, beating, renitency, and lastly pain. It hath its original either by some primitive cause or occasion, as a fall, stroke, dust, or small sand flying into the eyes. For the eye is a smooth part, so that it is easily offended by rough things, as saith *Hippocrates, lib. de Carnibus.* Or by an antecedent cause, as a defluxion falling upon the eyes. The signs follow the nature of the material cause, for from blood especially cholerick and thin, it is full of heat, redness and pain; from the same allayed with phlegm all of them are more remiss. But if a heaviness possess the whole head, the original of the disease proceeds there from. But if a hot pain trouble the forehead, the disease may be thought to proceed from some hot distemper of the *Dura mater*, or the *Pericranium*; but if in the very time of the raging of the disease the Patient vomit, the matter of the disease proceeds from the stomach. But from whencesoever it cometh, there

What *Ophthalmia* is, and the causes thereof.

Signs.

there is ſcarce that pain of any part of the body, which may be compared to the pain of the inflamed eyes. Verily the greatneſs of the inflammation hath forced the eyes out of their orb, and broken them aſunder in divers. Therefore there is no part of Phyſick more blazed abroad than for ſore eyes. For

The cure. the cure, the Surgeon ſhall conſider and intend three things, diet, the evacuation of the antecedent and conjunct cauſe, and the overcoming it by topick remedies. The diet ſhall be moderate, eſchewing all things that may fill the head with vapours; and thoſe things uſed that by aſtriction may ſtrengthen the orifice of the ventricle, and prohibit the vapors from flying up to the head; the Patient ſhall be forbidden the uſe of Wines, unleſs peradventure the diſeaſe may proceed from a groſs

Com. ad aphor. 31. ſect. 6. and viſcid humor, as *Galen* delivers it. The evacuation of the matter flowing into the eye ſhall be performed by purging medicines, phlebotomy in the arm, cupping the ſhoulders and neck with ſcarification, and without: And laſtly, by frictions, as the Phyſician that hath undertaken the cure

Lib. 13. meth. cap. ult. ſhall think fit. *Galen* after univerſal remedies for old inflammations of the eyes, commends the opening of the veins and arteries in the forehead and temples, becauſe for the moſt part the veſſels thereabouts diſtended with acrid, hot, and vaporous blood, cauſe great and vehement pains in the eye.

For the impugning of the conjunct cauſe, divers topick medicines ſhall be applied according to the four ſundry times or ſeaſons that every phlegmon uſually hath. For in the beginning when as the acrid matter flows down with much violence, repercuſſives do much conduce; and tempered with reſolving medicines, are good alſo in the increaſe. ℞ *Aq. roſ. & plantag. an.* ℥ ß *mucilag. gum,*

A repercuſſive medicine. *Tragacanth.* ʒ ij *album. ovi quod ſufficit, fiat collyr.* Let it be dropped warm into the eye, and let a double cloth dipped in the ſame *Collyrium* be put upon it. Or, ℞ *Mucil. ſem. pſil. & cydon extractæ in aq. plant. an.* ʒ ß. *Aq. ſolan. & lactis muliebris, an.* ℥ i. *trochiſc. alb. rha.* ϑ. *Fiat collyrium.* Uſe

Aſtringent emplaſters. this like the former. The veins of the temples may be ſtraitned by the following medicine. ℞ *Bol. arm. ſang. drac. & maſt. an.* ℥ ß. *Alb. ovi, aquæ roſ. & acet. an.* ℥ i. *Tereb. lot. & ol. cidon. an.* ℥ i. ſs, *Fiat defenſitum.* You may alſo uſe *Ung. de Bolo, empl. diacal.* or *contra rupturam* diſſolved in oyl of myrtles, and a little vineger. But if the bitterneſs of pain be intolerable, the following Cataplaſm ſhall

An anodyne Cataplaſm. be applied. ℞ *Medul. pomor. ſub ciner. coctorum* ℥ iiij. *Lactis muliebris* ʒ ſs; let it be applied to the eye, the formerly preſcribed *Collyrium* being firſt dropped in. Or ℞ *mucilag. ſem. pſil. & cidon. an.* ℥ ſs *micæ panis albi in lacte infuſi,* ʒ ij. *Aquæ roſ.* ʒ ß *fiat cataplaſma.* The blood of a Turtle Dove, Pigeon, or Hen, drawn by opening a vein under the wings, dropped into the eye, aſſwageth pain.

The efficacy of Bathes in pains of the eyes. Baths are not only anodyne, but alſo ſtay the defluxion by diverting the matter thereof by ſweats; therefore *Galen* much commends them in ſuch defluxions of the eyes as come by fits. In the ſtate when as the pain is either quite taken away or aſſwaged, you may uſe the following medicines. ℞

Ad Aphor. ſect. 7. *Sarcocol. in lacte muliebri nutritæ,* ʒ i. *Aloes lotæ in aq. roſar.* ϑ ii. *Trochiſc. alb. rha.* ʒ ß *ſacchar. cand.* ʒ ij. *Aq. roſ.* ℥ iij. *Fiat collyrium.* Or, ℞ *Sem. fœniculi, & fœnug. an.* ʒ ij. *Flo. chamæ. & melil. an.* m. ſs. *Coquantur in aq. com. ad* ℥ iij. *colaturæ adde tutiæ præp. & ſarcoc. nutritæ in lacte muliebri an.* ʒ i. ſs. *Sacchari cand.* ℥ ſs. *Fiat collyrium ut artis eſt.* In the declination the eye ſhall be fomented with a carminative decoction, and then this *Collyrium* dropped thereinto. ℞ *Sarcoc. nutritæ* ʒ ij. *Aloes & myrrh. an.* ʒ i. *Aq. roſ. & euphrag. an.* ℥ ij. *Fiat collyrium, ut artis eſt.*

Detergent *Collyria.*

CHAP. XIII.

Of the Proptoſis, *that is, the falling or ſtarting forth of the eye, and of the* Phthiſis *and* Chemoſis *of the ſame.*

THe Greeks call that affect *Proptoſis*, the Latines *Procidentia*, or *Exitus oculi* when as the eye ſtands, and is caſt out of the orb, by the occaſion of a matter filling and lifting up the eye into a great bigneſs and largeneſs of ſubſtance. The cauſe of this diſeaſe is ſometimes

The cauſe. external, as by too violent ſtraining to vomit, by hard labour in child-birth, by exceſſive and wondrous violent ſhouting, or crying out. It ſometimes happeneth that a great and cruel pain of the head, or the too ſtrait binding of the forehead and temples for the eaſing thereof, or the palſie of the muſcles of the eye, give beginning to this diſeaſe. Certainly ſometimes the eye is ſo much diſtended by the defluxion of humors, that it breaks in ſunder, and the humors thereof are ſhed, and blindneſs enſues thereof, as I remember befel the ſiſter of *Lewis de Billy* Merchant, dwelling at *Pa-*

The cure. *ris* near St. *Michael's* Bridge. The cure ſhall be diverſified according to the cauſes. Therefore univerſal medicines being premiſed, Cupping-glaſſes ſhall be applied to the original of the ſpinal marrow, and the ſhoulders; as alſo Cauteries or Setons: The eye ſhall be preſſed or held down with clothes doubled and ſteeped in an aſtringent decoction made of the juice of *Acacia*, Red-roſes, the leaves of Poppy, Henbane, Roſes and Pomegranate-pills; of which things poultiſſes may be made by addition of Barly-meal, and the like.

The *Atrophia* of the eye. There is ſometimes to be ſeen in the eye an affect contrary to this, and it is termed *Atrophia*. By this the whole ſubſtance of the eye grows lank and decays, and the apple it ſelf becomes much leſs. But

The *Phthiſis* thereof. *Lib. 3. cap. 22.* if the conſumption and emaciation take hold of the pupil only, the Greeks, by a peculiar name and different from the general, term it a *Phthiſis*, as *Paulus* teacheth. Contrary cauſes ſhall be oppoſed to each affect; hot and attractive fomentations ſhall be applied, frictions ſhall be uſed in the neighbouring parts, and laſtly, all things ſhall be applied which may without danger be uſed to attract the blood and ſpirits into the parts.

The *Chemoſis. Paulus l. 3. c. 2.* There is another affect of the eye, of affinity to the *Proptoſis*, which by the Greeks is termed *Chemoſis*. Now this is nothing elſe then when both the eye-lids are turned up by a great inflammation, ſo that they can ſcarce cover the eyes, and the white of the eye is lifted much higher up than the black. Sometimes the *Adnata* changing his wont, looketh red; beſides alſo, this affect may take its original from external cauſes, as a wound, contuſion, and the like. But according to the variety of the cauſes, and the condition of the preſent affect fixed and remaining in the parts, divers remedies ſhallbe appointed.

CHAP.

CHAP. XIV.

Of the Ungula, or Web.

THe *Ungula*, *Pterygion* or Web is the growth of a certain fibrous and membranous fleſh upon the upper coat of the eye called *Adnata*, ariſing more frequently in the bigger, but ſometimes in the leſſer corner towards the temples. When it is neglected, it covers not only the *Adnata*, but alſo ſome portion of the *Cornea*, and coming to the pupil it ſelf hurts the ſight therefore. Such a web ſometimes adheres not at all to the *Adnata*, but is only ſtretched over it from the corners of the eye, ſo that you may thruſt a *Probe* between it and the *Adnata:* It is of ſeveral colours, ſomewhiles red, ſomewhile yellow, ſomewhiles duskiſh, and otherwhiles white. It hath its original either from external cauſes, as a blow, fall, and the like; or from internal, as the defluxion of humors into the eyes. The *Ungula* which is inveterate, and that hath acquired much thickneſs and breadth, and beſides doth difficultly adhere to the *Adnata*, is difficultly taken away; neither may it be helped by medicines whereby ſcars in the eyes are extenuated. But that which covereth the whole pupil muſt not be touched by the Surgeon, for being cut away, the ſcar which is left by its denſity hindreth the entrance of objects to the cryſtalline humour, and the egreſs of the animal ſpirit to them. But oftentimes it is accompanied with an inflammation of the eyes, a burning, itching, weeping defluxion, and ſwelling of the eye-lids. That the cure may rightly and happily proceed, he muſt firſt uſe a ſpare diet, purging medicines ſhall be given, and blood taken away by opening a vein, eſpecially if there be great inflammation. For peculiar remedies, this excreſcence ſhall be eaten away, or at leaſt kept from growth, by dropping into the eye *Collyrium* of Vitriol deſcribed in wounds of the eyes. But if that we profit nothing by this means, it remaineth, that we take it away with the hand after the following manner;

What web curable, and what incurable.

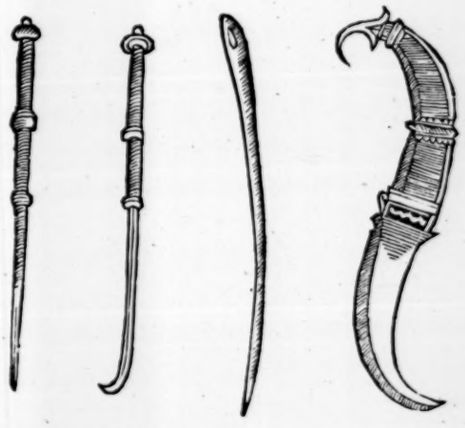
The cure.

You ſhall ſet the Patient upon a form or ſtool, and make him lean much back, and be held ſo firmly, that he may not fall nor ſtir, then muſt you open his ſore eye, putting therein a *ſpeculum oculi* formerly deſcribed in treating of the wounds of this part, and then muſt you lift up the web it ſelf with a ſharp little hook, with the point turned a little in, and put under the midſt of the web; when you have lifted it a little up, thruſt a needle threaded with a ſmooth thread between it and the *Adnata*, then taking hold of the hook, and the two ends of the thread drawn through with the needle, and lifting up the web by them, you ſhall gently begin to ſeparate it from the ſubſtance of the eye lying thereunder, beginning at the original thereof with a crooked Inciſion-knife, and ſo proſecute it even to the end, yet ſo as you hurt no part of the *Adnata* nor *Cornea*.

The cutting of the web.

The Figure of little Hooks, a Needle, and crooked Inciſion-knife.

Little Hooks. *A Needle.* *A crooked Inciſion-knife.*



Then muſt it be cut off with a pair of ſciſſers, and the white of an Egg beaten with ſome Roſe-water laid thereon, and often renewed. Afterwards the eye muſt every day be opened, leſt coming to cicatrization, the eye-lids ſhall be glued together in that part whereas the web is taken away, which alſo ſhall be hindred by putting of common Salt, Sage and Cummin-ſeed into the eye, being firſt champed and chawed in the mouth. There are ſome who inſtead of the crooked Knife ſeparate the web from the *Adnata* with a Horſes hair, others do it with a Gooſe-quill made ready for the ſame purpoſe, taking heed that they hurt not the caruncle at the corner by the noſe, for it will follow if that you draw the web away too violently; and if it be cut, there will remain a hole, through which during the reſt of the life a weeping humor will continually flow; a diſeaſe by the Greeks termed *Rhyas*. If after the cutting there be fear of inflammation, linnen rags moiſtned in repelling medicines, formerly preſcribed in wounds of the eye, ſhall be laid thereupon,

CHAP.

CHAP. XV.

Of the Ægilops, Fiſtula lacrymoſa, *or weeping of the Fiſtula of the Eye.*

The uſe of the glandule at the greater corner of the eye. The differences.

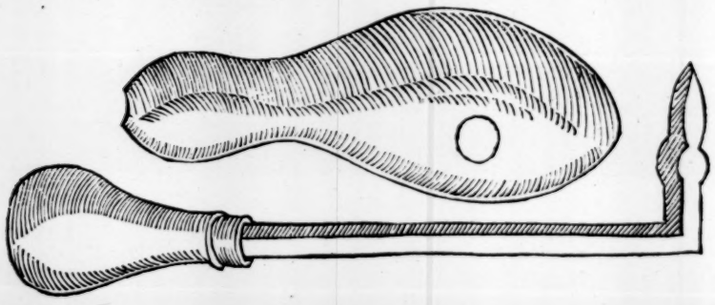
AT the greater corner of the eye there is a glandule, made for the receiving, and containing the moiſture which ſerveth for the lubricating and humecting the eye, leſt it ſhould dry by continual motion. This glandule ſometimes by a ſanguine or pituitous defluxion falling violently from the brain, ſwells, impoſtumates, and ulcerates with an ulcer, not ſeldom degenerating into a fiſtula, ſo that in ſucceſs of time it rotteth the bone that lieth under it. Of ſuch fiſtula's, ſome are open outwardly, and theſe uſually have their original from a phlegmon; otherſome are inwardly, and thoſe are ſuch as at firſt ſwelled by the defluxion or congeſtion of a phlegmatick matter, ſo that there appeareth no hole outwardly, but only a tumor of the bigneſs of a peaſe, this tumor being preſſed, floweth with a ſanious, ſerous and red, or otherwiſe with a white and viſcid matter, and that either by the corner of the eye, or by the inſide of the noſe. Some have this matter flowing continually, others have it only monthly, which is proper alſo to ſome fiſtula's. Such weeping fiſtula's if they become old, cauſe an *Atrophia* of the eye, and ſometimes blindneſs and a ſtinking breath. Therefore we muſt diligently and ſpeedily by phyſical and chirurgical means reſiſt the breeding diſeaſe. Wherefore, having uſed general medicines, we muſt come to particulars. Therefore if the ulcer be not ſufficiently wide, it ſhall be enlarged by putting tents of ſpunge therein. The fleſh of the glandule increaſing more than is fit, ſhall be corrected by putting therein the catheretick powders of Mercury, calcined Vitriol, or ſome *Aqua fortis*, or oyl of Vitriol; and laſtly, by a potential cautery. If you cannot prevail by theſe means, and that the bone begins to rot, and the Patient be ſtout hearted, then uſe an actual cautery whoſe uſe is far more effectual, ready, certain and excellent, than a potential cantery, as I have tried in many with happy ſucceſs. In my opinion it makes no matter, whether the cautery of Gold, Silver or Iron; for the efficacy it hath proceedeth not from the matter, but from the fire. Yet if we muſt religiouſly obſerve and make choice of metals, I had rather have it of Iron, as that which hath a far more drying and aſtringent faculty than Gold, for that the Element of Earth beareth the chief ſway therein, as appeareth by the waters which flow through Iron mines. Wherefore you ſhall cauſe to be made a triangular Iron, ſharp at the end, that it may the more ſpeedily penetrate. And then the ſound eye and adjacent parts being well covered and defended, and the Patients head firmly holden in ones hand, leſt the Patient being affrighted, ſtir himſelf in the very inſtant of the operation. But a plate of Iron ſomewhat depreſſed in the midſt, for the cavity of the greater corner ſhall be applied and fitted to the pained eye. This plate ſhall be perforated that the hot Iron may paſs thereby to the fiſtula lying thereunder and ſo may only touch that which is to be cauterized.

Periodical and typical fiſtula's.

The cure.

The efficacy of an actual Cautery.

The Figure of a Cautery, and a Plate with a hole therein.



Things to be done after the cauterzing.

After the bone is burnt with the Cautery, a *Collyrium* made of the whites of Eggs beaten in Plantain and Night-ſhade waters muſt be poured into the hole it ſelf, the eye and all the neighbouring parts; but the Patient ſhall be laid in bed with his head ſomewhat high, and the *Collyrium* ſhall be renewed as often and as ſoon as you ſhall perceive it to grow dry. Then the fall of the Eſchar ſhall be procured by anointing it with freſh Butter; when it is fallen away, the ulcer ſhall be cleanſed, filled with fleſh, and laſtly cicatrized.

CHAP. XVI.

Of the Staphyloma, *or Grape-like ſwelling.*

What a *Staphyloma*, is and the cauſes thereof.

Staphyloma is the ſwelling of the horny and Grape-like Coat, bred through the occaſion of an humor flowing down upon the eye, or by an ulcer, the horny coat, being relaxed, or thruſt forth by the violence of the puſtule generated beneath. It in ſhape reſembleth a Grape, whence the Greeks ſtile it *Staphyloma*. This tumor is ſometimes blackiſh, otherwhiles whitiſh. For if the horny coat be ulcerated and fretted in ſunder, ſo that the grapy coat ſhew it ſelf and fall through the ulcer, then the *Staphyloma* will look black like a ripe Grape, for the utter part of the *Uvea* is blackiſh. But if the *Cornea* be only relaxed and not broken, then the ſwelling appears of a whitiſh colour like an unripe Grape. The Ancients have made many kinds or differences thereof. For if it be but a ſmall hole of the broken *Cornea* by which the *Uvea* ſheweth or thruſteth forth it ſelf, then they termed it *Myocephalon*, that is, like the head of a Flie. But if the hole were large, and alſo callous, they called it

Paulus and Ætius.

Clavus,

Clavus, or a nail; if it were yet larger, then they termed it *Acinus*, or a Grape. But in what shape or figure soever this disease shall happen, it bringeth two discommodities, the one of blindness, the other of deformity. Wherefore here is no place for Surgery to restore the sight, which is already lost, but only to amend the deformity of the eye; which is by cutting off that which is prominent. But you must take heed that you cut away no more than is fit, for so there would be danger of pouring out the humors of the eye.

Every *Staphiloma* infers incurable blindness.

CHAP. XVII.

Of the Hypopyon, *that is, the suppurate or putrified eye.*

PUS or Quitture is sometimes gathered between the horny and grapy coat from an internal or external cause: From an internal, as by a great defluxion, and oft-times after an inflammation; but externally by a stroke, through which occasion, a vein being opened hath poured forth blood thither, which may presently be turned into Quitture. For the cure, universal remedies being premised, Cupping-glasses shall be applied, with Scarifications and Frictions used. Anodine and digestive *Collyria* shall be poured from above downwards. *Galen* writes that he hath sometimes evacuated this matter, the *Cornea* being opened at the *Iris*, in which all the coats meet, concur and are terminated. I have done the like, and that with good success, *James Guillemeau* the King's Surgeon being present, the Quitture being expressed and evacuated after the apertion. The ulcer shall be cleansed with *Hydromel*, or some other such like medicine.

The cause.

Lib. 14. *Method. cap. ult.*

CHAP. XVIII.

Of the Mydriasis, *or dilatation of the Pupil of the* Eye.

MYdriasis is the dilatation of the pupil of the eye, and this hapneth either by nature or chance: The former proceedeth from the default of the first conformation, neither is it curable; but the other is of sorts, for it is either from an internal cause, the off-spring of an humour flowing down from the brain, wherefore physical means must be used for the cure thereof. Now that which cometh by any external occasion, as a blow, fall or contusion upon the eye, must be cured by presently applying repercussive and anodyne medicines, the defluxion must be hindred by diet skilfully appointed, phlebotomy, cupping, scarification, frictions, and other remedies which may seem convenient. Then must you come to resolving medicines, as the blood of a Turtle-dove, Pigeon or Chicken, reeking-hot out of the vein, being poured upon the eye and the neighbouring parts. Then this following Cataplasm shall be applied thereto, ℞ *Farinæ fabar. & hordei an.* ℥ iij. *Ol. rosar. & myrtillor. an.* ℥ i. ß *pul. ireos flor.* ʒ ij. *Cum sapa fiat cataplasm.* You may also use the following fomentation: ℞ *Rosar. rub. & myrtil. an.* m. i *florum melil. & chamæm. an.* p. i. *Nucum cupress.* ℥ i. *Vini austeri* ℔ ß. *Aq. rosar. & plantag. an.* ℥ iii. Make a decoction of them all for a Fomentation to be used with a sponge.

The cause.

The cure.

A digesting Cataplasm

CHAP. XIX.

Of a Cataract.

A Cataract is called also by the Greeks *Hypochima*, by the Latines *Suffusio*. Howsoever you term it, it is nothing else but the concretion of an humor into a certain thin skin under the horny coat, just against the apple or pupil, and as, it were swimming upon the watery humor; and whereas the place ought to be empty, opposing it self to the internal faculty of seeing, whereby it differeth from spots and scars growing upon the horny coat and *Adnata*. It sometimes covereth the whole pupil, otherwhiles but the one half thereof, and somewhiles but a small portion thereof. According to this variety the sight is either quite lost, weak, or somewhat depraved, because the animal vitive spirit cannot in its entire substance pass through the density thereof. The defluxion of the humor whence it proceeds, is either caused by an external occasion, as a stroke, fall, or by the heat or coldness of the encompassing air, troublesome both to the head and eyes; or else it is by an internal means, as the multitude, or else the acrid hot and thin quality of the humors. This disease also sometimes taketh its original from gross and fumid humors sent from a crude stomach, or from vaporous meats or drinks, up to the brain, and so it falleth into the eyes, where, by the coldness, straitness, and tarrying in the place, they turn into moisture, and at length into that concretion or film which we see: The signs may be easily drawn from that we have already delivered. For when the Cataract is formed and ripe, it resembleth a certain thin membrane spred over the pupil, and appeareth of a different colour, according to the variety of the humor whereof it consisteth, one while white, another while black, blue, ash-coloured, livid, citrine green. It sometimes resembleth Quick-silver, which is very trembling and fugitive, more than the rest. At the first when it beginneth to breed, they seem to see many things, as Flies flying up and down, Hares, Nets, and the like, as if they were carelesly tossed up and down before their eyes: Sometimes every thing appeareth two, and some whiles less than they are, because the vitive spirit is hindred from passing to the objects by the density of the skin, like as a cloud shadowing the light of the Sun. Whence it is that the Patients are duller sighted about noon, and surer and quicker sighted in the morning and evening, for that the little vitive spirit diffused through the air, is dispersed by the greater light, but contracted by the less. Now if this film cover half the pupil, then all things shew but by halfs; but if the midst thereof be covered, and, as it were, the centre of the crystalline humor,

A Cataract.

The differences.

Causes.

Signs.

humor, then they ſeem as if they had holes or windows: But if it cover it all, then can he ſee nothing at all, but only the ſhadows of viſible bodies, and of the Sun, Moon, Stars, lighted candles, and the like luminous things, and that but confuſedly, and as by conjecture.

CHAP. XX.

Of the phyſical cure of a beginning Cataract.

Diet for ſuch as are troubled with a Cataract.

A Beginning Cataract is hindred from growing and concretion by diet conveniently and artificially preſcribed, by the abſtinence from Wine, eſpecially more ſtrong and vaporous, and forbearing the uſe of meats, which yield a phlegmatick juice and vaporous; as, Peaſe, Beans, Turneps, cheſnuts, and laſtly, all ſuch things as have the faculty of ſtirring up the humors, and cauſing defluxion in the body; ſuch as are all ſalt, and ſpiced meats, as alſo garlike, onions, muſtard. The immoderate uſe of venery hurts more than all the reſt, for that it more violently exagitates the whole body, weakens the brain and head, and begets crude humors. Let his bread be ſeaſoned with ſome Fennel-ſeeds, for it is thought to have a faculty of helping the ſight, and clearing the eyes, and diſſipating the miſty vapours in the ſtomach before they can aſcend to the brain. Wherefore by the ſame reaſon it is good to uſe Marmelade of Quinces, Conſerve of Roſes, and common Dridge-powder, or any ſuch like compoſed of things good to break wind, or corroborate the ventricle. Phlebotomy and purging, if they be requiſite, ſhall be fitly appointed: Ventoſes ſhall be applied to the ſhoulders and neck; and phlegmatick matter ſhall be diverted and evacuated by the mouth with uſing maſticatories in the morning. There be ſome which believe, that a beginning Cataract may be diſſipated and diſcuſſed by often rubbing the eye-lids with his fingers, and in like ſort by the often and earneſt beholding of the Stars and the Moon when it is at the full, Looking-glaſſes, Diamonds, and all other ſuch like bright ſhining things. I believe, that by beams plentifully and ſuddenly brought and diffuſed over the eye, directly oppoſite againſt ſome bright ſhining thing, it may ſeem to have a penetrating, dividing, diſſolving, as alſo a conſuming and drying faculty. Beſides, alſo the hot breath of him who holdeth in his mouth, and chaweth Fennel-ſeeds, Annis-ſeeds, Coriander-ſeeds, Nutmeg, Cinnamon, Cloves, and the like, hath a great faculty, the eyes being firſt gently rubbed with the finger, it being breathed in near at hand, and often received, to heat, attenuate, reſolve, digeſt and diffuſe the humor which is ready to concrete. Moreover, this *Collyrium* of *John Vigo* is thought very powerful to clear the eyes, ſtrengthen the ſight, hinder ſuffuſions, and diſcuſs them, if at any time they concrete, and begin to gather. ℞ *Hepatis hircini ſani & recentis* ℔ ij *calami aromatici & mellis an.* ℥ ſ. *Succi rutæ,* ʒ iij. *Aquæ chelidoniæ, fœniculi, verbenæ, euphraſiæ an.* ℥ iij. *Piperis longi, nucis moſchatæ, caryophyllorum an.* ʒ ij. *Croci* ℈ i. *floris roriſmarini aliquantum contriti,* m. ſ. *Sarcocollæ, aloes hepaticæ, an.* ʒ iij. *Fellis ratæ, leporis & perdicis. an.* ʒ i. *terantur omnia, tritiſq; adde ſacchari albi* ℥ ij. *mellis roſati* ʒ vi. *conjiciantur in alembicum vitreum, & deſtillentur in balneo Mariæ:* Let this diſtilled liquor be often dropped into the eyes. But if you prevail nothing by all theſe medicines, and that the cloudy and heaped-up humor doth daily increaſe and thicken, then muſt you abſtain from remedies, and expect until it be no more heaped up, but thickned, yea until it ſeem to be grown ſomewhat hard: For ſo it may be couched with a needle; otherwiſe if this ſame skin ſhall not be ripe, but more tender than is fitting, when you ſhall come to the operation, it will be broken and thruſt through with the needle, and not couched. On the contrary, if it be too hard hard, it will reſiſt the needle, neither will it ſuffer it ſelf to be eaſily couched. Wherefore it is requiſite that the Surgeon know when it is ripe, and he muſt diligently obſerve the ſigns whereby he may diſcern a ripe Cataract from an unripe; and that which is curable, from that which is uncurable. For that only which is ripe and curable, is to be couched; that which is unripe, that is ſuch an one as is more tender, and as it were crude, and that which is more hard and denſe, and laſtly, that which is uncurable muſt not be attempted at all.

How bright ſhining things may diſſipate a beginning Cataract.

A *Collyrium* diſſipating a beginning Cataract.

A Cataract muſt not be couched, unleſs it be ripe.

CHAP. XXI.

By what ſigns ripe and curable Cataracts may be diſcerned from unripe and uncurable ones.

Uncurable Cataracts.

IF the ſound eye being ſhut, the pupil of the ſore or ſuffuſed eye, after it ſhall be rubbed with your thumb, be preſently dilated and diffuſed, and with the like celerity return into the place, figure, colour and ſtate, it is thought by ſome to ſhew a ripe and confirmed Cataract. But an unripe, and not to be couched, if the pupil remain dilated and ſuffuſed for a long while after. But it is a common ſign of a ripe, as alſo more denſe, and conſequently uncurable ſuffuſion, to be able to ſee nor diſtinguiſh no viſible thing beſide light and brightneſs; for to diſcern other objects ſheweth that it is not yet ripe: Therefore the ſound eye being ſhut and preſſed, the pupil of the other rubbed with your thumb, is dilated, enlarged, ſwelleth, and is more diffuſed; the viſive ſpirits by this compreſſion being, as it were, forced from the ſound into the ſore-eye. But theſe following Cataracts are judged uncurable, that is, ſuch as are great, ſuch as when the eye-lid is rubbed are nothing dilated or diffuſed, whoſe pupil becometh no broader by this rubbing: For hence you may gather, that the ſtopping or obſtruction is in the optick nerve, ſo that how cunningly and well ſoever the Cataract be couched, yet will the Patient continue blind; you ſhall do no more good in couching a Cataract, which is in an eye conſumed and waſted with a *Phthiſis*. Alſo that Cataract is incurable, which is occaſioned by a moſt grievous diſeaſe, to wit, by moſt bitter and cruel pains of the head, or by a violent blow. Such as are of a plaſter-like green, black, livid, citrine and quick-ſilver-like colour, are uſually uncurable. On the contrary, ſuch as are of a Cheſnut colour, or of a ſky or ſea-water colour, with ſome little whiteneſs, yield great hope of a happy and ſucceſsful cure.

Curable Cataracts.

CHAP.

CHAP. XXII.

Of the couching a Cataract.

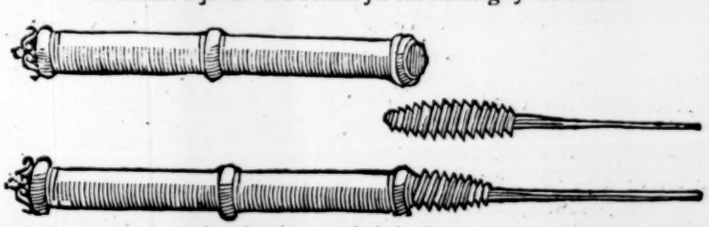
When to couch a Cataract.

After you ſhall know by the ſore-mentioned ſigns that the Cataract is curable, it remains that you attempt the couching thereof, but ſo, that there be nothing which may hinder. For if the pain of the head, cough, nauſeouſneſs or vomiting at that time trouble the Patient, you ſhall then beſtow your labour in vain: wherefore you muſt expect till theſe ſymptoms are gone. Then make choice of a ſeaſon fitting for that purpoſe, that is, in the decreaſe of the Moon, when the Air is not troubled with Thunder nor Lightning, and when as the Sun is not in *Aries*, becauſe that ſign hath dominion over the head. Then let the Surgeon conſult a Phyſician whether purging or bloud-letting be convenient for the Patient, ſo to reſiſt plethorick ſymptoms, otherwiſe ready to yield matter for relapſe. Two days after you muſt make choice of a place furniſhed with indifferent or competent light, and the Patient being faſting ſhall be placed in a ſtraight Chair, ſo that the light may not fall with the beams directly upon him, but ſide-wiſe. The eye which ſhall be cured, muſt be made more ſteddy by laying and binding Wool upon the other. Then the Surgeon ſhall ſeat and place himſelf directly againſt the Patient upon a ſeat ſomewhat higher, and bidding the Patient put his hands down to his girdle, he ſhall hold the Patients legs between his knees. One ſhall ſtand at the Patients back, who ſhall hold his head, and keep it from ſtirring; for by a little ſtirring he may loſe his ſight for ever. Then muſt you prepare and make ready your Needle, and thruſt it often into ſome ſtrong thick cloth, that it may be as it were ſmooth by this motion, and for the performance of the work in hand with the leſs pain ſomewhat warmed. It muſt be made of iron, or ſteel, and not of gold or ſilver, it muſt be alſo flatted on the ſides, and ſharp-pointed, that ſo it may the better pierce into the eye, and wholly couch the Cataract once taken hold of; and leſt it ſhould ſlip in the Surgeons hand, and be leſs ſteddy, it ſhall be put into a handle, as you may ſee by this Figure.

The place.

The Needle.

A Needle inſerted in a handle for the couching of Cataracts.



All things being thus in a readineſs, you muſt bid the Patient to turn the ſight of his eye towards his noſe, and the Needle muſt be boldly thruſt (for it is received in a place that is void, and onely filled with ſpirits) directly by the coat *Adnata*, in the middle ſpace between the leſſer corner and the horny coat, juſt againſt the midſt of the Cataract, yet ſo as that you hurt no vein of the *Adnata*, and then by ſtirring it as it were diverſly until it come to the midſt of the pupil and ſuffuſion. When it is come thither, the Needle muſt be inclined from above downwards to the ſuffuſion, and there to be ſtirred gently until by little and little it couch or bring down the Cataract as whole as may be beneath the compaſs of the pupil; let him ſtill follow it though couched with his Needle, and ſomewhat violently depreſs and keep it down for ſome ſhort ſpace, that ſo it may reſt and ſtay in that lower place whither it is depreſſed. The Surgeon ſhall try whether it firmly remain there or no, bidding the Patient preſently to move his eye; for if it remain conſtantly ſo, and do not return again, the Cure is perfect. Then muſt the Needle be lifted up by little and little, neither muſt it preſently be taken forth, that if the Cataract ſhould bear up, or riſe again, that it might again, and ſo often (whileſt the work is yet hot, and all things in a readineſs) be couched towards the leſſer corner, until it be fully and ſurely hid. Then muſt you draw back the Needle gently, and after the ſame manner as you put it in; leſt if you uſe not moderation, you bring back the Cataract from whence you couched it, or grievouſly offend the chryſtalline humour, the prime inſtrument of ſight, or the pupil with danger of dilating thereof. Some as ſoon as the work is done, give the Patient ſomething in his hand to look upon: but *Paulus* approves not thereof, for he fears leſt his endeavoring or ſtriving to ſee, may draw back the Cataract. Wherefore it is more wiſdom, and better preſently after the drawing forth of the Needle, to put on a ſoft rag the white of an Egg beaten in Roſe-water with a little choice Alum, and ſo apply it to the eye and neighbouring parts for to bind and hinder the inflammation; then alſo you muſt together therewith bind up the ſound eye, leſt by ſtirring to ſee, it might together therewith draw and move the ſore eye, by reaſon of the ſympathy and conſent they mutually have by the optick nerves. After all things are thus performed, the Patient ſhall be laid in a ſoft bed, and ſo placed, that his head may lie ſomewhat high; let him be laid far from noiſe, let him not ſpeak, nor eat any hard thing that may trouble his jaws, wherefore let him feed upon liquid meats, as panado, barley-cream, cullifſes, gellies, rear-eggs, and other meats of the like nature. At the end of eight days the ligature that binds up the eyes ſhall be looſed, and his eyes waſhed with Roſe-water, and putting on Spectacles, or ſome Taffaty, the Patient ſhall by little and little accuſtom himſelf to the light, leſt he ſhould be offended by the ſudden meeting with light. But if the ſuffuſion, after ſome ſhort while after lift it ſelf up again, it muſt be couched again, but through a new hole, for the eye is pained and tender in the former place. It ſometimes happens by the touch of the Needle that the Cataract is not couched whole, but is broken into many pieces; then therefore each of them muſt be followed, and couched ſeverally: if there be any very ſmall particle which ſcapes

Gal. lib. 10. de uſu partium c. 5. Celſ. lib. 7.

The ſign of a Cataract well couched.

Lib. 6. cap. 21.

What to be done after the couching of a Cataract.

Of a Cataract which is broken to pieces.

the needle, it must be let alone, for there is no doubt but that in process of time it may be dissolved by the force of the native heat. There are also some Cataracts which at the first touch of the needle are diffused and turn into a substance like to Milk or troubled Water, for that they are not throughly ripe, yet these put us in good hope of recovery, if it be but for this, that they can never afterwards concrete into one body as before. Wherefore at the length they are also discussed by the strength of the native heat, and then the eye recovers its former splendor. If that any other symptoms come unlooked for, they shall be helped by new counsels and remedies.

CHAP. XXIII.

Of the stopping of the passage of the Ears, and the falling of things thereinto.

The Cause.

IT sometimes happeneth that children are born without any holes in their ears, a certain fleshly or membranous substance growing in their bottom or first entrance. The same may also happen afterwards by accident, they being ulcerated by some impostume or wound, and the ear shut up by some fleshly excrescence or scar. When as the stopping is in the bottom of the cavity, the cure is more difficult than if it were in the first entrance. But there is a double way of cure; for this substance, whatsoever it be, must either be cut out, or else eaten away and consumed by acrid and catheretick Medicins; in performance of which there is need of great moderation of the mind and hand. For it is a part enduced with most exquisite sense and near the brain, wherefore by handling it too roughly, there is fear of distension of the nerves, and consequently of death.

The Cure.

Sometimes also the preternatural falling of some strange bodies into this passage maketh a stopping of the ears, such as are fragments of Stone, Gold, Silver, Iron, and the like Metals, Pearls, Cherry-stones, or Kernels, Pease and other such like Pulse. Now solid and bony bodies still retain the same magnitude; but Pease Seeds and Kernels, by drawing the moisture there implanted into them, swell up, and cause vehement pain by the distension of the neighbouring parts, wherefore the sooner they are drawn forth, the better it is for the Patient. This shall be done with small pincers and instruments made in the shape of Ear-picks. But if you profit nothing thus, then must you use such gimblets as are made for the drawing forth of bullets shot deep into the body. Little stones and bodies of the like stony hardness, shall be forced forth by the brain, provoked to concussion by sneezing, and by dropping some Oil of Almonds first into the passage of the Ear, that the way may be the more slippery; for it will come to pass by this sneezing, or violence of the internal air forcibly seeking passage out, that at length they may be cast forth, the mouth and nostrils being stopped with the hand. But if we cannot thus prevail, it remains, that we cut open the passage with an incision knife, so much as shall be sufficient for the putting in and using of an Instrument to extract them. If any creeping things of little creatures, as Fleas, Ticks, Pismires, Gnats, and the like, which sometimes happeneth, shall get therein, you may kill them by dropping in a little Oil and Vinegar. There is a certain little creeping thing, which for piercing and getting into the Ears, the *French* call *Perse-oreille* (we an Ear-wig,) this if it chance to get into the Ear, may be killed by the fore-said means; you may also catch it, or draw it forth by laying half an apple to your Ear, as a bait for it.

The concussive force of sneezing.

CHAP. XXIV.

Of getting of little bones and such like things out of the Jaws and Throat.

The Cure different according to the places where they stick.

SOmetimes little bones and such like things in eating greedily use to stick, or as it were fasten themselves in the Jaws or Throat. Such bodies if you can come to the sight of them, shall be taken out with long, slender and crooked Mallets made like a Cranes beak. If they do not appear, nor there be no means to take them forth, they shall be cast forth by causing vomit, or with swallowing a crust of bread, or a dry fig gently chawed, and so swallowed; or else they shall be thrust down into the stomach, or plucked back with a leek, or some other such long and stiff crooked body anointed with Oil and thrust down the throat. If any such like thing shall get into the Weazon, you must cause coughing, by taking sharp things, or else sneezing; so to cast forth whatsoever is there troublesom.

CHAP. XXV.

Of the Tooth-ach.

The Tooth-ach a most cruel pain.

OF all pain, there is none which more cruelly tormenteth the Patients than the Tooth-ach. For we see them often-times after the manner of other bones to suffer inflammation, which will quickly suppurate, and they become rotten, and at length fall away piece-meal; for we see them by daily experience to be eaten and hollowed, and to breed Worms, some portion of them putrefying. The cause of such pain is either internal, or external and primitive. The internal is a hot or cold defluxion of humours upon them, filling their sockets, and thence consequently driving out the teeth; which is the reason that they stand sometimes so far forth, that the Patient neither dares, nor can make use of them to chaw for fear of pain; for that they are loose in their sockets by the relaxation of the Gums, caused by the falling down of the defluxion. When as they are rotten and perforated even to the roots, if any portion of the liquor in drinking fall into them, they are pained as if you thrust in a pin or bodkin, the bitterness of the pain is such. The signs of a hot defluxion are sharp and pricking pain, as if needles were thrust into them, a great pulsation in the root of the pained Tooth and the Temples, and some ease by

The cause thereof.

The signs of this or that defluxion.

by the use of cold things. Now the signs of a cold defluxion are a great heaviness of the head, much and frequent spitting, some mitigation by the use of hot remedies. In the bitterness of pain we must not presently run to Tooth-drawers, or cause them presently to go in hand to pluck them out. First consult a Physician, who may prescribe remedies according to the variety of the causes. Now here are three intentions of Curing. The first is concerning Diet, the other for the evacuation of the defluxion or antecedent cause, the third for the application of proper remedies for the assuaging of pain. The two former scopes, to wit, of Diet, and diverting the defluxion by Purging, Phlebotomy, application of Cupping-glasses to the Neck and Shoulders, and Scarification, do absolutely belong to the Physician. Now, for proper and topick Medicins they shall be chosen contrary to the cause. Wherefore in a hot cause it is good washing the mouth with the juice of Pomgranates, Plantain Water, a little Vinegar, wherein Roses, *Balaustiæ* and *Sumach* have been boiled. But such things as shall be applied for the mitigating of the pain of the Teeth, ought to be things of very subtle parts, for that the Teeth are parts of dense consistence. Therefore the Ancients have always mixed Vinegar in such kind of remedies. ℞ *Rosar. rub. Sumach. hordei, an.* m. ſ. *seminis hyoscyami conquassati,* ʒ ij. *santalorum an.* ʒ j. *lactucæ summitatum rubi, solani, plantaginis, an.* m. ſ. *buliant omnia in aquæ* ℔ iv. *& pauco aceto ad hordei crepaturam.* Wash the mouth with such a decoction being warm. You may also make Trochisces for the same purpose after this manner. ℞. *Sem. hyoscyami, sandaracha, coriandri, opii, an.* ʒ ß. *terantur & cum aceto incorporentur, formenturque trochisci apponendi dentibus dolentibus.* Or else, ℞ *Sem. portulacæ, hyoscyami, coriandri, lentium, corticis, santali citrini, rosar. rub. pyrethri, camphoræ, an.* ʒ ſ. let them all be beaten together with strong Vinegar, and made into Trochisces, with which being dissolved in Rose-water, let the Gums and whole mouth be washed when need requireth. But if the pain be not assuaged with these, you shall come to narcoticks which may stupefie the nerve; as, ℞. *Sem. hyoscyami albi, opii camphoræ, papav. albi, an. quantum sufficit, coquantur cum sapa, & denti applicentur.* Besides you must also put this following Medicin into the ear of the pained side. ℞ *Opii & castorei, an.* ℈ j. *misceantur cum oleo rosato:* It hath sometimes availed in swollen and distended Gums, being first lightly scarified, to have applied Leeches, for the evacuation of the conjunct matter, as also to have opened the Veins under the Tongue, or these which are behind the ears. For I remember that I, by these three kinds of remedies, assuaged great pains of the Teeth. Yet there be some who in this affect open not these veins which are behind the ears, but those which are conspicuous in the hole of the ear, in the upper part thereof.

Three scopes of curing.

A cold and repercussive lotion for the mouth.

Trochisces for a hot defluxion.

Narcoticks.

Pain of the Teeth arising from a cold cause and defluxion, may be helped by these remedies; boil Rosemary, Sage, and Pellitory of *Spain* in Wine and Vinegar, and add thereto a little *aqua vitæ*; in this liquor dissolve a little treacle, and wash your Teeth therewith. Others mingle Gum *ammoniac* dissolved in *aqua vitæ* with a little *sandarachæ* and myrrh, and lay it to the pained Tooth after *Vigo*'s counsel. *Mesue* thinks that beaten Garlick carried in the right or left hand, assuages the pain, as the Teeth ake upon the right or left side. But I being once troubled with grievous pain in this kind, followed the counsel of a certain old Woman, and laid Garlick roasted under the embers to my pained tooth, and the pain fortwith ceased. The same remedy used to others troubled with the like affect, had like success. Moreover, some think it available if it be put into the auditory passage. Others drop into the ears Oil of *Castoreum*, or of Cloves, or some such other Chymical Oil. It is good also to wash the Teeth with the following decoction. ℞ *Rad. pyrethri* ʒ ß. *menthæ & rutæ, an.* p. j. *buliant in aceto,* and with this decoction being warm, wash the Teeth. Some like fumes better, and they make them of the Seeds of *Coloquintida* and mustard, and other like; they take the smoak by holding their mouths over a Funnel. Other some boil Pellitory of *Spain*, Ginger, Cinnamon, Alum, common Salt, Nutmegs, Cypress-nuts, Anise and Mustard Seeds, and *Euphorbium* in Oxycrate, and in the end of the decoction add a little *aqua vitæ*, and receive the vapour thereof through a Funnel; as also they wash their Teeth with the decoction, and put Cotton dipped therein into the ear, first dropping in a little thereof. Some there are which affirm, that to wash the Teeth with a decoction of Spurge is a very good and anodyne Medicin in the Tooth-ach. I have oft-times assuaged intolerable pains of the Teeth, by applying vesicatories under the ear, to wit, in that cavity whereas the lower jaw is articulated with the upper; for the vein, artery, and sinew that are distributed to the roots of the Teeth, lie thereunder. Wherefore the blisters being opened, a thin liquor runs out, which doth not only cause, but also nourish or feed the disease. But if the tooth be hollowed, and that the Patient will not have it pulled out, there is no speedier remedy than to put in caustick medicins, as oil of vitriol, *aqua fortis*, and also an hot iron; for thus the nerve is burnt in sunder, and loseth its sense. Yet some affirm that the milky juice that flows from Spurge made into a paste with *olibanum* and *amylum*, and put into the hollow tooth, will make it presently to fall away in pieces. When the gums and cheeks are swollen with a manifest tumor, then the Patient begins to be somewhat better and more at ease. For so by the strength of Nature the tumor causing the pain is carried from within outwards. But of what nature soever the matter which causeth the pain be, it is convenient to intercept the course thereof with *Empl. contra rupturam* made with Pitch and Mastich, and applied to the temple on that side where the tooth aketh.

Hot Fumes.

Vesicatories.

Caustick.

CHAP. XXVI.

Of other Affects of the Teeth.

THe Teeth are also troubled with other preternatural affects. For sometimes they shake by relaxation of the Gums, or else become corrupt and rotten, or have Worms in them, or else are set on edge. For the first, the Gums are relaxed either by an external or primitive cause, as a Fall or Blow: or else by an internal or antecedent, as by the defluxion of acrid or wateriſh humours from the brain, or through want of nourishment in old bodies. If the Teeth grow loose by the means of the decaying Gums, the disease is then uncurable: but

Causes of looseness of the Teeth.

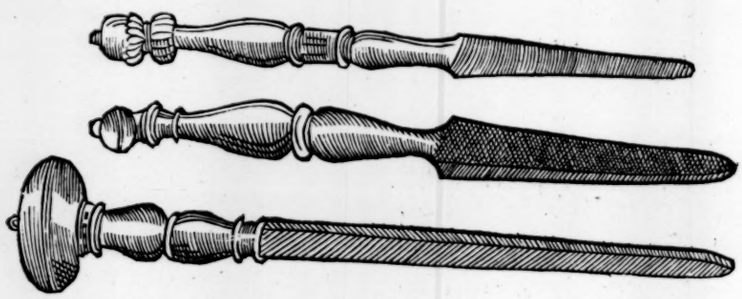
you may withſtand the other cauſes by the uſe of ſuch things as faſten the teeth, ſhunning on the contrary ſuch as may looſen them. Therefore the Patient muſt not ſpeak too earneſtly, neither chew hard things. If they become looſe by a fall or blow, they muſt not be taken forth, but reſtored and faſtned to the next that remain firm, for in time they will be confirmed in their ſockets, as I tried in

A Hiſtory. *Antony de la Rue* a Tailor, who had his Jaw broken with the Pommel of a Dagger, and three of his teeth were looſened, and almoſt ſhaken out of their ſockets; the Jaw being reſtored the teeth were alſo put in their places, and bound to the reſt with a double waxed thred; for the reſt, I fed the Patient with Broths, Gellies, and the like, and I made aſtringent Gargariſms of Cypreſs-nuts, Myrtle-berries, and a little Alum boiled in Oxycrate, and I wiſhed him to hold it a good while in his mouth: by theſe means I brought it ſo to paſs that he within a while after could chew as eaſily upon thoſe teeth as upon the other. I heard it reported by a credible perſon, that he ſaw a Lady of the prime Nobility, who in ſtead of a rotten tooth ſhe drew, made a ſound tooth, drawn from one of her waiting Maids at the ſame time, to be ſubſtituted and inſerted, which tooth in proceſs of time, as it were taking root, grew ſo firm, that ſhe could chew upon it as well as upon any of the reſt. But as I formerly ſaid, I have this but by hear-ſay.

The cauſes of hollow teeth. Now the teeth are corroded or eaten in by an acrid and thin humour penetrating by a plenteous and frequent defluxion even to their roots, and being there contained, it putrefies, and becoming more acrid, it doth not onely draw the teeth into the contagion of its putrefaction, but alſo perforates and corrodes them.

The Cure. The putrefaction may be corrected, if after general Medicins you put Oil of Vitriol or *aqua fortis* into the hole of the eaten tooth: or elſe, if you burn the tooth it ſelf to the root with a ſmall iron Wier being red hot: you ſhall thruſt this hot iron thorow a Pipe or Cane made for the ſame purpoſe, leſt it ſhould harm any ſound part by the touch thereof, and thus the putrefaction, the cauſe of the arroſion may be ſtaid. But if the hole be on the one ſide between two teeth, then ſhall you file away ſo much of the ſound tooth, as that you may have ſufficient liberty to thruſt in your Wier without doing any harm.

The forms of Files made for filing the Teeth.



Cauſes of Worms in the teeth. Worms breeding by putrefaction in the roots of the teeth, ſhall be killed by the uſe of cauſticks, by gargles or lotions made of Vinegar, wherein either Pellitory of *Spain* hath been ſteeped, or treacle diſſolved; alſo aloes and garlick are good to be uſed for this purpoſe.

Cauſes of ſetting the teeth on edge. Setting the teeth on edge happens to them by the immoderate eating of acrid or tart things, or by the continual aſcent of vapours endued with the ſame quality, from the orifice of the ventricle to the mouth, or by a cold defluxion, eſpecially of acrid phlegm, falling from the brain upon the teeth, or elſe by the too exceſſive uſe of cold or ſtupefying liquors. This affect is taken away, if after general Medicins and ſhunning thoſe things that cheriſh the diſeaſe, the teeth be often waſhed with *aqua vitæ*, or good Wine wherein Sage, Roſemary, Cloves, Nutmegs, and other things of the like nature have been boiled.

CHAP. XXVII.

Of drawing of Teeth.

TEeth are drawn, either for that they cauſe intolerable pains, which will not yield to Medicins, or elſe for that they are rotten and hollowed, ſo that they cauſe the breath to ſmell; or elſe for that they infect the ſound and whole teeth, and draw them into the like corruption, or becauſe they ſtand out of order. Beſides, when they are too deep and ſtrongly rooted, ſo that they cannot be plucked out, they muſt oft-times be broken of neceſſity, that ſo you may drop ſome cauſtick thing into their roots, which may take away the ſenſe, and conſequently the pain. The hand

A caveat in drawing of teeth. muſt be uſed with much moderation in the drawing out of a tooth; for the jaw is ſometimes diſlocated by the too violent drawing out of the lower teeth. But the temples, eyes, and brain are ſhaken with great danger by the too rude drawing of the upper teeth. Wherefore they muſt firſt be cut about, that the Gums may be looſed from them, then ſhake them with your fingers, and do this until they begin to be looſe; for a tooth which is faſt in, and plucked out with one pull, oft-times breaks the jaw, and brings forth the piece together therewith, whence follows a Fever and a great flux of bloud not eaſily to be ſtaid (for bloud or *pus* flowing out in great plenty is, in *Celſus*'s opinion, the ſign of a broken bone) and many other malign and deadly

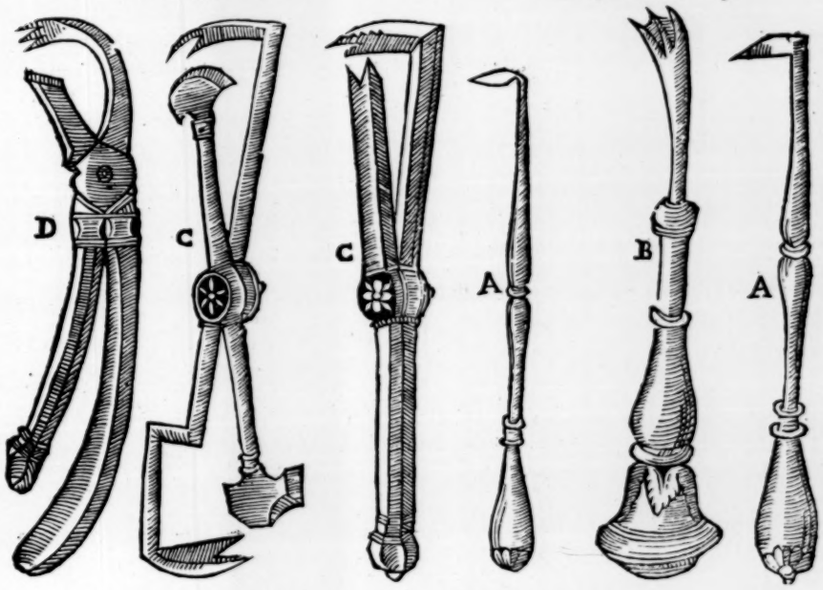
Lib.7.cap.8. ſymptoms. Some have had their mouths drawn ſo awry, during the reſt of their lives, that they could ſcarce gape. Beſides, if the tooth be much eaten, the hole thereof muſt be filled either with Lint, or a Cork, or a piece of Lead well fitted thereto, leſt it be broken under your *forceps*, when it

it is twitched more ſtraightly to be plucked out, and the root remain, ready in a ſhort time to cauſe more grievous pain. But judgment muſt be uſed, and you muſt take ſpecial care, leſt you take a ſound tooth for a pained one; for oft-times the Patient cannot tell, for that the bitterneſs of pain by neighbourhood is equally diffuſed over all the Jaw. Therefore for the better plucking out a tooth, obſerving theſe things which I have mentioned, the Patient ſhall be placed in a low ſeat, bending back his head between the Tooth-drawers legs; then the Tooth-drawer ſhall deeply ſcarifie about the tooth, ſeparating the gums therefrom with the inſtruments marked with this letter *A*, and then if ſpoiled as it were of the wall of the gums, it grow looſe, it muſt be ſhaken and thruſt out, by forcing it with the three-pointed Levatory noted with this Letter *B*; but if it ſtick in too faſt, and will not ſtir at all, then muſt the tooth be taken hold of with ſome of theſe toothed *forcipes* marked with theſe letters *C C D*; now one, then another, as the greatneſs, figure and ſite ſhall ſeem to require. I would have a Tooth-drawer expert and diligent in the uſe of ſuch toothed Mullets; for unleſs one know readily and cunningly how to uſe them, he can ſcarce ſo carry himſelf, but that he will force out three teeth at once, oft-times leaving that untoucht which cauſed the pain.

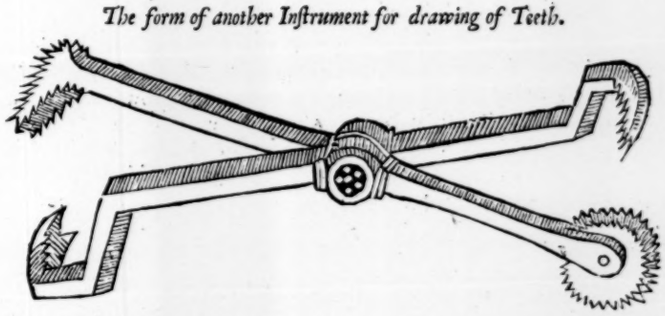
The manner of drawing Teeth.

The Effigies of Forcipes, *or Mullets for the drawing of Teeth.*

Inſtruments for ſcraping the Teeth and a three-pointed Levatory.



The form of another Inſtrument for drawing of Teeth.



After the Tooth is drawn, let the blood flow freely, that ſo the part may be freed from pain, and the matter of the tumor diſcharged. Then let the Tooth-drawer preſs the fleſh of the gums on both ſides with his fingers whereas he took out the Tooth, that ſo the ſocket that was too much dilated, and oft-times torn by the violence of the pluck, may be cloſed again. Laſtly, The mouth ſhall be waſhed with Oxycrate; and if the weather be cold, the Patient ſhall take heed of going much in the open air, leſt it cauſe a new defluxion upon his Teeth.

What to be done when the Tooth is pluckt out.

CHAP. XIV.

Of cleanſing the Teeth.

Pieces of meat in eating ſometimes ſtick between the teeth, and becoming corrupt by long ſtaying there, do alſo hurt the teeth themſelves, and ſpoil the ſweetneſs of the breath. He that would eſchew this, ought preſently after meat, to waſh his mouth with Wine mixed with Water, or Oxycrate, and well to cleanſe his teeth, that no ſlimy matter adhere to them. Many folks teeth by their own default gather an earthy filth of a yelloviſh colour, which eats into them by little and little, as ruſt eats into iron. This ruſty filthineſs, or as it were mouldineſs of the teeth, doth alſo oft-times grow by the omitting of their proper duty, that is of chawing. Whence-

Cauſes of foul or ruſty Teeth.

The Cure. soever this ſlimy filth proceeds, we muſt get *Dentrifrices* to fetch it off withall, and then the teeth muſt be preſently rubbed with *aqua fortis* and *aqua vitæ* mixed together, that if there be any thing that hath ſcaped the *Dentrifrices*, it may be all fetched off; yet ſuch acrid waſhings are hurtful to the ſound teeth, for that they by little and little conſume and waſte the fleſh of the gums.

A caution in the uſe of acrid things. *Dentifrices* ſhall be made of the root of Marſh-mallows boiled in white Wine and Allum; and, as when the teeth are looſe, we muſt abſtain from ſuch things as are hard to be eaten and chawed, but much more from breaking of ſuch things as are of a bony conſiſtence, ſo alſo here we muſt ſhun all things that by their toughneſs ſtick to the teeth. Many for the cleanſing of the teeth commend a Powder made of Scuttle-bones, Purple-ſhells, Pumice-ſtone, burnt Allum, and Harts horn, and a little Cinnamon, which is a ſingular remedy for the teeth howſoever affected. Many other are content with bread onely toſted and beaten; but this following Water is very effectual to whiten the teeth.

A Water to whiten the teeth. R. *Sal. ammon. & gemmei, an.* ʒ j. *alum. roch.* ʒ ß. *aquæ roſ. quod ſufficit, diſtillentur.* And let the teeth be cleanſed with this diſtilled liquor.

CHAP. XXIX.

Of the impediment and contraction of the Tongue.

The cauſe of being Tongue-tied. THe Tongue is ſometimes tied and ſhort from the nativity; as when the liberty of the Tongue is reſtrained by the ſubject and neighbouring, as well membranes as muſcles, being either too ſhort or too hard. Sometimes this diſeaſe happens after they are born by ſome accident or preternatural affect, as by too hard a ſcar left by the healing of an Ulcer under the Tongue.

The Cure. The Patient at his beginning to ſpeak, is too ſlow in ſpeaking, but preſently leaving his ſlowneſs, he becomes too quick, ſo that he ſtammers. If the diſeaſe proceed from the aſtriction and ſhortneſs of the ligamental membrane lying under the Tongue, then the inciſion ſhall be made broad-wiſe, having great care that the veins and arteries which are there, be not violated, for fear left they ſhould cauſe an *Hemorrhagie*, not eaſily to be ſtaid. Then the mouth ſhall be preſently waſhed with Oxycrate, and ſome lint dipped in Syrup of dried Roſes, or Honey of Roſes put into the midſt of the inciſion, leſt the part of the ligament, eſpecially in the night time when the Tongue is ſilent and at reſt, ſhould grow to the reſt of the ligament. For the ſame purpoſe the finger ſhall be often thruſt this way, and the Tongue more violently rowled up and down and thruſt out of the mouth. Yet ſometimes this ligament is ſo thick and ſhort, and therefore holds down the Tongue ſo cloſe, that you cannot come to cut it with a knife or lancet, without great and manifeſt danger of death by bleeding.

Another way to cut it. Therefore in ſuch a caſe a needle and thred ſhall be thruſt through it, and ſo the thred ſhall be tied ſtraighter and ſtraighter every day, until by little and little this ligamental tie of the Tongue, which by its immoderate ſhortneſs intercepts the liberty of the motion, ſhall be conſumed and broken.

CHAP. XXX.

Of ſuperfluous Fingers, and ſuch as ſtick together.

The differences. EAch hand hath naturally five Fingers onely; whatſoever is more or leſs is againſt Nature: and if there be fewer, it a fault not to be helped by Art. But if there be more, that for the moſt part maybe helped by Art. Superfluous Fingers uſually grow by the Thumb or the little Finger, but ſeldom otherwiſe. Theſe are either wholly fleſhy, or have bones of their kind and nails upon them. Thoſe which are of a bony nature, do either ariſe from the joints of the natural Fingers, and are jointed like them, and ſo are oft-times movable; or elſe from ſome middle ſpace of a joint, and theſe have not power to ſtir or move. Now they are ſometimes equal

Cutting Mullets neatly made for the cutting off ſuperfluous Fingers.

in magnitude to the natural Fingers to which they grow, yet more frequently they are ſhorter. Thoſe which are onely fleſhy, are eaſily amputated and made even with a razor; but ſuch as are alſo bony cannot be cut off, unleſs with the cutting Mullets here deſcribed, and this is a diſeaſe of the Fingers in number. There is alſo another diſeaſe in Fingers, for they ſometimes ſtick together,

gether, and otherwhiles they are very little separated. This fault happens either from the first original, by the errour of the formative faculty; or else it happens afterwards by accident, as by a Wound, or Burn ill cured. For neighbouring Fingers being ulcerated do easily grow together, unless they be kept asunder by a linnen rag. And if they by chance shall grow together by a little and thin skin and flesh, they shall forthwith be divided with a sharp Razor; but if they be joined by the interposition of a more gross and dense substance, to wit, the nerves, tendons, and vessels being knit together on each side, it will be best not to meddle at all with the dividing them.

The cure of nails running into the flesh of the fingers.

Neither must we omit, that many have their nails run with such bony sharpness into the flesh of their fingers lying under them, that they cause most cruel pain; neither commonly do you avail any thing by paring them; for growing up within a while after, they press downwards again with the more violence. Therefore the Surgeon is often forced to cut away all the flesh whereinto the sharpness of the nail runs. Which I have done in many with happy success. Many have Corns growing upon their Fingers in divers fashions: They are taken off by paring away by little and little, the callous hardness, and then laying a head of Garlick beaten thereon. Yet the Cure is more quick and certain, which is performed by caustick, as *aqua fortis*, or Oil of Vitriol.

How to take off the Corns of the fingers.

CHAP. XXXI.

Of the too short a Prepuce, and of such as have been circumcised.

The Cause.

The Cure.

When as the Prepuce ot fore-skin is too short, it cannot cover the *Glans*. This happens either by Nature, to wit, by the first conformation, or afterwards by some accident, as to those whom Religion and the custom of their Nation bids to be circumcised. The Cure is thus: The Prepuce is turned up, and then the inner membrane thereof is cut round, and great care is had, that the Vein and Artery which are there between the two membranes of the Prepuce, be not cut in sunder. Hence it is drawn downward by extension, until it cover the *Glans*, a deiccative emplaister being first put between it and the *Glans*, lest they should grow together. Then a Pipe being first put into the urinary passage, the Prepuce shall be there bound until the incision be cicatrized. This cure is used to the *Jews*, when having abjured their Religion full of superstitions, for handsomness sake, they would cover the Nut of their Yard with a Prepuce, and so recover their cut-off-skin.

CHAP. XXXII.

Of Phimosis *and* Paraphimosis, *that is, so great a constriction of the Prepuce about the* Glans *or Nut, that it cannot be bared or uncovered at pleasure.*

The Causes.

The Cure.

The Prepuce is straightned about the *Glans* two ways; for it either covers the whole Nut, and so straightly encompasses the end thereof, that it cannot be drawn upwards, and consequently the Nut cannot be uncovered; or else it leaves the *Glans* bare under it, being fastned so stiffly to the roots thereof, that it cannot be turned up, nor drawn down, or over the *Glans*. The first manner of constriction is termed *Phimosis*, the latter *Paraphimosis*. The *Phimosis* happens either by fault of the first conformation, or else by a scar, through which occasion the Prepuce hath grown lesser, as by the growing of Warts. Now *Paraphimosis* is often occasioned by the inflammation of the Yard, by impure copulation; for hence Ulcers breed between the Prepuce and *Glans*, with swelling and so great inflammation, that the Prepuce cannot be turned back. Whence it is that they cannot be handled and cured as you would, and a Gangrene of the part may follow, which may by the contagion bring death to all the body, unless it be hindred by amputation: but if a scar be the cause of the constriction of the prepuce, the Patient being placed in a convenient site, let the Prepuce be drawn forth and extended, and as much as may be stretched and enlarged, then let the scar be gently cut in three or four places on the inner side with a crooked Knife, but so, that the gashes come not to the outside, and let them be an equal distance each from other. But if a fleshly excrescence or a Wart shall be the occasion of this straitness and constriction, it shall be consumed by the same remedies, by which the Warts of the Womb and Yard are consumed or taken off. But when as the Prepuce doth closely adhere to the *Glans* on every side, the Cure is not to be hoped for, much less to be attempted.

CHAP. XXXIII.

Of those whose Glans *is not rightly perforated, and of the too short or strait ligament, bridle, or cord of the Yard.*

The Cause.

The Cure.

Some at their birth, by evil conformation, have not their *Glans* perforated in the middle, but have onely a small hole underneath, toward the bridle and ligament of the Yard, called the Cord. Which is the cause that they do not make water in a strait line, unless they turn up their Yard toward their belly, neither by the same reason can they beget children, because through this fault of conformation, the seed is hindred from being cast directly into the Womb. The Cure is altogether Chirurgical, and is thus performed. The Prepuce is taken hold of and extended with the left hand, but with the right hand, the extremity thereof, with the end of the *Glans*, is cut even to that hole which is underneath. But such as have the bridle or ligament of the Yard too short, so that the Yard cannot stand straight, but crooked, and as it were turned downwards; in these also the generation of children is hindred, because the seed cannot be cast directly and plentifully

tifully into the Womb. Therefore this ligament muſt be cut with much dexterity, and the wound cured after the manner of other wounds, having regard to the part.

Such as are born without a hole in their Fundament are not long-lived.

Children alſo are ſometimes born into the World with their fundaments unperforated, for a skin preternaturally covering the part, hinders the paſſage forth of the excrement; thoſe muſt have a paſſage made by Art with an Inſtrument, for ſo at length the excrements will come forth: yet I have found by experience, that ſuch Children are not naturally long-lived, neither to live many days after ſuch ſection.

CHAP. XXXIV.

Of the Cauſes of the Stone.

Why children are ſubject to the Stone in the Bladder.

THe Stones which are in the bladder have for the moſt part had their firſt original in the reins or kidnies, to wit, falling down from thence by the Ureters into the Bladder. The cauſe of theſe is two-fold, that is, material and efficient. Groſs, tough, and viſcid humours, which crudities produce by the diſtempers of the bowels and immoderate exerciſes, chiefly and immediately after meat, yield matter for the Stone; whence it is that children are more ſubject to this diſeaſe than thoſe of other Ages: But the efficient cauſe is either the immoderate heat of the kidnies, by means whereof the ſubtiler part of the humours is reſolved, but the groſſer and more earthly ſubſides, and is hardned as we ſee Bricks hardned by the Sun and Fire; or the more remiſs heat of the bladder, ſufficient to bake into a ſtone the *fæces* or dregs of the Urine gathered in great plenty in the capacity of the Bladder. The ſtraightneſs of the Ureters and urinary paſſage may be accounted as an aſſiſtant cauſe: For by this means the thinner portion of the Urine floweth forth, but that which is more feculent and muddy being ſtaid behind, groweth as by ſcale upon ſcale, by addition and collection of new matter into a ſtony maſs. And as a wick often times dipped by the Chandler into melted Tallow, by the copious adheſion of the tallowy ſubſtance preſently becomes a large Candle; ſo the more groſs and viſcid *fæces* of the Urine ſtay as it were at the barrs of the gathered gravel, and by their continual appulſe are at length wrought and faſhioned into a true ſtone.

The Cauſe.

CHAP. XXXV.

Of the Signs of the Stone in the Kidnies and Bladder.

Why the thigh is numb in the Stone of the Reins.

THe ſigns of the Stone in the Reins, are the ſubſiding of red or yellow Sand in the Urine, a certain obſcure itching at the Kidnies, and the ſenſe of a weight or heavineſs at the loins, a ſharp and pricking pain in moving or bending the body, a numbneſs of the thigh of the ſame ſide, by reaſon of the compreſſion cauſed by the ſtone, of the nerves deſcending out of the *Vertebræ* of the loins of the thigh. But when the ſtone is in the Bladder, the fundament and whole *perinæum* is preſſed as it were with a heavy weight, eſpecially if the ſtone be of any bigneſs, a troubleſom and pricking pain runs to the very end of the Yard, and there is a continual itching of that part, with a deſire to ſcratch it: hence alſo by the pain and heat there is a tenſion of the Yard, and a frequent and needleſs deſire to make water, and ſometimes their urine cometh from them drop by drop. A moſt grievous pain torments the Patient in making water, which he is forced to ſhew by ſtamping with his feet, bending of his whole body, and the grating of his teeth. He is oft-times ſo tormented with exceſs of pain, that the *Sphincter* being relaxed, the right gut falleth down, accompanied with the ſwelling heat and pain of the *Hemorrhoid* veins of that place. The cauſe of ſuch torment is the frequent ſtriving of the bladder to expel the ſtone wholly contrary to the nature thereof, whereto by ſympathy the expulſive faculty of the guts and all the parts of the belly come as it were for ſupply. The ſediment of the Urine is groſs and viſcid, and oft-times like the whites of Eggs, which argueth the weakneſs of the native heat not attenuating the juices. The Patient looketh of a pale and yellowiſh complexion and hollow-eyed, by reaſon of the almoſt continual watching which is cauſed by the bitterneſs of pain; yet may it more certainly be known by putting in or ſearching with a *Catheter*. Which to do, the Patient ſhall be wiſhed to ſtand with his body ſomewhat ſtooping, leaning againſt ſomewhat with his back, and holding his knees ſome foot aſunder. Then the *Catheter* being bigger or leſſer, as the body ſhall require, and anointed with oil or butter, ſhall be thruſt with a skilful hand into the paſſages of the Urine, and ſo into the capacity of the bladder. But if the *Catheter* cannot come to that capacity, the Patient ſhall be placed in ſuch a poſture; then ſhall he be laid upon his back on a bench, or the feet of a bed, with his knees bended, and his heels drawn to his buttocks, after which manner he muſt almoſt lie when he is to be cut for the ſtone, as ſhall be ſhewn hereafter. For thus the *Catheter* is more eaſily thruſt into the Bladder, and ſhews there is a ſtone by the meeting and obſcure ſound of the obvious, hard and reſiſting body. You muſt have ſundry *Catheters*, that they may ſerve for every body bigger and leſſer, and theſe muſt be crooked, ſmooth and hollow. When being thruſt into the urinary paſſage (which before unawares I omitted) they come to the neck of the bladder, they muſt not be thruſt ſtraight into the bladder; but taking hold of the Yard with the left hand, they muſt be gently thruſt with the right directly into the bladder, eſpecially in men, by reaſon of the length and crookedneſs of the way, which tends in the form of this letter *S*. It is not ſo in women by reaſon of the ſhortneſs and ſtraitneſs of the neck of the bladder. It is fit your *Catheters* be hollow or fiſtulous in manner of a pipe, that they may receive a ſilver Wiar or String, that may hinder the groſs and viſcid humour, clotted bloud, or the like, from ſtopping the further end of the *Catheter*, through which the ſuppreſſed Urine ought to paſs and be made. But now as ſoon as we perceive that the *Catheter* is come into the capacity of the bladder, the Wiar muſt be drawn forth, that ſo the Urine may the freelier flow out by the hollowneſs of the *Catheter*. You may perceive the ſhapes of theſe inſtruments by this following Figure.

Signs of the Stone in the Bladder.

Why ſuch as have a ſtone in the Bladder are troubled with the falling of the Fundament.

How to ſearch for the Stone in the Bladder with a *Catheter*.

The Figure of the neck of the Bladder is different in Men and Women.

CHAP. XXXVI.

Prognoſticks in the Stone.

WHen the Stone is caſt forth of the Kidney (whereas it bred by little and little) and is ſo driven into one of the Ureters, that it wholly ſtop it, yet thereupon there followeth no ſuppreſſion of the Urine; for ſeeing Nature hath made divers parts of our body double, all the Urine floweth into the other Ureter: But if they ſhall be both ſtopped with ſtones, there is no doubt but the Urine will be wholly ſuppreſt, and death enſue by the ſuffocation and extinction of the native heat, by the Urine flowing back by the rivelets of the Veins over all the whole body. Such as have a ſmall ſtone caſt forth of their Reins into the cavity of the Ureters, until this ſtone be fallen into the Bladder, have cruel pain with gripings, with often deſire to go to ſtool and make water, but oft-times do neither; For ſuch oft-times have their bellies diſtended with flatulencies: an argument hereof is their continual belching or breaking of wind: But by ſneezing and coughing, or any other conceſſion of the whole body, a pricking pain is forthwith felt, whereas the ſtone ſtops, eſpecially if it be either rough, or have ſharp points like horns. This pain is communicated to the hip and thigh by ſympathy, and ſome have the ſtones drawn up as it were with great violence. To theſe may be added the Colick, cholerick vomiting, and almoſt a general ſweat. The ſtone in the Kidnies is moſt commonly bred in ſuch as are ancient, by reaſon of the weakneſs of the expulſive faculty: But the ſtone in the Bladder happeneth to ſuch as are more young, becauſe the native heat is more vigorous in ſuch, and ſtrong and inordinate motions increaſe the ſtrength of the expulſive faculty. When the ſtone is in the bladder, and the Urine appeareth bloudy, it is the ſign of a ſmall, as alſo a prickly and rough ſtone, for thus it more eaſily entereth into the neck of the bladder, and exulcerateth it being fleſhy, whence the bloud cometh away with the Urine, and moſt cruel pain, as of needles thruſt into the fleſh, eſpecially after labour and much exerciſe: on the contrary, a large and more ſmooth ſtone will not cauſe ſuch tormenting pain, and it cauſeth a milky water. The ſhapes of ſtones in the kidnies are various, according to the variety of the ſtrainers through which they paſs whileſt they are bred. Verily I have ſeen ſtones which repreſented the figure of Gray-hounds, Hogs, and other Creatures, and things wholly contrary to mans nature, by the production of their prickles, and as it were branches. Some are four-ſquare, others longiſh and like a finger, other-ſome of a round figure with many protuberancies like a Pine-apple kernel; neither is the variety leſs in magnitude, number, and colour; for ſome are yellowiſh, others whitiſh, red, aſh-coloured, or ſome other like, according to the various temper of the affected bodies. The ſtones of cholerick and lean men uſually concrete by preternatural heat and drineſs; but thoſe of phlegmatick or fat bodies, of a certain congelation as it were, and obſtruction of the paſſages. A ſtone falling ſometimes from the bottom of the bladder into the paſſages of the Urine quite ſtops it up, and thence followeth a total ſuppreſſing of the Urine. Therefore then the Patient ſhall be placed upon his back and his legs being lifted up on high, he ſhall be ſhaken and toſſed up and down juſt as one would ſhake up a ſack to fill it; for thus it is forced back into the Bladder from whence it came, from the paſſage of the Urine whereinto it was got, yet it may alſo be forced back by thruſting in a *Catheter*. The pain which afflicteth ſuch as have the ſtone is ſomewhiles continual, yet more frequently it cometh by fits and returns, ſometimes monethly, otherwhiles yearly. Such as have the ſtone in the Kidnies make for the moſt part wateriſh Urine. Women are not ſo ſubject to the Stone as men, for they have the neck of their bladder more ſhort and broad, as alſo more ſtraight; wherefore the matter of the Stone by reaſon of the ſhortneſs of the paſſage is evacuated in gravel, before it can be gathered and grow into a ſtone of a juſt magnitude; yet ſtones breed in ſome Women, and thoſe equally as big as in Men, and therefore they are to be cured by ſection and the like remedies. When the ſtone exceedeth the bigneſs of an Egg, it can ſcarce be taken away without tearing of the Bladder; whence happeneth an unvoluntary ſhedding of the Water, curable by no Art, becauſe the bladder, ſeeing it is nervous and without bloud,

How death may enſue by the ſuppreſſing of Urine.

Why ſtones of the Kidnies have ſundry ſhapes.

Why men are more ſubject to the ſtone then Women.

What ſtones cannot be taken out of the Bladder without killing the Patient.

bloud, being once torn admitteth no conſolidation: add hereto that inflammation and a gangrene often following the rending of the Bladder, brings inevitable death. The Patient runs the ſame hazard, if a long ſtone be pulled out ſidewiſe with your Inſtrument, or if it be incloſed in a membrane (which kind of ſtone can ſcarce be found with a Catheter) and ſo be faſtned to the Bladder, or otherwiſe if the ſtone it ſelf be faſtned into the ſubſtance of the Bladder; or laſtly, if by any chance the Surgeon being about to pluck out the ſtone, ſhall hurt the body of the Bladder with his Inſtruments. Yet ſtones of a more indifferent bigneſs are more ſafely extracted out of the Bladder then thoſe which are leſs, and the Patient more frequently and happily recovereth; For they do not ſcape from the Inſtrument, and the Patient being uſed a long while to endure pain, as that which hath been a long time a growing, doth more eaſily and conſtantly away with the inflammation, pain and other ſymptoms which happen after cutting, yea in cutting. Having thus ſpoken of the Cauſes, Signs, Places, Symptoms, and Prognoſticks, we muſt come to the Cure, beginning with that part which is termed *Prophylactice*, that is the preventing part.

CHAP. XXXVII.

What Cure is to be uſed when we fear the Stone.

What Diet ſuch muſt uſe as fear the Stone.

Diet muſt firſt be appointed, which by the convenient uſe of the ſix things Not Natural (as they term them) may heap up ſmall ſtore of groſs, tough and viſcid humours in our bodies. Therefore cold and cloudy air is to be ſhunned. They muſt abſtain from Fiſh, Beef, Pork, Water-fowl, Pulſe, Cheeſe, Milk-meats, fried and hard Egs, Rice, Cakes and all Paſtry, unleavened Bread, and laſtly, all manner of obſtructing meats. Alſo Garlick, Onions, Leeks, Muſtard, Spices, and laſtly, all things which over-heat the bloud and humours muſt be ſhunned, eſpecially if you fear that the ſtone is concrete by the heat of the reins. Standing and muddy Waters, thick, and troubled Wines, Beer, and ſuch kind of Liquors muſt be eſchewed. Satiety in meats and drinks is to be ſhunned, as that which breeds crudities. Alſo long watching and continual labour becauſe they inflame the bloud, cauſe crudities and preternatural heat, muſt carefully be eſchewed, as alſo more vehement paſſions of the mind. If the body be plethorick, then it muſt be evacuated by Phlebotomy, Purging, and Vomiting, which is accounted for a ſingular remedy for the prevention of this diſeaſe. For the performance of all which things a Phyſician ſhall be conſulted with. But becauſe Phyſicians are not in every place and always at hand, I have thought good to ſet down theſe following Medicins; yet we muſt firſt remember this Counſel of *Galen*; the uſe of Diureticks and ſtrong purging Medicins is hurtful, as often as there is inflammation in the reins and bladder, for ſo the conflux of the humours to the affected parts is the greater, whence the inflammation and pain are increaſed.

*Lib.*13.*Method.*

Wherefore firſt uſing relaxing Medicins, as ſix drams of *Caſſia* newly drawn, with ℈ iv. of *Rubarb* in Powder mixed therewith, then lenitive and refrigerating Medicins ſhall be inwardly and outwardly uſed, ſuch as is this following ſyrup. ℞ *Summitatum malv. biſmal. & violar. an.* m. ß. *rad. alth.* ʒ j. *glycyr.* ʒ ß. 4. *ſem. frigid. major. an.* ʒ j. *fiat decoctio.* ℞ *prædict. decoctionis* ℔ ß. *in colatura diſſolv. ſacc. albiſſ.* ʒ ij. *mellis albi* ʒ j. ß. *fiat ſyrupus ſecund. artem*; let the Patient uſe this often. This following Apozeme is alſo very effectual for the ſame purpoſe. ℞ *Rad. aſpar. gramin. polyp. quercini, paſſul. mund. an.* ʒ ß. *betonic. herniar. ægrimon. omnium capill. & pimpinel. an.* m. ß. 4. *ſem. frigid. major. & ſem. fœnic. an.* ʒ j. *folior. ſen.* ʒ vj. *fiat decoct. ad* ℔ ß, *in colatura diſſolve ſyrupi de Althæa & de herniar. an.* ʒ j. ß. Make a clear Apozeme and let it be aromatized with a little Cinnamon, for two doſes; let him take the firſt doſis in the morning two hours before meat, and the other at four of the clock in the afternoon. Moreover this following broth hath an excellent and certain power to prevent the ſtone. ℞ *Hordei integr.* p. j. *radic. petroſelini, acetoſ. fœnic. cichor. bruſci an.* ʒ j. 4. *ſem. frigidorum conquaſſatorum an.* ʒ ß. *fol. acetoſ. portul. lactucæ, ſummitatum malvæ, & violar. an.* m. ß. *bulliant in aqua fluviatili cum gallo gallinaceo & crure vitulino*; let the broth be kept, and let the Patient take thereof ſix ounces for four days, in the morning two hours before meat, with an ounce of the juice of Citrons gently warmed with the ſame broth at the taking thereof: for thus, much urine will be made in a ſhort while after, full of a ſandy ſediment and a groſs viſcid humor. Whereby you may certainly gather, that this kind of broth is very effectual to cleanſe the paſſages of the Urine, neither in the interim doth it any harm to the ſtomach and other parts by which it paſſeth: ſo that it may be rightly termed a Medicinal nouriſhment. You may alſo profitably uſe this following Powder. ℞ *Nucleorum meſpilorum* ʒ j. *pul. elect. diamarg. frig.* ʒ ij. 4. *ſem. frig. major. mund. glycyrrhizæ razæ,* ʒ j. *ſem. ſaxifrag.* ʒ ij. ℈. *ſem. milii ſolis geniſt. pimpin. bruſci & aſparag. an.* ℈ j. *ſem. altheæ,* ʒ ß. *ſacch. albiſſ.* ʒ vj. *fiat pulvis*; let him take a ſpoonful in the morning three hours before meat. Alſo ſome think that Lee made of the ſtalks and huſks of Beans is a good preſervative againſt this Diſeaſe. Beſides the uſe of this following Clyſter hath done good to many. ℞ *Fol. lactuc. ſcariol. portul. an.* m. j. *flor. viol. & nenuph. an.* p. j. *fiat decoctio ad* ℔ j. *in colatura diſſolve caſſiæ fiſtulæ* ʒ i. *mellis viol. & ſacc. rub. an.* ʒ j. ß. *olei viol.* ʒ iv. *fiat clyſter.* This which followeth is the fitter to aſſwage the pain. ℞ *Flor. cham. melil. ſummitat. aneth. berul. an.* p. ij. *fiat decoctio in lacte vaccino, in colatura diſſolve caſſiæ fiſtul. & ſaccar. alb. an.* ʒ j. *vitellos ovorum num.* ij. *olei anethini, & chamæm. an.* ʒ ij. *fiat clyſter.* In the interim let the Kidnies be anointed on the outſide with *unguentum roſatum, refrigerans Galeni* and *populeon* uſed ſeverally or mixed together, laying a double linnen cloth dipped in oxycrate. But if the concretion of the ſtone be of a cold cauſe, the remedies muſt be varied, as follows: ℞ *Terebinth. venet.* ʒ j. *cort. citri.* ʒ ij. *aquæ coct.* ʒ ij. *fiat potio.* Or elſe, ℞ *Caſſiæ recent. extract.* ʒ vj. *benedict. lax.* ʒ iij. *aq. fœnic.* ʒ ij. *aq. aſparag.* ʒ j. *fiat potio*; let him take it three hours before dinner. This following Apozeme is alſo good. ℞ *Rad. cepet. bardan. & gram. an.* ʒ iij. *biſmal. cum toto, beton. an.* m. ℈. *ſem. milii ſolis bard. utrio an.* ʒ ij. *ſem. melon. glycyrrhiz. raſ. an.* ʒ ij. ß. *ficus num.* 4. *fiat decoct. ad quart.* iij. *in expreſſa colatura, diſſolve ſyrup. de raphan. & oxymelitis ſcyllitici an.* ʒ j. ℈. *ſacchar. albiſſ.* ʒ iv. *fiat*

Carminative Clysters.

CHAP. XXXVIII.

What is to be done when the stone falleth out of the Kidnies into the Ureter.

OFt-times it falleth out that the reins using their expulsive faculty, force down the stone (whose concretion and generation the Physicians by the formerly prescribed means could not hinder) from themselves into the Ureters; but it stayeth there either by reason of the straightness of the place, or the debility of the expulsive faculty. Therefore then cruel pain tormenteth the Patient in that place whereas the stone sticketh, which also by consent may be communicated to the Hip, Bladder, Testicles, and Yard, with a continual desire to make Water and go to Stool. In this case it behoveth the Physician that he supply the defect of Nature, and assist the weak endeavours.

Signs of the stone stopping in the ureter.

Therefore let the Patient, if he be able, mount upon a trotting Horse, and ride upon him the space of some two miles, or if he can have no opportunity to do so, then let him run up and down a pair of stairs, until he be weary, and even sweat again; for the stone by this exercise is oft-times shaken into the Bladder; then presently shall be given or taken by the mouth such things as have a lenitive and relaxing faculty, as Oil of Sweet Almonds newly drawn, and that without fire, and mixed with the Water of Pellitory of the Wall and White Wine. Let frictions of the whole body be made from above downwards with hot cloths; let Ventoses with a great flame be applied one while to the loins, and another while to the bottom of the belly, a little below the grieved place; and unless the Patient vomit of his own accord, or by the bitterness of his pain, let vomiting be procured with a draught of Water and Oil luke-warm; for vomiting hath much force to drive down the stone by reason of the compression of the parts, which is caused by such an endeavour. Lastly, if the stone descend not by the power of these remedies, then the Patient must be put into a *Semicupium*, that is, a Half-bath, made of the following decoction. ℞ *Malvæ, bismal. cum toto an.* m. ij. *beton. nasturt. saxifrag. berul. parietar. violar. an.* m. iij. *sem. melonum, milii solis, alkekengi an.* ʒ vj. *cicer. rub.* ℔ j. *rad. apii. gram. fœniculi, & eringii. an.* ℥ iv. *in sufficienti quantitate aquæ pro incessu; coquantur ista omnia inclusa sacco:* herein let the Patient sit up to the Navel, neither is it fit that the Patient tarry longer in such a bath than is requisite, for the spirits are dissipated, and the powers resolved by too long stay therein. But on the contrary, if the Patient remain as long as is sufficient in these rightly made, the pain is mitigated, the extended parts relaxed, and the passages of the Urine opened and dilated, and thus the stone descendeth into the bladder. But if it be not moved by this means any thing at all out of the place, and that the same total suppression of Urin does as yet remain, neither before the Patient entered into the bath the putting of a *Catheter* into the bladder did any thing avail, yet notwithstanding he shall try the same again after the Patient is come out of the bath, that he may be throughly satisfied whether peradventure there may be any other thing in these first passages of the yard and neck of the bladder, which may with-hold the Urine; for the *Catheter* will enter far more easily, the parts being relaxed by the warmness of the bath: then inject some Oil of Sweet Almonds with a Syringe into the *Urethra* or passage of the yard; whilest all these things are in doing, let not the Patient come into the cold air. But I have thought good to describe a Chair for a Bath, wherein the Patient may fitly sit, as you may see in the following Figure.

Remedies to force down the stone sticking in the ureter.

A Decoction for a Bath.

There may also be another decoction made for the bath, as thus: ℞ *Rad. raph. alth. an.* ℔ ij. *rad. ruse. petrosel. & asparag. an.* ℔ j. *cumin. fœnicul. ameos an.* ℥ iv. *sem. lini, fœnug. an.* ʒ vj. *fol. marrub. parietar. florum chamæm. melil. anethi, an.* m. ij. *bulliant omnia secundum artem in aquæ sufficienti, & vini albi odoriferi exigua quantitate ad consumptionem tertiæ partis pro Semicupio.* Also the same decoction may be used for Clysters, adding thereto two yolks of Egs, and four ounces of Oil of Lillies, with ʒ j. of Oil of Juniper, which hath a certain force to assuage the pain of the Stone and Collick. But a far less quantity of the decoction in a Clyster must be used in these diseases, than usually is appointed in other diseases; otherwise there will be danger lest the guts being distended, should more press upon the kidnies and ureters, troubled in some sort with inflammation, and so increase the pain and other symtoms. This following Cataplasm shall be profitably applied to the grieved place, to wit, the loins, or flanks, and bottom of the belly, for it is very powerful to assuage pain, and help forwards the falling down of the stone. ℞ *Rad. alth. & raphani, an.* ʒ iv. *pariet. fœnic. senecionis, nasturt. berul. an.* m. j. *herniariæ* m. ß. *omnibus in aqua sufficienti decoctis, & deinde contritis, adde olei aneth. chamæm. & pingued. cuniculi,*

An anodyne Cataplasm.

Signs of the Stone fallen out of the ureters into the bladder.

cuniculi, an. ℥ ij. *farin. cicer. quantum ſufficit, fiat cataplaſma ad uſum prædictum.* After, by theſe means, the ſtone forced out of the ureter is fallen into the bladder, the pain preſently (if there be but one ſtone, for ſometimes more with much gravel do again fall into the ureter) is mitigated, and then the Patient is troubled with an itching and pricking at the end of his Yard and Fundament. Therefore then unleſs he be very weak, it is fit that he ride and walk afoot, and take ʒ iv. of *ſpecies Lithontribon* in four doſes with white Wine, or the broth of red Cicers three hours before dinner and ſupper. Beſides, let him plentifully drink good Wine, and after he hath drunk, let him hold in his Urin as long as he can; that ſo it being gathered in great plenty, it may preſently thruſt the ſtone out of the bladder with the more force: for which purpoſe you may alſo inject the following liquor into the bladder. ℞ *Syrupi capill. ven.* ʒ j. *aquæ alkekengi* ʒ iij. *oleo ſcorpionum* ʒ β. Let it be injected into the bladder with a ſyringe.

The Figure of a Chair for a Semicupium.

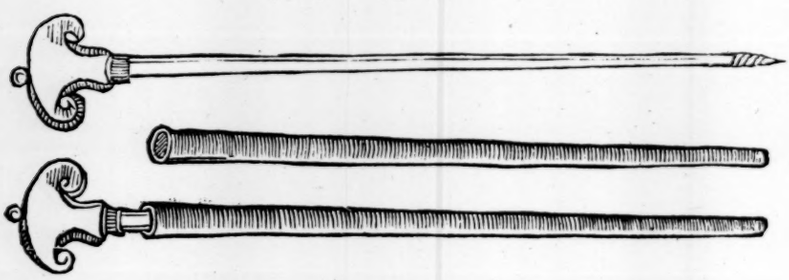
E *A Funnel whereby to pour in warm water.*

CHAP. XXXIX.

What muſt be done to the Stone being fallen into the neck of the Bladder, or paſſage of the Yard.

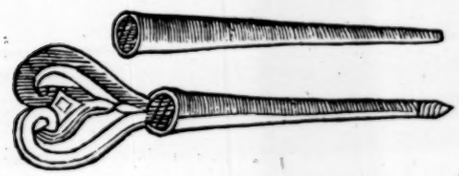
After the ſtone is fallen out of the capacity of the Bladder, and ſtops in the neck thereof, or paſſage of the Yard, the Surgeon ſhall have a ſpecial care that he do not force or thruſt back the ſtone from whence it came, but rather that he preſs it gently with his fingers to the end of the Yard, the paſſage being firſt made ſlippery by injecting ſome Oil of Sweet Almonds. But if it ſtop in the end of the *Glans*, it muſt be plucked out with ſome crooked inſtrument; to which if it will not yield a Gimblet with a Pipe or caſe thereto, ſhall be put into the paſſage of the Yard, and ſo it ſhall be gotten out, or elſe broken to pieces by the turning or twining about of the Gimblet, which I remember I have divers times attempted and done; for ſuch Gimblets are made with ſharp Screws, like ordinary Gimblets.

The delineation of a Gimblet made to break the ſtones in the paſſage of the Yard, together with its Pipe, or Caſe.



CHAP.

The effigies of another lesser Gimblet.



Verily what Gimblets soever are made for this business, their body or point must be no thicker than a small *Probe*; lest whilest they are forced or thrust into the *Urethra*, or urinary passage, they might hurt the bodies next unto them by their violent entrance.

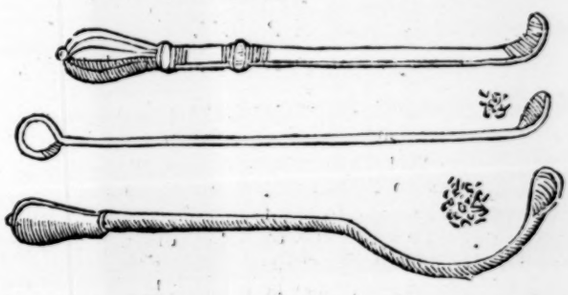
CHAP. XL.

What course must be taken, if the stone sticking in the Urethra, *or urinary passage, cannot be gotten out by the fore-mentioned Arts.*

BUt if the stone be more thick, hard, rough and remote from the end of the Yard, than that it may be gotten out by the means formerly mentioned in the precedent Chapter, and if that the urin be wholly suppresst therewith; then must you cut the Yard upon the side with a straight wound: for you must not make incision on the upper part, for fear of a flux of bloud, for a large vein and artery lieth thereunder; nor in the lower part, for so it would scarce ever heal again, for that it is a bloudless part, and besides, the continual and acrid falling of the urine would hinder the agglutination: wherefore the incision must be made on the side, on that part whereas the stone most resists and swells out. For that part is the more fleshy; yet first the end of the skin of the prepuce must be much drawn up so to cover the *Glans*, which being done, the *Urethra* shall be tied with thred a little above the stone, that so the stone may be staid there, and may not fall back again. Therefore then, incision being made, the stone must be taken forth, and the skin which was drawn more violently to cover the *Glans*, is to be let go back again; for so it will come to pass that a whole part of the skin may cover the cut Yard, and so it may be the more speedily united, and the urin may naturally flow out. I have by this means oft-times taken forth the stone with the instruments here delineated.

When the Yard may be safely cut.

Instruments fit to take the stone forth of the opened Urethra, *or urinary passage of the Yard.*



Then for the agglutination, if need require, it will be requisit to sew up the lips of the wound, and apply this agglutinative Medicin following. ℞ *Tereb. venet.* ℥ iv. *gum. elemi*, ℥ j. *sang. dracon. & mastic. an.* ʒ ß. *fiat medicamentum ut dictum est:* then the whole Yard must be covered over with a repercussive Medicin made of the whites of Eggs, with the Powder of Bole Armenick, Aloes, *farina volatilis*, and Oil of Roses. Lastly if need so require, a Wax-candle, or Leaden string anointed with Venice Turpentine shall be thrust into the *Urethra*, to hasten the agglutination, and retain the natural smoothness and straightness of the urinary passage, lest peradventure a caruncle grow therein.

An agglutinative medicin.

How to hasten the agglutination.

CHAP. XLI.

What manner of Section is to be made when a stone is in a Boys Bladder.

HItherto we have shewed, by what means it is convenient to draw small stones out of the Ureter, Bladder, and passage of the urin; now will we briefly shew the manner of taking of greater stones out of the bladder, which is performed by incision and iron instruments, and I will deliver the practice thereof first in children, then in men, and lastly in women. First therefore let the Surgeon take the Boy (upon whom it is determined the work shall be performed) under the arm-holes, and so give him five or six shakes, that so the stone may descend the more downwards to the neck of the bladder. Then must you cause a strong man, sitting upon an high seat, to lay the child upon his back with his face from him-ward, having his hips lying upon his knees. The child must lie somewhat high, that he may breath the freelier, and let not the nervous part be too much stretched, but let all parts be loose and free for the drawing forth of the stone. Furthermore, it is fit that this strong man, the childs legs being bended back, wish the child, that putting his legs to his hams, that he draw them up as much as he can, and let the other be sure he keep them so; for this site of the child much conduceth to well performing of the work. Then let the Surgeon thrust two of the fingers of his left hand as far into the childs Fundament as he is able; but

Why the Boy must be shaken before cutting.

How to place the child before dissection.

let him with his other hand preſs the lower belly, firſt wrapping a cloth about his hand, that ſo the compreſſion may be the leſs troubleſom, and leſt inflammation ſhould happen rather by this means than by the inciſion. Now the compreſſion hath this uſe, to cauſe the ſtone to deſcend out of the bottom of the Bladder into the neck thereof under the *os pubis*, whither after it is arrived, it muſt be there kept, and as it were governed by the command of your hand, leſt it ſhould ſlide from that place whereto you have brought it. Theſe things thus done, nothing now remaineth, but that the Surgeon, with a wound ſome two fingers bredth diſtant from the Fundament, cut through all the fleſh even to the ſtone on the left ſide of the *Perinæum*. But in the *interim*, let him beware that he hurt not the *inteſtinum rectum*; for it may, and uſually doth happen, that whileſt the ſtone is brought out of the bottom of the bladder to the neck thereof, this gut is doubled in: now if it be cut with your inciſion-knife, it cometh to paſs that the excrements may ſometimes come out at the wound, and the urin by the fundament, which thing hath in many hindred the agglutination and conſolidation of the wound; yet in ſome others it hath done little harm, becauſe in this tender age many things happen which may ſeem to exceed Nature: the inciſion being made, the ſtone muſt be plucked forth with the inſtrument here expreſſed.

Where to divide the *perinæum*.

Nature very powerful in children.

Hooks to pull ſtones forth of Childrens Bladders.

The ſtone being drawn out, a ſmall pipe ſhall be put into the wound, and there kept for ſome ſpace after, for reaſons hereafter to be delivered; then his knees ſhall be bound together, for thus the wound will the ſooner cloſe and be agglutinated. The reſidue of the Cure ſhall be performed by reducing the general Cure of Wounds to the particular temper of the childs age, and the peculiar nature of the child in cure.

General Rules muſt be reduced to particular bodies.

CHAP. LII.

How to cut men for the taking out of the Stone in the Bladder.

What to be done before diſſection.

SEeing we cannot otherwiſe help ſuch men as have ſtones in their Bladders, we muſt come to the extreme remedy, to wit, Cutting. But the Patient muſt firſt be purged, and if the caſe require, draw ſome bloud; yet muſt you not immediately after this, or the day following haſten to the work: for the Patient cannot but be weakned by purging and bleeding. Alſo it is expedient for ſome days before to foment the Privities with ſuch things as relax and ſoften, that by their yielding, the ſtone may the more eaſily be extracted. Now the Cure is thus to be performed. The Patient ſhall be placed upon a firm Table or Bench with a cloth many times doubled under his buttocks, and a Pillow under his loins and back, ſo that he may lie half upright with his thighs lifted up, and his legs and heels drawn back to his buttocks. Then ſhall his feet be bound with a ligature of three fingers bredth caſt about his ankles, and with the heads thereof being drawn upwards to his neck, and caſt about it, and ſo brought downwards, both his hands ſhall be bound to his knees, as the following figure ſheweth.

How to lay the Patient.

The Figure of a man lying ready to be cut of the Stone.

The Patient thus bound, it is fit you have four ſtrong men at hand; that is, two to hold his arms, and other two who may ſo firmly and ſtraightly hold the knee with one hand and the foot with the other, that he may neither move his limbs, nor ſtir his buttocks, but be forced to keep in the ſame poſture with his whole body. Then the Surgeon ſhall thruſt into the urinary paſſage even to the bladder a ſilver or iron and hollow Probe anointed with Oil, and opened or ſlit on the outſide, that the point of the knife may enter thereinto, and that it may guide the hand of the Workman, and keep the knife from piercing any further into the bodies lying there-under. The Figure of this Probe is here expreſt.

Why the Probe muſt be ſlit on the outſide.

Probes

Probes with ſlits in their ends.

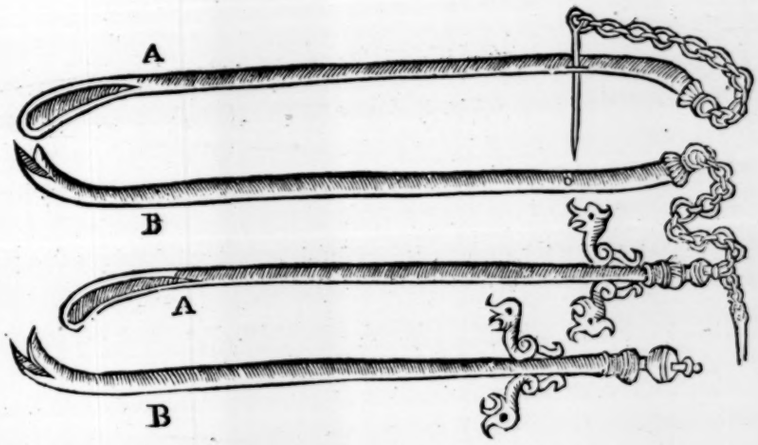
He ſhall gently wreſt the Probe, being ſo thruſt in, towards the left ſide, and alſo he who ſtandeth on the Patients right hand, ſhall with his left hand gently lift up his cods, that ſo in the free and open ſpace of the left ſide of the *Perinæum*, the Surgeon may have the more liberty to make the inciſion upon the Probe, which is thruſt in and turned that way. But in making this inciſion, the Surgeon muſt be careful that he hurt not the ſeam of the *Perinæum* and Fundament. For if that ſeam be cut, it will not be eaſily conſolidated, for that it is callous and bloudleſs, therefore the urin would continually drop forth this way. But if the wound be made too near the Fundament, there is danger leſt by forcible plucking forth of the ſtone he may break ſome of the hæmorrhoid veins, whence a bleeding may enſue, which is ſcarce to be ſtopped by any means, or that he may rend the ſphincter muſcle, or body of the bladder, ſo that it never can be repaired. Therefore it muſt be made the ſpace of two fingers from the fundament, according to the ſtraightneſs of the fibres, that ſo it may be the more eaſily reſtored afterwards. Neither muſt the inciſion thus made, exceed the bigneſs of ones thumb, for that it is afterwards enlarged by putting in the Crows-beak and the Dilater, but more by the ſtone as it is plucked forth. But that which is cut, is neither ſo ſpeedily nor eaſily healed up as that which is torn. Then preſently put into the wound ſome one of theſe ſilver inſtruments delineated here below, and called by the name of *Guiders*, for that they ſerve as guides to the other inſtruments which are to be put into the bladder; theſe are made with a round and prominent head, whereby it may be put into the deſcribed cavity of the Probe, and they are noted by theſe letters *A A*, then there are others marked with the letters *B B*, and called by the like name, and are to be put under the former, being made forked at the end, that ſo it may, as it were, embrace the end of the former.

Why the ſeam of the *Perinæum* muſt not be cut.

Where to make the wound to take forth the ſtone.

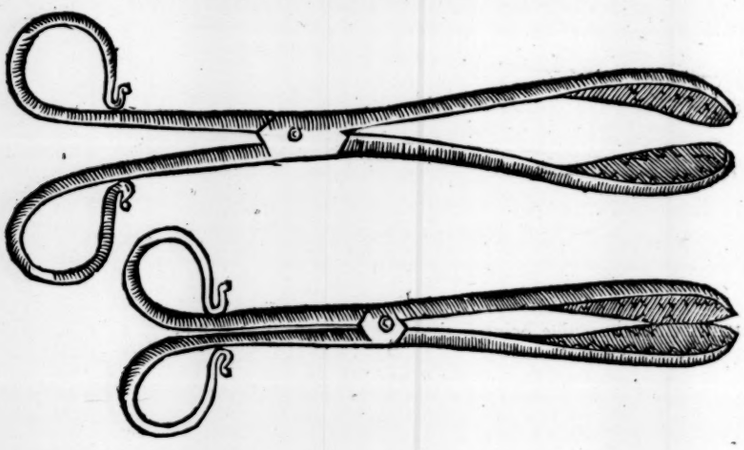
That which is torn ſooner healeth than that which is cut.

The Figures of Guiders of two ſorts.



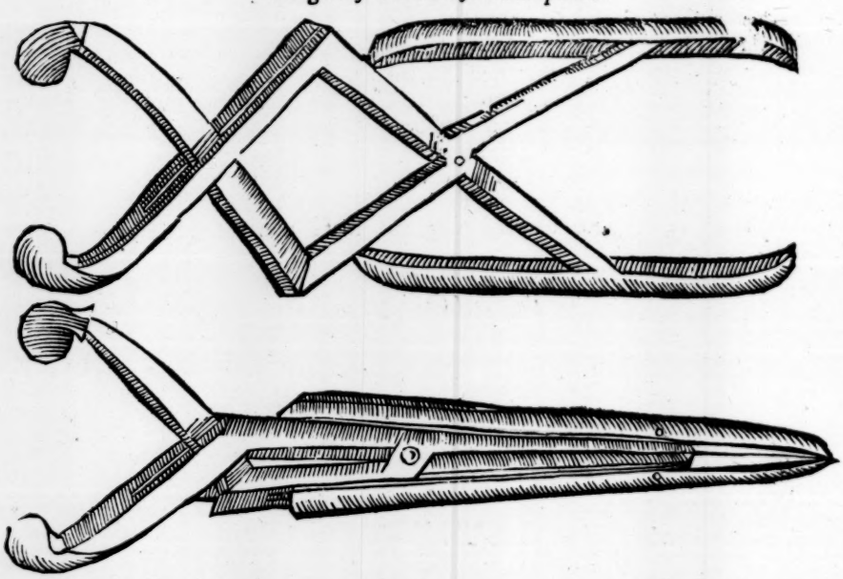
Now the Probe is to be drawn forth, and the Guiders to be thruſt and turned up and down in the bladder, and at length to be ſtaid there by putting in the pin; yet ſuch Guiders as want a Pin are fitter for the hand, and are by ſome called *ſpathæ*. Then muſt they be held betwixt the Surgeons fingers. It will be alſo neceſſary for the Surgeon to put another inſtrument called the Ducks-bill between the two guiders into the capacity of the bladder; he muſt thruſt it in ſomewhat violently, and dilate it ſo thruſt in with both his hands, turning it every way to enlarge the wound as much as ſhall be ſufficient for the admitting the other inſtruments which are to be put into the bladder; yet it is far better for the Patient, if that the wound may with this one inſtrument be ſufficiently dilated, and the ſtone pulled forth with the ſame without the help of any other.

The effigies of an Inſtrument called a Ducks-bill.



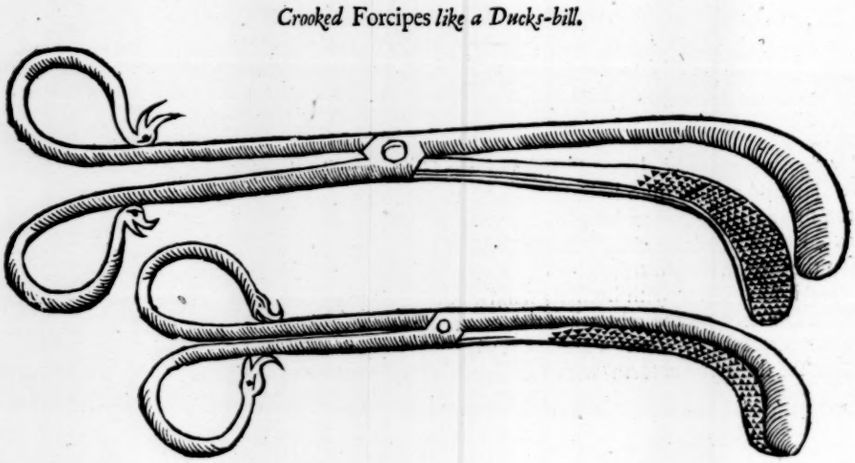
Which if you have not in readineſs, and the largeneſs of the ſtone require more dilatation, then muſt you put in this dilater; for being put into the bladder, and the handle preſſed together, it will dilate the inciſion as much as you deſire.

The Figure of a Dilater ſhut and opened.



The wound by the help of this Inſtrument being dilated as much as is ſufficient, then put in the ſtraight Ducks-bill before deſcribed, or the crooked here expreſt.

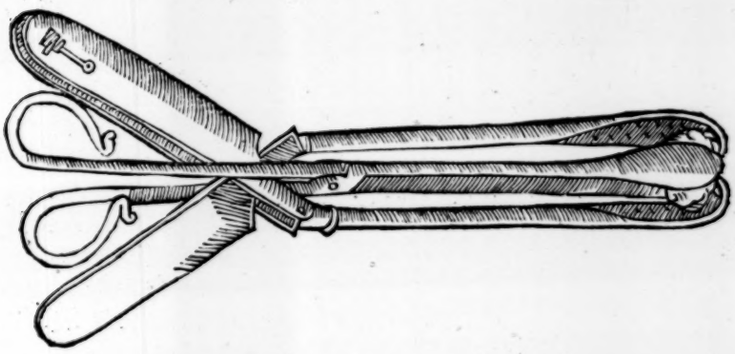
Crooked Forcipes *like a Ducks-bill.*



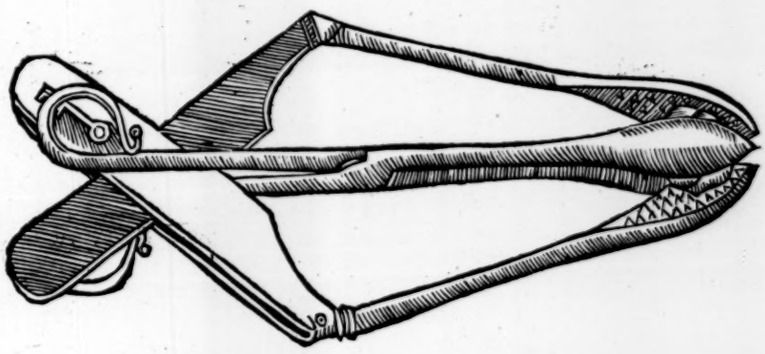
The ſtone may be ſought and taken hold of with theſe Inſtruments, and being taken hold on, the branches of the Inſtrument ſhall be tied together, leſt they ſhould ſuffer that to ſlide away which

which they have once taken hold of. Neither ſhall the ſtone be ſuddenly plucked out, but eaſily ſhaken to and again, and at length gently drawn forth. Yet you muſt beware that you do not preſs it too ſtraitly in the *forceps*, leſt you ſhould break it in pieces: Some, leſt it ſhould ſlip away, when they have once taken hold thereof, put their two fingers into the Fundament, and put them about the ſtone that it may not fall out, nor ſlip back again, which I think conduceth much to the eaſie extraction of the ſtone. There are others who ſtrengthen this comprehenſion by putting in on each ſide above and below theſe winged inſtruments, ſo that the ſtone can ſlip forth on no ſide.

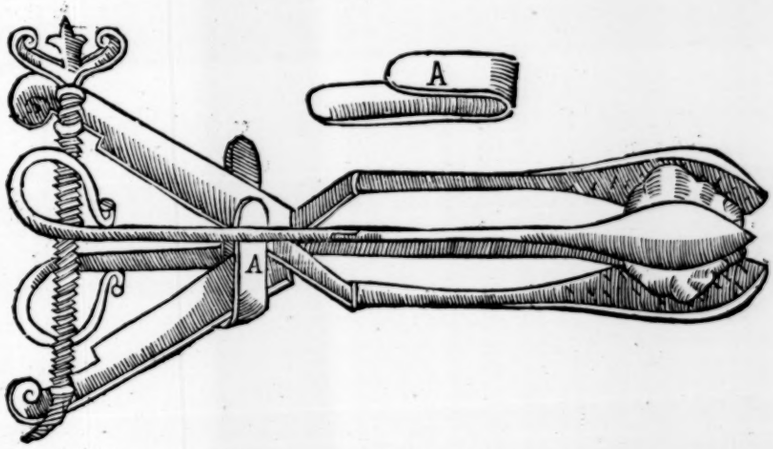
Winged Inſtruments to hold the ſtone with the Ducks-beak.



The Figure of another.

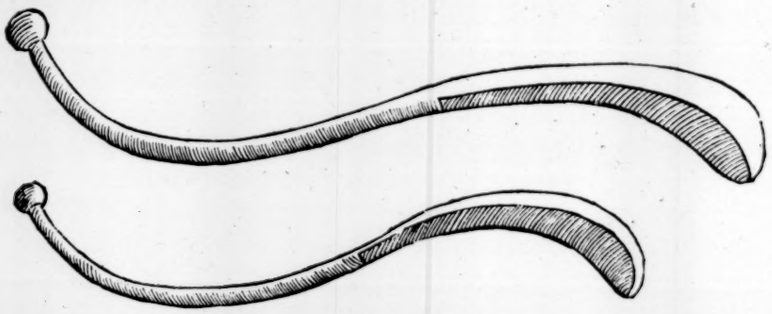


The Figure of another winged Inſtrument, the end of whoſe handle is faſtned by a ſcrue, as alſo a bended iron plate, which is marked with this letter A, *for the firmer holding thereof.*



After the ſtone is by this means drawn forth, obſerve diligently whether it be worn on any ſide, and as it were levigated; for that happeneth by the wearing or rubbing of one or more ſtones upon it; yet there is no ſurer way to know this, than by ſearching with a Catheter. The one end of the following Inſtrument may ſupply the want of a Catheter or Probe, and the other may ſerve for a ſcoop or cleanſer. A note of more ſtones than one.

A Cleanſer or Scoop whereby you may ſearch whether there be any more ſtones behind, as alſo cleanſe or purge the bladder from gravel, clots of bloud, and other ſuch bodies as uſe to remain behind after the drawing forth of the ſtone.



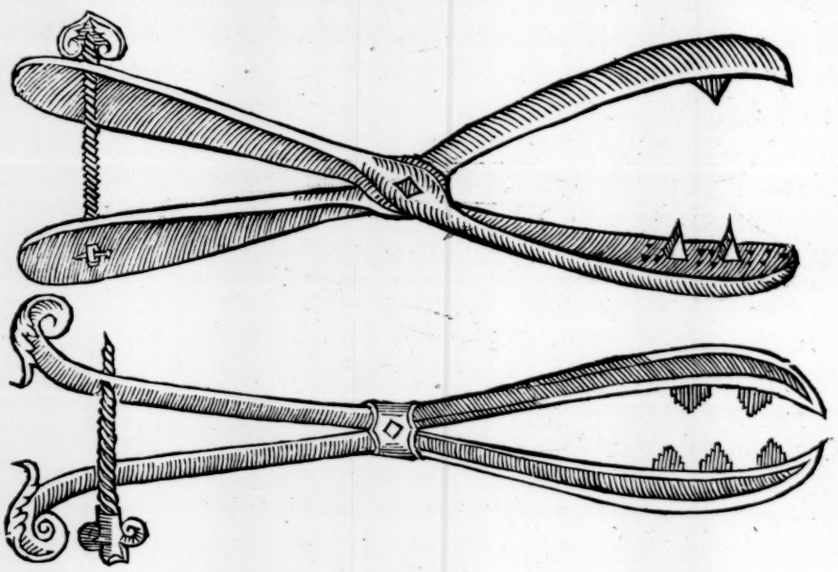
How to cleanſe the bladder.

For if other ſtones remain behind, they ſhall be drawn forth as the former, which being done, the end of the Inſtrument, which is crooked and hollowed like a ſcoop or ſpoon, ſhall be thruſt by the wound into the bladder, and therewith you ſhall gather together and take out what gravel ſoever, clotted bloud, and the like refuſe as ſhall be there, for that they may yield matter for another ſtone.

How to break a ſtone that cannot be taken out whole and at once.

But if you find that the ſtone which is in the bladder be too great, ſo that it may not be plucked forth without great and fearful rending of the bladder, as it will be better to take hold thereof with this Crows bill, and ſo break it to pieces.

The effigies of a toothed Crows-bill made neatly to break greater ſtones, with a Screw to force it together.



This Crows-bill hath onely three teeth, and thoſe ſharp ones on the inſide, of which two are placed above, and one below, which is the middlemoſt, ſo that it falleth between the two upper. When the ſtone is broken, all the pieces thereof muſt be taken forth, and we muſt have a ſpecial care, leſt any piece thereof lie hid, for that in time, increaſed by the acceſs of a tough and viſcous matter, or conjoined with other fragments by the interpoſition of the like matter as glew, may riſe to a ſtone of a large bigneſs.

CHAP. XLIII.

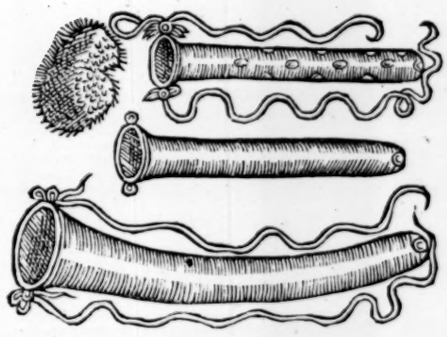
What cure muſt be uſed to the wound, when the ſtone is taken forth.

Of ſewing the wound when the ſtone is taken forth.

THe ſtone being drawn out, if the greatneſs of the wound ſo require, it ſhall have one or two ſtitches with a needle and thred, leaving onely ſo much ſpace as ſhall be ſufficient to put in a pipe for the uſe we ſhall hereafter ſhew; your thred muſt be of crimſon ſilk waxed, and let it not be too ſmall, leſt it by binding ſhould cut aſunder the fleſhy lips of the wound, or rot in a ſhort time, either by the moiſture of the Urin, or matter flowing from the Ulcer. Therefore you ſhall take up much fleſh with the skin in ſewing it, leſt the lips of the wound being torn, your labour prove in vain, and ſo you are forced to trouble the Patient with making a new one. Things being thus performed, a ſilver pipe ſhall be put through the wound into the bladder, whereof I have here given you divers forms, that you may take your choice, and ſo fit them to the wounds, and not the wounds to them, which oft-times in want of inſtruments the Surgeons are forced to do, to the great harm of the Patient.

Silver

Silver Pipes to be put in the Bladder when the ſtone is drawn out.



Theſe muſt have no holes in their ſides (as thoſe here expreſſed) but onely in their ends, that all the matter of the wound, and the filth gathered and concrete in the bladder may flow and be carried forth this way. When clear Urine ſhall begin to flow out of the wound, there ſhall be no more need of a Pipe; therefore if you continue it and keep it longer in the wound, there is ſome danger leſt Nature accuſtomed to that way, may afterwards neglect to ſend the Water through the *Urethra*, or urinary paſſage. Neither muſt you forget to defend the parts near to the wound with the following repercuſſive Medicin, to hinder the defluxion and inflammation, which are incident by reaſon of the pain. ℞ *Album. ovorum, nu.* iij. *pul. boli armeni, ſanguinis dracon. an.* ʒ iij. *olei roſ.* ʒ j. *pilorum leporinum quantum ſufficit:* make a Medicin of the conſiſtence of honey. A repercuſſive Medicin.

CHAP. XLIV.

How to lay the Patient after the Stone is taken away.

ALl things which we have recited, being faithfully and diligently performed, the Patient ſhall be placed in his bed, laying under him as it were a pillow filled with Bran, or Oat Chaff, to drink up the Urin which floweth from him. You muſt have divers of theſe pillows, that they may be changed as need ſhall require. Sometimes after drawing forth of the ſtone, the bloud in great quantity falleth into the Cod, which unleſs you be careful to provide againſt, with diſcuſſing, drying and conſuming Medicins, it is to be feared that it may gangrenate. Wherefore if any accident happen in curing theſe kind of Wounds, you muſt diligently withſtand them. After ſome few days a warm injection ſhall be caſt into the Bladder by the wound, conſiſting of the Waters of Plantain, Night-ſhade, and Roſes, with a little Syrup of dried Roſes. It will help to temper the heat of the Bladder cauſed both by the wound and contuſion, as alſo by the violent thruſting in of the Inſtruments. Alſo it ſometimes happens, that after the drawing forth of the ſtone, clots of bloud and other impurity may fall into the urinary paſſage, and ſo ſtop the Urin that it cannot flow forth. Therefore you muſt in like ſort put a hollow Probe for ſome days into the *Urethra*, that keeping the paſſage open, all the groſſer filth may flow out together with the Urin. Remedies for the Cod, leſt it gangrenate.

CHAP. XLV.

How to cure the Wound made by Inciſion.

YOu muſt cure this wound after the manner of other bloudy wounds, to wit, by agglutination and cicatrization, the filth, or ſuch things as may hinder, being taken away by detergent Medicins. The Patient ſhall haſten the agglutination if he lie croſs-legged, and keep a ſlender diet until the ſeventh or nineth day be paſt. He muſt wholly abſtain from Wine, unleſs it be very weak; in ſtead thereof let him uſe a decoction of Barley and Licoriſh, or Mead, or Water and Sugar, or boiled Water mixed with Syrups of dried Roſes, Maiden-hair, and the like. Let his Meat be Panado, Raiſins, ſtewed Prunes, Chickens boiled with the cold Seeds, Purſlain, Sorrel, Borage, Spinage, and the like. If he be bound in his belly, a Phyſician ſhall be called, who may help it, by appointing either *Caſſia*, a Clyſter, or ſome other kind of Medicins as he ſhall think good. What things haſten the union.

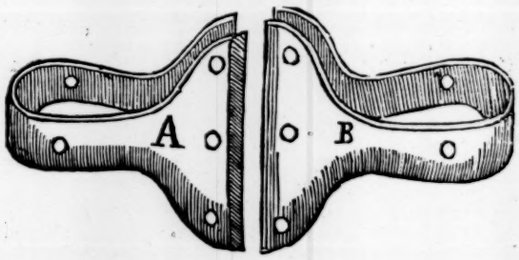
CHAP. XLVI.

What cure is to be uſed to Ulcers, when as the Urine flows through them, long after the ſtone is drawn out.

MAny after the ſtone is drawn out, cannot have the Ulcer conſolidated, therefore the Urin flows out this way continually by little and little, and againſt the Patients will during the reſt of his life, unleſs the Surgeon help it. Therefore the callous lips of the wound muſt be amputated, ſo to make a green wound of an old ulcer; then muſt they be tied and bound with the inſtrument we term a *Retinaculum* or ſtay; this muſt be perforated with three holes, anſwering to three other on the other ſide; Needles ſhall be thruſt through theſe holes, taking hold of much fleſh, and ſhall be knit about it, then glutinative Medicins ſhall be applied, ſuch as are Venice Turpentine, Gum *Elemi*, *Sanguis draconis*, Bole Armenick, and the like; after five or ſix days the Needles ſhall be taken out and alſo the ſtay taken away. For then you ſhall find the Wound almoſt glewed, and there will nothing remain but onely to cicatrize it. How to make a freſh wound of an old ulcer.

The

The Figure of a Retinaculum, *or Stay.*



A *Shews the greater.* B *The leſſer, that you may know that you muſt uſe divers according to the different bigneſs of the Wound.*

What to do in want of a ſtay.

If a *Retinaculum* or Stay be wanting, you may conjoin the lips of the Wound, after this following manner. Put two Quills ſomewhat longer than the Wound, on each ſide one, and then preſently thruſt them through with Needles having Thread in them, taking hold of the fleſh between, as often as need ſhall require, then tying the thread upon them. For thus the Wound ſhall be agglutinated, and the fleſhy lips of the wound kept from being torn, which would be in danger if the needle and thred were onely uſed.

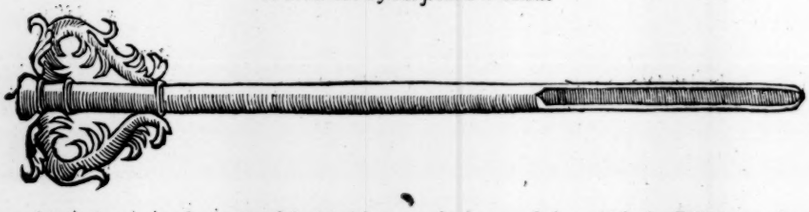
CHAP. XLVII.

How to take ſtones out of Womens bladders.

How to ſearch for the ſtone in Women.

WE know by the ſame ſigns that the ſtone is in a womans bladder as we do in a mans, yet it is far more eaſily ſearched by a Catheter, for that the neck of the bladder is the ſhorter, broader, and the more ſtraight. Wherefore it may not onely be found by a *Catheter* put into the bladder, but alſo by the fingers thruſt into the neck of the Womb, turning them up towards the inner ſide of the *Os pubis*, and placing the ſick woman in the ſame poſture as we mentioned in the cure of men. Yet you muſt obſerve that maids younger than ſeven years old, that are troubled with the ſtone, cannot be ſearched by the neck of the womb, without great violence. Therefore the ſtone muſt be drawn from them by the ſame means as from Boys, to wit, by thruſting the fingers into the Fundament; for thus the ſtone being found out, and the lower belly alſo preſſed with the other hand it muſt be brought to the neck of the bladder, and then drawn forth by the forementioned means. Yet if the riper years of the Patient permit it to be done without violence, the whole work ſhall be more eaſily and happily performed, by putting the fingers into the neck of the Womb, for that the bladder is nearer the neck of the womb than it is to the right gut. Wherefore the fingers thus thruſt in, a Catheter ſhall be preſently put into the neck of the bladder: This Catheter muſt be hollow, or ſlit on the outſide like thoſe before deſcribed but not crooked, but ſtraight, as you may perceive by the following Figure.

A Catheter, *upon which, being put into the bladder, the neck thereof may be cut to draw out a ſtone from a Woman.*



Upon this Inſtrument the neck of the bladder may be cut, and then with the Dilater made for the ſame purpoſe, the inciſion ſhall be dilated as much as need requires; yet with this caution, that ſeeing the neck of a womans bladder is the ſhorter, it admits not ſo great dilation as a mans, for otherwiſe there is danger that it may come to the body of the bladder, whence an involuntary ſhedding of the water may enſue and continue thereafter. The inciſion being dilated, the Surgeon putting one or two of his fingers into the neck of the womb, ſhall preſs the bottom of the bladder, and then thruſt his crooked Inſtruments or *forcipes* in by the wound, and with theſe he ſhall eaſily pluck out the ſtone, which he ſhall keep with his fingers from ſlipping back again. Yet *Laurence Collo* the Kings Surgeon, and both his ſons (than whom I do not know whether ever there were better cutters for the ſtone) do otherwiſe perform this operation; for they do not thruſt their fingers into the Fundament or neck of the womb, but contenting themſelves with putting in onely the Guiders (whereof we formerly made mention) into the paſſage of the Urine, they preſently thereupon make ſtraight inciſion directly at the mouth of the neck of the bladder, and not on the ſide as is uſually done in men. Then they gently by the ſame way thruſt the *forcipes* hollowed on the outſide formerly delineated, and ſo dilate the wound by tearing it as much as ſhall be ſufficient for the drawing of the ſtone forth of the bladder. The reſidue of the cure is the ſame with that formerly mentioned in men: yet this is to be added, that if an ulcer grow in the neck of the bladder by reaſon of the rending it, you may by putting in the *ſpeculum matricis*, dilate the neck of the womb, that fitting remedies may be applied with the more eaſe.

CHAP.

CHAP. XLVIII.

Of the ſuppreſſion of the Urin by internal cauſes.

BEſides the fore-mentioned cauſes of ſuppreſſed Urin, or difficulty of making water there are many other, leſt any may think that the Urin is ſtopt onely by the Stone or Gravel, as Surgeons think, who in this caſe preſently uſe Diureticks. Therefore the Urin is ſuppreſt by external and internal cauſes. The internal cauſes are clotted bloud, tough phlegm, warts, caruncles bred in the paſſages of the Urin, ſtones and gravel; the Urin is ſometimes ſuppreſt, becauſe the matter thereof, to wit, the ſerous or whayiſh part of the bloud, is either conſumed by the feveriſh heat, or carried other ways by ſweats or a ſcouring; ſometimes alſo the flatulency there contained, or inflammation ariſing in the parts made for the Urin and the neighbouring members, ſuppreſſes the Urin. For the right gut, if it be inflamed, intercepts the paſſage of the Urin, either by a tumor whereby it preſſeth upon the bladder, or by the communication of the inflammation. Thus by the default of an ill-affected Liver, the Urin is oft-times ſuppreſt in ſuch as have the dropſie; or elſe by dulneſs or decay of the attractive or ſeparative faculty of the reins by ſome great diſtemper, or by the default of the animal faculty, as in ſuch as are in a Phrenſie, Lethargy, Convulſion, Apoplexy. Beſides alſo a tough and viſcid humour falling from the whole body into the paſſages of the Urin, obſtructs and ſhuts up the paſſage. Alſo too long holding the water ſometimes cauſes this affect. For when the bladder is diſtended above meaſure, the paſſage thereof is drawn together and made more ſtraight: hereto may be added, that the too great diſtenſion of the bladder is a hinderance that it cannot uſe the expulſive faculty, and ſtraighten it ſelf about the Urin to the excluſion thereof; hereto alſo pain ſucceeds which preſently dejects all the faculties of the part which is ſeized upon. Thus of late a certain young man riding on horſe-back before his Miſtreſs, and therefore not daring to make water, when he had great need ſo to do, had his Urin ſo ſuppreſt, that returning from his journy home into the City, he coûld by no means poſſible make water. In the mean time he had grievous pain in the bottom of his belly and the *Perinæum*, with gripings and a ſweat all over his body, ſo that he almoſt ſwooned. I being called, when I had procured him to make water by putting in a hollow Catheter, and preſſing the bottom of his belly, whereof he forthwith made two pints; I told them that it was not occaſioned by the ſtone, which notwithſtanding the ſtanders by imagined to be the occaſion of that ſuppreſſion of Urin. For thence forward there appeared no ſigns of the ſtone in the Youth, neither was he afterwards troubled with the ſtopping of his Urin.

In ſuppreſſion of the urin we muſt not preſently fly to Diureticks.

Why the too long holding the urin cauſeth the ſuppreſſion thereof.

An hiſtory.

CHAP. XLIX.

A digreſſion concerning the purging of ſuch things as are unprofitable in the whole Body by the Urin.

I Think it not amiſs to teſtifie by the following Hiſtories, the providence of Nature in expelling by Urin ſuch things as are unprofitable in the whole body. *Monſieur Sarret* the Kings Secretary was wounded in the right arm with a Piſtol bullet; many and malign ſymptoms happened thereupon, but principally great inflammations, flowing with much *ſanies* and *pus* or quitture: it ſometimes happened that without any reaſon, this purulent and ſanious efflux of matter was ſtaid in inflammation; whereof while we ſolicitouſly inquired the cauſe, we found both his ſtools and water commixed with much purulent filth, and this through the whole courſe of the diſeaſe, whereof notwithſtanding by Gods aſſiſtance he recovered, and remains whole and ſound: we obſerved that as long as his arm flowed with this filthy matter, ſo long were his excrements of the belly and bladder free from the ſanious and purulent matter: as long on the contrary as the ulcers of the arm were dry, ſo long were the excrements of the guts and bladder ſanious and purulent. The ſame accident befel a Gentleman called *Monſieur de la Croix*, who received a deadly wound with a ſword on the left arm, though *German Cheval* and Maſter *Raſs* moſt expert Surgeons, and others, who together with me had him in cure, though it was not ſo for this reaſon, becauſe the *pus* cannot run ſo long a way in the body, neither if it were ſo, could that be done without the infection and corruption of the whole maſs of bloud, whileſt it flows through the Veins; therefore to be more probable that this quantity of filth, mixed with excrements and urine, flowed out by the default of the liver, or of ſome other bowel, rather than from the wounded arm. I was of a contrary opinion for theſe following reaſons: Firſt for that which was apparently ſeen in the Patient; for as long as the excrement and urin were free from this purulent matter, ſo long his arm plentifully flowed therewith; this on the contrary being dry, much purulent matter was voided both by ſtool and urin. Another was, that as our whole body is perſpirable, ſo it is alſo (if I may ſo term it) confluxible. The third was an example taken from the Glaſſes which the *French* term *Monte vins*, (that is, Mount-wines) for if a Glaſs that is full of Wine be ſet under another that is filled with Water, you may ſee the Wine raiſe it ſelf out of the lower veſſel to the upper through the midſt of the Water, and ſo the Water deſcends through the midſt of the Wine, yet ſo, that they do not mix themſelves, but the one take and poſſeſs the place of the other. If this may be done by Art, by things onely natural, and to be diſcerned by our eyes, what may be done in our bodies, in which by reaſon of the preſence of a more noble ſoul, all the works of Nature are far more perfect? What is it which we may deſpair to be done in the like caſe? For doth not the laudable bloud flow to the guts, kidnies, ſpleen, bladder of the gall, by the impulſe of Nature together with the excrements, which preſently the parts themſelves ſeparate from their nutriment? Doth not milk from the breſts flow ſometimes forth of the wombs of women lately delivered? Yet that cannot be carried down thither, unleſs by the paſſages of the mamillary veins and arteries, which meet with the mouths of the veſſels of the womb in the middle of the ſtraight

An Hiſtory.

An Hiſtory

How the *pus* may flow from the wounded arm by the urin and excrements.

Lib de loc. affec. 6. cap. 4.

ſtraight muſcles of the *Epigaſtrium*. Therefore no marvel, if according to *Galen*, the *pus* unmixt with the bloud flowing from the whole body by the veins and arteries into the kidnies and bladder, be caſt forth together with the urin. Theſe and the like things are done by Nature, not taught by any Counſel or Reaſon, but onely aſſiſted by the ſtrength of the ſegregating and expulſive faculty; and certainly we preſently diſſecting the dead body, obſerved that it all, as alſo all the bowels thereof, were free from inflammation and ulceration, neither was there any ſign of impreſſion of any purulent matter in any part thereof.

CHAP. L.

By what external cauſes the urin is ſuppreſt, and prognoſticks concerning the ſuppreſſion thereof.

THere are alſo many external cauſes, through whoſe occaſion the urin may be ſuppreſt; ſuch are bathing and ſwimming in cold water; the too long continued application of Narcotick Medicins upon the Reins, *Perinæum*, and Share; the uſe of cold meats and drinks, and ſuch other like. Moreover, the diſlocation of ſome *Vertebra* of the loins to the inſide, for that it preſſeth the nerves diſſeminated thence into the bladder; therefore it cauſeth a ſtupidity or numbneſs of the bladder. Whence it is, that it cannot perceive it ſelf to be vellicated by the acrimony of the urin, and conſequently it is not ſtirred up to the expulſion thereof. But from whatſoever cauſe the oppreſſion of the urin proceeds, if it perſevere for ſome days, death is to be feared, unleſs either a Fever which may conſume the matter of the urin, or a Scouring or Flux, which may divert it, ſhall happen thereupon. For thus by ſtay it acquireth an acrid and venenate quality, which flowing by the veins readily infecteth the maſs of bloud, and carried to the brain, much moleſts it by reaſon of that ſimilitude and ſympathy of condition which the Bladder hath with the *Meninges*. But Nature, if prevalent, eaſily freeth it ſelf from this danger by a manifeſt evacuation by ſtool, otherwiſe it muſt neceſſarily call as it were to its aid, a feverith heat, which may ſend the abounding matter of this ſerous humidity out through the skin, either by a ſenſible evacuation as by ſweat; becauſe ſweat and urin have one common matter: or elſe diſperſe and breath it out by tranſpiration, which is an inſenſible excretion.

Why the diſlocation of a *Vertebra* of the loins may cauſe a ſuppreſſion of urin.

Why the ſuppreſſion of the urin becomes deadly.

A Fever following thereon helps the ſuppreſſion of urin.

CHAP. LI.

Of bloudy Urin.

SOme piſs pure blood, others mixt, and that either with urin, and then that which is expelled reſembles the waſhing of fleſh newly killed; or elſe with *pus* or matter, and that either alone or mixed with the urin. There may be divers cauſes of this ſymptom, as the too great quantity of bloud gathered in the body, which by the ſuppreſſion of the accuſtomed and periodical evacuation, by the Courſes or Hemorrhoids, now turns its courſe to the reins and bladder: the fretting aſunder of ſome veſſel by an acrid humour, or the breaking thereof by carrying or lifting of ſome heavy burden, by leaping, falling from high, a great blow, the falling of ſome weight upon the loins, riding poſt too violently, the too immoderate uſe of venery, and laſtly, from any kind of painful and more violent exerciſe, by a rough and ſharp ſtone in the kidnies, by the weakneſs of the retentive faculty of the kidnies, by a wound of ſome of the parts belonging to the urin, by the too frequent uſe of diuretick and hot meats and medicins, or elſe of things in their whole nature contrary to the urinary parts; for by theſe and the like cauſes, the reins are oft-times ſo inflamed, that they neceſſarily impoſtumate, and at length the impoſtume being broken it turns into an ulcer, caſting forth quitture by the urin. In ſo great variety of the cauſes of bloudy urin, we may gather whence the cauſes of this ſymptom may ariſe, by the depraved action of this, or that part, by the condition of the flowing bloud, to wit, pure or mixt, and that either with the urin alone, or with *Pus*. For example, if this bloudy matter flow from the lungs, liver, kidnies, diſlocated *Vertebræ*, the ſtraight gut, or other the like part: you may diſcern it by the ſeat of the pain and ſymptoms, as a Fever: and the propriety of the pain, and other things which have preceded, or are yet preſent. And we may gather the ſame by the plenty and quality; for if, for example, the *pus* flow from an ulcer of the arm, the purulent matter will flow by turns, one while by the urin, ſo that little is caſt forth by the ulcer; then preſently on the contrary the urin becomes more clear. That purulent matter which flows from the lungs by reaſon of an *Empyema*, or from the liver, or any other bowel placed above the midriff, the *pus* which is caſt forth with the urin, is both in greater plenty and more exactly mixed with the urin than that which flows from the kidnies and bladder. It neither belongs to our purpoſe, or a Surgeons office either to undertake, or deliver the cure of this affect. It ſhall ſuffice onely to note that the cure of this ſymptom is not to be hoped for ſo long as the cauſe remains. And if this bloud flow by the opening of a veſſel, it ſhall be ſtaid by aſtringent medicins; if broken, by agglutinative; if corroded or fretted aſunder, by ſarcotick.

The differences.

Cauſes.

Signs of what cauſes they proceed.

Cure.

CHAP. LII.

Of the Signs of the ulcerated Kidnies.

I Had not determined to follow or particularly handle the cauſes of bloudy urins, yet becauſe that which is occaſioned by the ulcerated reins or bladder more frequently happens, therefore I have thought good briefly to ſpeak thereof in this place. The ſigns of an ulcer of the reins are, pain in the loins, matter howſoever mixt with the urin, never evacuated by it ſelf, but always flowing forth

forth with the Urin, and reſiding in the bottom of the Chamber-pot, with a ſanious and red ſediment, fleſhy and as it were bloudy fibres ſwimming up and down in the Urin, the ſmell of the filth is not ſo great as that which flows from the ulcerated bladder, for that the kidnies, ſeeing they are of a fleſhy ſubſtance, do far better ripen and digeſt the purulent matter than the bladder which is nervous and bloudleſs. Why the matter which flows from the kidnies is leſs ſtinking than that which flows from the bladder.

CHAP. LIII.

Of the ſigns of the ulcerated Bladder.

ULcers are in the bottom of the Bladder, and the neck thereof. The ſigns of an ulcer in the Bladder are, a deep pain at the ſhare-bones; the great ſtench of the matter flowing therefrom, white and thin skins ſwimming up and down in the water. But when the Ulcer poſſeſſeth the neck of the bladder, the pain is more gentle, neither doth it trouble before the Patient come to make water, but in the very making thereof, and a little while after. Differences.

But it is common both to the one and the other, that the Yard is extended in making water, to wit, by reaſon of the pain cauſed by the Urin fretting of the ulcerated part in the paſſage by: neither is the matter ſeen mixed with the Urin, as is uſual in an ulcer of the upper parts, becauſe it is poured forth not together with the Urin, but after it.

CHAP. LIV.

Prognoſticks of the ulcerated Reins and Bladder.

ULcers of the kidnies are more eaſily and readily healed than thoſe of the bladder; for fleſhy parts more ſpeedily heal and knit than bloudleſs and nervous parts. Ulcers which are in the bottom of the bladder, are incurable, or certainly moſt difficult to heal; for beſides that they are in a bloudleſs part, they are daily vellicated and exaſperated by the continual afflux of the contained Urin, for all the Urin is never evacuated: now that which remains after making water, becomes more acrid by the diſtemper and heat of the part, for that the bladder is always gathered about it, and dilated and ſtraitned according to the quantity of the contained Urin: therefore in the *Iſchuria*, that is, the ſuppreſſion or difficulty of making water, you may ſometimes ſee a quart of water made at once. Thoſe which have their legs fall away, having an ulcer in their bladder, are near their deaths. Ulcers ariſing in theſe parts, unleſs they be conſolidated in a ſhort time, remain uncurable. Why ulcers of the bladder are cured with more difficulty.

CHAP. LV.

What Cure muſt be uſed in the ſuppreſſion of the Urin.

IN curing the ſuppreſſion of the Urin, the indication muſt be taken from the nature of the diſeaſe, and cauſe thereof, if it be yet preſent or not. But the diverſity of the parts by which being hurt, the *Iſchuria* happens, intimates the variety of Medicins, neither muſt we preſently run to diureticks, and things breaking the ſtone, which many Empericks do. For hence grievous and malign ſymptoms often ariſe, eſpecially if this ſuppreſſion proceed from an acrid humour, or bloud preſſed out by a bruiſe, immoderate venery, and alſo more vehement exerciſe, a hot and acrid potion, as of *Cantharides*, by too long abſtaining from making water, by a *Phlegmon*, or ulcer of the urinary parts. For thus the pain and inflammation are increaſed, whence follows a gangrene, and at length death. Wherefore attempt nothing in this caſe without the advice of a Phyſician, no not when you muſt come to Surgery. For diureticks can ſcarce have place in another caſe, then when the urinary paſſages are obſtructed by gravel, or a groſs and viſcid humour, or elſe in ſome cold Country, or in the application of Narcoticks to the loins, although we muſt not here uſe theſe before we have firſt made uſe of general Medicins: now Diureticks may be adminiſtred ſundry ways, as hereafter ſhall appear. Scopes of curing. To what ſuppreſſion of the urin diureticks muſt not be uſed. To which, and when to be uſed.

℞ *Agrimon. urtic. parietar. ſurculos rubros habentis, an.* m.j. *rad. aſparag. mundat.* ℥ iv. *gran. alkekengi, nu.* xx. *ſem. malvæ* ʒ ß. *rad. acor.* ℥ j. *bulliant omnia ſimul in ſex libris aquæ dulcis ad tertias, deinde coletur.* Let the Patient take ℥ iv. hereof with ℥ j. of Sugar-candy, and drink it warm faſting in a morning, three hours before meat. Thirty or forty Ivy-berries beaten in white Wine, and given the Patient to drink ſome two hours before meat, are good for the ſame purpoſe. Alſo ʒ j. of nettle-ſeeds made into fine powder, and drunk in chicken-broth, is good for the ſame purpoſe. A decoction alſo of grummel, Goats-ſaxifrage, Pellitory of the Wall, white Saxifrage, the roots of Parſley, *aſparagus*, *acorus*, *bruſcus*, and Orris drunk in the quantity of ſome three or four ounces, is profitable alſo for the ſame purpoſe. Yet this following Water is commended above the reſt to provoke Urin, and open the paſſages thereof, from what cauſe ſoever the ſtopping thereof proceeds. ℞ *Rad. oſmund. regal. cyp. biſmal. gram. petroſel. fœnic. an.* ʒ ij. *raph. craſſior. in taleol.* ℥ iv. *macerentur per noctem in aceto albo acerrimo, bulliant poſtea in aquæ fluvialis* lb x. *ſaxifrag. criſt. marin. rub. tinct. milii ſolis, ſummitat. malvæ biſmal. an.* p. ij. *berul. cicer. rub. an.* p. j. *ſem. melon. citrul. an.* ℥ ij. ß. *alkekengi, gra.* xx. *glycyrrhiz.* ʒ j. *bulliant omnia ſimul ad tertias: in colatura infunde per noctem fol. ſen. oriental.* lb ß. *fiat iterum parva ebullitio, in expreſſione colata infunde cinam. elect.* ʒ vj. *colentur, iterum colatura injiciatur in alembicum vitreum, poſtea tereb. venet. luc.* lb ij. *aq. vitæ* ℥ vj. *agitentur omnia ſimul diligentiſſime. Lutetur alembicum luto ſapientiæ, fiat diſtillatio lento igne in balneo Mariæ.* Uſe it after the following manner: ℞ *Aq. ſtillatitiæ ſcriptæ* ℥ ij. *aut* iij. According to the operation which it ſhall perform, let the Patient take it four hours before meat. A diuretick Water.

Alſo

Why the uſe of diureticks is better after bathing.

To cleanſe the ulcers of the Kidnies and Bladder.

Also Radiſh-water diſtilled in *balneo Mariæ* is given in the quantity of ʒ iv. with ſugar, and that with good ſucceſs. Baths and *Semicupia*, or half-baths are artificially made, relax, ſoften, dilate, and open all the body; therefore the preſcribed Diureticks mixed with half a dram of Treacle may be fitly given at the going forth of the Bath. Theſe Medicins following are judged fit to cleanſe the ulcers of the Kidnies and Bladder. Syrup of Maiden-hair, of Roſes, taken in quantity of ʒ j. with *hydromel*, or barley-water: Aſſes or Goats milk are alſo much commended in this affect, becauſe they cleanſe the ulcers by their ſerous or whayiſh portion, and agglutinate by their Cheeſe-like. They muſt be taken warm from the dug, with honey of Roſes or a little ſalt, leſt they corrupt in the ſtomach; and that to the quantity of four ounces, drinking or eating nothing preſently upon it.

Trochiſces to heal the ulcers of the Kidnies.

The following Trochiſces are alſo good for the ſame purpoſe. ℞ *Quatuor ſem. frigid. major. ſeminis papaveris albi, portulacæ plantag. cydon, myrtil. gum. tragacanth. & arab. pinear. glycyrrh. mund. hordei mund. mucilag. pſilii, amygdal. dulcium an.* ʒ j. *boli armen. ſanguin. dracon. ſpodii, roſar. maſtich. terræ ſigil. myrrhæ, an.* ʒ ij. *cum oxymelite, conficiantur ſecundum artem trochiſci.* Let the Patient take ʒ ſ. diſſolved in Whay, Ptiſan, Barly-water, and the like; they may alſo be profitably diſſolved in Plantain-

Drink in ſtead of Wine.

water, and injected into the bladder. Let the Patient abſtain from Wine, and in ſtead thereof let him uſe Barley-water or *hydromel*, or a Ptiſan made of an ounce of Raiſins of the Sun, ſtoned and boiled in five pints of fair water, in an earthen Pipkin well leaded, or in a Glaſs, until one pint be conſumed, adding thereto of licorice ſcraped and beaten ʒ j. of the cold ſeeds likewiſe beaten two drams. Let it after it hath boiled a little more, be ſtrained through an Hypocras bag, with a quartern of Sugar, and two drams of choice Cinamon added thereto, and ſo let it be kept for uſual drink.

CHAP. LVI.

Of the Diabete, *or inability to hold the Urin.*

What *Diabete* is.

The Cauſes.

THe *Diabete* is a Diſeaſe, wherein preſently after one hath drunk, the Urin is preſently made in great plenty, by the diſſolution of the retentive faculty of the reins, and the depravation or immoderation of the attractive faculty. The external cauſes are the unſeaſonable and immoderate uſe of hot and diuretick things, and all more violent and vehement exerciſes. The internal cauſes are the inflammation of the Liver, Lungs, Spleen, but eſpecially of the kidnies and bladder. This affect muſt be diligently diſtinguiſhed from the excretion of the morbifick cauſes by Urin.

Signs.

The loins in this diſeaſe are moleſted with a pricking and biting pain, and there is a continual and unquenchable thirſt: and although this diſeaſe proceed from a hot diſtemper, yet the

Why the Urins are wateriſh.

Urin is not coloured, red, troubled, or thick, but thin, and white or wateriſh, by reaſon the matter thereof makes very ſmall ſtay in the Stomach, Liver, and hollow Vein, being preſently drawn away by the heat of the Kidnies or Bladder. If the affect long endure, the Patient for want of nouriſhment falleth away, whence certain death enſues. For the cure of ſo great a diſeaſe, the matter muſt be purged, which cauſes or feeds the inflammation or *phlegmon*, and conſequently bloud muſt be let.

The Cure.

We muſt abſtain from the four cold ſeeds, for although they may profit by their firſt quality, yet will they hurt by their diuretick faculty. Refrigerating and aſtringent nouriſhments muſt be uſed, and ſuch as generate groſs humours; as Rice, thick and aſtringent wine mixed with much water. Exceeding cold, yea narcotick things ſhall be applied to the loins, for otherwiſe by reaſon of the thickneſs of the muſcles of thoſe parts, the force, unleſs of exceeding refrigerating things, will not be able to arrive at the reins; of this kind are Oil of white Poppy, Henbane, *Opium*, Purſlain, and Lettuce-

Narcotick things to be applied to the loins.

ſeed, Mandrage, Vinegar, and the like: of which Cataplaſms, Plaſters, and Ointments, may be made fit t corroborate the parts, and correct and heat.

CHAP. LVII.

Of the Strangury.

What the Strangury is.

THe Strangury is an affect having ſome affinity with the *Diabete*, as that wherein the water is involuntarily made, but not together at once, but by drops, continually and with pain.

The Cauſes.

The external cauſes of a Strangury are, the too abundant drinking of cold water, and all too long ſtay in a cold place. The internal cauſes are, the defluxion of cold humours into the Urinary parts; for hence they are reſolved by a certain palſie, and the *ſphincter* of the bladder is relaxed, ſo that he cannot hold his water according to his deſire: inflammation alſo and all diſtemper cauſeth this affect, and whatſoever in ſome ſort obſtructs the paſſage of the Urin; as clotted bloud, thick phlegm, gravel, and the like. And becauſe, according to *Galens* opinion, all ſorts of diſtemper may cauſe this diſeaſe, divers Medicins ſhall be appointed according to the difference of the diſtemper.

Com. ad aphor. 15. ſect. 3.

Therefore againſt a cold diſtemper fomentations ſhall be provided of a decoction of Mallows, Roſes, *Origanum*, Calamint, and the like, and ſo applied to the Privities: then preſently after, let them be anointed with Oil of Bays, and of *Caſtoreum*, and the like. Strong and pure Wine ſhall be preſcribed for his drink, and that not onely in this cauſe, but alſo when the Strangury happens by the occaſion of obſtruction, cauſed by a groſs and cold humour, if ſo be that the body be not plethorick. But if inflammation, together with a *Plethora* or fulneſs, hath cauſed this affect, we may, according to

Ad aphor. 48. ſect. 7.

Galens advice, heal it by bloud-letting. But if obſtruction be in fault, that ſhall be taken away by Diureticks either hot or cold, according to the condition of the matter obſtructing. We here omit to ſpeak of the *Dyſuria*, or difficulty of making water, becauſe the remedies are in general the ſame with thoſe which are uſed in the *Iſchuria*, or ſuppreſſion of Urin.

CHAP.

CHAP. LVIII.

Of the Colick.

WHensoever the guts being obstructed, or otherwise affected, the excrements are hindred from passing forth, and if the fault be in the small guts, the affect is termed *Volvulus*, *Ileas*, and *Miserere mei*; but if it be in the greater guts, it is called the Colick, from the part affected, which is the *Colon*, that is, the continuity of the greater guts; but especially that portion of the greater guts, which is properly and especially named *Colon*, or the Colick-gut. Therefore *Avicen* rightly defines the Colick, A pain of the guts, wherein the excrements are difficultly evacuated by the fundament. *Paulus Ægineta* reduceth all the causes of the Colick, how various soever, to four heads: To wit, to the grossness or toughness of the humors impact in the coats of the guts: Flatulencies hindred from passage forth; the inflammation of the guts; and lastly, the collection of acrid and biting humors. Now we will treat of each of these in particular. Almost the same causes produce the grossness of humors and flatulencies in the guts, to wit, the use of flatulent and phlegmatick, tough and viscid meats, yea also of such as are of good nourishment, if sundry thereof, and of sundry kinds be eaten at the same meal, and in greater quantity then is fit. For hence crudity and obstruction, and at length the collection of flatulencies, whereon a tensive pain ensues. This kind of Colick is also caused by the use of crude fruits, and too cold drink, drunken especially when any is too hot by exercise, or any other way: For thus the stomach and the guts continued thereto, are refrigerated, and the humors and excrements therein contained are congealed, and, as it were, bound up. The Colick which is caused by the inflammation of the kidneys, happens by the sympathy of the reins pained or troubled with the stone or gravel contained in them or the ureters. Therefore then also pain troubles the Patient at his hips and loins, because the nerves, which arising from the *vertebræ* of the loins, are oppressed by the weight of the stones and gravel, about the joynt of the hip are disseminated into the muscles of the loins and thigh. Also the ureter are pained (for they seem nothing else but certain hollow nerves) and also the cremaster muscles, so that the Patients testicles may seem to be drawn upwards with much violence. Hence great phlegmatick, and cholerick vomiting, and sweat of the whole body, all which do not surcease before that the stone or gravel shall be forced down into the bladder. Now vomiting happens in this affect, for that the ventricle by reason of its continuity and neighbourhood which it hath with the guts, suffers by consent or sympathy. For the stomach is of the same kind or matter as the guts are, so that the guts seem nothing else but a certain production of the stomach. Therefore if at any time Nature endeavour to expel any thing that is troublesome in the kidneys, ureters, coats of the guts, mesentery, *pancreas*, and hypocondries, it causeth a Colick with pain and vomiting. An hot and dry distemper also causeth the Colick, prducing a pricking and biting pain, by drying the excrements shut up in the guts, as also by wasting, as it were, the radical humors of that place provided for the lubricating of the guts. Acrid, viscid and tough phlegm causeth the same. There is also another cause of the Colick which is not so common; to wit, the twining of the guts, that is, when they are so twined, folded, and doubled, that the excrements, as it were, bound in their knots, cannot be expelled, as it manifestly happens in the rupture called *Enterocele*, by the falling of the guts into the cod: Likewise also Worms generated in the Colick-gut, whilst that they mutually fold or twine themselves up, do also twine the *Colon* it self, and fold it with them. Also the too long stay of the excrements in the guts, whether it shall happen by the peculiar default of the too hot and dry body of the Patient, or by his diet, that is, the use of too dry meats, or exercises and pains taken in the heat of the Sun, or by the greatness of business, the mind being carried away, causeth the Colick, with Head-ach, and plenty of vapors flying upwards.

What *Ileos*, or *illaca passio* is.

What *Colica passio* or the Colick is.

Lib. 3.

Lib. 3. *c.* 43.

The manner of the Stone-colick.

How a hot distemper causeth the colick.

The folding of the guts the cause of the colick.

I remember I once dissected the body of a Boy of some twelve years old, who had his guts folded with many, as it were, ties or knots of the restrained, too hard and dry excrements, the which he cast out by his mouth a little before his death, which brought him to his end, being not helped in time by fitting medicines. Now these are the causes of the Colick, according to the opinion of the Ancient and Modern Physicians, of whose signs I judge it not amiss here to treat in particular. You shall know the Patient is troubled with the Stone-colick, by the pain which is fixed, and, as it were, kept in one place, to wit, of the kidneys; by his former manner of life; as if the Patient hath formerly voided stones or gravel together with his urine; by the pain of the hips and testicles for the formerly mentioned causes; and lastly, by that the Patient casteth forth by stone or urine, for that the great and laborious endeavour of Nature to cast forth the stone which is in the Kidneys, is propagated by a certain sympathy and like study of the neighbouring parts, stirring up the expulsive faculties each to his work. The signs of a flatulent colick are, a tensive pain, such as if the guts were rent or torn in pieces, together with a noise or rumbling in the belly. The force of the shut-up wind is sometimes so great, that it rendeth or teareth the guts in sunder, no otherwise than a Swines bladder too hard blown up: Which when it happens, the Patient dies with much vomiting, because the stomach oppress with wind, can contain nor imbrace no meat. The Colick which is occasioned by the too long keeping in of the excrements, is accompanied with the weight and pain of the belly, the tension of the guts, head-ach, apparent hardness of the belly, and the complaint of the Patient that he hath not gone to stool in a long time. That which proceeds from a cholerick inflammation, yields a sense of great heat and pulsation in the midst of the belly, by reason of the veins and arteries which are in the *pancreas* and coats of the guts, and there are the other signs of a *Phlegmon*, although also this, as it were, inflammation may arise also from salt, acrid and viscous phlegm, which Nature can neither expel upwards by vomit, nor downwards by stool; this sundry times is associated with a difficulty of making water,

An History.

Signs whereby we know that the colick proceeds from this or that cause.

ter, for that when as the right gut is inflamed, the bladder is preſſed by reaſon of their ſociety or neighbourhood. The Colick which proceeds from the conuſion of the guts, ſhews it ſelf by the exceſſive cruelty of the pain ariſing, for that the guts are not in their due ſite and place, and becauſe the excrements by their too long detention acquire a preternatural heat; and this is the cauſe of the death of many ſuch as have ruptures, for that the gut falling down from the natural place into the cod, being a preternatural place, is redoubled, and kept there, as it were, bound, whereby the excrements being baked, becoming more acridly hot, cauſe inflammation, and by raiſing up flatulencies, increaſe the diſtenſion through all the guts, until at length a deadly *Ileos* or colick ariſing, they come forth at the mouth. For prognoſticks, it is better to have the pain in the colick to wander up and down, than to be fixed: It is good alſo that the excrements are not wholly ſuppreſt. But the evil ſigns that are here, pronounce the affect either difficult or deadly. Now theſe ſhew that it is deedly, intolerable tormenting pain, continual vomiting, cold ſweat, coldneſs of the extreme parts, hicketing by reaſon of the ſympathy the ſtomach hath with the guts, a phrenſie by the conſent of the brain with the ſtomach, and oft-times a convulſion, by drawing the matter into the nerves. But ſuch as have griping and pain about their navil and loins, which can neither be helped by medicine nor otherwiſe, it ends in a Dropſie. The cure muſt be diverſified according to the variety of the cauſes, for the Stone-colick is cured by medicines proper to the ſtone; that which is cauſed by an *Enterocele*, is cured by the only reſtoring the gut to its place; that which is occaſioned by Worms, requires medicines fit to kill and caſt forth the Worms. But that which proceeds from the weakneſs and refrigeration of the guts and ſtomach, is cured by heating and ſtrengthning medicines as well applied outwardly, as taken inwardly by the mouth, or otherways. The beginning of the cure of that which is occaſioned by tough phlegm and flatulencies, is by the mitigation of the pain, ſeeing there is nothing which more dejects the powers than pain. To this purpoſe ſhall you provide Baths, *Semicupia*, fomentations of Mallows, Marſh-mallows, Violet leaves, Peny-royal, Fennel, *Origanum*, the ſeeds of Thyme and Fenugreek, flowers of Camomil, Melilote, and other ſuch like, which have power to heat, dry, attenuate and rarifie the skin, ſo to diſſipate the wind. But all muſt be actually hot. Alſo the belly may be anointed with this following oyntment. ℞ *Olei chamæm. aneth. butyr. recent. an.* ℥ i. *ſem. apii, petroſ. & galang. an.* ℥ ß. *Aq. vitæ, ol. ſalviæ aut Thymi chimici extracti. q.ſ.* The following liniment is much commended by *Hollerius*. ℞ *Olei. rut. & nardi an.* ʒ vi. *Galbani cum aq. vit. diſſoluti* ℥ ii. *Liquefactis ſimul adde zibetæ gr.* iiij. *Croci, gr.* vi. *Fiat linimentum.* Alſo little bags made with Millet, Oats, and Salt fried with a little White-wine in a frying-pan, ſhall be applied hot upon the belly and flanks, and renewed before they grow cold. You may, inſtead of theſe bags, uſe Ox-bladders half filled with a decoction of reſolving things; as Salt, Roſemary, Thyme, Lavender, Bay-berries, and the like: Then inject a Clyſter being thus made. ℞ *Quatuor emol. an.* m.i. *orig. puleg. calamenth. an.* m. ß. *aniſi, carui an.* m. ß. *Flor. aneth. an.* p.i. *buliant in hydromele ad* ib i. *in qua diſſolve bened. laxat. mellis anthoſati, ſacc. rub. an.* ℥ i. *Olei aneth. & chamæm. an.* ℥ i ß. Let a clyſter be made to be injected at twice; for the guts being ſtretched out cannot contain the accuſtomed *doſis* of a clyſter; Alſo this following clyſter is much approved. ℞ *Vini malvat. & olei nucum an.* ℥ iij. *Aq. vitæ,* ℥ i. *Olei juniperi, & rut. per quintum eſſent. extracti. an.* ℥ iij. Let this be injected as hot as the Patient can endure. I have oft-times, as by miracle, helped intolerable pain cauſed by the Wind-colick and Phlegm with this clyſter. *Avicen* preſcribes a carminative clyſter made of Hyſſop, *Origanum acorus*, Anis-ſeeds, and Engliſh Galengal. Let the Patient feed upon meats of good juice and eaſie digeſtion, as Broths made with the yolks of Eggs, Saffron, hot Herbs, and a Nutmeg, let him drink good Wine, as Muſcadine, or Hypocraſs made with good Wine, ſo to heat the ſtomach and guts. For in *Galen*'s opinion, all windineſs is generated by a remiſs heat. But if the pain ſhall continue, a large Cupping-glaſs ſhall be applied to the navel, to draw and diſſipate the windineſs; the belly ſhall be bound with ſtrong and broad ligatures, to ſtrengthen the guts, and diſcuſs the matter of flatulencies. The Patients taught by Nature to uſe this remedy, whilſt none admoniſhing them, they preſs the belly with their hands in the bitterneſs of pain. But if the pain cannot be thus appeaſed, we muſt come to ſuch medicines as work by an occult property, as the dried gut of a Wolf, for a dram thereof made into powder is given in Wine with good ſucceſs. That Colick which is cauſed by a cholerick inflammation requires contrary medicines, to wit, blood-letting, and a refrigerating diet; potions made of *Diacatholicon* and *Caſſia* diſſolved in Barley-water, alſo cooling clyſters. *Avicen* preſcribes narcoticks, for that being cold, they are contrary to the morbifick cauſe which is hot and dry; ſuch are pills of *Philonium*. Alſo pills of *Hiera picra* in the quantity of ʒ iv. with *Opium* and Saffron, of each one grain, may be uſed. Alſo Baths are appointed, made of water wherein Mallows, Marſh-mallows, Violet leaves, flowers of white Lilies, Lettuce, Purſlan have been boiled, to correct the acrimony of the cholerick and hot humors, whence the diſeaſe and ſymptom ariſeth. That Colick which is like to this, and proceeds from ſalt, acrid, thick and tough phlegm, is cured, the humor being firſt attenuated, and diffuſed, and at length evacuated by medicines taken by the mouth and otherwiſe, according to the preſcription of the learned Phyſician. But *Avicen* cures that which is occaſioned by the ſuppreſſion of the hardned excrements, and twining of them by meats which have an emollient faculty, ſuch as humecting broths, as that which is made of an old Cock tired with running, and threſhed to death, and ſo boiled with Dill, Polypody, and a little Salt, until the fleſh fall from the bones; alſo he uſeth detergent clyſters, ſuch as this which follows. ℞ *Betæ*, m.i *Furfuris*, p. i. *ficus*, nu. x. *alth.* m.i. *Fiat decoctio ad* ib i. *In qua diſſolve nitri & mutriæ an.* ʒ ii. *Sacc.* ℥ i. *Ol. ſeſamini*, ℥ ij. But if the obſtruction be more contumacious, you muſt uſe more powerful ones made *ex cyclamin. centaurio, & hiira diacolocinth. an.* ʒ ij. But if the obſtruction do notwithſtanding remain, ſo that the excrements come forth at the mouth, *Marianus Sanctius* witheth (by the counſel of many who have ſo freed themſelves from this deadly ſymptom) to drink three pounds of Quick-ſilver with water only. For the doubled, and, as it were, twined up-gut is unfolded by the weight of the Quick-ſilver, and the excrements are depreſt and thruſt forth, and

and the Worms are killed which gave occaſion to this affect. *John* of S. *Germans*, that moſt worthy Apothecary, hath told me that he ſaw a Gentleman, who when as he could not be freed from the pain of the colick by any means preſcribed by learned Phyſicians, at length by the counſel of a certain German his Friend, drank three ounces of oyl of Sweet-almonds drawn without fire, and mixed with ſome White-wine and Pellitory-water, and ſwallowed a leaden Bullet beſmeared with Quick-ſilver, and that Bullet coming preſently out by his fundament, he was wholly freed from his colick.

CHAP. LIX.

Of Phlebotomy, or Blood-letting.

PHlebotomy is the opening of a vein, evacuating the blood with the reſt of the humors; thus Arteritomy, is the opening of an artery. The firſt ſcope of Phlebotomy is the evacuation of the blood offending in quantity, although oft-times the Phyſicians intention is to draw forth the blood which offends in quality, or either way by opening a vein. Repletion, which is cauſed by the quantity, is two-fold; the one *ad vires*, that is, to the ſtrength, the veins being otherwiſe not very much ſwelled: This makes men infirm and weak, Nature not able to bear his humor, of what kind ſoever it be. The other is termed *ad vaſa*, that is, to the veſſels, the which is ſo called comparatively to the plenty of blood, although the ſtrength may very well away therewith. The veſſels are oft-times broke by this kind of repletion, ſo that the Patient caſts and ſpits up blood, or elſe evacuates it by the noſe, womb, hemorrhoids, or *varices*. The repletion which is *ad vires*, is known by the heavineſs and wearieſomneſs of the whole body; but that which is *ad vaſa*, is perceived by their diſtenſion and fulneſs, both of them ſtand in need of evacuation. But blood is only to be let by opening a vein, for five reſpects: The firſt is to leſſen the abundance of blood, as in plethorick bodies, and thoſe who are troubled with inflammation without any plenitude. The ſecond is for diverſion or revulſion, as when a vein of the right is opened to ſtay the bleeding of the left noſtril. The third is to allure or draw down; as when the *ſaphena* is opened in the ankle, to draw down the courſes in women. The fourth is for alteration or introduction of another quality; as when in ſharp feavers we open a vein to breathe out that blood which is heated in the veſſels, and cooling the reſidue which remains behind. The fifth is to prevent imminent diſeaſes; as when in the Spring and Autumn we draw blood by opening a vein in ſuch as are ſubject to ſpitting of blood, the Squinancy, Pluriſie, Falling-ſickneſs, Apoplexy, Madneſs, Gout, or in ſuch as are wounded, for to prevent the inflammation which is to be feared. Before blood-letting, if there be any old excrements in the guts, they ſhall be evacuated by a gentle Clyſter or ſuppoſitory, leſt the meſaraick veins ſhould thence draw unto them any impurity. Blood muſt not be drawn from ancient people, unleſs ſome preſent neceſſity require it, leſt the native heat, which is but languid in them, ſhould be brought to extreme debility, and their ſubſtance decay; neither muſt any in like ſort be taken from children, for fear of reſolving their powers by reaſon of the tenderneſs of their ſubſtance, and rareneſs of their habit. The quantity of blood which is to be let, muſt be conſidered by the ſtrength of the Patient and greatneſs of the diſeaſe: Therefore if the Patient be weak, and the diſeaſe require large evacuation, it will be convenient to part the letting of blood, yea by the interpoſition of ſome days. The vein of the forehead being opened is good for the pain of the hind-part of the head, yet firſt we foment the part with warm water, that ſo the skin may be ſofter; and the blood drawn into the veins in greater plenty. In the Squinancy, the veins which are under the tongue muſt be opened aſſant, without putting any ligagatures about the neck, for fear of ſtrangling. Phlebotomy is neceſſary in all diſeaſes which ſtop or hinder the breathing, or take away the voice or ſpeech; as likewiſe in all contuſions by a heavy ſtroke, or fall from high, in an Apoplexy, Squinancy, and Burning-feaver, though the ſtrength be not great, nor the blood faulty in quantity or quality, blood muſt not be let in the height of a Feaver. Moſt judge it fit to draw blood from the veins moſt remote from the affected and inflamed part, for that thus the courſe of the humors may be diverted, the next veins on the contrary being opened, the humors may be the more drawn into the affected part, and ſo increaſe the burthen and pain. But this opinion of theirs is very erroneous, for an opened vein always evacuates and burthens the next part. For I have ſundry times opened the veins and arteries of the affected part, as of the hands and feet in the Gout of their parts; of the temples in the Megrim; whereupon the pain always was ſomewhat aſſwaged, for that together with the evacuated blood, the malignity of the Gout, and the hot ſpirits (the cauſes of the Head-ach or Megrim) were evacuated. For thus *Galen* wiſheth to open the arteries of the temples in a great and contumacious defluxion falling upon the eyes, or in the Megrim or Head-ach.

CHAP. LX.

How to open a vein, or draw blood from thence.

How to place the Patient.

THe firſt thing is, to ſeat or place the Patient in as good a poſture as you can, to wit, in his bed, if he be weak; but in a chair, if ſtrong, yet ſo, that the light may fall directly upon the vein which you intend to open. Then the Surgeon ſhall rub the arm with his hand, or a warm linnen cloth, that the blood may flow the more plentifully into the vein: Then he ſhall bind the vein with a ligature a little above the place appointed to be opened, and he ſhall draw back the blood upwards towards the ligature from the lower part; and if it be the right arm, he ſhall take hold thereof with his left hand; but if the left, then with his right hand, preſſing the vein in the mean time with his thumb a little below the place were you mean to open it, leſt it ſhould ſlip away; and that it may be the more ſwoln by forcing up the blood: Then with with his nail he ſhall mark or deſign the place to be opened, and ſhall anoint it, being ſo marked, with butter or oyl, whereby the skin may be relaxed, and the lancet enter more eaſily, and therefore the ſection may be the leſs painful. He ſhall hold his lancet between his thumb and fore-finger, neither too near, nor too far from the point; he ſhall reſt his other three fingers upon the Patients arm, that ſo his hand may be the more ſteddy, and leſs trembling. Then ſhall he open the vein with an Inciſion agreeable to the magnitude of the veſſel, and the indifferent thickneſs of the contained blood, ſomewhat aſſant, diligently avoiding the artery which lies under the *Baſilica*, and the nerve or tendon of the two-headed muſcle, which lies under the Median vein. But for the Cephalick, it may be opened without danger. As much blood as is ſufficient being drawn, according to the mind of the Phyſician, he ſhall looſe the ligature, and laying a little boulſter under, he ſhall with a ligature bind up the wounded part to ſtay the bleeding, the ligature ſhall be neither too ſtrait nor looſe, but ſo that the Patient may freely bend and extend his arm; wherefore whilſt that is in doing, he muſt not hold his arm ſtrait out, but gently bended, otherwiſe he cannot freely bend it.

CHAP. LXI.

Of Cupping-glaſſes or Ventoſes.

The uſe of Cupping-glaſſes.

CUpping glaſſes are applied eſpecially when the matter conjunct and impact in any part is to be evacuated, and then chiefly there is place for ſcarification after the Cupping glaſſes: yet they are alſo applied for revulſion and diverſion; for when an humor continually flows down into the eyes, they may be applied to the ſhoulders with a great flame, for ſo they draw more ſtrongly and effectually. They are alſo applied under womens breaſts, for to ſtop the courſes flowing too immoderately, but to their thighs, for to provoke them. They are alſo applied to ſuch as are bit by venemous beaſts, as alſo to parts poſſeſſed by a peſtiferous *Bubo* or Carbuncle, ſo to draw the poyſon from within outwards. For (as *Celſus* ſaith) a Cupping glaſs where it is faſtned on, if the skin be firſt ſcarified, draws forth blood; but if it be whole, then it draws ſpirit. Alſo they are applied to the belly, when any groſs or thick windineſs ſhut up in the guts, or membranes of the *Epigaſtrium*, or lower belly cauſing the colick, is to be diſcuſſed. Alſo they are faſtned to the *Hypocondries*, when as flatulency in the liver, or ſpleen, ſwells up the entrail lying thereunder, or in too great a bleeding at the noſe. Alſo they are ſet againſt the reins in the bottom of the belly, whereas the ureters run down to draw down the ſtone into the bladder, when as it ſtops in the middle or entrance of the ureter. You ſhall make choice of greater and leſſer Cupping glaſſes, according to the condition of the part, and the contained matter. But to thoſe parts whereto theſe cannot by reaſon of their greatneſs be applied, you may fit horns for the ſame purpoſe.

Lib. 8. *cap.* 1.

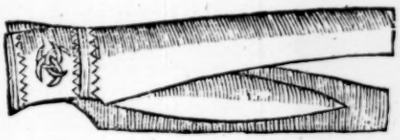
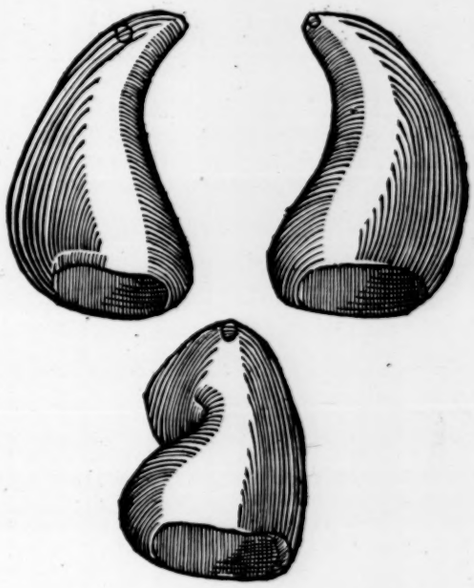
A Lancet.



Horns which without fire, by only ſucking at the upper holes draw from the part lying under them.



CHAP. LXII.

Of Leeches, and their uſe.

The uſe of Leeches.

IN thoſe parts of the body whereto Cupping-glaſſes and horns cannot be applied, to thoſe Leeches may for the moſt part be put, as to the fundament, to open the coat of the Hemorrhoid veins, to the mouth of the womb, the gums, lips, noſe, fingers. After the Leeches being filled with blood, ſhall fall off, if the diſeaſe require a large evacuation of blood, and the part affected may endure it, Cupping-glaſſes, or Horns, or other Leeches ſhall be ſubſtituted. If the Leeches be handled with the bare hand, they are angred, and become ſo ſtomachful, as that they will not bite; wherefore you ſhall hold them in a white and clean linnen cloth, and apply them to the skin, being firſt lightly ſcarified, or beſmeared with the blood of ſome other creature; for thus they will take hold of the fleſh, together with the skin more greedily and fully. To cauſe them fall off, you ſhall put ſome powder of Aloes, Salt or Aſhes upon their heads. If any deſire to know how much blood they have drawn, let him ſprinkle them with Salt made into powder, as ſoon as they are come off; for thus they will vomit up what blood ſoever they have ſucked. If you deſire they ſhould ſuck more blood than they are able to contain, cut off their tails as they ſuck, for thus they will make no end of ſucking, for that it runs out as they ſuck it. The Leeches by ſucking, draw the blood not only from the affected part whereto they are applied, but alſo from the adjacent and diſtant parts. Alſo ſometimes the part bleeds a good while after the Leeches be fallen away, which happens not by ſcarification after the application of Cupping-glaſſes or Horns. If you cannot ſtop the bleeding after the falling away of the Leeches, then preſs the half of a Bean upon the wound, until it ſtick of it ſelf, for thus it will ſtay; alſo a burnt rag may be fitly applied with a boulſter and fit ligature.

How to apply them.

How to cauſe them to fall off.

The end of the Seventeenth Book.

BOOK XVIII.

Of the Gout.

CHAP. I.

The deſcription of the Gout.

What it is.

THE Gout is a diſeaſe occupying and harming the ſubſtance of the joynts by the falling down and collection of a virulent matter accompanied by four humors. This word *Arthritis* or Gout, is general for every joint ſo affected; yet it enjoys divers particular names in ſundry joynts of the body; as that which falleth upon the joint of the Jaw, is termed *Siagonagra*, for the Greeks call the Jaw *Siagon*; that which affects the neck is termed *Trachelagra*, for that the neck is termed *Trachelos:* That which troubles the back-bone is called *Rhaciſagra*, for the ſpine is termed *Rhacis:* That which moleſts the ſhoulders *Omagra*, for the joynt of the ſhoulder is called *Omos:* That which affects the joynt of the collar-bones *Cleiſagra*, for that the Greeks call this bone *Cleis:* That in the elbow *Pechyagra*, for *Pechys* ſignifieth the elbow: The Gout in the hand is called *Chiragra*, in the hip *Iſchias*, in the knee *Gonagra*, in the feet *Podagra*, for that the hand, hip, knee and foot are in Greek termed, *Cheir*, *Iſchion*, *Gonia* and *Pous*. When as there is great abundance of humors in a body, and the Patient leads a ſedentary life, not ſome one, but all the joynts of the body are at once troubled with the Gout.

Particular Gouts.

CHAP. II.

Of the occult cauſes of the Gout.

THE humor cauſing the Gout is not of a more known, or eaſily expreſt nature than that which cauſeth the plague, *Lues venerea*, or Falling ſickneſs. For it is of a kind and nature clean different from that which cauſeth a *Phlegmon*, *Oedema*, *Eryſipelas*, or *Scirrhus*; for as *Aetius* ſaith, it never cometh to ſuppuration like other humors, not for that, as I think, becauſe it happens in bloodleſs parts, but through the occaſion of ſome occult malignity. Hereto may be added, that the humors which cauſe the fore-mentioned tumors, when as they fall down upon any part, not then truly when they are turned into *Pus* or matter, do they cauſe ſo ſharp pains as that which cauſeth the Gout, for the pain thereof is far more ſharp, than of that humor which cauſeth an ulcerated *Cancer*. Beſides theſe humors, when they fall upon the joynts through any other occaſion, never turn into knots, only that which cauſeth the Gout in the joynts, after it hath fallen thither, is at length hardned into a certain knotty, and, as it were, plaſter-like ſubſtance to be amended by no remedies. But ſeeing it offends not the parts by which it flows down (no more than the matter which creeping upwards from the lower parts to the brain, cauſeth the *Epilepſie*) as ſoon as it falleth into ſpaces of the joynts, it cauſeth cruel pain, one while with heat, another while with cold.

Lib. 12. *cap.* 12.

The reſemblance of the Gout or the Epilepſie.

For

For you may ſee ſome troubled with the Gout, who complain that their pained joynts are burnt; there are others to whom they ſeem colder than any ice, ſo that they cannot be ſufficiently heated to their hearts deſire; verily you may ſometimes ſee in the ſame body troubled with the Gout, that the joynts of the right ſide will, as it were, burn with heat, but on the left ſide will be ſtiff with cold; or which is more, the knee in the ſame ſide to be tormented with a hot diſtemper, and the ankle troubled with a cold. Laſtly, there ſometimes happens a ſucceſſion of pain in a ſucceſſion of days, as the ſame joynts will be this day troubled with a hot, to morrow with a cold diſtemper, ſo that we need not marvel to ſee Phyſicians preſcribe one while hot, another while cold medicines againſt the ſame diſeaſe of the ſame part and body. Alſo it ſometimes happens that the malignity of this humor doth not only not yield to medicines, but it is rather made worſe, ſo that the Patients affirm that they are far better when they have none, than when they have any remedies applied. For all things being rightly done, and according to reaſon, yet the diſeaſe will come again at certain ſeaſons by fits; and hereupon it is ſaid by *Horace:*

The ſtrange variety of the Gout.

Qui cupit, aut metuit, juvat illum ſic domus aut res,
Ut lippum pictæ tabulæ, fomenta podagram.

Riches the covetous, and fearful ſo do pleaſe,
As Pictures ſore eyes, Bathes the Gout do eaſe.

Certainly ſuch as have this diſeaſe hereditarily, can no more be helped and throughly freed therefrom, than thoſe in whom the matter of the diſeaſe is become knotty, whereof *Ovid* thus ſpeaketh:

Tollere nodoſam neſcit medicina podagram.

Phyſick the knotty Gout it cannot heal.

Theſe reaſons have induced many to believe, that the eſſence of this diſeaſe is unknown, for there is a certain occult and inexplicable virulency, the author of ſo great malignity and contumacy; which *Avicen* ſeems to acknowledge, when he writes that there is a certain kind of Gout whoſe matter is ſo acute and malign, that if it at any time be augmented by the force of anger, it may ſuffice to kill the party by ſudden death. Therefore *Galen* himſelf writes that Treacle muſt be uſed in all Arthritical and gouty affects, and as I think for no other reaſon, than for that it dries, waſtes, and weakens the malignity thereof. *Gordonius* is of the ſame opinion, but addeth withal, that the body muſt be prepared and purged before we uſe Treacle. Therefore the matter of the Gout is a thin and virulent humor, yet not contagious, offending in quality rather than quantity, cauſing extreme pains, and therefore inſtigating the humors together with the caliginous and flatulent ſpirits prepared or ready for defluxion upon the affected parts. Therefore as the bitings of Aſps, and ſtingings of Waſps cauſe cruel pain with ſudden ſwelling and bliſtering, which is by the heat of the humors which the poyſon hath tainted, and not by the ſimple ſolution of continuity, ſeeing that we daily ſee Shoo-makers and Taylors pricking their fleſh with auls and needles, without having any ſuch ſymptom: So the virulency of the Gout cauſeth intolerable tormenting pain, not by the abundance, becauſe it happens to many who have the Gout, no ſign of defluxion appearing in the joynts, but only by a malignant and inexplicable quality, by reaſon whereof theſe pains do not ceaſe unleſs abated by the help of medicines, or nature, or both. The recital of the following Hiſtories will give much light to that inexplicable and virulent malignity of the matter cauſing the Gout. Whilſt King *Charles* the ninth of happy memory, was at *Burdeaux*, there was brought to *Chappellain* and *Caſtellan* the Kings Phyſicians, and *Taſte* a Phyſician of *Burdeaux*, *Nicolas Lambert* and my ſelf, Surgeons, a certain Gentlewoman ſome forty years old, exceedingly troubled for many years, by reaſon of a tumor ſcarce equalling the bigneſs of a Peaſe, on the outſide of the joynt of the left hip: One of her tormenting fits took her in my preſence; ſhe preſently began to cry and roar, and raſhly and violently to throw her body this way and that way, with motions and geſtures above a womans, yea a mans nature; for ſhe thruſt her head between her legs, laid her feet upon her ſhoulders; you would have ſaid ſhe had been poſſeſſed of the Devil. This fit held her ſome quarter of an hour; during all which time I heedfully obſerved whether the grieved part ſwelled any bigger than it was accuſtomed, whether there hapned any new inflammation; but there was no alteration as far as I could gather by ſight or feeling, but only that ſhe cried out more loudly when as I touched it. The fit paſſed, a great heat took her, all her body ran down with ſweat, with ſo great wearineſs and weakneſs of all her members, that ſhe could not ſo much as ſtir her little finger. There could be no ſuſpicion of an Epileptick, for this woman all the time of her agony did perfectly make uſe of all her ſenſes, did ſpeak, diſcourſe, and had no convulſion. Neither did ſhe ſpare any coſt or diligence, whereby ſhe might be cured of her diſeaſe by the help of Phyſicians or famous Surgeons; ſhe conſulted alſo with Witches, Wizzards, and Charmers, ſo that ſhe had left nothing unattempted, but all art was exceeded by the greatneſs of the diſeaſe. When I had ſhewed all theſe things at our conſultation, we all with one conſent were of this opinion, to apply a potential Cautery to the grieved part, or the tumor. I my ſelf applied it; after the fall of the Eſchar very black and virulent *ſanies* flowed out, which freed the woman of her pain and diſeaſe for ever after. Whence you may gather, that the cauſe of ſo great evil was a certain venenate malignity, hurting rather by an inexplicable quality than quantity; which being overcome and evacuated by the Cautery, all pain abſolutely ceaſed. Upon the like occaſion, but on the right arm, the wife of the Queens Coach-man at *Amboiſe*, conſulted *Chappellain*, *Caſtelan* and me, earneſtly craving eaſe of her pain, for ſhe was ſo grievouſly tormented by fits, that through impatiency, being careleſs of her ſelf, ſhe endeavoured to caſt her ſelf headlong out of her chamber window, for

The matter of the Gout partakes of occult maligni-ty.

An Hiſtory.

A terrible fit.

How an Epileptick fit differs from the Gout.

for fear whereof ſhe had a'guard put upon her. We judged that the like Monſter, was to be aſſaulted with the like weapon, neither were we deceived, for uſing a potential Cautery, this had like ſucceſs as the former. Wherefore the bitterneſs of the pain of the Gout is not occaſioned by the only weakneſs of the joynts, for thus the pain ſhould be continual, and always like it ſelf; neither is it from the diſtemper of a ſimple humor, for no ſuch thing happens in other tumors of what kind ſoever they be; but it proceeds from a venenate, malign, occult and inexplicable quality of the matter: Wherefore this diſeaſe ſtands in need of a diligent Phyſician, and a painful Surgeon.

CHAP. III.

Of the manifeſt cauſes of the Gout.

The firſt primitive cauſe of the Gout.

Although theſe things may be true which we have delivered of the occult cauſe of the Gout, yet there be and are vulgarly aſſigned others, of which a probable reaſon may be rendred, wherein this malignity, whereof we have ſpoke, lies hid and is ſeated. Therefore as of many other diſeaſes, ſo alſo of the Gout, there are aſſigned three cauſes; that is, the primitive, antecedent, and conjunct: The primitive is twofold, one drawn from their firſt original and their mothers womb, which happens to ſuch as are generated of gouty Parents, chiefly if whilſt they were conceived, this gouty matter did actually abound and fall upon the joynts. For the ſeed falls from all the parts of the body, as ſaith *Hippocrates*, and *Ariſtotle* affirms *lib. de gen. animal.* Yet this cauſes not an inevitable neceſſity of having the Gout, for as many begot of ſound and healthful Parents are taken by the Gout by their proper and primary default; ſo many live free from this diſeaſe, whoſe fathers notwithſtanding were troubled therewith. It is probable that they have this benefit and priviledge by the goodneſs of their Mothers ſeed, and the laudable temper of the womb; whereof the one by the mixture, and the other by the gentle heat, may amend and correct the faults of the paternal ſeed; for otherwiſe the diſeaſe would become hereditary, and gouty perſons would neceſſarily generate gouty; for the ſeed followeth the temper and complexion of the party generating, as it is ſhewed by *Avicen.* Another primitive cauſe is from inordinate diet, eſpecially in the uſe of meat, drink, exerciſe and venery. Laſtly, by unprofitable humors which are generated and heaped up in the body, which in proceſs of time acquire a virulent malignity; for theſe fill the head with vapors raiſed up from them, when the membranes, nerves and tendons, and conſequently the joynts become more lax and weak. They offend in feeding who eat much meat, and of ſundry kinds at the ſame meal, who drink ſtrong Wine without any mixture, who ſleep preſently after meat, and which uſe not moderate exerciſes; for hence a plenitude, an obſtruction of the veſſels, crudities, the increaſe of excrements, eſpecially ſerous: Which if they flow down unto the joynts, without doubt they cauſe this diſeaſe; for the joynts are weak either by nature or accident, in compariſon of the other parts of the body: By nature, as if they be looſe and ſoft from their firſt original; by accident, as by a blow, fall, hard travelling, running in the Sun by day, in the cold by night, racking, too frequent venery, eſpecially ſuddenly after meat; for thus the heat is diſſolved by reaſon of the diſſipation of the ſpirits cauſed in the effuſion of ſeed, whence many crude humors, which by an unſeaſonable motion are ſent into the ſinews and joynts. Through this occaſion old men, becauſe their native heat is the more weak, are commonly troubled with the Gout. Beſides alſo the ſuppreſſion of excrements accuſtomed to be avoided at certain times, as the courſes, hemorrhoids, vomit, ſcouring, cauſeth this diſeaſe. Hence it is, that in the opinion of *Hippocrates*, a woman is not troubled with the Gout, unleſs her courſes fail her. They are in the ſame caſe who have old and running ulcers ſuddenly healed, or *varices* cut and healed, unleſs by a ſtrict courſe of diet they they hinder the generation and increaſe of accuſtomed excrements. Alſo thoſe which recover of great and long diſeaſes, unleſs they be fully and perfectly purged, either by nature or art; theſe humors falling into the joynts, which are the reliques of the diſeaſe, make them to become gouty: And thus much for the primitive cauſe. The internal or antecedent cauſe is the abundance of humors, the largeneſs of the veſſels and paſſages which run to the joynts, the ſtrength of the amandating bowels, the looſneſs, ſoftneſs, and imbecillity of the reviving joynts. The conjunct cauſe is the humor, it ſelf repact and ſhut up in the capacities and cavities of the joynts. Now the unprofitable humor, on every ſide ſent down by the ſtrength of the expulſive faculty, ſooner lingers about the joynts, for that they are of a cold nature and denſe, ſo that once impact in that place, it cannot be eaſily digeſted and reſolved. This humor then cauſeth pain by reaſon of diſtention or ſolution of continuity, diſtemper; and beſides the virulency and malignity which it requires. But it ſavours of the nature ſometimes of one, ſometimes of more humors; whence the Gout is either phlegmonous, eryſipelatous, œdematous, or mixt. The concourſe of flatulencies, together with the flowing down humors, and as it were tumult by the hinderance of tranſpiration, increaſeth the dolorifick diſtention in the membranes, tendons, ligaments and other bodies wherein the joynt conſiſts.

Another primitive cauſe of the Gout.

Alph. 19. ſect. 9.

The antecedent cauſe of the Gout.

The conjunct.

Five cauſes of the pain of the Gout.

What and how the matter of the Gout comes down from the brain.

CHAP. IV.

Out of what part the matter of the Gout may flow down upon the joynts.

The matter of the Gout comes for the moſt part from the liver, or brain; that which deſcends from the brain is phlegmatick, ſerous, thin and clear, ſuch as uſually drops out of the noſe, endued with a malign and venenate quality. Now it paſſeth out by the muſculous skin and *Pericranium*, as alſo through that large hole by which the ſpinal marrow, the brains ſubſtitute, is propagated into the ſpine, by the coats and tendons of the nerves into the ſpaces of

of the joynts, and it is commonly cold. That which proceeds from the liver is diffuſed by the great vein and arteries filled and puffed up, and participates of the nature of the four humors, of which the maſs of the blood conſiſts, more frequently accompanied with an hot diſtemper, together with a gouty malignity. Beſides this manner of the Gout, which is cauſed by defluxion, there is another which is by congeſtion; as, when the too weak digeſtive faculty of the joynts cannot aſſimilate the juices ſent to them.

Gout by congeſtion.

CHAP. V.

The ſigns of the Arthritick humor flowing from the Brain.

WHen the defluxion is at hand, there is an heavineſs of the head, a deſire to reſt, and a dulneſs with the pain of the outer parts, then chiefly perceptible, when the hairs are turned up, or backwards; moreover, the muſculous skin of the head is puffed up, as ſwoln with a certain œdematous tumor; the Patients ſeem to be much different from themſelves by reaſon of the functions of the mind hurt by the malignity of the humor, from whence the natural faculties are not free; as the crudities of the ſtomach, and the frequent and acrid belchings may teſtifie.

CHAP. VI.

The ſigns of a gouty Humor, proceeding from the Liver.

THe right Hypocondry is hot in ſuch gouty perſons, yea the inner parts are much heated by the bowels, blood and choler carry the ſway, the veins are large and ſwoln, a defluxion ſuddenly falls down, eſpecially if there be a greater quantity of choler than of other humors in the maſs of the blood. But if, as it often falls out, the whole blood, by means of crudities degenerate into phlegm and a wheyiſh humor; then will it come to paſs, that the Gout alſo, which proceeds from the liver, may be pituitous or phlegmatick, and participate of the nature of an *œdema*, like that which proceeds from the brain. As if the ſame maſs of blood decline towards melancholy, the Gout which thence ariſeth, reſembles the nature of a *ſcirrhus*; yet that can ſcarce happen, that melancholy by reaſon of the thickneſs and ſlowneſs to motion may fall upon the joynts. Yet notwithſtanding, becauſe we ſpeak of that which may be of theſe, it will not be unprofitable briefly to diſtinguiſh the ſigns of each humor, and the differences of Gouts to be deduced from thence.

When the Gout which proceeds from the default of the liver, aſſimilates the nature of an *œdema*.

Why the Gout ſeldom proceeds from melancholy.

CHAP. VII.

By what ſigns we may underſtand this or that humor to accompany the gouty malignity.

YOu may give a gueſs hereat by the Patients age, temper, ſeaſon of the year, condion of the Country where he lives, his diet and condition of life, the increaſe of the pain in the morning, noon, evening or night, by the propriety of the beating, pricking, ſharp or dull pain; by numneſs, as in a melancholy Gout or Itching; as in that which is cauſed by tough phlegm, by the ſenſible appearance of the part in ſhape and colour (as for example ſake) in a phlegmatick Gout, the colour of the affected part is very little changed from its ſelf, and the neighbouring well parts, in a ſanguine Gout it looks red, in a cholerick it is fiery or pale, in a melancholy livid or blackiſh, by the heat and bigneſs which is greater in a ſanguine and phlegmatick than in the reſt, by the change; and laſtly, by things helping and hurting. And there be ſome, who for the knowledge of theſe differences, wiſh us to view the Patients urine, and feel their pulſe, and conſider theſe excrements, which in each particular nature, are accuſtomed to abound or flow, and are now ſuddenly and unaccuſtomarily ſuppreſt. For hence may be taken the ſigns of the dominion of this or that humor. But more ample knowledge of theſe things may be drawn from the humors predominant in each perſon, and the ſigns of tumors formerly delivered. Only this is to be noted by the way, that the Gout which is cauſed by melancholy, is rare to be found.

CHAP. VIII.

Prognoſticks in the Goat.

BY the Writings of Phyſicians the pains of the Gout are accounted amongſt the moſt grievous and acute; ſo that through vehemency of pain many are almoſt mad, and wiſh themſelves dead. They have certain periods and fits, according to the matter and condition of the humor wherein this malign and inexplicable gouty virulency reſides. Yet they more frequently invade in the Spring and Autumn; ſuch as have it hereditary are ſcarce ever throughly free therefrom, as neither ſuch as have it knotty: For in the former it was born with them, and implanted, and, as it were, fixed in the original of life; but in the other, the matter is become plaſter-like, ſo that it can neither be reſolved nor ripened. That which proceeds from a cold and pituitous matter, cauſeth not ſuch cruel tormenting pain, as that which is of an hot, ſanguine or cholerick cauſe, neither is it ſo ſpeedily healed, for that the hot and thin matter is more readily diſſolved; therefore commonly it ceaſeth not until forty days be paſt: Beſides alſo, by how much the ſubſtance of the affected part is more denſe, and the expulſive faculty more weak, by ſo much the pain is more tedious. Hence it is, that thoſe Gouty pains which moleſt the knee, heel and

The Gout frequent in the Spring and Fall.

What Gout uncurable.

Gal. ad aphor. 49. ſect. 5.

and huckle-bone, are more contumacious. The Gout which proceeds of an hot matter, reſts not before the fourteenth or twentieth day. That which is occaſioned by acrid choler, by the bitterneſs of the inflammation of the pain cauſeth a difficulty of breathing, raving, and ſundry times a Gangrene of the affected part, and laſtly death; and healed, it often leaves a palſie behind it.

Why the Sciatica cauſeth lameneſs.

Amongſt all the gouty pains, the Sciatica challengeth the prime place, by the greatneſs of the pain and multitude of ſymptoms; it brings unquietneſs and watching, a Feaver, Diſlocation, perpetual lameneſs, and the decay of the whole leg, yea and oftentimes of the whole body. Now lameneſs and leanneſs, or decay of the part are thus occaſioned, for that the decurrent humor forceth the head of the thigh-bone out of the cavity of the huckle-bone; this being forceth out preſſed the muſcles, veins, arteries, and that notable and large nerve which runs along the thigh, even to the further joynts of the toes, and by the way is diverſly diſperſed over the muſcles of the whole leg: Therefore becauſe the head of the thigh is put out of its place, the Patient is forced to halt; becauſe the veſſels and nerves are oppreſſed, the nouriſhment and ſpirits do not freely flow into the parts there-under, whence proceeds their decay. Yet it ſundry times happens, that the head of the thigh being not diſplaced, many halt becauſe the viſcid humor, which is naturally implanted in that place, and continually flows thither, both for the nutrition of theſe parts, and the lubrication of the joynt for quicker motion, is hardned by heat and idleneſs, and the other unprofitable humors which flow down to their concrete, and ſo intercept the liberty of motion. A groſs and viſcid humor in what joynt ſoever it falleth and ſtayeth, doth the ſame. For by concretion it turns into a plaſter-like nature at or near the joynt, poſſeſſing the cavities thereof, and it depraveth the figure of the part, making it crooked and knotted, which formerly was ſtrait and ſmooth. Furthermore, every diſtemperature cauſed by the defluxion of humors, if it ſhall lye long upon any part, depraves all the actions, and oft-times wholly aboliſheth them; ſo that there may be three cauſes of the leanneſs or decay of the joynt by the Gout, the obſtruction or compreſſion of the veſſels, idleneſs, and an hectick diſtemper: But two of lameneſs, diſlocation and the concretion of an adventitious humor impact in the joynt. If contrary to cuſtom and reaſon the pains of the Gout do not go away, or return at their accuſtomed periods, moſt grievous and dangerous diſeaſes thereon follow; for the matter accuſtomed to flow down into the joynts, if it ſeize upon the ſubſtance of the liver, cauſes a ſtegmon; if it ſtay in the larger veins, a continual Feaver; if it flow in the membrane inveſting the ribs, a Pluriſie; if it betake it ſelf to the guts, and adhere to their coats, the Colick, or *Iliaca paſſio:* And to conclude, it produceth divers other ſymptoms, according to the diverſity of the parts whereto it flows and abides. For thus ſundry that have been troubled with the Gout, become paralytick, becauſe the matter, which formerly flowed down into the joynts, ſtays in the ſubſtance and pores of the nerves, and ſo hinders the ſpirit that it cannot freely in its whole ſubſtance paſs through them: Hence therefore comes the reſolution of the part, whereinto the nerve is inſerted. Old men can never be quite or abſolutely cured of the Gout, for that the maſs of their blood is ſo departed from its primary and native goodneſs, that it can no more be reſtored, than dead or ſowred Wine. The Gout, which proceeds from a cold cauſe, invadeth ſlowly, and by little and little, and is helped by the uſe of hot things; that which is from an hot matter quickly ſhews it ſelf, and is helped by the uſe of cold things. Now, although the Gout more frequently returns in the Spring and Fall, yet it comes in the midſt of Winter, the nerves being weakned by the exceſs of cold, and the humors preſſed out; otherwhiles in the midſt of Summer, the ſame being diffuſed and diſſipated. Laſtly, it comes at any time or ſeaſon of the year, if thoſe who are ſubject to this diſeaſe feed plenteouſly, and do all things according to their own minds and deſire. Thoſe who are troubled with the Gout, feel and perceive change of weather, ſtorms, rains, ſnows, winds, and ſuch like, before they come. A Southerly conſtitution of the air, for example, fills the body with humidities, and ſtirs up the humors that lye quiet in the body; and therefore cauſe defluxions upon the weaker parts, ſuch as the joynts, both by nature, as being without blood and fleſh, as alſo by accident, for that they a long time have been accuſtomed to be ſo tormented; therefore their pains are increaſed in a wet ſeaſon. Many of theſe that are troubled with the Gout, deſire venery in the bitterneſs of their pain, becauſe the internal heat wherewith they then are inflamed, doth not diſſipate into ſpirits and air, as the feaveriſh heat doth, but diſſolves, and, as it were, melts down the ſeminal humor, which diſſolved, flows to the genitals, filleth and diſtends them. The ſame thing befals carriage and running horſes, for in theſe by labour, much heat ſends flatulencies to the bottom of the belly. Yet venery is very hurtful to ſuch as are troubled with Gout, becauſe it diſſipates the ſpirits and native heat, and increaſeth the unnatural heat; whereby it cometh to paſs, that the nervous parts are weakned, and the pain exaſperated. Rich men, that is, ſuch as feed riotouſly on variety of dainties, and in the mean ſpace live idly and lazily are more frequently and cruelly tormented with the Gout than poor people, who live ſparingly and hardly: Wherefore there have been ſeen not a few of ſuch rich and riotous perſons, who having ſpent their eſtates, therewith changed their health, together with their fortune and diet, and ſo have been wholly freed from the Gout.

The cauſes of the lameneſs or decay of the limbs.

How the Gout turns into the Palſie.

Why the Gout takes one in Winter, and the midſt of Summer.

Why ſuch as have the Gout upon them, do oft-times deſire venery.

Venery hurtful in the Gout.

CHAP. IX.

The general method of preventing and curing the Gout.

Aph. 30. ſect. 6.

THoſe who deſire to prevent the Gout, muſt not glut themſelves with meat, muſt be quick to labour, and abſtain from Wine and Venery, or certainly muſt not uſe them unleſs for their healths ſake, muſt vomit and purge at certain times. *Hippocrates* writes, that bodies are not troubled with the Gout before the uſe of Venery. Yet at this day many Eunuchs are ſeen to

to have the Gout, but especially those who abound with idleness and pleasure; yet these we have heretofore mentioned are very effectual, not only for the prevention, but also for the cure of the present disease. Yet we must diligently distinguish the causes, what they be, and whence they may proceed, and oppose thereto remedies contrary in quantity and quality. There are absolutely three distinct causes of Gout: A tainture from the Parents; a corruption of the humors by diet and air; a native, or adventitious weakness of the joynts. Against these there is a twofold indication: The first is the evacuation and alteration of the peccant humors, the other the strengthning of the weak joynts. These two shall be performed by diet conveniently appointed, purging, blood-letting, provocation of the hemorrhoids, courses, vomit, sweat, urine, and fit application of local medicines. Therefore, when the time shall come, wherein the Gout accustometh to return by course, the Patient shall have a care of himself by a diligent manner of diet, he shall lessen the matter of the disease by Phlebotomy (if that the Gout shall arise from the blood) from the opposite part, that by the same means revullion and evacuation may be made; as if the upper parts be inflamed, blood shall be drawn from the lower; if on the contrary the lower, out of the upper, always observing the straitness of the fibres. Thus the right arm being troubled with a gouty inflamm ation, the *Saphena* of the right leg shall be opened, and so on the contrary; but if this general blood-letting being premised, the pain shall not cease, it will be requisite to open the vein next to the pain, which I have often performed with happy success.

Two general scopes of curing the Gout.

Whence blood must be let in the Gout.

Yet Phlebotomy hath not the like effect in all, for it is not available to such as are continually and uncertainly troubled with gouty pains, or whose bodies are weak and cold, wherein phlegm only is predominant. We may say the same of purging, for though it be oft-times necessary, yet too frequently re-iterated, it proves hurtful; furthermore, neither of these remedies is usually very profitable to such as observe no order in meat and drink, which use venery too intemperately, who abound with crude and contumacious humors, whose joynts by long vexation of the disease, have contracted an hectick distemper and weakness, so that they are departed from their natural constitution, and suffer a great change of their proper substance. Wherefore as often as these greater remedies shall be used, a Physician shall be called, who according to his judgment may determine thereof. For oft-times diet proveth more available than medicines; Therefore the Patient (if the matter of the Gout be hot) shall either drink no Wine at all, or else very much allayed, that is, as much as his custom and the constitution of his stomach can endure. A fit time for purging and bleeding is the Spring and Autumn, because, according to the opinion of *Hippocrates*, Gouts reign chiefly in these seasons; in Autumn, for that the heat of the precedent Summer debilitateth the digestive faculty, the native heat being dissipated: As also the eating of Summer-fruits hath heaped up plenty of crude humors in the body, which easily flow down into the passages of the joynts opened and dilated by the Summers heat: Add hereunto, that the inequality or variableness of Autumn weakneth all nervous parts, and consequently the joynts. But in the Spring, for that the humors forced inward, by the coldness of the Winter, are drawn forth from the centre to the circumference of the body, and being attenuated, fall into the joynts upon a very small occasion, therefore there is great both necessity and opportunity for evacuation, which if it shall not avert the accustomed fit, yet it will make it more gentle and easie.

What gouty persons find no benefit by phlebotomy.

In what Gout diet proves more effectual than medicines.

Aph 55. *sect.* 6.

CHAP. X.

Of Vomiting.

VOmiting is by all the Antients exceedingly commended, not only for the prevention, but also for the cure, especially when as the matter floweth from the brain and stomach; for the phlegmatick, serous and cholerick humors, which usually flow from the joynts, are excluded and diverted by vomit, and also there is attenuation of that phlegm, which being more thick and viscid, adhereth to the roots of the stomach: yet you must consider and see, that the Patient be not of too weak a stomach and brain, for in this case vomiting is to be suspected. For the time, such as have excrementitious humors flowing down to the stomach through any occasion, as by exercise and motion, must vomit before they eat; on the contrary, such as are over-charged with an old congestion of humors, must vomit after they have eaten something. Certainly, it is safer vomiting after meat, than it is before. For the dry stomach cannot, unless with great contention and straining, free it self from the viscid humors impact in the coats thereof; and hence there is no small danger of breaking a vein or artery in the chest or lungs, especially if the Patient be straitchested, and long-necked, the season cold, and he unaccustomed to such evacuation. I remember that with this kind of remedy I cured a certain Gentleman of *Geneva*, grievously molested with a cruel pain in his shoulder, and thereby impotent to use his left arm; the Physicians and Surgeons of *Lions* seemed to omit nothing else for his cure. For they had used purging, phlebotomy, hunger, a diet-drink of *Guaiacum* and *China* (although his disease was not occasioned by the *Lues venerea*) and divers other topick medicines, nether yet did they any thing avail. Now learning by him that he was not apt to vomit, but that it was difficult to him. I wished him to feed more plentifully, and that of many and sundry meats; as, fat meats, onions, leeks; with sundry drinks, as Bear, Ptisan, sweet and sharp Wine, and that he should, as it were, over-charge his stomach at his meal, and presently after get him to his bed; for so it would happen, that Nature not enduring so great confusion and perturbation of meats and drinks, whereof some were corrupted already in the stomach, and other-some scarce altered at all, Nature not enduring this confusion and perturbation, would easily, and of its own accord provoke the stomach to vomit; which that it might the better succeed, he should help forward Natures endeavour, by thrusting his finger or a teather into his throat, that so the thick and tenacious phlegm might by the same means be evacuated:

To what Gout vomiting is to be used.

What time the fittest therefore.

An History.

How to make one vomit easily.

And

Lib. de rat. victis.

And not content to do thus once, I wiſhed him to do the like the ſecond and third day following; for ſo it veriſieth that ſaying of *Hippocrates*, *The ſecond and third day exclude the reliques of the firſt:* Afterwards, that he ſhould vomit twice a month, chaw Maſtick faſting, rub his neck and the pained part with *Aqua vitæ*, ſtrengthned by infuſing therein Lavander, Roſemary, and Cloves groſly beaten, confirm his arm by indifferent exerciſe: He performed all this, and ſo became free from his pain, and recovered the uſe of his arm. Thoſe who do not like ſuch plentiful feeding, ſhall drink a great quantity of warm water, wherein Radiſh roots have been boiled, and they ſhall have a care leſt by uſing their ſtomachs to this excretion by vomit, they weaken the digeſtive and retentive faculty thereof. Wherefore ſuch as can naturally, ſhall think it ſufficient to vomit twice a month.

CHAP. XI.

The other general remedies for the Gout.

How diureticks are good for the Gout.

THe defluxion of ſerous humors is very fitly diverted from the joynts by the urine, by the uſe of diuretick medicines. Therefore the roots of Sorrel, Parſly, *Ruſcus*, *aſparagus*, and Graſs, and the like, ſhall be boiled in Broth, and given to ſuch as have the Gout: For when the urine floweth much and thick, the pain is leſſened. Many have found benefit by iſſues; for the Arthritick malignity flows forth of theſe, as by rivulets; experience ſhews it in ſuch as are troubled with the *Lues venerea*, for in thoſe that you cannot overcome the malignity by the proper antidote, that is, Quick-ſilver, they feel no greater eaſe of the pain, then by application of Cauſticks, and making of iſſues. They ſhall be made in ſundry places, according the difference of the pained joynts, to wit, in the beginning of the neck, if the defluxion proceed from the brain, and fall into the joynts of the collar-bones or ſhoulder; if into the elbow or hand, under the muſcle *Epomis*; if into the hip, knees and feet, ſome three fingers breadth under the knee, on the inſide: For thus there will follow more plentiful evacuation, by reaſon that the *Sapheia* runneth down that way. Yet if the Patient be troubled with much buſineſs, and muſt travel much on horſe-back, then ſhall they be made on the out-ſide of the leg, between the two bones thereof, that ſo they may trouble him the leſs in riding. If any had rather uſe an actual Cautery, let him take ſuch an one as is triangular and ſharp, that ſo he may with more ſpeed and leſs pain, perform that which he intends, and let him thruſt it through a plate of iron which hath an hole therein, and let the plate be marked, leſt he ſhould err; the ulcer ſhall be kept open, by putting in a pill of gold, ſilver, lint, or the root of Orris, Hermodactiles, Gentian, Wax, wherewith ſome powder of Vitriol, Mercury or Alum ſhall be incorporated, leſt it ſhould fill up with fleſh ſooner than the Phyſician ſhall think fit. In the mean ſpace, the head, oft-times the original of the evil, ſhall be evacuated by taking in the Winter the pills *Cochiæ*, and *de Aſſajereth*; but in Summer *ſine quibus*, or *Imperiales*, before the full of the Moon. ℞ *Pul. hieræ ſimp.* ʒ i. *agar. recent. troch. & rhei an.* ʒ ij. *myrobal. chebul.* ʒ ß. *Tamarind.* ϑ ij. *Cum infuſione ſenæ, fiat maſſa de qua formentur pil.* vi. *pro drachma:* Let the Patient take two before ſup per every eighth day; the day after he ſhall drink ſome broth of the decoction of cicers, and the diuretick roots. Alſo theſe following pills will be good to purge the phlegmatick and ſerous humor. ℞. *Pilular. fœtid. & de hermodactyl. an.* ʒ ß, *formentur cum ſucco vel ſyrup. roſar. ſolut.* Or elſe, ℞ *Aloes* ʒ iij. *Agarici trochiſ. & rhei, an.* ʒ i. *Maſſæ pilul. arthrit. & de Hermodact. an.* ϑ ij. *Diacrid.* ϑ; *cum melle roſato fiat maſſa, capiat pondus,* ʒ i. as the Phyſician ſhall think fit, by whoſe adviſe theſe ſhall be uſed and changed as occaſion ſhall offer it ſelf, and the nature of the humor cauſing the diſeaſe. The day after the purging, the Patient ſhall take three hours before meat half a dram of treacle, to ſtrengthen the entrails: Pills are preferred before liquid medicines, for that by their too long ſtay in the ſtomach they eaſily attract the noxious humor from the brain, and the other more diſtant parts. I have known ſome Phyſicians, who mixing with ordinary pills a good quantity of Scamony, as ſeven or eight grains, with a little Ginger, leſt it ſhould hurt the ſtomach, have purged by ſtool a great quantity of ſerous humors; the day following they gave Barley cream to correct the harm which the Scamony may have done to the ſtomach. Others for the ſame purpoſe give treacle, which doth not only ſtrengthen the entrails, but alſo weakens the virulency of the gouty malignity; the orifice of the ventricle muſt be ſhut after meat, that ſo the vapors aſcending to the brain may be reſtrained: For this purpoſe common drige-powder, marmelate, or conſerve of Roſes are good. In a wet ſeaſon uſe Cephalick perfumes thus made: ℞ *Thuris vernicis, & maſtich. an.* ʒ i. *granorum juniperi, baccarum lauri, an.* ʒ ß. *Ligni aloes* ʒ ij. *Aſſæ odoratæ* ʒ i. ß. Let them be groſly beaten; let the fume be received in tow, or carded cotton, and ſo applied to the Head. Alſo the excrementitious humors ſhall be dried up by the following powder ſtrewed on the Patients head for fifteen days. ℞ *Fol. roſ. rub. ſenæ, ſtœchad. utriuſque an.* m. ß. *Milii,* ℥. iiij. *Furfuris loti in vino albo,* ʒ iij. *Florum chamæm. melil. an.* p. i. *Sem. aniſi* ʒ i. *Salis com.* ʒ ii. *Fiat omnium pulvis.* Let it be put into linnen bags, with which, being warmed at the fire in a frying-pan, and kept with ſtirring, the head ſhall be rubbed. Let the following medicine be chawed, and kept in the mouth in the form of a Maſticatory, in the time of the falling down of the defluxion. ℞ *Cubebarum, nucis moſchat. glycyrrhiz. aniſ. an.* ʒ i. *Pyrethri,* ʒ ij. *Maſtich. rad. ſtaphiſarg. eryngii, an.* ʒ ij. Let them all be made into powder, and mixed together, and tied up in a little taffaty to the bigneſs of a haſel-nut, and let them be rowled up and down the mouth with the tongue to cauſe ſpitting or ſalivation. Working with the hands, and frictions of the arms, eſpecially in the morning after the evacuation of the excrements, are good for ſuch as are troubled with the Gout in the feet, for ſo, it not only cauſeth revulſion from the feet, but alſo the reſolution of that which is unprofitable.

CHAP.

CHAP. XII.

What diet is convenient for such as have the Gout.

AFter the body is once fed, they must not return to meat before that the concoction be perfected in the stomach, lest the liver be forced to draw by the mesaraick veins that which is yet crude and ill digested, and as it were forced thence. Whence the depravation of the nutriment of the whole body; for the following decoctions do not amend the default of the first. Let them make choice of meat of good juice and easie digestion, rosted for such as are phlegmatick, but boiled for such as are cholerick: As they shall shun much variety one meal, so must they eschew the use of pulses, milk-meats, sallads, and sharp things; as verjuice, vinegar, the juice of oranges, and citrons. They shall not eat unless they be hungry, and shall desist therefrom before they be fully satisfied, if it be but for this, that whilest the native heat is busied in the digestion of meat plenteously eaten, it is diverted from the concoction of the noxious humors. The flesh of great fowl, as swans, cranes, peacocks are not of laudable juice, and are with more difficulty digested in the stomach. Some of the ancients have disallowed of the eating of capons, and such like birds, because they are subject to be troubled with the Gout in the feet. Fishes are to be shunned, for that they heap up excrementitious humors, and are easily corrupted in the stomach, yea and relax it by continual use. Of the flesh of beasts, veal is most to be commended, for that it breeds temperate blood, and laudable juice, and is easily digested. Neither in the mean time is mutton to be found fault withall. But the like hunger or abstinence must not be appointed to all men troubled with the Gout, for such as are of a sanguine and cholerick complexion, because they are endued with much, and much wasting heat, are to be refreshed with more plentiful nourishment; for hunger sharpens choler, and so augments their pains; neither in the *interim* must they be fed with too much moist meats, for too much moisture, besides that it is the author of the putrefaction, will cause desluxions, and draw down the matter to the joint. Therefore the cholerick humor must be incrassated and refrigerated by taking things inwardly, and applying things outwardly lest by its tenuity it should fall down into the grieved parts. To this purpose conduce broths altered with lettuce, purslain, sorrel, and the like herbs, and barly creams made with a decoction of the four cold seeds. Phlegmatick bodies, by reason that they have not so vigorous heat, do as it were carry their provant about them, wherefore they must not be fed, neither with many, nor with moist meats. All that are troubled with the Gout, must shun those things that are hard of digestion, and which are soon corrupted, for they all have a certain remiss feaver, which diminisheth the native heat, and makes the meats apt to putrifie. Too plentiful drinking not only of wine, but also of any other liquor is to be avoided. For by too great a quantity of moisture the meat float in the stomach and the native heat is in some sort extinguished, whence proceed crudities. Some Physicians commend the use of white wine, for that it provokes urine, which is not altogether to be disallowed, if so be that the body be free from excrements, otherwise by this, as it were a vehicle, especially if the temperature of the body be somewhat more hot, they shall be carried down into the joints. Therefore in such a case I should rather advise them to use claret, which is somewhat weak and astringent, for that it doth not so much offend the head nor joints, and it shuts and strengthens the orifices of the vessels, yet it will be more convenient wholly to abstain therefrom, and instead thereof to drink an *Hydromel* made after this manner: ℞ *aquæ* ℔ iv. *mellis opt.* q. j. *bulliant ad consumptionem* ℔ j. *bene despumando, adde ad finem salviæ* p. j. *imo si æger sit pituitosus, cinnamomi aut caryophyllorum momentum.* For cholerick persons make a sugred water thus: ℞ *aquæ fontis* ℔ iv. *sacchari* ℔. ß. *colentur per manicam sine ebullitione, addendo in fine cinnamomi* ʒij. For thus the stomach shall also be strengthened; also he may drink *ptisan*, wherein at the end of the decoction shall be boiled some dried roses, or else some syrup of pomegranates added thereto, lest it should offend the stomach; as soon as it comes from off the fire, let it stand and settle, and then strain it through an hypocras bag, or clean linnen cloth.

The fault of the first concoction, is not amended in the after.

Capons subject to the Gout.

Cholerick persons cannot away with long fasting.

Phlegmatick bodies in fasting feed upon themselves.

White wine not good for the gout.

Claret may be the safelier drunk.

Hydromel most safely.

An *Hydrosaccharum.*

CHAP. XIII.

How to strengthen the Joints.

IT is a matter of much consequence for the prevention of this evil, to strengthen the joints, whereby they may be able to resist the humors preternaturally falling down upon them. Wherefore it is good morning and evening to rub them with *oleum omphacinum*, that is, oil made of olives not come to their perfect maturity; or with oil of roses mixed with common salt finely powdered. It may also be mixed with common oil, adding thereto the powder of Harts-horn, as that which hath an astringent and drying faculty. Also it is good to bathe them in this following lee: ℞ *cort. granat. nucum cupress. gallarum, sumach. cortic. querni, an.* ʒij. *salis com. alumin. roch. an.* ʒj. *salviæ, rorismar. lavendul. lauri, ivæ arthritic. an.* m. j. *rosar. rub.* m. ß. *bulliant omnia in* vi. ℔ *vini crassi & astringentis, & lixivio parato ex aqua chalibeata, & cinere querno.* Then foment the part with spunges or cotten cloths; after, this fomentation shall be carefully wiped and dried with hot linnen cloths, taking heed of cold. The juice of unripe haws tempered with oxycrate is a singular thing for this purpose. But if you desire to strengthen the joints weakned by a cold cause, then, ℞ *salviæ, rorismar. thymi, lavendul. laur. absinth. an.* m. j. *caryophyl. zinzib. piperis, conquassatorum an.* ʒj. *infundantur in aqua vitæ & vini rubri astringentis, an.* ℔ iv. *bulliant leniter in balneo Mariæ.* With this liquor foment the joints morning and evening. Some think it good to strengthen the joints, to tread grapes in vintage-time, which if they be not able to do, then let them wash their feet in the must or new pressed wine.

A fomentation to strengthen the joints.

The juice of haws with oxycrate.

Bags. Alſo bags may be thus made for the ſame purpoſe. ℞ *ſalis com. alum. roch. cort. granat, ſumach. berberis, nucum cupreſſi, an.* ℥iv. *fol. ſalviæ, roriſm. roſar. rub. an.* m. ß. Let them be all put in linnen bags, and boiled in lee, and ſo make a decoction, for to foment the joints.

CHAP. XIV.

Of the Palliative Cure of the Gout and the material cauſes thereof.

The ſcopes of curing. HEre alſo muſt we conſider the cauſes whence this diſeaſe proceeds, the temper of the diſeaſed body, the parts affected, and thoſe from whence it proceeds. For as theſe are not always alike, ſo neither can one and the like remedy be uſeful in every Gout. For firſt thoſe which proceed of a cold cauſe require other remedies, than thoſe which ariſe from a hot, and that which proceeds from any one ſimple humor, than that which ariſeth from diverſe mixed together. For Choler alone cauſeth cruel pains, but tempered by the admixture of Phlegm, it becomes more gentle. Furthermore ſome remedies are good in the beginning, ſome in the encreaſe, and ſome at other times. Neither may we uſe repercuſſives in the Sciatica, as we may in the Gout of the feet and other joints; unleſs peradventure the part be fearfully inflamed.

Repercuſſives not to be uſed in the *Sciatica.* Taking theſe things to conſideration we muſt obſerve that the Palliative cure of that Gout, which cannot abſolutely be helped, as that which is hereditary and inveterate, is performed by four ſcopes. The firſt is by appointing a convenient diet in the *ſix things* which are termed *not-natural.* The ſecond by evacuating and diverting the antecedent matter, both by purging and phlebotomy. The third by topick medicines according to the condition of the morbifick humor and nature. The fourth by correcting the ſymptoms, but eſpecially the pain, whereof in theſe affects there is oft-times ſo great exceſs by reaſon of the inexplicable and invincible malignity of the virulent quality aſſociating the humor that it alone is oft-times ſufficient to kill the patient. And becauſe the variety of morbifick cauſes, brings a variety of remedies, fitted to theſe four intentions, therefore it behoves a Phyſician to be moſt attentive in the diſtinction of the cauſes. For he may be eaſily deceived and miſtake one for another; for arthritick pains proceeding from a cold matter, if they be mitigated by the application of Narcotick and cold medicines, it may induce us to believe that the material cauſe is hot, though really it be not ſo; for Narcoticks aſſwage pain, not for that they are contrary to the cauſe thereof, but becauſe they take away the ſenſe by inducing a numnneſs; on the contrary, the material cauſe may ſeem cold, which notwithſtanding is hot, for that it becomes better by application of hot medicines, that is, by taking an argument from that which helps, becauſe contraries are cured by contraries, and the like preſerved by the like. But herein conſiſts the error, for that hot medicines profit not by their contrariety, but by the attenuation of the groſs matter, by the rarefaction of the skin, and diſſipating them into air. Whence you may gather, that an argument drawn from that which helps and hurts, is very deceitful: moreover it may happen that a large quantity of cold matter flowing down from the brain, may cauſe great pain by reaſon of the virulency, and a ſmall quantity of choler mixed therewith, which ſerves for a *vehicle* to carry down the tough and ſlow phlegm into the joints, whence the patient becomes thirſty and feaveriſh by reaſon of the heat and inflammation of theſe parts, whereby ſuch as are leſs cautelous and heedy will eaſily be induced to believe that ſome hot matter is the occaſion of this Gout. Now when as not ſome one ſimple humor, but different by reaſon of mixture, cauſeth the Gout, the yelloviſh colour of the part may deceive one, as, if the evil matter ſhould proceed from choler only, which by the tenuity of its ſubſtance leaving the center, eaſily poſſeſſeth the circumference of the body or part: and notwithſtanding much phlegm being as it were enraged by the admixtion of a little choler, may be the chief cauſe of the diſeaſe, and may peradventure be diſcovered by the encreaſe of pain in the night ſeaſon. A feaver ariſing by means of pain and watching may encreaſe the conceived opinion of choler, which attenuating and diffuſing the humors, drives them into the joints, and cauſeth fiery urines, tinctured with much choler, and a quick pulſe. Yet notwithſtanding the Phyſician ſhall be in an error, if deceived with theſe appearances, he attempt the cure of this Gout, as ariſing from a hot, and not from a cold cauſe: yet I am not ignorant that the cure of the proper diſeaſe muſt be neglected for the cure of the ſymptoms. Beſides alſo it may come to paſs that choler may be the cauſe of the Gout, and notwithſtanding no ſigns thereof may appear in the skin and ſurface of the affected part, becauſe the coldneſs of the ambient air, and the force of applied Narcoticks may have deſtroyed the colour of the juices lying thereunder, and as it were imprinted a certain blackneſs. It alſo happens that the body being overcharged with a great quantity of groſs and viſcid humors the expulſive faculty may diſcharge ſome portion thereof unto the joints, but leave the reſt impact in the cavity of ſome entrail, where cauſing obſtruction and putrefaction, may preſently cauſe a feaver, and that intermitting, if it be ſmall, and obſtruct only the leſſer veins, and theſe of the habit of the body. Wherefore then it is not ſufficient that the Phyſician employ himſelf in the cure of the Gout, but it behoves him much to attend the cure of the feaver, which if it be continual, it diſcredits the Phyſician, and endangers the patient; if it be intermitting, it eaſily becomes continual, unleſs it be withſtood with fit remedies, that is, unleſs you let blood, the belly being firſt gently purged, and nature be preſently freed by a ſtronger purge of the troubleſome burden of humors. Now it is convenient, the purge be ſomewhat ſtronger than ordinary; for if it ſhould be too weak, it will ſtir up the humors, but not carry them away, and they thus agitated will fall into the pained and weak joints, and cauſe the Gout to encreaſe. By this it appears how deceitful that conjecture is, which relies and is grounded on one ſign, as often as we muſt pronounce judgment of morbifick cauſes. Wherefore to conclude, we muſt think that opinion moſt certain concerning the matter of the diſeaſe, which is ſtrengthned with multiplicity of ſigns, as thoſe which are drawn from the colour of the part, the heat or coldneſs manifeſt to the touch,

An argument taken from that which helpeth or giveth eaſe, is not always certain.

How cold diſeaſes may be helped by cold, and hot, by hot medicines.

The firſt thing that may deceive a Phyſician.

The ſecond.

The third.

The fourth.

The fifth.

The ſixth.

Why ſtrong purges muſt be given to ſuch as have the Gout.

That judgment moſt certain which reſts upon multiplicity of ſigns.

thoſe

thoſe things that help and hurt, the patients familiar and uſual diet, temper, age, region, ſeaſon of the year, propriety of pain, the exacerbation or exceſs thereof, in what days, and in what hours of the day, the length of theſe fits, the urine and other excrements coming from the patients body. But for that not a few are in that hereſie, that they think that we muſt neither purge nor let blood in the Gout, we muſt here convince that opinion; For ſeeing that phyſick is the addition of that which wants, and the taking off thoſe things that are ſuperfluous, and the Gout is a diſeaſe which hath its eſſence from the plenty of abounding humors, certainly, without the evacuation of them by purging and bleeding, we cannot hope to cure, either it, or the pain which accompanies it. *Metrius*, in his Treatiſe of the Gout writes, that it muſt be cured by purging, uſed not only in the declination, but alſo in the height of the diſeaſe, which we have found true by experience; and it is conſonant to this ſaying of *Hippocrates*; In pains we muſt purge by the ſtool. Beſides alſo, *Galen* profeſſeth that in great inflammations, fevers and pains, he knew no greater nor ſurer remedy than to let blood, even to the fainting of the Patient. If thoſe which are in this caſe ſhall not become better by purging and phlebotomy conveniently preſcribed, then it happens by the means of drunkenneſs, gluttony, and the like diſtemper. For hence abundance of crude humors are heaped up, which by their contumacy yield themſelves leſs obedient to medicines. Therefore ſuch gouty perſons as are intemperate and given to gluttony and venery; may hope for no health by uſe of medicines.

Why we muſt uſe purging and bleeding in the Gout.

Lib. de cur. per ſang. miſſionem.

CHAP. XV.

Of local medicines which may be uſed to a cold Gout.

LIttle do topick medicines avail, unleſs the body of the gouty patient ſhall be purged from excrementitious humors; beſides alſo there is danger leſt by the uſe of repelling medicines, the virulency of the humor may be driven into the entrails, which thing hath been the cauſe of ſudden death to many. Now in the firſt place we will ſpeak of local medicines which are thought meet for a phlegmatick juice, becauſe this is more frequent, than that which is from a hot cauſe. At the beginning in every Gout, the *Sciatica* excepted, we muſt uſe aſtringent things which have a faculty to bind or ſtrengthen the joints, and to dry and waſte the excrementitious humor. As, ℞ *fol. ſabinæ* m. ß. *nucum cupreſſi* ʒiij. *aluminis roch.* ʒj. *gum. tragacanthæ* ʒiv. *mucilaginis pſilii & cydon. quantum ſufficit, fiat cataplaſma.* Or, ℞ *ſtercoris bubuli recentis* ℔ j. *mellis roſ.* ʒiv. *olei roſ. & aceti an.* ʒij. *bulliant ſimul parum, fiat cataplaſma.* Or elſe, ℞ *olei roſar. & myrtill. an.* ʒij. *pulveris myrrhæ & aloes an.* ʒj. *acaciæ* ʒij. ß. *incorporentur cum aqua gallarum coctarum, & fiat unguentum.* Some boil ſage, camomile and melilote flowers, wormwood and danewort, of each a handful in a ſufficient quantity of vinegar, then they put the grieved part into this decoction being warm; and by frequent uſing this medicine, it hath been found to repel and conſume the noxious humor, not only cold, but alſo cholerick; and alſo to ſtrengthen the part. The freth *fæces* of Olives laid to the part, aſſwage pain: dried Oranges boiled in vinegar, beaten and applied, do the ſame. Or, ℞ *medii corticis ulmi* ℔ ß. *caudæ equin. ſtœchad. conſolid. majoris, an.* m. ſ. *aluminis roch. thuris an.* ʒiij. *farin. hordei* ʒv. *lexivii com. quantum ſufficit, fiat cataplaſma ad formam pultis ſatis liquidæ.* Commonly then when as the part ſwelleth up, the pain is leſſened, for that the expulſive faculty driveth the humor from the center into the circumference of the part, that is, from within outward; for in like ſort, ſuch as have the tooth-ach have leſs pain when their cheeks begin to ſwell.

It is not ſafe to uſe repercuſſives in the Gout before purging.

An aſtringent Cataplaſm.

A diſcuſſing ſomentation.

One, partly aſtringent and partly diſcuſſing.

After repercuſſives, we muſt come to thoſe which evacuate the contained humor by evacuating or reſolving it. For every defluxion of humors remaining in any part requires evacuation. Neither muſt we marvel thereat, if the digeſted humor doth not vaniſh at the firſt time; for we muſt have regard to the cold phlegm which is thick and viſcid, as alſo of the part which is ligamentous, membranous and nervous, and conſequently more denſe than fleſhy parts. ℞ *rad. bryon. ſigilli beat. Mariæ an.* ʒiv. *bulliant in lixivio, poſtea terantur, & colentur per ſetaceum, addendo farin. hordei & faharum an.* ʒj. *olei chamæm.* ʒiij. *fiat cataplaſma.* Or, ℞. *hordei & lupin. an.* ʒiij. *ſulphuris vivi & ſalis com. an.* ʒj. *mellis com.* ʒv. *pul. aloes & myrrhæ an.* ʒ ß. *aq. vit.* ʒj. *cum lixivio, fiat cataplaſma.* Or, ℞ *ſucci calium rub. aceti boni, an.* ʒiv. *farin. hordei* ʒj ß. *pul. Hermodactyl.* ʒ ß. *vitellos ovorum* nu. iij. *olei chamæm.* ʒij. *croci* ℈ij. ſome burn the roots and ſtalks of Coleworts, and mix the aſhes with hogs greaſe and the powder of Orris, and ſo make a pultis. Or, ℞ *Lactis vaccini* lb. ij. *micæ panis albi quantum ſufficit, bulliant ſimul, addendo pulveris ſubtilis florum chamæm. & meliloti an.* m. ß. *croci* ℈j. *vitellos ovorum* nu. iv. *ol. roſ.* ʒiij. *butyri recentis* ʒj. *terebinth.* ʒij. *fiat cataplaſma ad formam pultis ſatis liquidæ.* This Cataplaſm may be applied with good ſucceſs, not only to phlegmatick and cold, but alſo to any gout, at any time to mitigate the extremity of the pain in men of any temper, and it muſt be changed twice or thrice a day. Alſo Treacle diſſolved in wine, and anointed on the part, is ſaid to aſſwage this pain. You may for the ſame purpoſe make and apply emplaiſters, unguents, cerats, and liniments: This may be the form of an emplaiſter. ℞ *gummi ammoniaci, bdellii, ſtyracis, an.* ʒij. *cum aceto & aqua vit. diſſolve & adde farin. fœnugr.* ʒ ſ. *olei chamæm. & aneth. an.* ʒij. *ceræ quantum ſufficit, fiat emplaſtrum molle.* Or, ℞ *rad. bryon. ſigill. beat. Mariæ an.* ʒv. *bulliant in lixivio complete, & colentur per ſetaceum, addendo olei cham.* ʒiv. *ſevi hircini* ʒiv. *ceræ nov. quantum ſufficit, fiat emplaſtrum molle.* Or, ℞ *gum. ammon. opopanacis, galbani, an.* ʒij. *diſſolvantur in aceto, poſtea colentur, adde olei liliorum, terebinth. venet. an.* ʒj. *picis navalis, & cer. nov. quantum ſufficit, fiat emplaſtrum molle.* Or elſe, ℞. *ſucci rad. enul. camp. & ebuli an.* ʒiij. *rad. alth.* lb ſ. *coquantur & colentur per ſetaceum, addendo florum cham. melil. ſambuci, roriſmar. & hyperici an.* p. ij. *nucum cupreſſi,* nu. iv. *ol. cham. aneth. hyper. liliorum, deſpica an.* ʒij. *pinguedinis anatis, gallin. anſeris an.* ʒ ß. *ranas virides vivas* nu. vi. *catellos duos nuper natos, bulliant. omnia ſimul, in* ℔ ij. ſ. *vini odoriferi & una aquæ vit. ad conſumptionem ſuccorum & vini, & oſſium catellorum diſſolutionem, & fortiter exprimantur;*

Why the gouty humor doth not preſently vaniſh upon the uſe of repercuſſives. Greater diſcuſſers.

A cataplaſm good for any Gout at any time.

Diſcuſſing emplaiſters.

primantur ; & expreſſis adde terebinth. ℥iij. *cer. quantum ſufficit, fiat emplaſtrum mol'e.* Alſo, *Emp. de Vigo. Oxycroceum, de mucilaginibus, de meliloto* and the like mixed together, and ſoftned with a little oil or *axungia*, are of the like faculty, and good for the ſame purpoſe.

Ointments.

Let this be the form of an ointment. ℞ *anſerem pinguem, & imple catel'is duobus, de quibus deme cutem, viſcera, caput & pedes ; item accipe ranas* nu.x. *colubros detracta cute in fruſta diſſectos* nu. iv. *mithridat. & theriac. an.* ℥ ß. *fol. ſalviæ, roriſmar. thymi, rutæ, an.* m. ß. *baccarum lauri, & juniperi, conquaſſat. an.* ℥j. *pulveris nuc. moſchat. zinzib. caryophyl. & piper. an.* ʒj. *de eo quod ſtillabat fiat unguentum vel linimentum cum cera & terebinth. veneta, pauca, aq. vitæ addita* ; this marvelouſly aſſwageth the pain of the Gout ariſing from a cold cauſe. Another, ℞ *gummi pini, & laudani, an.* ℥iv. *gummi elemi & picis naval. an.* ℥ ß. *terebinth. venet. claræ* ʒvi. *chamæm, & liliorum an.* ℥vi. *vini. rub.* ℔. i ß. *aq. vit. & ſalv. an.* ʒvj. *diſſolvantur omnia ſimul lento igne baculo ſemper agitando, deinde adde pul. ireos, flor. baccarum lauri & hermodactyl. an.* ℥ij ß. *maſtiches, myrrhæ & olibani an.* ℥ij. *farinæ fabar.* ℥iv. *incorporentur omnia ſimul, fiat unguentum molle.* Or elſe, ℞. *mucilag. ſeminis fœnugr. in aceto extract. quantum volueris, cui miſce mellis quantum ſufficit* ; let them be boiled together until they acquire the conſiſtence of an ointment. Theſe things ſhall be changed, as often as need ſhall ſeem to require. Alſo an anodyne and diſcuſſing fomentations are good to reſolve ; as this, ℞ *fol. rutæ, ſalv. roriſmar. an.* m. j. *bulliant cum aceto & vino* ; and ſo make a decoction for a fomentation, which you may uſe not only in a cold Gout, but alſo in a hot, becauſe it reſolveth and ſtrengtheneth the part by aſtriction, and freeth it from the defluxion : you muſt have a care that the medicines which are uſed to pains of the Gout be changed now and then. For in this kind of diſeaſe that remedy which did good a little before, and now availeth, will in a ſhort time become hurtful.

Diſcuſſing fomentations.

Remedies muſt be often changed in the Gout.

But if the the contumacy and exceſs of the pain be ſo great, that it will not yield to the deſcribed medicines ; then it is fit, becauſe the diſeaſe is extreme, to uſe (according to *Hippocrates* counſel) extreme, ſuch are are thoſe which follow. ℞ *axungiæ gallinæ, olei laurini maſtic. & euphorb. an.* ℥j. *pulv. euphorb. & pyreth. an.* ʒj. *fiat litus* ; herewith let the part be rubbed every day, for it is a very effectual medicine. For *Euphorbium* and Pellitory by their heat attenuate and reſolve, the capons greaſe and oil of bays relax, the oil of maſtich ſtrengtheneth the part and hindreth a new defluxion. Alſo there is made a very anodyne ointment of oil of Foxes, wherein earth worms, the roots of elecampane and bryony have been boiled, with a little turpentine and wax ; this ſoftens, attenuates and reſolves the cold humor impact in the joints. Or elſe, ℞ *ſeminis ſinapi pulviſerati, & aceto acerrimo diſſoluti,* ℥iij. *mellis anacardani* ℥ij. *aquæ vitæ* ℥j. *ſalis com.* ʒij. let them be all mixed together, and applied to the pained part. Or, ℞ *picis nigræ,* ℥iij. *terebinth. venetæ* ℥j. *ſulphuris vivi ſubtiliter pulveriſati* ℥iij. *olei quantum ſufficit, liquefiant ſimul, fiat emplaſtrum* ; let it be ſpread upon leather, and laid upon the part for two or three days ſpace, if the patient perceive any eaſe thereby ; if otherwiſe, let it be changed as we ſaid before. Some for the ſame purpoſe apply nettles thereto, and preſently after wath the part in the ſea or ſalt water. Others foment the part with vinegar wherein pigeons have been boiled. A veſicatory made of very ſower leaven, *cantharides*, and a little *aqua vitæ* is very powerful to evacuate the conjunct matter. For thus the malign and virulent *ſerum*, or whayiſh humor is let out, whence follows ſome caſe of the pain. Now there are ſome gouty pains, which cannot be leſſened or aſſwaged unleſs by remedies more powerful than the diſtemper, therefore veſicatories ought not to be rejected, ſeeing that the Ancients in this affect have alſo made uſe of actual cauteries, as we ſhall ſhew hereafter. *Chriſtopher Andreas* in his book termed *Oecoitarie* [that is, domeſtick phyſick] much commends Oxdung wrapped in cabbage or vine-leaves, and roaſted in the embers, and ſo applied hot to the grieved part.

A great diſcuſſer.

An Anodyne.

A veſicatory againſt the contumacy of the conjunct matter.

CHAP. XVI.

Of local medicines to be applied to a hot or ſanguin Gout.

What repercuſſives are here required.

HEre muſt we in the beginning make uſe of repercuſſives, ſuch as are cold and dry, that they may contend with the morbifick matter by both their qualities ; alſo let them be aſtrictive, ſo to add ſtrength to the part. But I would have you always to underſtand that you muſt firſt premiſe general medicines. ℞ *albuminum ovorum* nu. iv. *ſucci lactucæ & ſolani an.* ℥j. *aq. roſar.* ℥ij. *incorporentur ſimul, & fiat linimentum ſæpius renovandum.* Others take the meal of barly, lentils, *acatia*, oil of roſes, myrtles, and with a little vinegar they make a cataplaſm ; Or, ℞. *ſumach. myrtillorum, boli arm. an.* ʒ ß. *acaciæ, corticum granat. balauſt. an.* ʒij. *aq. plantag. & roſar. an.* ℥iij. *ol. roſati* ℥j ß. *aceti* ℥ij. *farinæ hordei & lentium quantum ſatis erit, fiat cataplaſma.* This is very excellent and effectual to ſtay or hinder phlegmonous and eryſipelatous tumors. Alſo you may make a cataplaſm *ex mucagine Cidoniorum in aquâ roſarum extractâ, caſſia fiſtula, oleo roſato, & aceto :* Or, ℞ *pampinorum vitis viridium,* m. ij. *terantur & bulliant in oxycrato ex aqua fabrorum, cui adde ſumach. conquaſſat.* ʒj. *olei roſat.* ℥ij. *farinæ hordei quantum ſufficit, fiat cataplaſma.* Or elſe, ℞ *ſucci ſempervivi, hyoſcyami, portulacæ an.* ℥iv. *corticum mali granati* ℥j ß. *farinæ hordei* ℥v. *vini auſteri quantum ſufficit, fiat cataplaſma* ; this is much commended, for it hath entring thereinto wine and the pomgranate pill, which both are very great aſtrictives ; and the juices are exceeding cooling, the meal alſo hinders and thickens the ſanguin humors that are ready to flow down, and make the medicine of a good conſiſtence. Another : ℞ *fol. hyoſcyami & acetoſæ an.* m. j. *involvantur papyro, & ſub cineribus coquantur, mox cum unguento populeon, aut roſat.* ℥ij. *incorporentur* ; and then lay this Cataplaſm thus made warm unto the part. Another : ℞. *florum hyoſcyami* ℔ ij. *ponantur in phiala vitreata, & reconde in fimo equino donec putruerint, accipe ex putredine* ℥ij. *in quibus diſſolve olei de junipero* ℥ ß. *fiat linimentum ad uſum.* Others beat pulp of a Gourd or Citrul in a mortar, and ſo apply it. Another : ℞ *mucilag. ſem. pſilii, & cydon. extract. in aq. roſar. & ſolani an.* ℥iv. *olei roſati*

An excellent aſtringent cataplaſm.

omphacini

omphacini ʒiii. *vini granat.* ʒi. *vitellos ovor. cum albumine* nu. iii. *camphoræ* ʒi. *incorporentur simul, fiat linimentum.* Or elſe, ℞. *ol. roſat. omphacini* ʒiv. *album ovorum cum vitellis* nu. vi. *ſucci plantag. & ſolani an.* ʒi. *farinæ hordei* ʒiii. *incorporentur ſimul, fiat cataplaſma.* Or, ℞. *farinæ faharum & hordei an.* ʒiii. *olei roſati,* ʒii. *oxycrati quantum ſufficit, coquantur ſimul, fiat cataplaſma.* Another, ℞. *mucilag. cent. pſilii.* ʒiv. *ol. roſati* ʒii. *acet.* ʒi. *vitellos ovorum,* nu. iii. *croci* ϑi. *miſce. Pliny* reporteth that *Sextus Pomponius* the Governour of the hither-Spain, as he overlooked the winnowing of his corn, was taken by the pain of the Gout in his feet, wherefore he covered himſelf with the Wheat above his knees, and ſo was eaſed, his feet being wonderfully dryed; and he afterwards uſed his kind of remedy. *Lib. 22. cap. 25.*

It is note-worthy, which often happeneth, that the pain cannot be altogether eaſed by ſuch remedies, by reaſon of the abundance of blood impact in the part; wherefore it muſt be evacuated: which I have done in many with good ſucceſs, opening the vein which was moſt ſwelled and nigh to the affected part; for the pain was preſently aſſwaged. Neither muſt we too long make uſe of repercuſſives; leſt the matter become ſo hardned, that it can ſcarce be afterwards reſolved, as when it ſhall be concrete into knots and plaſter-like-ſtones: reſolving medicines are to be mixed with repercuſſives conveniently applyed, ſo to diſcuſs the humor remaining as yet in the part, whereof ſhall be ſpoken in the following Chapter.

Phlebotomy to evacuate the conjunct matter, and aſſwage pain.

CHAP. XVII.

Of Local medicines for a cholerick Gout.

THe repercuſſives that muſt firſt be uſed in this kind of Gout ought to be cold and moiſt that ſo they may reſiſt both the qualities of choler; ſuch are the leaves of night-ſhade purſlain, houſ-leek, henbane, ſorrel, plantain, poppy, cold water and the like, whereof may be made divers compoſitions. As, ℞. *ſucci hyoſcyami, ſempervivi, lactuc. an.* ʒii. *farin. hordei* ʒi. *olei roſati* ʒii. *agitando ſimul fiat medicamentum*; Let it be applyed and often changed, for ſo at length it will aſſwage the inflammation. Some think the brain of a hog mixed with white ſtarch, or barly-meal and oil of roſes, an excellent medicine. The leaves of mallows boiled in water, and beaten with a peſtle, and applied, aſſwage pain. ℞. *mucilag. ſem. pſilii extract. in aq. ſolani, vel roſarum* ʒii. *farin. hordei* ʒi. *aceti q. ſ. fiat linimentum.* Or elſe, ℞. *unguent. roſat. meſue, & populei an.* ʒiii. *ſucci melonum* ʒii. *alb. ovorum,* nu. iii. *miſceantur ſimul pro litu.* Alſo a ſponge dipped in oxycrate, and preſſed out again and applied thereto doth the ſame. Or elſe, ℞. *fol. caulium rub.* m. ii. *coquantur in oxycrato & terantur, adde ovorum vitellos tres, olei roſati* ʒiii. *farinæ hordei quantum ſufficit, fingantur cataplaſma.* Alſo you may take the crude juice of cole-worts, dane-weed, and roſes beaten and preſſed out, and of theſe incorporated with oil of roſes and barly-meal make a cataplaſm. In winter-time, when as theſe things cannot be had green, you may uſe *unguent. infrigidans Galeni & populeon.* Or elſe, ℞. *ceræ albæ* ʒi. *croci* ϑi *opii* ϑiv. *olei roſati quantum ſufficit, macerentur opium & crocus in aceto, deinde terantur & incorporentur cum cera & oleo, fiat ceratum*; ſpread it upon a cloth, and lay it upon the part, and all about it, and let it be often renewed. Some cut frogs open and apply them to the grieved part. It is confirmed by ſundry mens experience, that pain of the *Sciatica*, when it would yield to no other remedy, to have been aſſwaged by anointing the affected part with the mucous water or gelly of Snails, being uſed for the ſpace of ſeven or eight days; truth whereof was aſſured me by the worthy Gentleman the Lord of *Longeman*, a man of great honeſty and credit, who himſelf was troubled for ſix months ſpace with the *Sciatica*. This water is thus made, Take fifty or ſixty red Snails, put them in a copper-pot or kettle, and ſprinkle them over with common ſalt, and keep them ſo for the ſpace of a day; then preſs them in a coarſe or hair cloth: in the expreſſed liquor dip linnen rags and apply them ſo dipped to the part affected, and renew them often. But if there be great inflammation, the Snails ſhall be boiled in Vinegar and Roſe-water They ſay that Citrons or Oranges boiled in Vinegar, and beaten in a mortar, and incorporated with a little barly or bean flower, are good againſt theſe pains. Or elſe, ℞. *pomorum coctorum in lacte* ℔. i. *butyri* ʒi. *vitellos ovorum,* nu. ii. *aceti* ʒi. *fiat cataplaſma.* There are ſome who take cheeſ-curd newly made, and mix it in a mortar with oil of Roſes and barly-meal, and ſo apply it; it repreſſeth inflammation and aſſwageth pain. Others mix *caſſia* newly extracted forth of the cane, with the juice of Gourds or Melons. Others apply to the part the leaves of Coleworts, and Dane-weed or Smallage, or all three mixed together and beaten with a little Vinegar. Others macerate or ſteep an ounce of linſeed in Wort and make the mucilage extracted therefrom into a Cataplaſm with ſome oil of Roſes and barly-meal. Some put oil of poppies to the pulp of Citrulls or Gourds being beaten, and ſo incorporate them together, and apply it.

What repercuſſives are here required.

A cerate with *opium*.

The water of Snails.

This following medicine hath its credit from a certain Gaſcoin of *Baſas* that was throughly cured therewith, when as he had been vexed long and much with gouty pains, above the common cuſtom of ſuch as are troubled with that diſeaſe. Thus it is; Take a great ridg-tile thick and ſtrong, and heat it red hot in the fire, then put it into ſuch another tile of the ſame bigneſs, but cold, leſt it ſhould burn the bed cloths, then forthwith fill the hot one with ſo many Dane-wort-leaves, that the patient may ſafely lay the affected part therein without any danger of burning it. Then let the patient endure the heat that comes therefrom, and by ſweat receive the fruit thereof, for the ſpace of an hour, ſubſtituting freſh Dane-wort-leaves, if the former become too dry; as alſo another hot tile, if the former ſhall grow too cold before the hour be ended. This being done, let the part be dried with warm and dry linnen cloths. Uſe this particular ſtove for the ſpace of fifteen days, and that in the morning faſting; afterward anoint the part with this following ointment. ℞. *ſucci ebuli* ℔. ʃ. ß. *olei com.* ℔. ʃ. *miſceantur ſimul*, and let them be put into a ſtraight mouthed glaſs, and well luted up; then let it boil in *balneo Mariæ*, being firſt mixed with ſome wine, until the half thereof be conſumed, for the ſpace of ten or twelve hours, then let it cool, and

An hiſtory.

A particular ſtove.

An ointment of the juice of Dane-wort.

and ſo keep it for uſe, adding thereto in the time of anointing, ſome few drops of *aqua vitæ*. It may be anointed twice or thrice in a day, long after meat. Moreover; the roots and leaves of Dane-wort boiled in water, beaten and applyed aſſwage pain; the oyl thereof chymically extracted performs the ſame.

When to uſe narcoticks.

But if the contumacious pain cannot be mitigated by the deſcribed remedies, and becoming intolerably hot and raging, make the patient almoſt to ſwoun; then muſt we flie to Narcoticks; For although the temper of the part may be weakned by theſe, the native heat diminiſhed or rather extinguiſhed; yet this is a far leſs inconvenience than to let the whole be waſted by pain. Theſe things have a powerful refrigerating and drying faculty, taking away the ſenſe of the pain, and furthermore, incraſſate, thin acrid and biting humours, ſuch as cholerick humors are. Wherefore if the matter which cauſeth the pain be thick, we muſt abſtain from Narcoticks, or certainly uſe them with great caution. ℞. *micæ panis ſecalini parum cocti in lacte*, ʒii. *vitellos ovorum*, nu. ii. *opii* ʒi. *ſuccorum ſolani, hyoſcyami, mandragoræ, portulacæ, ſempervivi, an.* ʒi. let them be mixed together and applied, and often changed. Or elſe, ℞. *fol. hyoſcyami cicutæ, acetoſ. an.* m. i. *bulliant in oxycrato & contundantur, cumque vitellis ovorum crudorum* nu. ii. *& olei roſat.* ʒii. *farin. hordei quod ſatis ſit, incorporentur, fiat cataplaſma*; with the uſe thereof I am accuſtomed to aſſwage great pains. Or elſe, ℞. *opii.* ʒiii. *camphor.* ʒ ß, *olei nenuph.* ʒi. *lactis* ʒii. *unguent. roſ. Galeni* ʒiv. *incorporentur ſimul in mortario, applicentur.* Moreover, cold water applied and dropped upon the part drop by drop, is narcotick and ſtupefactive, as *Hippocrates* affirmeth, *Aphor.* 29. *Sect.* 5. for a moderate numneſs mitigateth pain. There is alſo another reaſon why it may be profitably uſed in all pains of the Gout, for that by repelling the humors, it hindereth their defluxion into the part. Mandrag-apples boiled in milk, and beaten, do the ſame thing; alſo the leaves of henbane, hemlock, lettuce, purſlain, being ſo boiled do the ſame. If any deſire to uſe theſe more cold, he muſt apply them crude, and not boiled.

A cataplaſm with *opium*.

But the exceſs of pain being mitigated, we muſt deſiſt from the uſe of ſuch narcoticks, and they muſt rather be ſtrengthned with hot and digerating things; otherwiſe there will be danger leſt it be too much weakned, the temper thereof being deſtroyed, and ſo afterwards it may be ſubject to every kind of defluxion. Wherefore it ſhall be ſtrengthned with the formerly diſcuſſing fomentations, and theſe enſuing remedies. As, ℞. *gum. ammoniaci & bdelii an.* ʒi. *diſſolvantur in aceto, & paſſentur per ſetaceum, addendo ſtyracis liquid. & farin. fœnugr. an.* ʒ ß. *pulv. ireos.* ʒiv. *olei chamæm.* ʒii. *pulveris pyrethri* ʒii. *cum cera, fiat emplaſtrum molle.* Or elſe, ℞. *rad. emulæ, ebuli, althææ an.* ℔ ß. *ſem. lini, fœnugr. an.* ʒii. *ficuum ping.* nu. xx. *coquantur completè & trajiciantur per ſetaceum, addendo pul. euphorb.* ʒii. *olei chamæm. aneth. & rutacei, an.* ʒiii. *medullæ cervi* ʒiv. *fiat cataplaſma.* Yet you muſt uſe moderation in diſcuſſing, leſt the ſubtler part of the impact humor being diſcuſſed, the groſſer part may turn into a ſtony conſiſtence, which alſo is to be feared in uſing repercuſſives.

How to mend the harm done by Narcoticks. Diſcuſſers.

A mean to be uſed in diſcuſſing

Baths aſſwage the pain of the Gout.

I alſo omitted, that according to the opinion of the Ancients, baths of freſh-water, wherein cooling herbs have been boiled, uſed three hours after meat, conduce much to the aſſwaging of pain; for ſo uſed, they are more convenient in cholerick natures, and ſpare bodies, for that they humect the more, and quickly digeſt the thin and cholerick, and conſequently acrid vapors, the pores being opened, and the humors diſſipated by the gentle warmneſs of the bath. After the bath the body muſt be anointed with *hydrelium*, or oil and water tempered together, leſt the native heat exhale and the body become more weak. Meats of more groſs juice are more convenient, as beef, ſheeps-feet, and the like, if ſo be that the patient can digeſt them, for theſe inſpiſſate the cholerick blood, and make it more unfit for defluxion.

How meats of groſs juice are profitable.

CHAP. XVIII.

What remedies muſt be uſed in pains of the joints proceeding of a diſtemper only, without matter.

An hiſtory.

PAins alſo happen in the joints by diſtemper without any matter, which though rare, yet becauſe I hapned once to feel them, I have thought good to ſhew what remedies I uſed againſt them. I once earneſtly buſied in ſtudy, and therefore not ſenſible of ſuch external injuries as might befal me; a little wind coming ſecretly in by the crannies of my ſtudy, fell upon my left Hip; at length wearied with ſtudy, as ſoon as I roſe up to go my way, I could not ſtand upon my feet, I felt ſuch bitter pain without any ſwelling or humor which might be diſcerned. Therefore I was forced to go to bed, and calling to mind, that cold, which was abſolutely hurtful to the nerves, had bred me that pain, I attempted to drive it away by the frequent application of very hot cloths, which though they ſcorched and bliſtered the ſound parts adjoining thereto, yet did they ſcarce make any impreſſion upon the part where the pain was ſetled, the diſtemper was ſo great, and ſo firmly fixed therein. And I laid thereto bags filled with fried oats and millet, and dipped in hot red wine; as alſo ox-bladders half filled with a decoction of hot herbs. And laſtly, a wooden diſh almoſt filled with hot aſhes, covered over with ſage, roſemary, and rue lightly bruiſed, and ſo covered with a cloth, which, ſprinkled over with *aqua vitæ*, ſent forth a vapor which aſſwaged the pain. Alſo brown bread newly drawn out of the oven, and ſprinkled over with roſe-water, and applied, did very much good. And that I might more fully expel this hurtful cold, I put ſtone bottles filled with hot water to the ſoals of my feet, that the brain might be heated by the ſtraitneſs and continuity of the nerves. At length, by the help of theſe remedies, I was very well freed from this contumacious diſtemper, when it had held me for the ſpace of four and twenty hours.

Hip. ap. 10. *ſect.* Divers remedies for pain ariſing from a cold diſtemper without matter.

A fuliginous vapour ſometimes the cauſe of the Gout.

There is another kind of Gouty pain ſometimes cauſed by a certain excrementitious matter, but ſo thin and ſubtle that it cannot be diſcerned by the eyes. It is a certain fuliginous or ſooty vapor, like

like to that which passeth from burning candles or lamps, which adheres and concretes to any thing that is opposed thereto; which being infected by the mixture of a virulent serous humor whithersoever it runneth, causeth extreme pain, some whiles in these, and otherwhiles in other joints, unless you make a way therefore, when as it seeketh passage forth, which must be done by horns cupping glasses, vesicatories, cauteries, or other the like art.

CHAP. XIX.

What is fit to be done after the fit of the Gout is over.

How to strengthen the joints.

IT is convenient when the pain is asswaged, that you strengthen the joints. Now, to strengthen them is not only to bind and dry, but wholly to amend the weakness left in the part by the disease, that is to discuss the humor, if any superfluity thereof remain; but to humect the part; if the moisture be exhausted and dryed up. But such as are troubled with the Gout, after they are freed from their pain, have notwithstanding such impotency of their joints that they cannot go of a long time after; for that the nerves and tendons which are in great number in the feet, being moistned with much Phlegm, are so relaxed, that they can no more sustain or bear themselves upon their feet, than paper when it is wet can be made stand. Wherefore, that they may recover the use of their feet, the impacted humor must by all means be discussed, and spent with fomentations, cataplasms, drying and astringent emplasters. You may use the formerly described fomentation, encreasing the quantity of alum and salt, and adding thereto a like quantity of *sulphur vivum*: then the following emplaster shall be applyed thereto. ℞. *mas. emplast. contra rupturam* ʒiv. *tereb.* ʒii. *pulv. ros. rub. nucum cupress. gallarum, gran. myrtil. & fol. ejusdem, thuris, mastich. & caryophyl. an.* ʒi *malexentur omnia simul, manibus injunctis oleo myrtino & mastichino, fiat emplastrum.* Let it be spread upon leather to a just bigness, and applied to the top and soal of the foot. Draw over the plaster, and the whole leg a stocking made of a tanned-dogs-skin; this emplaster strengthneth the nerves, draweth forth the humor impact therein, and intercepts the defluxion. But the Dog-skin-stocking preserveth the native heat of the part, and for that it bindeth, hindreth the defluxion into the feet.

Remedies for the weakness left in the joints after the pain is gone.

The benefit of a dog-skin stocking.

CHAP. XX.

Of the Tophi, *or knots which grow at the joints of such as are troubled with the Gout.*

SOme that are troubled with the Gout, have knotty bunches growing in their joints, which by the ancients were called *Tophi*. These are generated by the congestion of gross viscid and crude Phlegm, with a little admixtion of an acrid and cholerick humor. These matters remain setled in the part, for that it being too weak cannot digest and depress them; wherefore being there impact, they easily concrete into a certain plaster-like or chalk-like substance, whilest by the adventitious and burning heat caused by pain, and the gouty malignity, their more subtle part is dispersed, but the grosser subsides. Yet sometimes the unfit application of repercussive or discussive medicines is a cause of the generation of these *Tophi*. For by the former, the impact matter is incrassated and gathered together; but by the latter, the subtle part being discussed, the remnant that subsides, concretes into *Tophi*. Those medicines which are made to mollifie, ought to have a moderately heating, and humecting faculty, that they may diffuse, and as it were dissolve the impact matter; such is warm water, the decoction of emollient herbs, the decoction of calves or sheeps entrails, heads and feet: after these or the like fomentations, you shall use the following medicine. ℞. *axungiæ human. anseris & gallinæ, medul. cervin. an.* ʒii. *tereb. ven.* ʒi. *aq. vitæ parum, ceræ quantum sufficit, fiat unguentum molle.* Then this which followeth will be good. ℞. *rad. alth. liliorum, bryon. lapath. acuti, an.* ℥iv. *coquantur complete, & trajiciantur per setaceum; adde gum. ammon. bdel. galb. opopanacis in aceto dissolutorum* ʒi. *medul. cervin.* ʒiß. *incorporentur simul, & applicentur.* Or else, ℞. *olei liliorum, amygd. dul. medullæ cruris cer. an.* ʒii. *mucag. sem. lini, alth. fœnugr. an.* ʒi. *ceræ quantum sufficit; fiat ceratum.* Or else, ℞. *empl. de Vigo cum mercurio, & cerat. de æsipo humidâ descript. Philagrii, an.* ʒii. *malexentur simul cum oleo lilior. fiat massa.* Or else, ℞. *gum. ammon. opopan. galb. bdel. dissolutorum in aceto an.* ʒii. *panno linteo calatis, adde pulv. sulph. nitr. sinapi, pyrethri, an.* ʒß. *styracis liq. & axung. hum. an.* ʒi. *res. pini, tereb. ven. an.* ʒß. *ceræ quantum sufficit, fiat ceratum molle.* This which follows is thought most effectual in the opinion of *Galen* and *Avicen*. ℞. *pedes porcel. bene salsos, nu.* iv. *veterem pernam cum illis coque; addendo sub finem, radicis bryoniæ, lapath. acut. an.* ʒiii. *axungiæ tauri, & medul. cervi, an.* ʒi. *cum caseo putrefacto fiat empl. molle ad usum.* This which follows is also most effectual. ℞. *casei acris & putrefacti,* ʒiv. *pulv. sulph. vivi euphorb. & pyreth. an.* ʒiii. *decoctionis veteris pernæ & porcellorum quod sufficit ad incorporandum, ducantur in mortario, & fiat empl. ad usum.* Or else, ℞. *spumæ nitri,* ʒvi. *tereb.* ʒii. *olei veteris, lixivii, quo lanæ pileorum lavantur, & ceræ quantum sufficit, fiat ceratum satis molle.* After the use of emollients, a fumigation shall be made in this manner: Heat a cogle-stone, mill-stone or brick red hot in the fire, take it forth, and cast upon it a sufficient qnantity of very sharp vinegar, and *aqua vitæ*, the rising vapor shall be diligently received by the affected member, for this hath a faculty to attenuate and cut gross, viscid, and plaster-like matter, yea also, and to break the skin; yet that is broken oft times of its own accord without the help of either medicine or instrument. To conclude, those medicines which are good to mollifie scirrhous tumors, the same are also good to soften the gouty knots and *tophi*. But we must note; that these knotty bunches are sometimes suppurated, not truly by the impact and plaster-like matter, but by a new defluxion coming on a sudden, and then it is necessary to make way for the contained matter, which being done, first there cometh forth an humor like milk, then a plaster-

Whence the *Tophi* are generated.

plaſter-like matter, then it leaves behind it an ulcer to be cured by applying thereto *empl. gratia Dei*, and others as the Surgeon ſhall think fit.

CHAP. XXI.

Of Flatulencies contained in the joints, and counterfeiting true Gouts, and of the remedies to be uſed thereto

In what joints flatulencies are chiefly generated.

OFt-times there is ſmall quantity of humor, which moves the pain of the Gout but much flatulency mixed therewith, eſpecially in great joints, as in the huckle or hip-bone, and the knees; they ſometimes cauſe ſo great diſtention, that they drive the heads of the bones forth of their places.

Signs of flatulencies.

You may partly underſtand it is ſo, if a tenſive pain afflict the patient with any ſenſe of heavineſs; if when you preſs the tumor with your fingers, the place retain no mark or impreſſion thereof, as happens in an *œdema*; but on the contrary, a flatulent ſpirit lifts it up as it were by renitency, as if one ſhould thruſt a pair of bellows, which are filled with wind; hence the part cannot perform its duty, for that the ſpaces of the joints are poſſeſſed with abundance of flatulencies, ſo that the liberty of motion is intercepted, and the member is kept as it were bound up.

How flatulencies may make you believe there is *pus*, or matter.

Many no very skilful Surgeons, putting their fingers to theſe kind of tumors, ſo that lifting up the one, they preſs down the other, when as they perceive the flatulency, as it were riſing between their fingers, ſuppoſing it to be the motion of *pus*, or matter already generated and flowing up and down, as is uſual in impoſtumes, they have opened it by inciſion; but when as nothing flowed forth, it appeared how much they were deceived, yet in the *interim*, by this their raſhneſs they have cauſed many dangerous ſymptoms: as increaſe of pain, defluxion of humors, by force whereof the bones have been diſlocated, and brought to the patient an incurable lameneſs.

Why hard to cure.

But theſe flatulent Gouts are ſeldom without ſome plegmatick matter; which is neither too crude nor viſcid. Such like flatulencies are not eaſily diſcuſſed, nor at the firſt endeavour, by reaſon of a cold diſtemper which they bring to the part, and the denſity of the membranes and ligaments, by which the articulation is knit and faſtned, ſo that ſcarce any part of that which is there ſhut up, can breath forth of ſuch ſtrait paſſages. Therefore the cure muſt be undertaken with reſolving, diſcuſſing, and drying fomentations; as for example, with a decoction of fennel, aniſ-ſeeds, rue, camomil, melilote, ſage, roſemary, *origanum*, calamints, hore-hound, and the like, boiled in wine with a little lee, roſe-vinegar, and common ſalt. This following ointment ſhall be uſed after the fomentation. ℞ *olei chamæm. aneth. rut. lauri, an.* ℥ij. *cum cerâ albâ, fiat linimentum. addendo aq. vitæ parum.* After you have anointed it, apply thereto this following Cataplaſm. ℞ *flor. cham. melil. aneth. roſ. rub. pulv. an.* m.j. *fol. malv. & abſinth, an.* m.ſ. *furfur.* m.j. *bulliant omnia ſimul cum lixivio, & vino rubro, deinde piſtentur cum medulla panis, & farina fabarum, quantum ſufficit, fiat cataplaſma, addendo ol. roſar. & myrtil. an.* ℥ij. Some highly approve of this following medicine for the waſting of flatulencies. ℞ *axung. ſuil.* ℥iv. *calcis vivæ,* ℥iſ. *terantur diligenter in mortario, & incorporata applicentur.* Or elſe, ℞ *ſtercor. caprar. cocti cum vino & aceto, an.* lbſ. *tereb. venet. & mel. com. an.* ℥ij. *aq. vitæ,* ℥ſ. *pul. rad. Ireos florent. & ſabin. an.* ℥iij. *olei. rut. & aneth. an.* ℥j. *farin. fabarum quantum ſufficit.* Make a cataplaſm to the form of a pultis. Alſo ſtoups dipped in oxycrate, and wrung out, ſhall be applied: in this oxycrate ſhall be boiled wormwood, *origanum*, chamomil, melilote, rue, common ſalt, adding thereto ſome *aqua vitæ*. Then the part ſhall be bound up as ſtraight as the patient can endure it: in concluſion that the native ſtrength may by little and little be reſtored to the part, it ſhall be fomented with lee made of the aſhes of oak-wood and the cuttings of vines, wherein ſhall be boiled ſalt, ſulphur, choice alum; and wetting linnen clothes, or ſtoups therein, and applying them, it ſhall be ſtraitly ſwathed up. Yet if great pain ſhall more cruelly vex the part, then neglecting for a time the proper cure of the diſeaſe, you ſhall withſtand the ſymptom by rubbing the part, and anointing it with ſome diſcuſſing oil laying thereon ſome moiſt wool, and other anodyne things.

CHAP. XXII.

Of the Iſchias, *Hip-gout, or* Sciatica.

Why it hath the moſt grievous ſymptoms.

FOr that the hip-gout in the greatneſs of other cauſes, bitterneſs of pain, and vehemency of other ſymptoms, eaſily exceeds the other kinds of Gout, therefore I have thought good to treat thereof in particular. The pain of the *Sciatica* is therefore the moſt bitter, and the ſymptoms moſt violent for that the dearticulation of the huckle bone, with the head of the thigh-bone, is more deep than the reſt; becauſe alſo the phlegmatick humor which cauſeth it, is commonly more plenteous, cold, groſs, and viſcid, that flows down into this joint: and laſtly, becauſe the *Sciatica* commonly ſucceeds ſome other chronical diſeaſe, by reaſon of the tranſlation and falling down thither of the matter, become malign and corrupt by the long continuance of the former diſeaſe.

The cauſe of the large ſpreading of the pain.

But the pain not only troubles the hip, but entring deep, is extended to the muſcles of the buttocks, the groins, knees, and very ends of the toes, yea often times it vexeth the patient with a ſenſe of pain in the very *vertebra* of the loins, ſo that it makes the patients, and alſo oft-times the very Phyſicians and Surgeons to think it the wind or ſtone-colick. The cauſe of ſuch wandring and diſperſed pain is to be referred to the manifold diſtribution of the nerves which come to that joint from the loins and *holy-bone*, for they are ſent into the muſcles of the buttocks, and ſo diſperſed over the whole leg to the very ends of the toes, as it is ſhewed in our Anatomy. Therefore the pain is largely extended, that is, to what part ſoever a nerve runs which comes from the affected hip. Oftentimes there is no ſwelling, no redneſs, nor diſtemper manifeſt to the eye, by reaſon that the veins are very few which riſe into the ſurface and

skin

skin of this part, and the humor lies, as it were, ſunk in; which is the cauſe that divers times the excrementitious humors mixed with flatulency, run ſo violently into the cavity of this joint, that relaxing the ligaments, as well proper as common, the head of the thigh-bone is eaſily driven out from hence, ſo that it may never be reſtored again, if it remain ſo for any ſpace of time; for that in this time the humor falling down into this cavity, by delay concretes as it were into a ſtony body, and the head of the thigh-bone wears it ſelf another cavity in the neighbouring bone; but the lips of the true cavity, which are griſtly, become more ſtraight and depreſt: and laſtly, all the ligamentous bodies moiſtened with this excrementitious humor become more looſe and weak, whence ſucceed many and moſt grievous ſymptoms; as lameneſs, and the decay not only of the thigh and leg, but at length of the whole body; and laſtly, a ſlow and hectick feaver, which in continuance of time will conſume the Patient for the cauſes formerly mentioned. Therefore let Phyſicians and Surgeons have a care that they reſiſt it at the firſt, and, with ſuch powerful remedies as are mentioned in the following Chapter, hinder the ſpringing up and growth of the formerly mentioned ſymptoms.

The thigh-bone often diſlocated by the *Sciatica*.

CHAP. XXIII.

The cure of the Sciatica.

THough the *Sciatica* be commonly occaſioned by tough phlegm, yet if the patient be ſtrong, and abound with blood, and all things elſe conſent, it ſhall be good to draw blood by opening a vein; for phlebotomy equally evacuates all humors: therefore the falling down of the humors into the part affected, is thereby hindred or retarded. Verily, I have known no ſpeedier remedy to aſſwage the pain of inflammation, than blood-letting, being firſt made on the *Baſilica* of the grieved ſide for revulſions ſake; and then for evacuation of the conjunct matter on the *vena Iſchiadica*, which is at the cut-ſide of the ankle, if the pain of the *Sciatica* be more on the out-ſide; or elſe on the *Sapheia*, which is on the inſide of the ankle, if the inner parts be more pained. The quantity of blood which is to be drawn, muſt be left to the judgment of the Phyſician, without whoſe advice I would attempt nothing in this caſe. Alſo acrid clyſters are good, if there be nothing which may hinder; as ulcers of the guts, or hemorrhoids. ℞ *rad. acor.* ℥ij. *centaur. rut. ſalv. roriſm. calam. origan. puleg. an.* m. ℈. *ſtœchad. arabic. flo. cham. melil. aneth. an.* p. j. *ſem. aniſ. & fœnic. an.* ℥ ℈. *fiat decoctio ad* lb j. *in colatura diſſolve hieræ & diaphen. an.* ʒ ℈. *mellis anthoſ. ſacch. rub. an.* ℥j. *olei liliorum* ℥iij. *fiat clyſter.* Strong purgations are alſo here uſeful, as of *pillul. fœtid. arthritic. Aſſajereth de Hermodactylis*, and others uſed in phlegmatick cauſes. *Electuarium Diacarthami* purgeth choler and phlegm. Often vomitings do not only evacuate the humors, but alſo make revulſion, as we have formerly delivered, Baths and ſweats profit no otherwiſe than a decoction of *Guaiacum* or *Sarſaparilla*. If heat moleſt the part, then foment it with oil of roſes and vinegar, eſpecially if the pain be deep in, for vinegar by its tenuity pierceth to the bottom, and makes way for the oil, which of its own nature is anodyne. After the uſe of general medicines, you ſhall apply attractive and reſolving things: emplaſters of pitch and ſulphur, or of *ammoniacum, euphorbium, terebinthina, propolis, galbanum, bdelium, opopanax*, draw the humor from within to the ſurface or skin. As in like ſort alſo the chymical oil of ſage, roſemary, Pellitory of Spain, and other ſuch like do the ſame, which by reaſon of the tenuity of their ſubſtance, and their ſeparation from earthy impurity, have far more powerful and expedite faculties to penetrate and diſcuſs. Yet muſt you uſe none of all theſe without very good judgment and deliberation, otherwiſe there will be danger of inflammation.

When the *vena Iſchiadica* and *Sapheia* muſt be opened in the *Sciatica*.

Strong purgations in the *Sciatica*.

There may alſo be made fomentations of diſcuſſing and reſolving herbs, as the roots and leaves of dane-weeds, orris, bay and juniper-berries, the ſeeds of fenugreek, anis, fennel, the leaves of ſage, roſemary, chamomil, melilote, elder, and the like, boiled in wine and oil; the following plaſter is much commended by the ancients to digeſt, or reſolve and aſſwage the pain, with this which draws forth thorns, ſplinters, and rotten bones. ℞. *ſem. urtic. mundat. ſpumæ borac. ſalis ammoniaci, rad. ariſtoloch. rotund. colocinth. terebinth. venet. an.* ℥.x. *fœnug. piperis longi, xylobalſam. thur. myrrhæ, adipis cap. gum. pini, an.* ℥.v. *ceræ* lb ℈. *lactis ficus ſylv.* ℥ ℈. *ex omnibus ſecundum artem præparatis cum olei liliorum, & vini generoſi quantitate ſufficiente fiat emplaſtrum.* Let it be applied to the hip. Or, ℞ *ſinapi acerrimo aceto diſſoluti*, ℥ij. *fermenti aceris*, ʒ ℈. *pul. hermodact.* ʒij. *mellis com.* ℥iij. *tereb.* ℥iv. *olei laur. & de ſpica. an.* ℥ij. *far, fœnug.* ʒi ℈. *terræ formicarum cum ovis*, lb j. *fol. laur. ſalv. rut. roriſm. an.* m. ℈. *vermium terreſt. præpar.* lb ℈. The earth with the eggs and worms ſhall be boiled apart with the white wine, and herbs cut in pieces, and theſe being ſtrained out, the reſt of the things ſhall be added according to art, and then it ſhall be applied to the hip. Or elſe, ℞ *rad. enul. camp. ſigil. Salom. bryon. biſmal. an.* ℥ij. *coquantur complete & terantur, trajiciantur per ſetaceum, addendo farin. fœnug. & hordei, an.* ℥j. *olei liliorum, & chamæm. an.* ℥iij. *tereb.* ℥iv. *ceræ quantum ſufficit, fiat cataplaſma.* It reſolves, aſſwageth pain, and calleth forth the humors to the skin. Or elſe, ℞. *rad. ſigil. beatæ Mariæ*, ℥vj. *empl. diachyl. albi*, ʒiv. *croci in aqua vitæ diſſoluti*, ℥ij. *terebinth.* ℥j. *ol. de ſpica nardi quantum ſufficit, fiat empl.* Let it be ſpread upon leather, and applied warm. I have oftentimes ſuddenly aſſwaged the pain of the *Sciatica*, by putting to the pained hip the root of black Briony cut into ſlices, and applied, when the matter was cold. Or elſe, ℞ *ceræ citrin. & tereb. abiet. an.* ℥ij. *liquefiant ſimul in vaſe duplici, & ubi refrixerint, adde pulv. hermodact.* ʒ ℈. *flor. chamæm. irid. flor. an.* ʒiij. *ſpicæ nardi, flor. thymi, an.* ʒij. *interioris cinamomi elect. & ſeminaſturt. an.* ʒij. *croci,* ℈iv. *malaxantur ſimul manibus axungia porci vetere non ſalita unctis, & fiat maſſa empl.* But if the pain be not by this means aſſwaged, then muſt we come to powerful medicines, as to uſe great cupping-glaſſes applied with much flame, and to veſicatories: As, ℞. *cantharid. quibus detractæ ſunt alæ*, ʒii. *ſtaphiſagr.* ℥iij. *ſinapi* ʒi ℈. *fermenti acerrimi* ʒ ℈. *incorporentur ſimul, & fiat veſicatorium.* Alſo bliſters may

Black briony diſcuſſeth.

A ſtrong veſicatory.

The inner rind of Travellers-joy a vesicatory.

may be raised by applying the inner rind of Travellers-joy to the weight of some two drams, a little beneath the grieved part: you must have a care that the ulcers that remain after the skin of the blisters is taken off, do run, and be kept open for some time after, and so more of the humor contained in the part may be drawn away. But if we cannot avail by these means, we must according to *Hippocrates* his counsel, come to the last and extremest remedy. *Such* (saith he) *as are troubled with a long pain of the* Sciatica, *have their hip fall out of joint, their leg consumes, and they become lame, unless they be burnt.* We have also read the same approved by *Celsus*. *It is the last* (saith he) *and most effectual medicine in longer diseases, to cauterize with hot irons, the skin of the hip in three or four places; and then not heal up these ulcers or fontanels as soon as may be, but to keep them open, by putting thereinto bullets of gold, or silver, or pills of gentian, or wax melted and wrought up with the powder of vitriol, mercury, and the like catheretick, until the affect against which we use this remedy, be helped, for by this means many have been helped.* Therefore three or four actual canteries, or hot irons shall be thrust in, about the joint of the hip, that they may enter into the flesh some fingers breadth, yet so that you shun the nerves. Cauteries here do good, for that by heating the part, they heat and dissolve the cold humors, they cut, attenuate, and draw forth the gross, and viscid, so that they flow out by the ulcers, together with the quitture. Over and besides, the ligaments are strengthened by their cicatrization, and their looseness helped, and by this means the whole part is notably corroborated.

Lib. 4. cap. 22.

The use of cauteries in the *Sciatica*.

CHAP. XXIV.

Of the flatulent convulsion, or convulsive contraction, which is commonly called by the French, Gout Cramp, *and by the English,* The Cramp.

What the Cramp is.

THat which the French call *Gout Cramp*, we here intend to treat of, induced thereto rather by the affinity of the name, than of the thing; for if one speak truly, it is a certain kind of convulsion generated by a flatulent matter, by the violence of whose running down or motion, oft-times the neck, arms, and legs are either extended, or contracted into themselves with great pain, but that for a short time. The cause thereof is a gross and tough vapor, insinuating it self into the branches of the nerves, and the membranes of the muscles. It takes one on the night, rather than on the day, for that then the heat and spirits usually retire themselves into the entrails and centre of the body; whence it is that flatulencies may be generated, which will fill up, distend and pull the part whereinto they run, just as we see lute-strings are extended. This affect often takes such as swim in cold water, and causeth many to be drowned, though excellent swimmers, their members by this means being so straightly contracted, that they cannot by any means be extended: For the skin, by the coldness of the water is contracted and condensed, and the pores thereof shut, so that the engendred flatulencies have no passage forth. Such as give themselves to drunkenness and gluttony, or sloth and idleness, are usually more frequently troubled with this disease, by reason of their heaping up of crudities. Therefore it is cured by moderate diet, and ordering of the body, and exercise of each part thereof; for thus they gather strength, and the generation of the flatulent matter is hindred, In the very time when it takes one, the patient shall be cured by long rubbing with warm cloths, and *aqua vitæ*, wherein the leaves of sage, rosemary, thyme, savory, lavendar, cloves, ginger, and the like discussing and resolving things have been infused. The extension and flexion of the members or joints, and walking, are also good.

The cause thereof.

Who subject thereto.

The cure.

The end of the Eighteenth Book.

BOOK XIX.

Of the LUES VENEREA, and those Symptoms which happen by means thereof.

CHAP. I.

What the *Lues Venerea* is.

THe French call the *Lues Venerea* the *Neapolitan disease*; the Italians and Germans (as also the English) term it the *French disease*; the Latines call it *Pudendagra*: others name it otherwise. But it makes no great matter how it be called, if the thing it self be understood: Therefore the *Lues Venerea* is a disease gotten or taken by touch, but chiefly that which is in unclean copulation; and it partakes of an occult quality, commonly taking its original from ulcers of the privy parts, and then further manifesting it self by pustles of the head, and other external parts; and lastly, infecting the entrails and inner parts, with cruel and nocturnal tormenting pain of the head, shoulders, joints, and other parts. In process of time, it causeth knots and hard *tophi*: and lastly, corrupts and fouls the bones, dissolving them, the flesh about them being oft-times not hurt; but it corrupteth and weakneth the substance of other parts, according to the condition of each of them, the distemper and evil habit of the affected bodies, and the inveteration or continuance of the morbifick cause. For some lose one of their eyes, others both: Some lose

What hurt it doth to the Body.

loſe a great portion of their eye-lids, other ſome look very gaſtly, and not like themſelves, and ſome become ſquint-eyed. Some loſe their hearing, others have their noſes fall flat, the palat of their mouths perforated with the loſs of the bone *Ethmoides*, ſo that inſtead of free and perfect utterance, they faulter and fumble in their ſpeech. Some have their mouths drawn awry, others their yards cut off, and women a great part of their privities tainted with corruption. There be ſome, who have the *Urethra* or paſſage of the yard obſtructed by budding caruncles, or inflamed puſtles, ſo that they cannot make water without the help of a Catheter, ready to die within a ſhort time, either by the ſuppreſſion of the urine, or by a gangrene ariſing in theſe parts, unleſs you ſuccor them by the amputation of their yards. Others become lame of their arms, and other ſome of their legs, a third ſort grow ſtiff by the contraction of all their members; ſo that they have nothing left them ſound but their voice, which ſerveth for no other purpoſe but to bewail their miſeries, for which it is ſcantly ſufficient. Wherefore ſhould I trouble you with mention of thoſe that can ſcantly draw their breath by reaſon of an *Aſthma*: or thoſe whoſe bodies waſte with an hectick feaver, and ſlow conſumption? it fares far worſe with theſe, who have all their bodies deformed by a leproſie ariſing there-hence, and have all their throttles and throats even with putrid and cancrous ulcers; their hair falling off from their heads, their hands and feet cleft with tetters and ſcaly chinks: neither is their caſe much better, who, having their brains tainted with this diſeaſe, have their whole bodies ſhaken by fits of falling-ſickneſs; who troubled with a filthy and curſed flux of the belly, do continually caſt forth ſtinking and bloody filth. Laſtly, there are no kinds of diſeaſes, no ſorts of ſymptoms, wherewith this diſeaſe is not complicate, never to be taken away, unleſs the virulency of this murrain be wholly taken away, and impugned by its proper antidote, that is, *argentum vivum*.

The Leproſie ſometimes the off ſpring of the *Lues Venerea*.

CHAP. II.

Of the cauſes of the Lues Venerea.

THeſe are two efficient cauſes of the *Lues venerea*; the firſt is, a certain occult and ſpecifick quality which cannot be demonſtrated; yet it may be referred to God, as by whoſe command this hath aſſailed mankind, as a ſcourge or puiſhnent to reſtrain the too wanton and laſcivious luſts of unpure whoremongers. The other is an impure touch or contagion, and principally, that which happeneth in copulation, whether the man or woman have their privities troubled with virulent ulcers, or be moleſted with a virulent ſtrangury (which diſeaſe crafty Whores colour by the name of the whites) the malignity catcheth hold of the other; thus a woman taketh this diſeaſe by a man, caſting it into her hot, open and moiſt womb; but a man taketh it from a woman, which for, example ſake, hath ſome ſmall while before received the virulent ſeed of a whoremaſter polluted with this diſeaſe, the mucous *ſanies* whereof remaining in the wrinckles of the womans womb, may be drawn in by the pores of the ſtanding and open yard, whence ſucceed malign ulcers, and a virulent ſtrangury. This virulency, like a torch or candle ſet on fire, will by little and little be propagated and ſent by the veins, arteries and nerves to the noble parts; whoſe malignity a ſtrong liver not enduring, by the ſtrength of the natural expulſive faculty, will ſend it into the groins, whereon follow abſceſſes, therefore called *Venereal Buboes*. Theſe if they return in again, and caſt not forth matter by being opened, will by their falling back into the veins and arteries, infect the maſs of the blood by the like tainture, and thence will enſue the *Lues Venerea*: Yet this diſeaſe may be got by a more occult manner of touch, as by breathing only. For it is not altogether beſide reaſon and experience, that a woman long troubled with this diſeaſe, may by importunate and often kiſſing, transfuſe malignity into a child; for the tender and ſoft ſubſtance of a little child may be altered, infected, and by little and little corrupted by receiving of filthy, and in their whole kind malign vapors. For it is known, and now vulgarly believed, that mid-wives, by receiving the child of a woman infected with this diſeaſe, have got this affect, the malignity being taken and drawn into their bodies through the pores of their hands by the paſſage of the veins and arteries. Neither doth it ſpare any condition, ſex, nor age of men: for not only whoſoever uſe copulation, but ſuch as only lie with them, may be taken with this virulency; yea verily, if they only lie in the ſheets or coverings which retain his ſweat, or the virulency caſt forth by an ulcer. The ſame danger may aſſail thoſe who ſhall drink in the ſame veſſel after ſuch as are troubled with this diſeaſe: For by the impure touch of their lips, they leave a virulent *ſanies* and ſpittle upon the edges of the cup, which is no leſs contagious in its kind, than the virulency of leprous perſons, or the ſome of mad dogs. Wherefore it is no marvel if children nurſed by an infected nurſe, draw in the ſeeds of this diſeaſe together with the milk, which is only blood whitened in the breaſts; or infected ſucking children by their hot and ulcerated mouths, may transfuſe this malignity into the body of the nurſe, by the rare, looſe and porous ſubſtance of the dugs which it frequently ſucketh.

The *Lues Venerea* the ſcourge of Whoremongers.

Venereal buboes returning inagain, occaſion the *Lues venerea*.

The *Lues venerea* may be got by the only communication of vapor.

How nurſes may infect children, and they their nurſes.

This following hiſtory is very memorable to this purpoſe. A certain very good Citizen of this City of *Paris* granted to his wife, being a very chaſte woman, that conditionally ſhe ſhould nurſe her own child, of which ſhe was lately delivered, ſhe ſhould have a nurſe in the houſe to eaſe her of ſome part of the labour: by ill hap, the nurſe they took was troubled with this diſeaſe; wherefore ſhe preſently infected the child, the child the mother, the mother her husband, and he two of his children, who frequently accompanied him at bed and board, being ignorant of that malignity wherewith he was inwardly tainted. In the mean while the mother when ſhe obſerved that her nurſe-child came not forward, but cried almoſt perpetually, ſhe asked my counſel to tell her the cauſe of the diſeaſe; which was not hard to be done, for the whole body thereof was repleniſhed with venereal ſcabs and puſtles, the hired nurſes and the mothers nipples were eaten in with virulent ulcers; alſo the fathers, and the two other childrens bodies, whereof the

An hiſtory.

the one was three, the other four years old, were troubled with the like puſtles and ſcabs. I told them, that they had all the *Lues Venerea*, which took its original and firſt off-ſpring by malign contagion from the hired nurſe. I had them in cure, and by Gods help healed them all, except the ſucking child, which died in the cure. But the hired nurſe was ſoundly laſhed in the priſon, and ſhould have been whipped through all the ſtreets of the City, but that the Magiſtrate had a care to preſerve the credit of the unfortunate family.

CHAP. III.

In what humor the malignity of the Lues Venerea *reſides.*

THough in the opinion of many the antecedent cauſe of this diſeaſe be the maſs of blood containing the four humors, yet I had rather place the matter, and primary and chief ſeat thereof in groſs and viſcid phlegm infected with the malign quality of the venereous venom, and from this beginning and foundation, I think by a certain contagious growth, it ſooner or later infects the other humors, as each of them is diſpoſed or apt to ſuffer: Of which my opinion there are many arguments, but this chiefly, That by the evacuation of a phlegmatick humor, whether by the mouth and ſalivation, or by ſtool, urine, or ſweat in men of what temper ſoever, whether cholerick, ſanguine or melancholick, the diſeaſe is helped or cured. Secondly, for that the exceſs of pain is more by night than by day, becauſe then the phlegm bearing ſway, ſevers the *perioſteum* from the bone, or elſe offends it and the reſt of membranous and nervous bodies by the acrimony of its malignity. Thirdly, becauſe the patients are hurt by the uſe of cold things, but uſually find benefit by hot medicines, whether they be ointments, plaiſters, fumigations, or whatſoever elſe, inwardly taken, or outwardly applied. Fourthly, for that in venereous puſtles there is found a certain hardneſs at the root, though outwardly they make ſhew of choler or blood: For being opened, you ſhall find them ſtuffed with a certain plaiſter-like and tophous matter, or elſe with rough phlegm, or viſcous *pus*; whence ariſe theſe hard *tophi*, or bony excreſcences upon the bones, if not from phlegmatick humors there heaped up and concrete. Fifthly, for that the ſpermatick and cold parts do primarily and principally feel the harm of this diſeaſe. Sixthly, for that the ulcers which over-ſpread the body, by reaſon of this diſeaſe, admit of no cure, unleſs you cauſe ſweats. Therefore if the matter of the diſeaſe, and ſuch ulcers as accompany it, were hot and dry, it would grow worſe, and be rather increaſed by a decoction of *Guaiacum*, the roots of *China*, or *Sarſaparilla*. Seventhly, becauſe oft-times this diſeaſe, the ſeed thereof being taken or drawn into the body, ſo lieth hid for the ſpace of a year, that it ſhews no ſign thereof, which happens not in diſeaſes proceeding from a hot matter, which cauſeth quick and violent motions. By this it appeareth that the *Baſis* and foundation of the *Lues Venerea* is placed or ſeated in a phlegmatick humor: yet may not deny, but that other humors confuſed therewith may be alſo in fault, and defiled with the like contagion. For there are ſcarce any tumors which proceed from a ſimple humor, and that of one kind, but as in tumors, ſo here the denomination is to be taken from that humor which carrieth the chief ſway.

Why the pain is worſe upon the night than on the day.

The diſeaſe ſometimes lies long hid in the body before it ſhews it ſelf.

CHAP. IV.

Of the ſigns of the Lues Venerea.

WHen the *Lues Venerea* is lately taken, malign ulcers appear in the privities, ſwellings in the groins, a virulent ſtrangury runneth oft-times with filthy *ſanies*, which proceeds either from the *proſtatæ*, or the ulcers of the *urethra*; the patient is troubled with pains in his joints, head, and ſhoulders, and as it were breakings of his arms, legs and all his members, they are weary without a cauſe, ſo that neither the foot nor hand can eaſily perform his duty; their mouths are inflamed, a ſwelling troubles their throats, which takes away their freedom of ſpeaking and ſwallowing, yea of their very ſpittle; puſtles riſe over all their bodies, but chiefly certain garlands of them engirt their temples and heads; the ſhedding or loſs of the hair, diſgraceth the head and chin; and leanneſs deformeth the reſt of the body; yet all of theſe uſe not to appear in all bodies, but ſome of them in ſome. But the moſt certain ſigns of this diſeaſe are, a callous ulcer in the privities, hard and ill conditioned, and this ſame is judged to have the ſame force in a prognoſtick, if after it be cicatrized, it retain the ſame callous hardneſs; the Buboes or ſwellings in the groins to return back into the body without coming to ſuppuration or other manifeſt cauſe, theſe two ſigns, if they concur in the ſame patient, you may judge or foretel that the *Lues venerea* is either preſent, or at hand; yet this diſeaſe happeneth to many without the concourſe of theſe two ſigns, which alſo bewraieth it ſelf by other manifeſt ſigns, as ulcers and puſtles in the reſt of the body, rebellious againſt medicines though powerful, and diſcreetly applyed, unleſs the whole body be anointed with *Argentum vivum*. But when as the diſeaſe becometh inveterate many become impotent to venery, and the malignity and number of the ſymptoms increaſe, their pains remain fixed and ſtable, very hard and knotted *tophi* grow upon the bones, and oft-times they become rotten and foul, as alſo the hands and feet by the corruption of ſalt phlegm are troubled with chops or clefts, and their heads are ſeized upon by an *ophiaſis* and *alopecia*; whitiſh tumors with roots deep faſtned in, ariſe in ſundry parts of the body, filled with a matter like the meat of a cheſnut, or like a tendon; if they be opened they degenerate into divers ulcers, as putrid, eating and other ſuch, according to the nature and condition of the affected bodies. But why the pains are more grievous on the night ſeaſon, this may be added to the true reaſon we rendred in the precedent Chapter, firſt, for that the venereous virulency lying as it were aſleep is ſtirred up and enraged by

The moſt certain ſigns of the *Lues venerea.*

Two other cauſes of the exceſs of pain in the night.

by the warmneſs of the bed and coverings thereof; ſecondly, by reaſon of the Patients thoughts which on the night ſeaſon are wholly turned and fixed upon the onely object of pain.

CHAP. V.

Of Prognoſticks.

IF the Diſeaſe be lately taken, aſſociated by a few ſymptoms, as with ſome ſmall number of puſtles, and little and wandring pains, and the body beſides be young and in good caſe, and the conſtitution of the ſeaſon be good and favourable, as the Spring, then the Cure is eaſie, and may be happily performed. The ſigns of a curable *Lues Venerea.* But on the contrary, that which is inveterate and enraged by the fellowſhip of many and malign ſymptoms, as a fixed pain of the head, knots and rottenneſs of the bones, ill-natured ulcers in a body very much fallen away and weak, and whereof the cure hath been already ſundry times undertaken by Empericks, but in vain; or elſe by learned Phyſicians, but to whoſe remedies, approved by reaſon and experience, the malignity of the diſeaſe and the rebellious virulency hath refuſed to yield, is to be thought incurable, eſpecially if to theſe ſo many evils this be added, that the Patient be almoſt waſted with a conſumption and hectick leanneſs, by reaſon of the decay of the native moiſture. The ſigns of an incurable one. Wherefore you muſt onely attempt ſuch by a palliative cure; yet be wary here in making your Prognoſticks: for many have been accounted in a deſperate caſe, who have recovered; for by the benefit of God and Nature, wonders oft-times happen in diſeaſes. Young men who are of a rare or lax habit of body, are more ſubject to this diſeaſe, than ſuch as are of a contrary habit and complexion. For as not all who are converſant with ſuch as have the Plague, or live in a peſtilent Air, are alike affected; ſo neither all who lie or accompany with ſuch who have the *Lues Venerea*, are alike infected or tainted. How theſe pains differ from thoſe of the Gout. The pains of ſuch as have this diſeaſe, are far different from the pains of the Gout. For thoſe of the Gout return and torment by certain periods and fits, but the other are continual and almoſt always like themſelves; Gouty pains poſſeſs the joints, and in theſe condenſe a plaſter-like matter into knots; but thoſe of the Pox are rather faſtned in the midſt of the bones, and at length diſſolve them by rottenneſs and putrefaction. Venereous ulcers which are upon the Yard, are hard to cure, but if being healed, they ſhall remain hard and callous, they are ſigns of the diſeaſe lying hid in the body.

Generally, the *Lues Venerea* which now reigneth is far more mild and eaſie to be cured then that which was in former times, when as it firſt began amongſt us: beſides, each day it ſeemeth to be milder than other. The *Lues Venerea* becomes more gentle than formerly it was. Aſtrologers think the cauſe hereof to be this, for that the celeſtial influences which firſt brought in this diſeaſe, in ſucceſs of time by the contrary revolutions of the Stars loſe their power and become weak, ſo that it may ſeem ſomewhat likely, that at length after ſome few years it may wholly ceaſe; no otherwiſe than the diſeaſe termed *Mentagra*, which was very like this in many ſymptoms, and troubled many of the *Romans* in the reign of *Tiberius*; and the *Lichen*, which in the time of *Claudius* (who ſucceeded *Tiberius*) vexed not onely *Italy*, but all *Europe* beſides: Yet Phyſicians had rather take to themſelves the glory of this leſs raging diſeaſe, and to refer it to the many and wholſom means which have been invented, uſed and oppoſed thereto by the moſt happy labours of noble Wits.

CHAP. VI.

How many, and what means there are to oppugn this Diſeaſe.

MAny ſorts of remedies have been found out by many to oppugn and overcome this Diſeaſe. Why the decoction of *Guaiacum* is not ſufficient to impugn the diſeaſe. Yet at this day there are onely four which are principally uſed. The firſt is by a decoction of *Guaiacum*, the ſecond by Unction, the third by Emplaſters, and the fourth by Fumigation: all of them by *Hydrargyrum*, the firſt excepted. Yet that is not ſufficiently ſtrong and powerful; for experience hath taught, that the decoction of *Guaiacum* hath not ſufficient ſtrength to extinguiſh the venom of the venerous virulency, but onely to give it eaſe for a time; for becauſe it heats, attenuates, provokes Sweat and Urin, waſtes the excrementitious humours by drying them; it ſeemeth to cure the diſeaſe, for that thereupon for ſome time the pain and all other ſymptoms ſeem more remiſs: but theſe endeavours are weak and deceitful, as whereby that onely which is more ſubtle in the humours in fault, is exhauſted and diſperſed by ſweat. But *Hydrargyrum* is a certain higher power, contains therein all the power of *Guaiacum*, yet much more excellent and efficacious; for beſides that it heats, attenuates, cuts, reſolves and dries, it provokes Sweat and Urin, and beſides it expels noxious humours upwards and downwards, by the Mouth and Stool. *Hydrargyrum* is ſufficient to overcome the diſeaſe. By which evacuations not onely the more ſubtle, but alſo the more groſs and feculent excrements, wherein the ſeat of this diſeaſe is properly fixed, are diſperſed and evacuated; by which the Phyſician may be bold to aſſure himſelf of certain victory over the diſeaſe. But after the uſe of the decoction of *Guaiacum*, freſh pains and knots ariſe by the reliques of the more groſs and viſcous humours left in the cavities of the entrails; but *Hydrargyrum* leaves no reliques behind it.

CHAP. VII.

How to make choice of the Wood Guaiacum.

THat is preferred before the reſt which is of a great log, of a duſky colour, new, gummy, with a freſh ſtrong ſmell, an acrid, and ſomewhat biting taſte, the bark cleaving very cloſe to the Wood. The faculty. It hath a faculty to heat, rarifie, attenuate, attract, to cauſe Sweat, and move

The parts.

Urin, and beſides by a ſpecifick property to weaken the virulency of the *Lues Venerea*. There are three ſubſtances taken notice of in this wood, the firſt is the bark, the other is a whitiſh wood which is next to the bark, the third is the heart of the wood, that is, the inner, blackiſh, and more dusky part thereof. The bark is more dry, wherefore you ſhall uſe it when as you would dry more powerfully; the middle ſubſtance is more moiſt, becauſe it is more ſucculent and fat; that which lieth between both, is of a mild temper: wherefore the two laſt are more convenient for delicate Natures and rare Bodies, which require leſs drying. Furthermore, the bark muſt be given to denſe and ſtrong Natures, that by the more fiery force thereof, the humours may be made more fluid, and the paſſages of the body more paſſable. But I would here be underſtood to mean ſuch bark as is not putrid and rotten with age, to which fault it is very ſubject, for that long before it be ſhipped by our people, the wood lieth in heaps upon the ſhore in the open air, until they can find Chapmen for it; which when it is brought aboard, it is ſtowed in the hold or bottom of the ſhip, where beneath by the Sea through the chinks of the boards, and above by the Mariners, it uſually gathereth much dirt. When it is brought hither to us, it is bought and ſold by weight, wherefore that it may keep the weight, the Druggiſts lay it up in Vaults and Cellers under ground, where the ſurface thereof bedewed with much moiſture, can ſcarce eſcape mouldineſs and rottenneſs. Wherefore, I do not like to give the decoction either of the bark or wood which is next thereto, to ſick people.

The hot and fiery faculty of the bark.

CHAP. VIII.

Of the preparation of the decoction of Guaiacum.

The proportion of the *Guaiacum* to the Water.

Firſt you muſt have your *Guaiacum* ſhaved into ſmall pieces, and to every pound of the ſhavings, add of fair water eight, ten, or twelve pints, more or leſs, as the nature of the party, and condition of the diſeaſe ſhall ſeem to require, according to the rule of the formerly mentioned Indications. Let the Water be hot or warm, eſpecially if it be in Winter, that ſo it may the more eaſily and throughly enter into the body of the wood, and draw into it ſelf the faculties thereof in the ſpace of twenty four hours, wherein it is macerated, then boil it in *balneo*, to avoid *Empyreuma*, or taſte of fire, which it will contract by boiling it over a hot fire. Yet ſome nothing regard this, but think the Patient ſufficiently ſerved, if they make a decoction in an earthen pot well glazed over a gentle fire, ſo that no part of the liquor may run over the mouth of the veſſel, for that thus ſo much of the ſtrength of the decoction might vaniſh away. Howſoever it be made, let it be boiled to the conſumption of half, a third, or fourth part, as the nature of the Patient and Diſeaſe ſhall ſeem to require. There be ſome who mix divers Simples therewith, which have an occult and proper ſympathy with that part of the body which is principally hurt by the Diſeaſe, which at the leaſt may ſerve in ſtead of a vehicle to carry the faculties of the decoction thither where the diſeaſe moſt reigneth. Others add thereto purging Medicins, whoſe judgment I cannot approve of, for that I think it is not for the Patients good to attempt two evacuations at once; that is, to expel the humours by Sweat by the habit of the body, and by purging by the belly; for that as much Urin, ſo alſo much Sweat ſhews little evacuation by Stool. For theſe two motions are contrary, which Nature cannot brook at once: For Purging draws from the Circumference to the Center, but Sweat runs a quite contrary courſe, and this is the opinion of many and great Phyſicians. This firſt decoction being boiled out and ſtrained, the like quantity of Water ſhall be put to the ſtuff, or maſs, that ſo being boiled again without any further infuſion, and ſtrained, with the addition of a little Cinamon for the ſtrengthening of the Stomach, the Patient may uſe it at his meals, and between his meals (if he be dry) for his ordinary drink. The quantity of the firſt decoction to be taken at once, ought to be ſome five or ſix ounces, and it ſhall be drunk warm, that ſo it may be the ſooner brought into action, and leſt the actual coldneſs ſhould offend the ſtomach; and then the Patient being well covered, ſhall keep himſelf in bed, and there expect ſweat, which if it come ſlowly on, it ſhall be helped forwards with ſtone-bottles filled full of Water, and put to the ſoals of the feet. If any parts in the *interim* ſhall be much pained, they ſhall be comforted by applying of Swines bladders half filled with the ſame decoction heated. Neither will it be unprofitable before the decoction be drunk, to rub over all the body with warm linnen cloths, that by this means the humours may be attenuated, and the pores of the skin opened. When he ſhall have ſweat ſome two hours, the parts oppoſite to the grieved places ſhall firſt be wiped, then preſently, but more gently, the grieved parts themſelves, leſt a greater conflux of humours flow thereto. Theſe things being done, he ſhall keep himſelf in bed, ſhunning the cold air until he be cooled and come to himſelf again, ſome two hours after he ſhall ſo dine, as the diſeaſe and his former cuſtom ſhall ſeem to require; ſix hours after, betaking himſelf to his bed, he ſhall drink the like quantity of the decoction, and order himſelf as before. But if he be either weak, or weary of his bed, it ſhall be ſufficient to keep the houſe without lying down; for although he ſhall not ſweat, yet there will be a great diſſipation of the vapours and venenate ſpirits, by inſenſible tranſpiration; for the *Lues Venerea* by the onely communication of theſe, often times catcheth hold, and propagates it ſelf in lying with a bedfellow tainted therewith. But it is requiſite to have let blood, and purge the body by the advice of a Phyſician, before the taking of the decoction of *Guaiacum*; ſo whileſt he doth take it, it much conduceth to keep the belly ſoluble (which is much bound by the heat and drineſs of ſuch a drink) and to preſerve the purity of the firſt Veins by a Clyſter, or laxative Medicin taken every fifth or ſixth day. But for the uſe of it, we muſt warily obſerve, taking indication, not onely from the malignity and contumacy of the diſeaſe, but alſo from the particular nature of the Patient; for ſuch as have their body waſted by heat and leanneſs, and their skin dry and ſcaly (whence you may gather a great aduſtion of the humours, and as it were, a certain incineration of the habit of the body) muſt more ſparingly make

Whether it be fit to add purges to a decoction of *Guaiacum*.

Hip. aph. ult. ſect.6.

How, and in what quantity this decoction muſt be taken

How to dry the ſweat of the body.

How long this decoction muſt be uſed.

make uſe of theſe things, but rather temper the body by humecting things taken inwardly, and applied outwardly, as Baths, Ointments without Quick-ſilver, and other ſuch like things: And then a very weak decoction of *Guaiacum* ſhall be uſed for a few days before your unction with Quickſilver. A more plentiful diet, as it draws forth the diſeaſe, which of its own nature is long, ſo a more ſparing and ſlender diet makes the ulcers more rebellious and contumacious, by a hectick drineſs. The manner of Diet.

Therefore a middle courſe muſt be kept, and meats made choice of, which are fit and naturally engender good and laudable juice in the body. For it is not onely great ignorance, but much more cruelty to go about to contain all Patients without any difference, within the ſtraight allowance of four ounces of Ship-bisket, and twelve damask Prunes: for I judge it far better to diet the Patient with Lamb, Veal, Kid, Pullets, fat Larks, and Black-birds, as thoſe which have a greater familiarity with our bodies, than Prunes and the like Junkets. Let his bread be made of white wheat well leavened, neither too new, or tough, neither too old or hard. Let his drink be made of the maſs or ſtrainings of the firſt decoction of *Guaiacum* boiled with more water, as was formerly mentioned; yet if there ariſe any great weakneſs of the faculties, you may permit the uſe of ſome little Wine, drinking eſpecially before each, a cup of the laſt mentioned decoction. Let him avoid ſleep preſently after meat, for ſo the head is filled with groſs vapors. Paſſions or perturbations of the mind muſt alſo be avoided, for that by theſe the ſpirits are inflamed and diſſipated; all the delights of honeſt pleaſure are to be deſired, but venery wholly avoided, as that which weakens all the nervous parts. Many in ſtead of a decoction of *Guaiacum*, uſe a decoction of *China*. Now this *China* is the root of a certain Ruſh, knotty, rare, and heavy when it is freſh, but light when it is waxed old; it is alſo without ſmell, whence many judge it void of any effectual quality, it is brought into uſe out of *India*, it is thus prepared, it is cut into thin round ſlices, boiled in Fountain or River Water, and is given to Patients to drink morning and evening after this manner. ℞ *Rad. chin. in taleol. ſect.* ℥ ij. *aquæ font.* ℔ xij. *infundantur per hor.* xij. *& coquantur ad conſumption. tertiæ partis.* Let him take ℥ vj. in the morning, and ſo much at night; let him expect a ſweat in his bed: a ſecond decoction may be made of the maſs remaining of the firſt, but with a leſs quantity of water put thereto, which alſo by longer boiling may draw forth the ſtrength remaining in the maſs, and be uſed at meals for ordinary drink. There are ſome who make a third decoction thereof, but that is wholly unprofitable and unuſeful. *Sarſaparilla* is prepared alſo juſt after the ſame manner. To whom, and what manner of Wine may be allowed. The deſcription of *China*. The preparation. Of *Sarſaparilla*.

CHAP. IX.

Of the ſecond manner of curing the Lues Venerea, *which is performed by Friction or Unction.*

THe Cure of the *Lues Venerea* which is performed by Unction and Friction is more certain, yet not in every kind, condition, and ſeaſon thereof. For if the diſeaſe be inveterate from an humour, tough, groſs, viſcous, and more tenaciouſly fixed in the ſolid parts, as you may gather by the knotty tumours of the bones; for then we are ſo far from doing any good with a Friction uſed at the firſt, that on the contrary, we bring the Patient in danger of his life, unleſs we ſhall have firſt prepared the tumor to expulſion, by emollient and digeſting things firſt uſed. But if it be lately taken with moveable pains, puſtles, and ulcers in the jaws, throat, and privy parts, then may it be eaſily cured without ſuch preparatives, eſpecially if the humour be ſufficiently obedient, and as it were prepared of it ſelf, and its own nature. Therefore firſt uſing general medicins, you may afterwards come to uſe the Unction with *Hydrargyrum*. When the body muſt be prepared with humecting things before unction.

CHAP. X.

Of the choice preparation and mixing of Hydrargyrum.

Hydrargyrum which is clear, thin, white, and fluid, is the beſt: on the contrary, that which is livid, and not ſo fluid, is thought to be adulterated, by the admixture of ſome Lead. That it may be the purer, ſtrain it through ſome ſheeps-leather, for by preſſing it when it is bound up, it paſſeth through by its ſubtilty, and leaves the filth and leaden droſs behind it on the inſide: Then it may be boiled in Vinegar, with Sage, Roſemary, Thyme, Camomil, Melilot, and ſtrained again, that ſo many ways cleanſed, it may enter into Ointments and Platters. To kill it more ſurely, it ſhall be long wrought, and as it were ground in a Mortar, that it may be broken and ſeparated into moſt ſmall particles, that by this means it may not be able to gather it ſelf into the former body: to which purpoſe you may alſo add ſome *ſulphur* or *ſublimate*, as we ſhall ſhew hereafter. It is moſt uſually mixed with Hogs-greaſe, adding thereto ſome Oil of Turpentine, Nutmegs, Cloves, Sage, and *Galens* Treacle. If a *Leucophlegmatia* together with the *Lues Venerea* affect the body, then hot, attenuating, cutting and drying things ſhall be added to the Medicin, which ſhall be provided for Unction; the ſame ſhall be done when as we would have it to enter into the ſubſtance of the bones. But if the Patient be of a cholerick temper, and his bloud eaſie to be inflamed, you ſhall make choice of leſs hot attractive and diſcuſſing things; as when the body ſhall be repleniſhed with knotty and ſcirrhous tumours, or ſqualid by exceſſive drineſs, then ſhall emollient and humecting things mixed therewith: But that ſuch Ointments may have a better conſiſtence, I uſe to add to each pound thereof, four, five, or ſix yolks, of hard Egs. Therefore this ſhall be the form of the Ointment called Vigoes. ℞ *Axung. porci,* ℔ j. *olei chamæm. anethi maſtich. & laurini an.* ℥ j. *ſtyrac. liquid.* ℥ x. *rad. enulæ cam. parum tritæ, & ebuli, an.* ʒ iij. *pul. euphorb.* ℥ ß. *vini odorif.* ℔ j. *buliant omnia ſimul uſque ad conſumptionem vini, deinde colentur; colaturæ adde lythargyri auri* ℥ vj. *thuris, maſtich. an.* ℥ vj. *reſ. pini,* ℥ j. ℔. *tereb. venet.* ℥ j. *argenti vivi,* ℥ iv. *ceræ albæ,* ℥ j. ℔. *liquefactis oleis, cum cera incorporentur omnia ſimul, fiat linimentum ad uſum.* Or elſe ℞ *Argenti vivi præparati,* ℥ vj. *ſublimati,* ʒ ℔. *ſulphuris vivi,* ℥ ℔. *axung. porci ſalis expertis* How to kill *argentum vivum*. What to mix therewith. An unction with *argentum vivum*. Another.

experti, ℔ j. *vitellos ovorum ſub cineribus coctorum*, nu. iij. *olei terebinth. & laurini, an.* ℥ ij. *theriac. vet. & mithridat.* ℥ ſ. *fiat linimentum ut artis eſt.* You ſhall compoſe it thus, firſt the *ſublimatum* and *ſulphur* ſhall be finely powdered, then ſome part of the *Argentum vivum* and Hogs-greaſe put to them, then preſently after, ſome of the hard yolks of Eggs, continually and diligently ſtirring and mixing them all together. All theſe being well incorporate, add ſome more *Argentum vivum*, Hogs-greaſe, and yolks of Eggs, and incorporate them with the former; at laſt add the Oils, then Treacle and Mithridate, and ſo let them be all beaten together for a whole days ſpace, and thus you ſhall make an ointment of a good conſiſtence, which I have often uſed with good ſucceſs. Yet the Hogs-greaſe ſhall be firſt boiled with the hot herbs good for the ſinews, as Sage, Roſemary, Thyme, Marjerom, Lavender, and others which the Seaſon affords. For ſo the *axungia* acquires a more attenuating faculty, and conſodating of thoſe parts which the *Lues Venerea* afflicts. Beſides, when unguents are made for this purpoſe, that ſuch virulency may be drawn from within outwards, by ſweats and tranſpiration through the pores of the skin, no man need doubt but that they ought to be furniſhed with relaxing and rarifying and attractive faculties. But *axungia*, beſides that it is very fit to kill the *Argentum vivum*, it alſo relaxeth and mollifieth. Now *Oleum laurinum, de ſpica, rutaceum*, rarifie, digeſt, and aſſwage pain, Turpentine alſo extinguiſheth and bridleth the *Argentum vivum*, moderately heats, reſolves, and ſtrengthens the nervous parts. But *Argentum vivum* is the proper antidote of the *Lues Venerea*, as that which cures it howſoever uſed, drying by the ſubtilty of the parts, and provoking ſweat. Verily Treacle and Mithridate ſomewhat conduce to retund the virulency of this diſeaſe, but unleſs *Argentum vivum* aſſiſt as a ferret to hunt, and an *Alexiterium* to impugn the diſeaſe, they can do no great matter.

How to make it.

How to prepare the hogs-greaſe before you mix the *argentum vivum* therewith

CHAP. XI.

How to uſe the Unction.

THe body and humours apt to cauſe or nouriſh a *plethora* or inflammation, being prepared by digeſtive ſyrups, and evacuated by purging and bleeding as is fitting, according to the direction of ſome Phyſician, the Patient ſhall be ſhut up in a Parlour or Chamber, hot either by Nature or Art, and free from cold blaſts of wind; for cold is moſt pernicious in this diſeaſe, both for that it hurts the nervous parts, already ill-affected by reaſon of the diſeaſe, as alſo for that it leſſens the efficacy of Medicins. Wherefore many do ill in this, who, whether in Winter or Summer anoint their Patients in a large room, expoſed on every ſide to the winds. They deal ſomewhat more wiſely, who put a cloth faſtned like half a Tent preſently behind the Patient, though anointed by the Fire ſide, ſo to keep away the cold air from him. Yet it is the ſafeſt to ſet, and anoint the Patient either in a little Room, or elſe in ſome corner of a large Room, ſeparated from the reſt of the Room by ſome hangings, and building a ſtove, or making ſome fire therein, for ſo he may ſtand or ſit as he beſt likes, the longer, and with the leſs offence, and be equally heated on every ſide; whereas ſuch as are anointed in a Chimney by a fires-ſide cannot but be heated unequally, being ready to burn on the one ſide, whileſt the other is cold, which motions are contrary hurtful to that we require: beſides, if the Patient ſhall be weak he cannot ſtand and endure the heat of the fire. Or if he be ſhame-faced, he will be unwilling to ſhew all his body at once naked to the Surgeon, but he may without any harm, and with modeſty, lying on a Bed in a little Room wherein a ſtove is made, have all his limbs anointed about the joints, and preſently bound up, either with ſtoups, or carded cotten, or brown paper.

Cold moſt hurtful to ſuch as are troubled with the *Lues Venerea*.

CHAP. XII.

What cautions to be obſerved in rubbing or anointing the Patient.

HE ſhall be anointed orrubbed over with the Ointment in the morning, the concoction and diſtribution of the meat being perfected, which functions otherwiſe would not be well performed, the powers of Nature being diſtracted into ſeveral operations: Yet if the Patient ſhall be weak, you may ſome hour before the unction give him ſome Gelly, the yolk of an Egg, or ſome Broth made of Meat boiled to pieces, but very ſparingly, leſt Nature intent upon the concoction of ſolid Meats, or in great quantity, ſhould be drawn away from that which we intend. At firſt let onely the joints of the limbs be anointed, as about the Wriſts, Elbows, Knees, Ankles, Shoulders. But afterward, if the Patient ſhall be more ſtrong, and a greater commotion of the humours and body ſeem neceſſary; the emunctories of the principal parts may alſo be anointed, and the whole ſpine of the back; yet having much care, and always ſhunning the principal and noble parts, leſt we ſhould do as thoſe butcherly Empericks do, who equally, and in like manner daub and rub over all the body, from the ſoles of the feet to the crown of the head: moreover, diligent regard muſt be had of thoſe parts which are ſeized upon by the ſymptoms of this diſeaſe, that they may be more anointed, and that it may be more throughly rubbed in. Yet you may always begin your anointing or rubbing at thoſe parts which are leſs offended, leſt the humours ſhould be drawn in greater meaſure to the grieved part. And as gentle frictions do not ſufficiently open the pores of the skin, ſo more ſtrong and hard ones ſhut them up, cauſe pain, and more plentifully attract the morbifick matter. Wherefore it will be more convenient to uſe moderate frictions, taking indication from the ſtrength of the Patient, as that whereto we muſt ſtill have the chief regard. There is alſo another thing whereto the Phyſician and Surgeon muſt diligently attend, as that, which if it be not carefully prevented, will either haſten the death of the Patient, or make him ſubject to a relapſe; that is, the quantity of the remedies and unctions, and the number

The Patient, if it may be conveniently done, muſt be anointed faſting.

In what places the body muſt be anointed.

Where to begin the Unction.

number of the frictions. Which conſideration, together with that which is of the degrees of the temperaments of the whole body, and each part thereof, much troubles the minds of good Phyſicians, and maketh the Art conjectural. It is far from being attained to by Empericks; yet we muſt endeavour by Method and Reaſon, that by the Rule of Indications ſo frequently mentioned, we may attain to the knowledge thereof, as near as may be: for to have perfect knowledge hereof, and to ſay that thoſe need onely four, others five, and otherſome ſix, more or fewer frictions at the beginning, which Empericks, commonly do, is a thing both impoſſible and vain. All theſe muſt be changed and ordered according to the malignity and continuance of the diſeaſe, and the condition of the affected bodies. Verily we muſt ſo long uſe frictions and unctions, until the virulent humours be perfectly evacuated by Spitting and Salivation, by Stool, Urin, Sweat, or inſenſible tranſpiration. Which you may underſtand by the falling away and drying up of the Puſtles and Ulcers, and the ceaſing of the pains and other ſymptoms proper to this diſeaſe. In many, by reaſon of the more denſe and compact habit of the body Nature is more ſlow in excretion. Yet I have learnt by long experience, that it is beſt to anoint and chafe ſuch twice in a day, to wit Morning and Evening, ſix hours after meat. For ſo you ſhall profit more in one day, then by the ſingle friction of three days. But on the contrary, I have often, and with good ſucceſs, rubbed over but each other day more rare and delicate bodies, giving them one or two days reſt to recollect their ſtrength, which by the too much diſſolution of their ſpirits becoming too weak, were not ſufficient to expel the reliques of the morbifick matter. And certainly about the end of the appointed friction, eſpecially when as the Patient begins to flux at the mouth, the bodies, together with the noxious humours are made ſo fluid by the means of the precedent friction, that one friction is then more efficacious then two were at the beginning. Therefore as *Galen* bids, when as the diſeaſe is great, and the ſtrength of the Patient infirm, that we ſhould part our bloud-lettings, and draw a little and a little at once; ſo alſo here, when as we ſhall obſerve Nature ſtirred up, and ready bent to any kind of evacuation by the Mouth, Stool, or other like; you ought not to uſe any Unction or Friction oftner than once in a day; yea, certainly it will be better to intermit for ſome few days. For thus *Maſſa* reports, that there was a certain man who almoſt waſted with a Conſumption, being continually afflicted with the moſt grievous pains of this diſeaſe, and reputed in a deſperate caſe by other Phyſicians, was notwithſtanding at length recovered by him, when as he had anointed him thirty ſeven times, putting ſome time between for the recovery of his ſtrength. I my ſelf have obſerved others, who thus, by the interpoſition of one or two days, being rubbed over for fifteen or ſeventeen times, have perfectly recovered. Where you muſt take this courſe in reſolved and weak bodies, yet in the *interim* muſt you have a care that the frictions be not too weak, and ſo few, that the morbifick cauſe may not be touched to the quick: for in this kind of diſeaſe Nature doth not of it ſelf endeavour any *criſis*, or excretion; it requires the auxiliary forces of Medicins, by whoſe aſſiſtance it may expell all the malignity. Theſe are ſigns of ſuch a *criſis*, either at hand or already preſent, if the Patient be ſo reſtleſs, ſo loath all things, that he cannot remain in one place either ſtanding or lying; he can neither eat nor drink, if he be oppreſſed with a continual wearineſs, almoſt ready to ſwound, yet have a good and equal pulſe, and gripings in his belly afflict him, with bloudy and viſcous dejections, until at length Nature after one or two days portion of the morbifick matter being ſpent, be ſomewhat freed, and all pains and ſymptoms ſo much abated, as the excretions have proceeded. But whereas Medicins are not ſufficient in number or ſtrength, there follows an imperfect *criſis*, which leaves behind it ſome reliques of the morbifick matter, which like leven do ſo by little and little infect the whole maſs of the humours, that oft-times after ten years ſpace the diſeaſe riſeth as out of an ambuſh, or lurking-hole, and becomes far worſe than before. But we muſt in like manner have a care leſt theſe Medicins, that are either given inwardly, or applied outwardly, be not too ſtrong: for by cauſing ſuch colliquation of the radical moiſture and ſolid parts, many have been brought into an incurable conſumption. In others ſordid and putrid ulcers have thence ariſen in the mouth, which having eaten a great part of the Palate and Tongue, have degenerated into a deadly *Cancer*. In others hereupon the tongue hath ſo ſwelled up, that it hath filled the whole capacity of the mouth, ſo that it could not be bended to any part of the mouth for chawing, whereupon they have by little and little, been famiſhed. In other ſome there hath been cauſed ſo great colliquation of humours, that for a whole moneth after tough and filthy ſlaver hath continually flowed out of their mouths. Other ſome have the muſcles of their jaws relaxed, others troubled with a Convulſion, ſo that during the reſt of their lives they can ſcarce gape. Others by loſing a portion of their jaw, have loſt ſome of their teeth. But you muſt not always ſo long anoint and chafe the body, until a flux of the mouth or belly appear: For you may find ſundry perſons, who if you ſhould anoint or rub them to death, you cannot bring them to flux at the mouth; yet theſe will recover notwithſtanding, excretion being made either by inſenſible tranſpiration, or evacuation of Urin, or ſome gentle flux of the belly, either procured by Art, or coming of it ſelf. In which caſe I have obſerved that many have received much good by a purging decoction of *Guaiacum*, adminiſtred according to the quantity of the peccant humour, and given for ſome days in the morning, adding thereto white Wine, if the body abounded with tough and viſcid humours. Dyſenteries, or bloudy Fluxes cauſed by Unctions, may be helped by Clyſters, wherein much Hogs-greaſe is diſſolved to retund the acrimony cauſed by the Medicin and humour which nouriſheth the Dyſentery. Alſo new Treacle diſſolved in new milk, is thought wonderfully to mitigate this ſymptom.

What it is that maketh the Art of Phyſick conjectural.

Who muſt be rubbed over once, who twice in a day, and who but every other day.

Lib. de vent. ſect.

Nature is not ſufficiently able to expel the virulent matter.

Signs that the *Criſis* is nigh.

Inconveniences following upon immoderate unctions.

For what perſons a purging decoction of *Guaiacum* is good.

The cure of a Dyſentery occaſioned by too ſtrong friction.

CHAP. XIII.

Of the third manner of Cure, which is performed by Cerates and Emplaſters, as ſubſtitutes of Unctions.

The cure by Emplaſters more ſlow.

FOr that ſundry by reaſon of the name, abhor the uſe of friction, which is performed by the fore-mentioned Ointments, therefore there is found out another manner of cure by Cerates and Emplaſters, as ſubſtitutes of Frictions, but that uſually is ſomewhat ſlower; for which purpoſe it is not needful onely to uſe the things which are deſcribed by *Vigo*, but you may alſo deviſe other, which are more or leſs anodyne, emollient, attenuating, diſcuſſing, or drying, according to the condition of the preſent diſeaſe, ſymptoms, humours, and Patient, never omitting *Hydrargyrum*, the onely antidote of this diſeaſe. Such Emplaſters mitigate pains, and knots, and reſolve all hardneſs, and are abſolutely very effectual; for continually ſticking to the body, they continually operate:

In what caſe they are chiefly uſeful.

Wherefore they are of prime uſe in relapſes of this diſeaſe, or when the humours are thick and viſcous, or otherwiſe lie deep in the body, and very difficult to root out. But for that they work more ſlowly oft-times, ſuch as uſe them are forced at length to uſe ſome frictions to ſtimulate Nature, and cauſe the ſpeedier excretion. Yet in ſome, whoſe bodies and humours have been fluid, either by Nature or Art, the applied Emplaſters have in three days ſpace procured evacuation ſufficient for the diſeaſe, ſo that if they had not been taken away, they would have cauſed a colliquation, like that which we lately mentioned in too violent friction: Wherefore you ſhall uſe the like diſcretion in taking of

The deſcription of an Emplaſter.

theſe, as you uſe in your unctions and friction. In ſtead of *Emp. de Vigo*, this following may be fitly uſed. ℞ *Maſſæ Emp. melil. & oxycr. an.* ℔ ß. *argenti vivi extin.* ʒ vj. *oleo laurino, & de ſpica reducantur ad formam emplaſtri.* Theſe Plaiſters muſt be equally ſpread upon leather, and laid upon the ſame places of the joints, as were formerly mentioned in the cure by frictions. Yet ſome there be who cover with the plaiſter all the arm, from the hand even to the ſhoulder, and all the leg from the top of the knee, even to the ends of the toes, which thing I do not diſallow of, if ſo be that the places or the joints be covered over with a thicker Plaiſter. They muſt be left ſticking thereon ſo long, until Nature be ſtirred up and provoked to cauſe excretion of the virulent humours. Yet if in the *interim*, great itching ſhall ariſe in the parts, you may take them off ſo long until the parts ſhall be fomented with a decoction of the flowers of Camomil, Melilot, red Roſes, and the like, made in Wine, to diſcuſs that which cauſed the itching, and then you may lay them on again. Some to hinder the riſing of any itch, lay not the bare Plaiſter to the part, but cover it over with Sarcenet, ſo to keep it from ſticking, and thus intercept the tranſpiration of the part, the cauſe of itching. They ſhall be ſtronger or weaker, and lie to the part a long or ſhorter ſpace, as long as the indications ſo often formerly mentioned, ſhall ſeem to require. The effects of Emplaſters are the ſame as of frictions: for they cauſe excretion, one while by inſenſible tranſpiration, otherwhiles by a *Diarrhœa*, or flux of the belly; ſometimes by Urins, but moſt frequently (which *Criſis* is alſo moſt certain) by ſalivation. Sordid and virulent ulcers often breed in the Mouth, Tongue, Pallat, and Gums by ſalivation, by reaſon of

What excretion beſt in this diſeaſe.

the acrimony of the virulent humours adhering to the ſide of the mouth: to hinder the growth of theſe, many inject Clyſters made of emollient things, eſpecially at the beginning of the ſalivation, ſo to draw downwards the humours forcibly flying up in greater quantity than is fit, although the part it ſelf may endure them.

There are alſo ſome, who to the ſame end give a purging Medicin at the very time when as the humours are ready to move upwards, the which I think is not a ſafe courſe. The cure of ſuch ul-

To avoid the ulcers of the mouth.

cers is far different from the cure of others; for they ought by no means to be repercuſſed or repelled, how inflamed ſoever they be, but onely to be mitigated by gargariſms, ſo onely to leſſen the heat, and that by this frequent waſhing of the mouth, you may hinder the ſticking or furring of viſcid

To cure them.

humours to ſuch like ulcers. A decoction of Barley, Cows milk warm, held and gargled in the mouth, the mucilages of the ſeeds of Mallows, Marſh-mallows, *Pſilium*, Lettuce, Line extracted in the Water of Barley, Mallows, and Pellitory of the Wall, are good for this purpoſe; for thus the ulcers become more mild, and the tenacity of the adherent humours is looſed. You muſt at the firſt beware of ſtrong detergent Medicins, for almoſt all ſuch have acrimony joined with them, which will increaſe the pain, but chiefly in the ſtate of the diſeaſe: for ſo, the ulcers gently cleanſed by frequent gargling, would become worſe by the uſe of acrid things. Therefore it ſhall be ſufficient to make uſe of the fore-mentioned Medicins, ſo to hinder the increaſe of the filth, and inflammation of the ulcers, if ſo be that ſuch ulcers be not too exceeding malign and burning. For if it ſhall happen either by the powerful efficacy of the applied Plaſters, or by the violence of Nature in its motion of the ill humours upward, that ſuch ſtore of viſcous and groſs humours are carried to the mouth, that it wants little, but that the part it ſelf is over-ruled by the morbifick matter, ſo that by the violence and continuance of the flux, the Mouth and Jaws become ſo ſwelled, that a gangrene is to be feared, by hindring the entrance of the ſpirits, and extinguiſhing of the native heat of theſe parts. In this caſe

Reſtrictive repelling Gargariſms.

we are forced to leave the proper cure for to withſtand the accidents, and for this purpoſe we uſe reſtrictive and repelling things, ſuch as are Barley Water, Plantain, Night-ſhade, Knot-graſs, Shepherds-purſe, and the like; with ſyrup of Roſes, Violets, Quinces, Berberies, Pomgranats, and the like; alſo ſuch are the mucilages and decoctions of the ſeeds of Lettuce, Piſilium, Quinces, Plantain, Night-ſhade, Water-lillies, Wood-bind, &c. Alſo it is convenient to procure ſweats by Stoves, or the application of any hot and dry things; for thus the humours which run forth of the veſſels into all the ſurface of the body, are diverted. But when as the courſe of the humours running to the mouth, is begin-

To dry the ulcers of the mouth.

ning to ſtop, and the tumours of ulcers begin to leſſen, then nothing hinders, but that we may uſe gently detergent things, as *Syrup. roſarum ſiccar. mel roſat. Diamoron, Dianucum*, and the like. But when it is time to dry the ulcers, they may be lightly touched with Alum-water, or with *Aqua fortis*, ſuch as Goldſmiths have uſed for the ſeparation of Metals. They may alſo frequently uſe drying

Gargariſms

Gargariſms made with aſtriction of the water of Roſes, Plantain, Night-ſhade, Shepherds-purſe, Knot-graſs, and Dogs-tongue, boiling therein *balauſt. roſ. rub. myrtil. ſumach. alum. acacia, berber. gallar. malicor.* and the like. During the time of fluxing or ſalivation, you muſt diet and feed the Patient with liquid meats, and thoſe of good juice and eaſie digeſtion, for that then he can neither chaw, ſwallow, nor digeſt hard things: For Nature wholly intent upon the excretion of the noxious and peccant humours, as alſo weakned by the bitterneſs of pain, watchings and unquietneſs, and conſequently a great reſolution of the ſpirits, cannot inſiſt powerfully upon the work of concoction. Therefore he ſhall be fed with rear new-laid Egs, Caudles of the ſame, Barley-creams, Culleſſes made of a decoction of Knuckles of Veal, and a Capon, and Gellies; and with theſe in ſmall quantity, but frequently adminiſtred, always gargling his mouth before he eat. For his drink he ſhall uſe a decoction of *Guaiacum* aromatized with a little Cinamon; but if any deſire that the drink ſhall become nouriſhment; for that the Patients cannot feed on more ſolid meats, you may give them old Wine, Claret and thin, mixed with ſome Barley-water. Some there are who ſteep ſome crums of pure Manchet in the forcſaid Wine, and then preſs it out, but yet ſo, that there may ſome part of the bread remain therein, which may make it more nouriſhing, and leſs ſharp or acrid. Others ſteep bread hot out of the Oven in Wine for the ſpace of a night, then they diſtil it all over in *balneo Mariæ*; the liquor which comes over is more ſtrong and hot, but that which flows out afterwards, more mild, and ſuch as the Patient may uſe to mix with his Wine without any danger, for his better nouriſhment, and the recovery of his ſtrength.

Manner of diet when the mouth is ulcerated.

To make their drink nouriſh.

For to refreſh the ſpirits in fear of fainting, Muſcadine, Hippocras, Roſe Vinegar, and the like, put to the noſe to ſmell to, will be ſufficient, unleſs peradventure the Patient ſhould naturally abhor ſuch things, for ſo they would rather deject the powers and ſpirits. In the *interim* you muſt have care of the belly, that you keep it open by gentle and emollient Clyſters.

CHAP. XIV.

Of the fourth manner of Curing the Lues Venerea.

SOme have deviſed a fourth manner of curing the *Lues Venerea*, which is by *Suffitus*, or Fumigations. I do not much approve hereof, by reaſon of ſundry malign ſymptoms which thence ariſe, for they infect and corrupt by their venemous contagion, the Brain and Lungs, by whom they are primarily and fully received, whence the Patients during the reſidue of their lives, have ſtinking breaths. Yea many while they have been thus handled have been taken hold of by a convulſion and a trembling of their Heads, Hands, and Legs, with a Deafneſs, Apoplexy, and laſtly, miſerable death, by reaſon of the malign vapours of Sulphur and Quickſilver, whereof *Cinnabaris* conſiſts, drawn in by their mouth, noſe, and all the reſt of the body. Wherefore I can never approve the uſe of ſuch fumigations which are to be received in fumes by the mouth and noſtrils for to work upon the whole body; yet I do not diſlike of that which is undertaken for ſome one part onely, as to dry up ill-conditioned ulcers, which ſo affect it, they cannot be overcome by any other means, or for to diſperſe or digeſt knots, or to reſolve fixed pains, otherwiſe unmoveable. Theſe Fumigations, by reaſon of the admixture of *argentum vivum*, have an attenuating, cutting, reſolving, and colliquating faculty. Thoſe who prepare theſe Fumigations for the cure of the whole diſeaſe and body, take this courſe. They put the Patient under a Tent or Canopy made cloſe on every ſide, leſt any thing ſhould expire, and they put in unto him a Veſſel filled with hot coals, whereupon they plentifully throw *Cinnabaris*, that ſo they may on every ſide enjoy the riſing fume, juſt after the ſame manner as Farriers uſe to ſmoak their Horſes for the Glaunders: they repeat this every day ſo long, until they begin to flux at the mouth. The principal matter or *baſis* of ſuch Fumigations, as we have already noted, is *Cinnabaris* conſiſting of Sulphur and *argentum vivum* mixed together: there is added alſo, *Radix ireos flor. thus, olibanum myrrha, juncus odoratus, aſſa odorata, maſtiche terebinthina & theriaca*, all which have a faculty to reſolve and ſtrengthen the Spirits and Nature, and correct the ſtench and evil quality of the *argentum vivum*. There are alſo other Fumigations made after another manner, but that alſo when as the *argentum vivum* is extinct, and as it were fixt after this manner, let ſome Lead be melted, and let there be poured or put thereto ſome *argentum vivum*, then let it all be powdered, adding thereto Antimony, Aloes, Maſtich, Coperas, Orpiment, and Benjamin made into Powder, and framed into Trochiſces with ſome Turpentine. Or elſe ℞ *Cinnabaris* ʒ j. *ſtyracis liq. & calamitæ, nucis moſchat. an.* ʒ iij. *benzoini* ʒ ß. *excipe terebinth. fiant trochiſci ponderis* ʒ ij. for the aforeſaid uſe. The *terebinthina* is added to incorporate the dry things, and the gums are added to yield matter to the fume. But virulent ulcers of the *Lues Venerea* ſhall not be fumigated before they be cleanſed; alſo this following Fumigation is good. ℞ *Cinnab.* ʒ j. *benzoini, myrrhæ, ſtyracis, olibani, opopanacis, an.* ʒ ß. *maſtiches, macis, thuris, an.* ℈ ij. *excipiantur terebinth. & fiat ſuffumigium.*

What fumigations good.

The common manner of uſing them.

The matter of them.

Trochiſces for fumigations.

CHAP. XV.

The Cure of the ſymptoms, or ſymptomatick affects of the Lues Venerea: *and firſt, of the Ulcers of the Yard.*

CAllous and malign ulcers in this diſeaſe may grow all over the Yard; but theſe are far more malign which ariſe upon the Prepuce, than thoſe that grow on the *Glans* or Nut of the Yard. Now they are rebellious to the common Medicins of Ulcers which happen otherways, and they are alſo ſubject to turn into a Gangrene, ſo that ſundry who have not in time provided for themſelves by the uſe of *argentum vivum*, are forced for their negligence, to ſuffer the loſs of their *Glans*, and oft times of their whole Yard. Yet I am of opinion, that I think we muſt begin the cure of Ulcers

The Ulcers of the prepuce more malign than thoſe of the *Glans*.

Ulcers of the Yard with the general remedies of Ulcers. For all Ulcers arising in these parts by reason of copulation, are not virulent. But when as we shall find that we do no good by this means, and that the disease notwithstanding grows worse and worse, then must we come to make use of such things as receive *argentum vivum*, that by these we may resist the virulency which is ready to disperse it self over all the body; yet it is absolutely necessary that all these things be endued with such faculties as may return the malign acrimony of this venom, such an one is this following *collyrium* of *Lanfrank*. ℞ *Vini albi*, ℔ j. *aq. ros. & plantag. an.* quart 1. *auripig.* ʒ ij. *viridis æris*, ʒ j. *aloes, myrrhæ, an.* ʒ ij. *terantur subtilissime, & fiat collyrium.* Also these ulcers may be profitably touched with Mercury water, or *aqua fortis* which the Goldsmiths have used, or else Mercury in Powder, or our *Ægyptiacum:* but the falling away of the Eschar shall be procured with *basilicon*, or fresh butter. Yet I think it not fit to use these acrid things without very great caution, for fear of a Gangrene, which easily happens to this part: but if such Ulcers are so stubborn, that they will not yield to these remedies, then must we come to the friction or unction of the groins, *perinæum*, and ulcers, with the Ointments formerly prescribed for the general friction. Also Fumigations may be made, as we mentioned in the former Chapter: For thus at length the malignity of the virulent humour will be overcome, and the callous hardness mollified; and lastly, the Ulcers themselves cleansed, and being cleansed, consolidated. Sometimes after the perfect cure of such Ulcers, there will appear manifest signs of the *Lues Venerea* in many, which shewed not themselves before, for that the virulency flowed forth of the running Ulcers, and now this vent being stopt, it flows back into the body, and shews signs thereof in other parts; and these men have need of a general Unction.

Lanfranks Collyrium.

CHAP. XVI.

How a Gonorrhœa *differeth from a* * *Virulent Strangury.*

EVen to this day very many have thought that the virulent Strangury hath some affinity with the *Gonorrhœa* of the Ancients, but you shall understand by that which follows, that they are much different. For a *Gonorrhœa* is an unvoluntary effusion of seed running from the whole body to the genitals, by reason of the resolution and palsie of the retentive faculty of these parts, as it is delivered by *Galen, lib. de loc. affect.* This disease befalleth others by the collection of the bloud and seminal matter by the Vessels of the whole body, which not turning into fat and good flesh, takes its course to the genitals; but on the contrary, a virulent Strangury is a running, or rather dropping out of the urinary passage, of a yellowish, livid, bloudy, filthy *sanies*, like to *pus*, or matter not well concocted, oftentimes fretting and exulcerating the passage with the acrimony, and causing a painful erection of the Yard, and distension of all the genital parts. For in this erection there is caused as it were a convulsive contraction of these parts. And hence it is that the Patients complain that they feel as it were a string stretched stiff in that part, which draws the yard as it were downwards. The cause hereof is a gross and flatulent spirit, filling and distending by its plenty, the whole channel or hollow nerve, yea verily, the whole porous substance of the Yard. If to these symptoms this be added, that the urinary passage be exulcerated, a grievous pain afflicts the Patient whilest he makes water, for that the Ulcers are irritated by the sharp Urin passing that way. Such a virulent Strangury, or Running of the Reins oft-times continueth for two or three years space: but the *Gonorrhœa*, or Running of the Seed cannot endure so long, but that it will bring the body to an extreme and deadly leanness, for that the matter of the Seed is of the more benign and laudable portion of the bloud, as you may perceive by those who have too immoderately used copulation but the space of one night: For such have their Faces more lean and lank, and the rest of their bodies enervated, languisheth and becometh dull. By this we have delivered, it may be perceived that the running of virulent Strangury, is not the running of a seminal humour, fit for generation of issue, but rather of a viscous and acrid filth, which hath acquired a venenate malignity by the corruption of the whole substance.

* This which by our Author is here termed *Stranguria virulenta*, and in French *Chaudepisse*, is the same which by other Authors is usually termed *Gonorrhœa virulenta*, and by us vulgarly in English, *The Running of the Reins.*

What a virulent Strangury is.

The cause of the convulsive distension of the Yard.

Vid. aut. defin. med. apud Galen.

What kind of matter floweth forth in a virulent Strangury.

CHAP. XVII.

Of the Causes and Differences of the Scalding or Sharpness of the Urin.

THe heat or scalding of the Water, which is one kind of the virulent Strangury, ariseth from some one of these three Causes; to wit, Repletion, Inanition, and Contagion. That which proceeds from Repletion, proceeds either from too great abundance of bloud, or by a painful and tedious Journey in the hot Sun, or by feeding upon hot, acrid, diuretick, and flatulent Meats causing tension and heat in the urinary parts, whence proceeds the inflammation of them and the genital parts; whence it happens that not onely a seminal, but also much other moisture may flow unto those parts, but principally to the *Prostatæ*, which are Glandules situate at the roots, or beginning of the neck of the bladder, in which place the spermatick vessels end; also abstinence from Venery causeth this plenitude in some who have usually had to do with Women, especially the expulsive faculty of the seminal and urinary parts being weak, so that they are not of themselves able to free themselves from this burden: For then the suppressed matter is corrupted, and by its acrimony contracted, by an adventitious and putredinous heat, it causeth heat and pain in the passage forth. The *Prostatæ* swelling with such inflamed matter, in process of time become ulcerated, the abscess being broken. The purulent *sanies* dropping and flowing hence alongst the urinary passage causes the Ulcers by acrimony, which the Urin falling upon, exasperates; whence sharp pain, which also continueth for some short time after making of water, and together therewith by reason of the inflammation, the pains attraction, and the vaporous spirits distension, the Yard stands, and is contracted with

The cause of a particular repletion of the privy parts.

with pain, as we noted in the former Chapter. But that which happens through inanition, is acquired by the immoderate and unfit uſe of Venery, for hereby the oily and radical moiſture of the fore-mentioned Glandules is exhauſted, which waſted, and ſpent, the Urin cannot but be troubleſome and ſharp by the way to the whole *Urethra*. From which ſenſe of ſharp pain, the ſcalding of the Urin hath its denomination. That which comes by contagion, is cauſed by impure copulation with an unclean perſon, or with a woman, which ſome ſhort while before hath received the tainted ſeed of a virulent perſon, or elſe hath the Whites, or her Privities troubled with hidden and ſecret ulcers, or carrieth a virulent ſpirit ſhut up or hidden there, which heated and reſuſcitated by copulation, preſently infects the whole body with the like contagion, no otherwiſe then the ſting of a Scorpion or *Phalangium*, by caſting a little poiſon into the skin, preſently infects the whole body, the force of the poiſon ſpreading farther than one would believe, ſo that the party falls down dead in a ſhort while after. Thus therefore the ſeminal humour contained in the *proſtatæ*, is corrupted by the tainture of the ill, drawn thence by the Yard, and the contagion infects the part it ſelf; whence follows an abſceſs, which caſting forth the virulency by the urinary paſſage, cauſeth a virulent ſtrangury; and the malign vapour carried up with ſome portion of the humour unto the entrails and principal parts, cauſe the *Lues Venerea*.

The cauſes of the inanition of the genital parts.

The reaſon of a contagious Strangury.

CHAP. XVIII.

Prognoſticks in a virulent Strangury.

WE ought not to be negligent or careleſs in curing this affect, for of it proceed pernicious accidents, as we have formerly told you, and neglected, it becomes uncurable, ſo that ſome have it run out of their urinary paſſage during their lives; oft-times to their former miſery is added a ſuppreſſion of the Urin, the *proſtatæ* and neck of the bladder being inflamed and unmeaſurably ſwelled. Copulation, and the uſe of acrid or flatulent meats increaſe this inflammation, and alſo together therewith cauſe an *Iſchuria* or ſtoppage of the urin; they are worſe at the change of the Moon: certain death follows upon ſuch a ſtoppage; as I obſerved in a certain man, who troubled for ten years ſpace with a virulent Strangury, at length died by the ſtoppage of his water. He uſed to be taken with a ſtopping of his urin as often as he uſed any violent exerciſe, and then he helped himſelf by putting up a ſilver Catheter, which for that purpoſe he ſtill carried about him; it happened on a certain time that he could not thruſt it up into his bladder, wherefore he ſent for me, that I might help him to make water, for which purpoſe when I had uſed all my skill, it proved in vain: when he was dead and his body opened, his bladder was found full, and very much diſtended with urin, but the *proſtatæ* preternaturally ſwelled, ulcerated, and full of matter reſembling that which formerly uſed to run out of his Yard, whereby you may gather that this virulency flows from the *proſtatæ*, which runs forth of the Yard in a virulent Strangury, and not from the Reins, as many have imagined. Certainly a virulent Strangury, if it be of any long continuance, is to be judged a certain peculiar *Lues Venerea*, ſo that it cannot be cured unleſs by frictions with *Hydrargyrum*. But the ulcers which poſſeſs the neck of the bladder are eaſily diſcerned from theſe which are in the body or capacity thereof. For in the latter the filth comes away as the Patient makes water, and is found mixed with the Urin, with certain ſtrings or membranous bodies coming forth in the urin: to theſe may be added, the far greater ſtench of this filth, which iſſueth out of the capacity of the bladder. Now muſt we treat of the Cure of both theſe Diſeaſes, that is, the *Gonorrhœa* and virulent Strangury; but firſt of the former.

A virulent Strangury continues with ſome during their lives.

An Hiſtory.

From what part the matter of a virulent Strangury flows.

CHAP. XIX.

The chief heads of curing a Gonorrhœa.

LEt a Phyſician be called, who may give direction for purging, bleeding, and diet, if the affect proceed from a fulneſs and abundance of bloud and ſeminal matter; all things ſhall be ſhunned which breed more bloud in the body, which increaſe ſeed, and ſtir to venery. Wherefore he muſt abſtain from Wine, unleſs it be weak and aſtringent, and he muſt not onely eſchew familiarity with women, but their very pictures, and all things which may call them to his remembrance, eſpecially if he love them dearly; ſtrong exerciſes do good, as the carrying of heavy burdens even until they ſweat, ſwimming in cold water, little ſleep, refrigerations of the loins and genital parts, by anointing them with *unguentum roſarum refrigerans Galeni & nutritum*, putting thereupon a double cloth ſteeped in oxycrate, and often renewed. But if the reſolution or weakneſs of the retentive faculty of theſe parts be the cauſe of this diſeaſe, contracted by too much uſe of venery before they arive at an age fit to perform ſuch exerciſe; in this caſe ſtrengthening and aſtringent things muſt both be taken inwardly, and applied outwardly. But now I haſten to treat of the virulent Strangury, which is more proper to my purpoſe.

Diet.

For a Strangury occaſioned by repletion.

For the decay of the retentive faculty.

CHAP. XX.

The general Cure both of the ſcalding of the Water, and the virulent Strangury.

WE muſt diverſly order the Cure of this Diſeaſe, according to the variety of the Cauſes and Accidents thereof. Firſt, care muſt be had of the diet, and all ſuch things ſhunned as inflame the bloud, or cauſe windineſs; of which nature are all diuretick and flatulent things, as alſo ſtrong and virulent exerciſes. Purging and bleeding are convenient, eſpecially if fulneſs

Diet.

neſs cauſe the affect. Womens companies muſt be ſhunned and thoughts of venereous matters; the Patient ought not to lie upon a ſoft bed, but upon a quilt or mattrice, and never, if he can help it, upon his back: boiled meats are better than roſted, eſpecially boiled with Sorrel, Lettuce, Purſlain, cleanſed barley, and the four cold ſeeds beaten: for ſauce, let him uſe none, unleſs the juice of an Orange, Pomgranate, or Verjuice: let him ſhun Wine, and in ſtead thereof uſe a decoction of Barley and Licorice, an *hydromel*, or *hydroſaccarum*, with a little Cinamon, or that which is termed *Potus divinus*. In the morning let him ſup of a Barley Cream, wherein hath been boiled a *nodulus* of the four cold Seeds beaten together with the ſeeds of white Poppy; for thus it refrigerateth, mitigateth, and cleanſeth; alſo the ſyrups of Marſh-mallows and Maiden-hair are good. Alſo purging the belly with half an ounce of *Caſſia*, ſometimes alone, otherwhiles with a dram, or half a dram of Rhubarb in powder put thereto, is good. And theſe following Pills are alſo convenient. ℞ *Maſſæ pilul. fine quibus* ℈ j. *rhei electi* ʒ ß. *camphuræ gr.* iv. *cum terebinthina formentur pilulæ*; let them be taken after the firſt ſleep.

Pills.

The force of Venice Turpentine in this diſeaſe.

Venice Turpentine alone, or adding thereto ſome Rhubarb in powder, with Oil of ſweet Almonds newly drawn without fire, or ſome ſyrup of Maiden-hair, is a ſingular Medicin in this caſe, for it hath an excellent lenitive and cleanſing faculty, as alſo to help forwards the expulſive faculty to caſt forth the virulent matter contained in the *Proſtatæ*. You may by the bitterneſs perceive how it reſiſts putrefaction, and you may gather how it performs its office in the Reins and Urinary parts, by the ſmell it leaves in the Urin after the uſe thereof. But if there be any who cannot take it in form of a Bole, you may eaſily make it potable, by diſſolving it in a Mortar with the Yolk of an Egg, and ſome white Wine, as I learned of a certain Apothecary, who kept it as a great ſecret. If the diſeaſe come by inanition or emptineſs, it ſhall be helped by fatty injections, oily and emollient potions, and inwardly taking and applying theſe things which have the like faculty, and ſhunning theſe things which cauſed the diſeaſe. How to cure that which happens by contagion, or unpure copulation, it ſhall be abundantly ſhewed in the enſuing Chapter.

How to be made potable.

CHAP. XXI.

The proper Cure of a virulent Strangury.

An injection to ſtay inflammation.

FIrſt, we muſt begin with the mitigation of pain, and ſtaying the inflammation, which ſhall be performed by making injection into the *Vrethra* with this following decoction warm. ℞ *Sem. pſilii, lactucæ, papav. albi, plantag. cydon. lini, hyoſcyami albi an.* ʒ ij. *detrahantur mucores in aquis ſolani & roſar. ad quantitatem ſufficientem, adde trochiſc. alborum Rhaſis camphoratorum in pollinem redactorum,* ʒ j. *miſce ſimul, & fiat injectio frequens:* For this becauſe it hath a refrigerating faculty, will help the inflammation, mitigate pain, and by the mucilaginous faculty lenifie the roughneſs of the *Vrethra*, and defend it by covering it with the ſlimy ſubſtance, againſt the acrimony of the Urin and virulent humours. In ſtead hereof you may uſe Cows milk newly milked, or warmed at the fire. Milk doth not onely conduce hereto, being thus injected, but alſo drunk, for it hath a refrigerating and cleanſing faculty, and by the ſubtilty of the parts it quickly arrives at the urinary paſſages. Furthermore, it will be good to anoint with *Cerat. refriger. Galeni, addita camphora*, or with *Ceratum centalinum, ung. comitiſſæ*, or *nutritum*, upon the region of the kidnies, loins, and *perinæum*, as alſo to anoint the Cods and Yard. But before you uſe the aforeſaid Ointments, or the like, let them be melted over the fire, but have a care that you make them not too hot, leſt they ſhould loſe their refrigerating quality, which is the thing we chiefly deſire in them. Having uſed the aforeſaid ointment, it will be convenient to apply thereupon ſome linnen cloths moiſtned in oxycrate, compoſed *ex aquis plantaginis, ſolani, ſempervivi, roſarum*, and the like. If the Patient be tormented with intolerable pain in making water, and alſo ſome ſmall time after, as it commonly cometh to paſs, I would wiſh him that he ſhould make water, putting his Yard into a Chamber-pot filled with milk or water warmed. The pain by this means being aſſwaged, we muſt come to the cleanſing of the ulcers by this or the like injection: ℞ *Hydromelitis ſympt.* ʒ iv. *ſyr. de roſis ſiccis, & de abſinth. an.* ʒ ß. *fiat injectio.* But if there be need of more powerful deterſion, you may ſafely add, as I have frequently tried, a little *Ægyptiacum*. I have alſo found this following decoction to be very good for this purpoſe. ℞ *Vini albi odoriferi,* ℔ ß. *aquar. plantag. & roſ. an.* ʒ ij. *auripigmenti,* ʒ ß. *viridis æris,* ℈ j. *aloes opt.* ʒ ß. *pulveriſentur pulveriſanda, & bulliant ſimul.* Keep the decoction for to make injection withall. You may increaſe or diminiſh the quantity and force of the ingredients entering into this compoſition, as the Patient and Diſeaſe ſhall ſeem to require. The Ulcers being thus cleanſed, we muſt haſten to dry them, ſo that we may at length cicatrize them. This may be done by drying up the ſuperfluous moiſture, and ſtrengthening the parts that are moiſtned and relaxed by the continual defluxion, for which purpoſe this following decoction is very profitable. ℞ *Aq. fabrorum,* ℔ j. *pſidiarium, balauſt. nucum cupreſ. conquaſſatorum, an.* ʒ j. ℥. *ſemin. ſumach. & berber. an.* ʒ ij. *ſyrup. roſar. & de abſinth. an.* ʒ j. *fiat decoctio.* You may keep it for an injection to be often injected into the *Vrethra* with a ſyringe, ſo long as that there ſhall no matter or filth flow over thereat, for then there is certain hope of the cure.

The faculties of Milk againſt a virulent Strangury.

How to make water without pain.

Detergent injections.

How the cleanſed ulcers may be dried.

CHAP.

CHAP. XXII.

Of Caruncles or fleshy Excrescences which sometimes happen to grow in the Urethra, *by the heat or scalding of the Urin.*

A Sharp humour which flows from the Glandules, termed *Prostatæ*, and continually runs alongst the urinary passage, in some places by the way it frets, and exulcerates by the acrimony the *Urethra* in men, but the neck of the womb in women. In these, as also is usual in other ulcers, there sometimes grows up a superfluous flesh, which oft-times hinders the casting or coming forth of the Seed and Urin by their appropriate and common passage, whence many mischiefs arise; whence it is that such ulcers as have caruncles growing upon them must be diligently cured. But first we must know whether they be new or old. For the later are more difficultly to be cured than the former, because the caruncles that grow upon them become callous and hard, being oft-times cicatrized. We know that there are caruncles, if the *Catheter* cannot freely pass alongst the passage of the Urin, but finds so many stops in the way, as it meets with caruncles that stop the passage; if the Patient can hardly make water, or if his water run in a very small stream, or two streams, or crookedly, or onely by drop and drop, with such tormenting pain, that he is ready to let go his excrements, yea and oft-times doth so, after the same manner as such as are troubled with the stone in the bladder. After making water, as also after copulation, some portion of the urin and seed stays at the rough places of the caruncles, so that the Patient is forced to press his Yard, to press forth such reliques. Sometimes the urin is wholly stopped, whence proceeds such distension of the bladder, that it causeth inflammation, and the urin flowing back into the body, hastens the death of the Patient. Yet sometimes the urin thus suppresst, sweats forth preternaturally in sundry places, as at the Fundament, *Perinæum*, Cod, Yard, Groins. As soon as we, by any of the fore-mentioned signs, shall suspect that there is a caruncle about to grow, it is expedient forthwith to use means for the cure thereof; for a caruncle from a very little beginning doth in a short time grow so big, that at the length it becomes incurable: verily, you may easily guess at the difficulty of the cure, by that we have formerly delivered of the essence hereof; besides, Medicins can very hardly arrive thereat. The fittest season for the undertaking hereof is the Spring, and the next thereto is Winter; yet if it be very troublesom, you must delay no time. Whilest the cure is in hand, the Patient ought wholly to abstain from Venery, for by the use thereof, the Kidnies, Spermatick Vessels, *Prostatæ*, and the whole Yard, swell up and wax hot, and consequently draw to them from the neighbouring and upper parts, whence abundance of excrements in the affected parts, much hinder the cure. You must beware of acrid and corroding things in the use of detergent injections, for that thus the *Urethra* being induced with most exquisit sense, may be easily offended, whence might ensue many ill accidents. Neither must we be frighted, if at sometimes we see bloud flow forth of secret or hidden caruncles. For this helps to shorten the cure, because the disease is hindered from growth, by taking away portion of the conjunct matter, the part also it self is eased from the oppressing burden, for the material cause of caruncles is superfluous bloud. Wherefore unless such bleeding happen of it self, it is not amiss to procure it by thrusting in a *Catheter* somewhat hard, yet with good advice. If the caruncles be inveterate, and callous, then must they be mollified by Fomentations, Ointments, Cataplasms, Plasters, and Fumigations; you may thus make a Fomentation. ℞ *Rad. althæ. & lilior. alb. an.* ℥ v. *rad. bryoniæ, & fœnic. an.* ℥ j. ß. *fol. malvar. violarum parietar. & mercur. an.* m. ß. *sem. lini. fœnugr. an.* ℥ ß. *caricas ping.* nu. xij. *florum chamæm. & melil. an.* p. j. *contundantur contundenda, incidenda incidantur, bulliant omnia in aqua communi:* make a Fomentation, and apply it with soft Sponges. Of the mass of the strained-out things you may make a cataplasm after this manner. ℞ *Prædicta materialia, terantur, & trajiciantur, adde axungiæ porci, unguenti basiliconis, an.* ℥ ij. *fiat cataplasma:* let it be applied presently after the fomentation. You may use this following Liniment whilest the Cataplasm is providing. ℞ *Unguenti althæ. & agrippæ, an.* ℥ j. ß. *æspi humidæ, & axung. human. an.* ℥ j. *butyri recentis, olei lilior. & chamæm. an.* ʒ vj. *liquefiant simul, addendo aquæ vitæ* ℥ j. *fiat linimentum.* Let it be applied outwardly upon the part wherein the caruncles are. For the same purpose Plasters shall be applied, which may be diversified and fitted as you shall think good; yet *Emplastrum de Vigo* truly made, exceedeth all the rest in a mollifying faculty, and in wasting such callous hardness. The following Fumigation is also good for the same purpose; take some pieces of a Mill-stone (for this we use in stead of the *Pyrites* mentioned by the Ancients) or else some Bricks of large size, after they are heated hot in the fire, let them be put into a Pan and set under a Close-stool, then cause the Patient to sit thereon as if he were going to Stool, then pour upon the hot stones equal parts of very sharp Vinegar, and very good *aqua vitæ*, and casting cloths about him, that nothing may exhale in vain: let him receive the ascending vapour at his Fundament, *Perinæum*, *Scrotum*, and *Urethra*. Moreover that this Medicin may work the better effect, you may put the Patient naked into the Barrel noted with this letter *A*, so that he may sit upon a seat or board perforated on that part, whereas his genitals are, then place the Pan holding the hot stones between his legs, then presently sprinkle the stones with the fore-mentioned liquor, by the door marked with the letter *B*. Thus the Patient shall easily receive the fume that exhales therefrom, and none thereof be lost, he covering and vailing himself on every side. Such a fumigation in *Galen*'s opinion, hath a faculty to penetrate, cut, resolve, soften and digest scirrhous hardnesses.

CHAP. XXIII.

What other remedies ſhall be uſed to Caruncles occaſioned by the Lues Venerea.

Particular defaults of the *Lues Venereæ* not to be cured unleſs by the general remedy of the virulency.

BUt if you ſuſpect that theſe Caruncles come or are occaſioned by a virulent humour, or the malignity of the *Lues Venerea*, it is meet that the Patient obſerve ſuch a diet as uſually is preſcribed to ſuch as are troubled with the *Lues Venerea*; let him uſe a decoction of *Guaiacum*, and let the *perinæum* and the whole Yard be anointed with ointment made for the *Lues Venerea*; otherwiſe the Surgeon will loſe his labour. In the *interim*, whileſt he ſhall ſweat in his bed, he ſhall be wiſhed to hold between his legs a ſtone-bottle filled with hot water, or elſe a hot brick wrapped in linnen cloths moiſtned in Vinegar and *Aqua vitæ*; for thus the heat and vapour will aſcend to the genitals, which, together with the help of the applied ointment, will diſſolve the matter of the Caruncles, and being thus ſoftned, they muſt be conſumed with convenient Medicins. Wherefore firſt, if they become callous, or cicatrized (which you may ſuſpect if they caſt forth no excrementitious humidity) they ſhall be exaſperated, excoriated and torn with a leaden *Catheter* having a rough button at the end like a round file. He ſhall ſo long uſe the *Catheter* put into the *Urethra*, thruſting it up and down the ſame way ſo long and often as he ſhall think fit for the breaking and tearing the Caruncles, he ſhall permit them thus torn to bleed freely, ſo to eaſe the affected part. You may alſo for the ſame purpoſe put into the *Urethra* the *Catheter* marked with this letter *B*; whereinto putting a ſilver wier ſharp at the upper end, that by oft thruſting it in and out it may wear and make plain the reſiſting Caruncles. Verily by this means I have helped many much perplexed with the fearful danger of this diſeaſe. Some better like of the *Catheter* marked with this letter *A*, being thus uſed: it is thruſt into the *Urethra* with the prominent cutting ſides downwards, and then preſſing the Yard on the outſide cloſe with your hand to the *Catheter* in the place where the Caruncles are, it is drawn forth again.

Caruncles, if callous, muſt firſt be ſoftned.

A Powder to waſte Caruncles.

The Caruncle thus torn ſhall be ſtrewed over with the following powder, being very effectual to waſte and conſume all Caruncles of the Privities without much pain. ℞ *Herb. ſabin. in umbra exſiccat.* ʒ ij. *ocræ, antimon. tut. præparat. an.* ʒ ß. *fiat pulv. ſubtiliſſimus*; let it be applied in the following manner. Put the powder into the Pipe or *Catheter* having holes in the ſides thereof, the which is the lowermoſt of the laſt deſcribed: then put the *Catheter* into the urinary paſſage until the ſlit or openneſs of the ſide come to the Caruncle, then into the hollowneſs of the *Catheter* put a ſilver wier, wrapped about the end with a little linnen rag, which as it is thruſt up, will alſo thruſt up the powder therewith, until it ſhall come to the ſlit againſt the Caruncle, then will it adhere to the Caruncle bloudy, by reaſon of the ſaid attrition. Then ſhall you draw forth the *Catheter*, firſt twining it about, that ſo it may not ſcrape off the powder again. If intolerable pain hereupon happen, it ſhall be aſſwaged, and the inflammation reſtrained by the following injection. ℞. *Succorum portulacæ, plantag. ſolani, & ſempervivi, an.* ʒ ß. *album ovorum*, nu.vj. *agitentur diu in mortario plumbeo*; let it be injected warm into the *Urethra* with a ſyringe. In ſtead hereof you may alſo make uſe of another injection, which is formerly preſcribed. Neither will it be unprofitable to apply repercuſſives to the genitals to hinder pain and inflammation. You may alſo uſe other Medicins, having a faculty to conſume the Caruncle, amongſt which theſe following are excellent. ℞ *Viridis æris, auripigmenti, vitriol. Rom. aluminis roch. an.* ʒ ij. *infundantur omnia in aceto acerrimo, atque inter duo marmora in pollinem redigantur:* then let it be expoſed to Summers Sun, and dried, again infuſed in ſharp Vinegar, and then as before ground upon a Marble, ſo that you find nothing ſharp with your fingers; laſtly, let it be oppoſed to the Sun until it may be made into moſt ſubtil Powder, and all the acrimony be vaniſhed, which will be commonly in eight days ſpace. Then, ℞ *ol. roſar.* ʒ iv. *litharg yr.* ʒ ij. *coquantur ad*

How to apply it.

An injection to hinder inflammation.

An Emplaſter uſed by the Surgeons of *Mountpelier* for Caruncles.

ignem

which will be commonly in eight days ſpace. Then ℞ *Ol. roſat.* ℥ iv. *lithargyr.* ℥ ij. *coquantur ad ignem, quouſque coierint in emplaſt. ſolidæ conſiſtentiæ, ab igne tum ſemotis, adde pulv. prædict.* ℥ ij. let them be mixed with a Spatula, and put it upon the fire until it come to ſo hard a conſiſtence, that it will ſtick faſt to a Wax Candle, or Lead Wier, ſo that it may not come off by handling with your hands. The Surgeons of *Montpelier* uſe this Medicin. This following is another; ℞ *Tutiæ præparat.* ℥ vj. *antimonii* ℥ iij. *trochiſc. alborum, Rhaſ. camphorat.* ʒ j. *corticis granati, aluminis uſti, an* ℥ j. ß. *ſpongiæ uſtæ,* ʒ ij. let them be all made into powder: then, ℞ *Ung. diapompholygos, & alb. Rhaſis, an.* ℥ ij. *miſceantur cum prædictis pulveribus in mortario plumbeo, & diu agitentur:* let a very fine rag be ſpread over with this ointment, and wrapped about a Wax Candle, and ſo thruſt into the *Urethra*, and then draw forth the Candle by twining it a contrary way; ſo let the end of the rag hang out of the Yard ſo to pluck it forth again, when as you ſhall think it hath done what it can to the Caruncle, which is, when it hath covered it with the Medicin with which it was ſpread. Some alſo make Wax Candles with a ſlender, but ſtiff wick, whoſe end, which is to be put to wear and conſume the Caruncle, is compoſed of the following Medicin. ℞ *Emplaſtri nigri, vel diachylonis ireati,* ℥ ij. *pulv. ſabinæ, ocræ, vitriol. Rom. calcin. pul. mer. an.* ʒ ß. *omnia liqueſcant ſimul ad dictum uſum.* Whileſt the cure ſhall be in hand, by theſe following Medicins, let the Patient be careful that he ſo ſhake his Yard after making water, that he may ſhake forth all the reliques of the Urin which may chance to ſtop at the Caruncles, for if but one drop ſhould ſtay there, it would be ſufficient to ſpoil the whole operation of the applied Medicins. After that the Caruncle ſhall be worn away and wholly conſumed by the deſcribed Medicins, which you may know by the Urin flowing forth freely, and in a full ſtream, and by thrutting up a *Catheter* into the bladder without any ſtoppage; then it remains that the ulcers be dried and cicatrized, for which purpoſe the following injection is very powerful and effectual, and without any acrimony. ℞ *Aq. fabrorum,* ℔ ß. *nuc. cupreſ. gallar. cort. granat. an.* ʒ j. ß. *alum. roch.* ʒ ß. *bulliant. omnia ſimul ſecund. art.* ſo make a decoction for an injection, which you ſhall uſe ſo long until no excrementitious humidity diſtil out of the Yard. The following Powder dries more powerfully, and conſequently haſtens forwards cicatrization, and it is alſo without acrimony. ℞ *Lapidem calamin. lotum, teſtas ovorum uſtas, corallum rubrum, corticem granat. comminue omnia in pollinem;* let this Powder be uſed to the ulcers with a Wax Candle joined to ſome *unguentum deſiccativum rubrum*, or ſome ſuch like thing. Alſo ſtrings or rods of lead thruſt into the *Urethra* as thick as the paſſage will ſuffer, even to the Ulcers, being firſt beſmeared with quick-ſilver, and kept in day and night as long as the Patient can endure, are good to be uſed. For they dry by their touch and cicatrize, they dilate the urinary paſſage without pain, and laſtly hinder the ſides of the Ulcers from corrupting one another.

CHAP. XXIV.

Of venereal Buboes, *or ſwellings in the Groins.*

THe virulency of the *Lues Venerea* is ſometimes communicated to the Liver, which if it have a powerful expulſive faculty, it expels it into the groins, as the proper emunctories thereof, whence proceed venereal Buboes. The matter of theſe, for the moſt part, is abundance of cold, tough, and viſcous humours, as you may gather by the hardneſs and whiteneſs of the tumor, the pravity of the pain, and contumacy of curing; which alſo is another reaſon, beſides theſe that we formerly mentioned, why the virulency of this diſeaſe may be thought commonly to faſten it ſelf in a phlegmatick humour. Yet ſometimes venereal Buboes proceed from a hot, acrid, and cholerick humour, aſſociated with great pain and heat, and which thereupon often degenerate into virulent and corroding ulcers. Some venereous Buboes are ſuch conjoined accidents of the *Lues Venerea*, that they foretell it; ſuch are theſe which for a ſmall while ſhew a manifeſt tumor, and ſuddenly, without any manifeſt occaſion hide themſelves again, and return back to the noble parts. Others are diſtinct from the *Lues Venerea* though they have a ſimilitude of eſſence and matter therewith, and which therefore may be healed, the *Lues Venerea* yet remaining uncured. Such are theſe which are uſually ſeen, and which therefore compared with the former, may be termed ſimple and not implicit. For the cure, you muſt not uſe diſcuſſing Medicins, leſt reſolving the more ſubtil part, the groſſer dregs become impact and concrete there; but much

The efficient and material cauſes of venereous Buboes.

What Buboes fore-tell the *Lues Venerea*.

leſs muſt we uſe repercuſſives, for that the matter is virulent. Wherefore onely attractive and ſuppurating Medicins are here to be uſed, agreeable to the humour predominant and cauſing the tumor, as more hot things in œdematous and ſcirrhous tumors, than in thoſe which reſemble the nature of a *phlegmon*, or *eryſipelas*: the indication taken from the rarity and denſity of bodies inſinuates the ſame variety. The applying of Cupping-glaſſes is very effectual to draw it forth: But when as it is drawn forth, you ſhall forthwith apply an emplaſtick Medicin, and then you ſhall come to ſuppuratives. When the tumor is ripe it ſhall be opened with a potential cautery, if it proceed from a cold cauſe; for by the inducing of heat the reſidue of the crude matter is more eaſily concocted; beſides, when as an ulcer of this kind is opened, the matter will be more eaſily evacuated, neither ſhall it be fit to uſe any tent, but only to apply pledgets. The reſidue of the cure ſhall be performed by detergent Medicins, and then, if need require, the Patient ſhall be let bloud, and the humours evacuated by a purging Medicin, but not before the perfect maturity thereof.

Cupping.

A potential Cautery.

CHAP. XXV.

Of the Exoſtoſis, *bunches or knots growing upon the bones by reaſon of the* Lues Venerea.

The matter of knots and virulent *Tophi*.

HArd tumors, *Exoſtoſes* and knots, have their matter from thick and tough phlegm, which cannot be diſſolved unleſs by hot Medicins, which have a mollifying and diſſolving faculty. For which purpoſe, beſides thoſe Medicins which uſually are applied to ſcirrhous humours, you muſt alſo make uſe of *Argentum vivum* commonly after this manner. ℞ *Emplaſt. filii Zach. & Ceronei, an.* ʒ iij. *cuphorb.* ʒ ß. *emplaſt. de Vigo,* ʒ ij. *cerat. æſp. deſcript. Philagr.* ʒ j. *argent. vivi extinct.* ʒ vj. *fiat emplaſtrum.* Spread it upon Leather for your uſe. In the mean ſpace let the Patient obſerve a ſparing diet; for thus he ſhall be helped, if ſo be that the ſubſtance of the bones be yet unperiſhed: For if it be putrefied and rotten, then deſcribed Medicins are of no uſe, but you muſt of neceſſity lay bare the bone, either by inciſion, or elſe by an actual or potential cautery; but I had rather do it with an actual, for that it extracts the virulency impact in the bones, as alſo it haſtens the abſceſs, or falling away of the corrupted bone. It ſhall be of a convenient figure to cauterize the bone, as round, ſquare, or long. I uſually before the application of ſuch a Cauſtick, firſt divide the fleſh that lies over it with an inciſion-knife, that ſo the pain may be the leſs, becauſe the fleſh cannot burn through but in a long time, by which the fire may come to the bone. But it will not be amiſs before we treat of this Art, firſt to conſider the nature of the rottenneſs of the bones.

An emplaſter againſt the bunching out of the bones.

CHAP. XXVI.

Why the bones become rotten, and by what ſigns it may be perceived.

Gal. meth. 6.

THat ſolution of continuity which is in the bones, is called by *Galen*, *Catagma*. This uſually is the cauſe of rottenneſs; for bones that are grated, bruiſed, rent, perforated, broken, luxated, inflamed and deſpoiled of the fleſh and skin, are eaſily corrupted; for deſpoiled of their covering, they are altered by the appulſe of the air, which they formerly never felt; whence alſo their bloud and proper nouriſhment is dried up and exhauſted. Beſides alſo, the *ſanies* running down by reaſon of wounds and old ulcers, in proceſs of time faſtens it ſelf into their ſubſtance, and putrefies by little and little: this putrefaction is increaſed and cauſed by the too much uſe of oily and fatty Medicins, as moiſt and ſuppurate things; for hence the Ulcer becometh more filthy and malign, the fleſh of the neighbouring parts groweth hot, is turned into *pus*, which preſently falling upon the bone lying under it, inflames it. Laſtly, the bones are ſubject to the ſame diſeaſes as the fleſh that lieth under them is; beſides alſo, according to *Galen*, the beginning of inflammation oft-times proceeds from the bones, but they heat not, becauſe according to the opinion of the Ancients, pulſation is a dolorifick motion of the Arteries, but the bones want ſenſe. Which verily I cannot deny, but alſo we muſt confeſs that the membrane that encompaſſeth them, and the arteries that enter into their body, are endued with moſt exquiſite ſenſe. Wherefore the arteries compreſſed and waxing hot by reaſon of the inflamed bone, cauſe a ſenſe of pain in the *periоſteum*, ſo that the Patients complain of a dull and deep pain, as it were ſunk into the ſubſtance of the bones. The rottenneſs or corruption is oft-times manifeſt to the eye, as when the bone is laid bare, for then it varieth from the natural colour, and becomes livid, yellowiſh, or black. Otherwiſe you may perceive it by touch, as by ſearching it with a probe, as when you meet with any inequality or roughneſs, or when but gently touching it your Probe runs into the ſubſtance of the bone as into rotten wood; for a bone is naturally hard, but being rotten, becomes ſoft. Yet hardneſs is not an infallible ſign of a ſound bone: for I have ſeen rotten and bared bones to have ſometimes grown ſo hard, by the appulſe of the air, that a Trepan could not, without a ſtrong endeavour, enter them. Alſo the rottenneſs of the bone is known by the condition of the filth which flows forth of the ulcer, for it is not onely more thin and liquid, but alſo more ſtinking. Furthermore, ſuch ulcers have a ſoft, looſe, and watery fleſh; beſides alſo they are untoward and rebellious to ſarcotick and epulotick Medicins; to which if they chance to yield and be cicatrized, yet within a ſhort while after, the ſcar will relent of its own accord, for that Nature deſtitute of the firm and ſound foundation of the bones, cannot build up a laudable and conſtant fleſh. Neither is it ſufficient that the Surgeon know certainly that the bone is rotten and corrupt; it is furthermore fit he know, whether the corruption be ſuperficiary, or pierce deep into the ſubſtance of the bone, that he may know how much of the bone muſt be ſcaled: for ſcaling is the onely cure of that which is corrupted; now it is ſcaled by that which dries exceedingly, and draws forth all the humidity, as well the excre-

The frequent cauſe of the rottenneſs of bones.

Signs of the rottenneſs.

Hardneſs is no infallible ſign of ſound bones

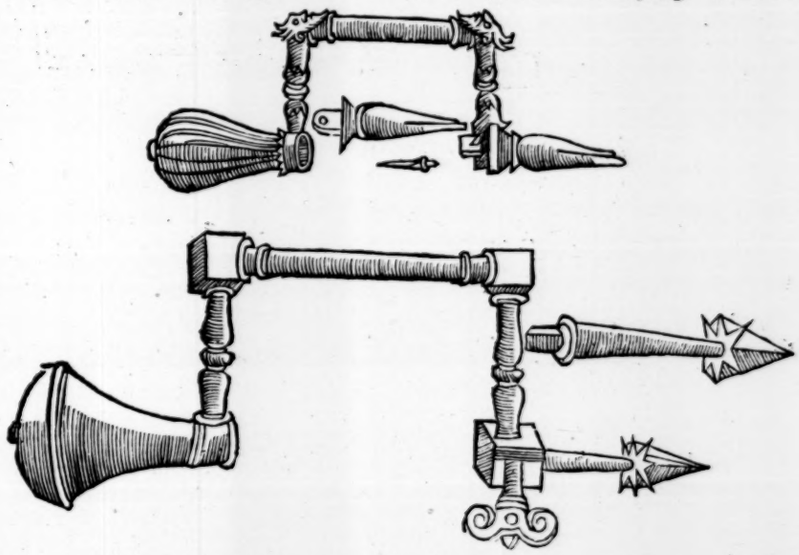
The cure of a rotten bone.

excrementitious, the author of the rottenneſs, as the alimentary: For thus it remains without bloud and nouriſhment, and conſequently life alſo; whence it muſt of neceſſity ſcale or fall off, being deſtitute of the glue or moiſture which joined it to the ſound parts in vicinity and communion of life, like as leaves which fall away from the trees, the humidity being exhauſted, by which, as by glue, they adhered to the boughs. For this purpoſe Catagmatick powders are prepared to amend the corruption which is onely ſuperficiary. ℞ *Pul. aloes, cretæ combuſtæ, pompholygos, an.* ʒ ij. *ireos flor. ariſtoloch. rot. myrrh. ceruſſæ, an.* ʒ j. *pul. oſteor. combuſt.* ʒ ß. *terantur ſubtiliſſ. fiat pulvis*; let it be applied either alone by it ſelf, or elſe with Honey and a little *Aqua vitæ*. Alſo the following Emplaſter being applied, ſtirs up Nature to the excluſion of the broken bones, and cleanſeth the ulcers from the more groſs and viſcid *ſanies*. ℞ *Cer. nov. reſ. pini, gum. ammon. & elemi, an.* ʒ vj. *tereb.* ℥ iij. *pul. maſtich. myrrh. an.* ℥ ß. *ariſtol. rot. ireos flor. aloes, opopan. euphorb. an.* ʒ j. *olei roſati quantum ſufficit, fiat emplaſt. ſecundum artem.* *Euphorbium*, according to *Dioſcorider*, takes off the ſcales of bones in one day. Hereto alſo conduceth *Emp. de betonica*. Or, ℞ *olei caryophyl.* ℥ ß. *camph.* ʒ ij. *miſceantur ſimul in mortario, & utere*. But if that part of the bone which is corrupt cannot thus be taken away, then muſt you uſe the ſcaling Trepans and Scrapers deſcribed formerly in wounds of the head; eſpecially if any more great or ſolid bone be foul. Furthermore the here-deſcribed Trepan will be good to perforate the rotten bone in many places where it is corrupted, until as it were a certain bloudy moiſture iſſue forth at the holes; for thus it more freely enjoys the air, and alſo the force of the medicins admitted by theſe holes work more powerfully.

A catagmatick Powder.

A deſquamatory or ſcaling Plaſter. *Dioſc. lib. 7. cap. 78.*

A Trepan with two triangular bits and a pin no hold them in the ſtock: as alſo another Trepan having four-ſquare and ſix-ſquare bits convenient to be uſed in the rottenneſs of greater bones.



But if the rottenneſs be more deep, and the bone more hard, either by Nature or Accident, as by the occaſion of the too long admiſſion of the air, then the rotten ſcales ſhall be cut off by the inſtruments deſcribed in wounds of the head, driving them into the bone with leaden mallets, leſt the part ſhould be too much offended or ſhaken with the blow. The ſcales and fragments ſhall be taken forth with mullets; the ſigns that all the rottenneſs is taken away, are the ſolidneſs of the bone thereunder, and the bloudy moiſture ſweating out thereat.

Signs that the rottenneſs is taken away.

CHAP. XXVII.

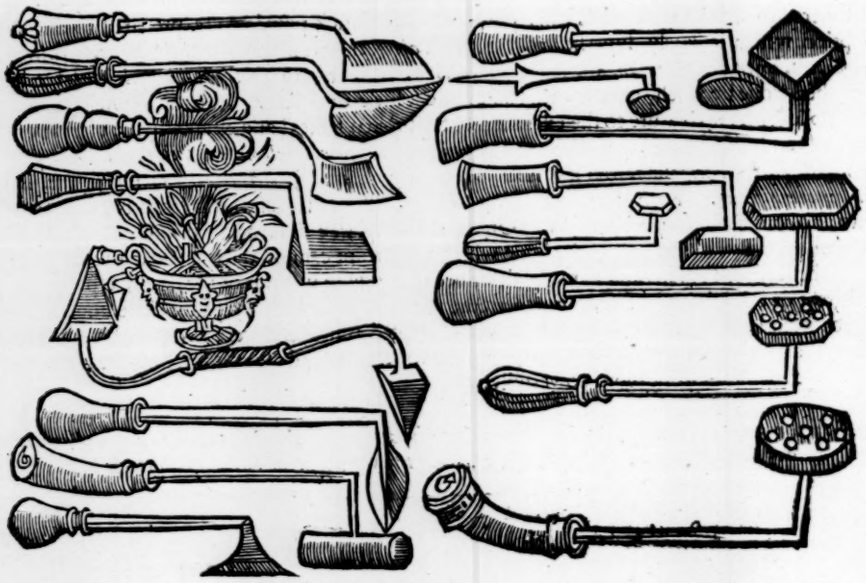
Of actual and potential Cauteries.

BUt if the deſcribed remedies cannot take place, by reaſon of the malignity or magnitude of the rottenneſs, then muſt we come to actual and potential Cauteries. But I ſhould rather approve of actual, becauſe by ſtrengthening the part they conſume the excrementitious humours wherewith it is overcharged, to wit, the matter of the *Caries*; which is not ſo effectually performed by potential cauteries. Yet are we oft-times forced to uſe theſe, to pleaſe the Patients which are terrified at, and afraid of hot irons. Potential Cauteries are *Aqua fortis, Aqua vitrioli*, ſcalding Oil, melted Sulphur and boiling, and the like; in pouring on of which I would have the Surgeon to be prudent and induſtrious, leſt he ſhould raſhly violate the neighbouring ſound parts by the burning touch of theſe things; which his temerity would cauſe vehement pains, inflammations, and other horrid ſymptoms. For actual Cauteries, their variety in figure is ſo great, that it cannot be defined, much leſs ſet down in writing; for they muſt be varied according to the largeneſs of the rottenneſs, and the figure and conformation of the fouled bones. Such as are more uſual I have thought good to delineate unto you, content onely to admoniſh you thus much, that ſome of theſe work by pricking, ſome by cutting, ſome flatwiſe, and other ſome with their points made to the form of an Olive-leaf.

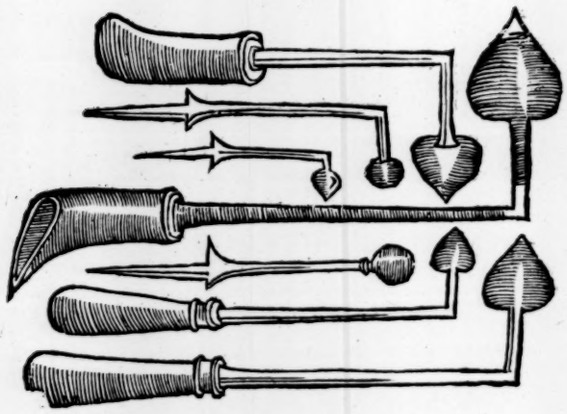
Actual Cauteries to be preferred before Potential.

Potential Cauteries.

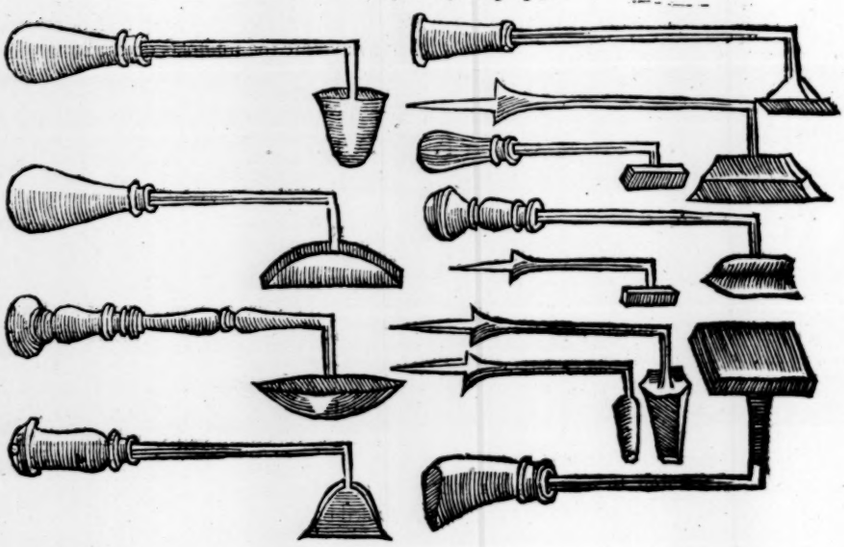
Sundry forms of actual Cauteries fit in all neceſſary caſes of all parts.



Other Cauteries.

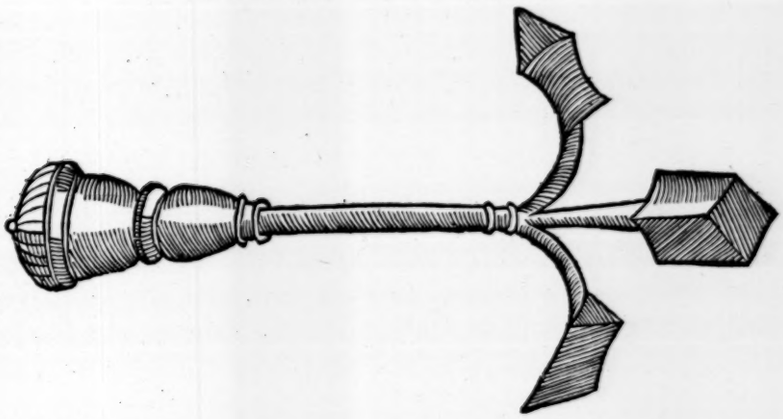


Other Cauteries for the ſame purpoſe.



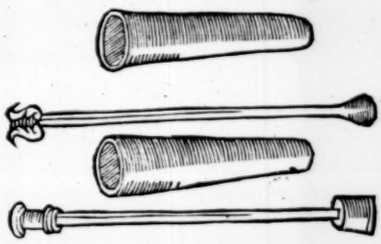
The following figure of a Cautery is fit for virulent knots that ariſe in the ſcull, when you deſire to take away the fleſh that covers the bone; for this purpoſe it is made hollow and ſharp in a triangular and quadrangular form, divided as it were into three branches, that you may ſo make uſe of which you pleaſe.

The Figure of an hollow and cutting Cautery.



The Cauteries whoſe forms are hereafter expreſt, take place in rotten bones that lie deep in, where in you cannot make uſe of the formerly deſcribed, without touching of the neighbouring ſound parts. To avoid which danger, you ſhall put your cautery even to the bone through an iron pipe, which may keep the neighbouring and fleſhy parts from burning.

Actual Cauteries with their Pipes.



Great diſcommodities enſue upon too raſh, that is, too frequently applied Cauteries, or too long adhering to the bone; for by this immoderate and fiery heat not onely the excrementitious humidity of the rotten bone is conſumed, but alſo the radical and ſubſtantial moiſture of the part is exhauſted, wherein alone Nature endeavouring to caſt off the corrupt ſcales, and ſever the ſound from the rotten bone, and to ſubſtitute fleſh, ſtands and conſiſts. Wherefore, the meaſure of applying of cauteries ought to be taken from the greatneſs of the rottenneſs, and the excrementitious, or after a manner, foming humidity ſweating through the pores of the bone. But before you preſs your cautery into the rotten bone which lies very deep in, as that which happens in the thigh-bone, and upon other very fleſhy parts, you muſt diligently defend the neighbouring ſound and fleſhy part, as it were with a covering, for that the humour diffuſed by the touch of the fire, burns the other places whereunto it diffuſeth it ſelf like ſcalding oil. After the cauterization, you muſt help forwards the falling away of the ſcales by ſometimes dropping in our Oil of Whelps, being made ſcalding hot. This Oil, though very fit for this purpoſe, yet do I not judge it fit to uſe it too often, it may ſuffice to have dropped it in ſome twice or thrice: for at length it may violate the ſound bone that lies under the rotten, by the oily, ſubtil and moiſt ſubſtance. Furthermore, a bone is the moſt dry part of the body, therefore unctuous and moiſt Medicins are contrary to its temper and conſiſtence. But it conduceth often and gently to move the ſcales already beginning to ſeparate themſelves, and it haſtens the ſlackneſs of Nature in caſting them off. Yet may you not uſe force, unleſs peradventure when as they hang by a ſlender thread; otherwiſe if the unwary Surgeon forcibly pluck away the ſcales before that Nature hath put a cover upon the ſound bone, he ſhall give way to a new alteration and foulneſs, by the appulſe of the air. Furthermore, after the corrupt ſcale is falling off, by the force of Nature expelling it, you muſt have a diligent heed that you put not eating or corroding Medicins upon the bone that is under it; for thus thou ſhalt conſume or waſte the fleſh which Nature hath generated thereupon, which compoſed of newly concreted bloud, is like in ſoftneſs to newly curdled milk, which otherwiſe in time would grow into a more ſolid and hard conſiſtence. This under-growing fleſh by little and little thruſts the rotten bone above it, out of its place, and is the cauſe of the ſcaling thereof; it is at the firſt gathered together like the grains of a pomgranate, with a red, ſmooth and equal *ſanies*, and not ſtinking, and at length it caſts forth a white matter. Therefore then we muſt rather ſtrew thereon Cephalick powder compoſed of ſuch things as have a faculty to dry without biting, ſuch as are Orris-root, waſhed Aloes, Maſtich, Myrrh, Barly-flower, and the like. Laſtly, it muſt be cicatrized, it is better that ſcales of bones fall away of themſelves, by the onely force of Nature, than to be plucked away by the force of Medicins or Inſtruments; becauſe ſuch as are too violently and forcibly plucked away, leave corners like to fiſtulous ulcers. Neither ought the corrupted membranes when they are turned into *pus*, to be plucked away too violently, or to be touched by too acrid Medicins; for pain hereupon ariſing, hath divers times cauſed inflammation, convulſion, and other pernicious ſymptoms. Therefore it is better to commit this buſineſs to Nature, which in ſucceſs of time, by making uſe of the expulſive faculty, will eaſily free it ſelf from this rotten ſubſtance; for that which is quick as far as it is able, will ſtill put away that which is dead from it.

Manner of applying of Cauteries.

Oil of Whelps helps forwards the caſting off of ſcales.

A caution in moving the ſcales of burnt bones.

Cephalick Powders of what compoſed.

CHAP. XXVIII.

Of a Vulnerary Potion.

The uſe of Vulnerary Potions.

But if the contumacious rottenneſs of the bone, and alſo a rebellious ulcer ſhall not yield to the deſcribed remedies, it will be convenient to preſcribe a Vulnerary Potion to the Patient. For Nature helped by ſuch a Potion, hath to my knowledge ſundry times done wondrous things in amendment of corrupt bones, and conſolidation of ulcers. For theſe potions, though they do not purge the noxious humours away by ſtool, yet are they wondrous effectual to cleanſe ulcers, and free them from the exceſs of excrementitious humours, to cleanſe the bloud, and purge it from all impurity, to agglutinate broken bones, and knit the ſinews. I have here thought good to ſpeak of them, and chiefly, for that they were much commended by the Ancients, but neglected by the modern Phyſicians and Surgeons. But if the cure of Wounds and old Ulcers be performed by deterſion, and the repoſition of the loſt ſubſtance, what Medicin can ſooner or rather do it than that, which by its admirable and almoſt divine force, ſo purgeth the bloud, that thereof, as from a fit and laudable matter, the fleſh or any other loſt ſubſtance may be fitly reſtored, and the part recover its former union? But if fiſtulous Ulcers, Cancers, Gouts, and the like diſeaſes be offended by the uſe of ſalt, ſpiced, acrid meats, and others which are of ſubtil parts, as Muſtard, Onions, and Garlick, or any other exceſs in meat or drink; why may they not become mild and gentle by medicated and contrary meats and drinks, or at leaſt be reduced to a more equal temper? Therefore that Surgeons may know of what things ſuch compoſitions may ariſe, I have here thought good to reckon them up, that you may learn what they are.

Scabious.	*Centaury.*	*Gentian.*
Sanicle.	*Adders-tongue.*	*Herniaria.*
Bugle.	*Betony.*	*Red Colewort, or Cabbage.*
Mouſ-ear.	*Carduus benedictus.*	*Scordium.*
Burnet.	*The Cordial Flowers.*	*Cats-mint.*
Madder.	*Ariſtolochia, or Birth-worts.*	*Cinque-foil.*
Tanſie.	*Speed-well.*	*River-Crabs.*
Tops of Hemp.	*Agrimony.*	*Mace.*
Tops of Brambles.	*The Capillaries.*	*Bole-armenick.*
Sow-bread.	*Herb-Robert.*	*Petum, or Tobacco.*
Comfrey the greater and leſſer.	*Doves-foot.*	*Mead-ſweet.*
Vervain.	*Dogs-tongue Avens.*	*Colts-foot.*
Biſtort.	*Prunella.*	*Dandelion.*
Mug-wort.	*Oſmund.*	*Plantain.*
Periwincle.	*Clary.*	*St. Johns-wort.*

Of all theſe the Surgeon ſhall make choice according to the mind and judgment of the Phyſician, ſuch as he ſhall think fit and proper to every Ulcer or Wound, or to each wounded and ulcerated part, according to the condition of the time, the temper of the Patient, and kind or nature of the diſeaſe. You may make drinks not onely of the decoctions of theſe, but alſo of their juices in white Wine, or *ænomel*, which are good not onely to purifie the maſs of the bloud, to cleanſe ſanious, virulent, filthy, and dyſenterious ulcers, but alſo to drive away putrefaction, ſcale-bones, diſſolve clotted bloud in bruiſes, to draw, pluck out and exterminate all ſtrange bodies, as I have often obſerved to my great admiration. They are compoſed uſually after this manner. ℞ *Savie. bugul. ſcabioſ. beton. ſcord. nepet. an.* m. ſ. *uvar. mund. ſem. hyper. & card. ben. an.* ℥ j. *trium flor. cord. an.* p. ij. *coquantur complete in aqu. communi; poſtea in fine adde vini alb. mel. roſ. & cinnam. quod ſufficit, fiat decoctio, coletur per manicam.* Let him drink ℥ iij. in the morning three hours before dinner. You may alſo with good ſucceſs make injections with the ſame liquor into fiſtulous and ſinuous ulcers, as alſo to waſh the ſordid ulcers therewith. You may alſo boil the ſame Simples, as herbs, flowers, and ſeeds, in the Patients broths, that ſo they may acquire a medicinable and nouriſhing faculty. For the time of the affect, wherein you may with good ſucceſs make uſe of theſe, we have read in *Guido*, that he uſed not to preſcribe theſe potions to his Patients when as they were newly wounded, for that they commonly are compoſed of things hot and opening, which heat and attenuate the bloud, whence there would be danger of a defluxion upon the affected part. Wherefore when the matter is come to ſuppuration, when as there is nothing remains, but to cleanſe the ulcer, and fill it with fleſh, no inflammation as now remaining in the part, I judge theſe potions may then be uſed with good ſucceſs.

The form of a Vulnerary Potion.

In what time of the diſeaſe they are chiefly to be uſed.

CHAP. XXIX.

Of Tetters, Ring-worms, or Chops occaſioned by the Lues Venerea.

Upon the cure of the *Lues Venerea*, uſually Tetters and Chops happen thereupon, which makes furrows in the palms of the hands and ſoals of the feet. They acquire their matter from ſalt phlegm, or aduſt choler, or the reliques of the venereous virulency ſent thither. The cure, eſpecially when as the diſeaſe is grown old, is difficult; by reaſon that the humour hath long accuſtomed to flow that way, and for that it hath corrupted the habit of the part by the continual

nual defluxion; but the cure is more eaſie, if the diſeaſe be newly bred. Now you may know it is newly bred by the redneſs, accompanied by a great itching, and not onely a drineſs of the skin, but alſo a thickneſs and denſneſs thereof. That which is old, beſides theſe fore-recited ſigns, hath ſcaly and bran-like hardneſſes conjoined therewith, which by ſcratching and rubbing caſteth off ſcales. For general Medicins, the diſtemper of the Liver, and habit of the Body muſt be corrected, which by the occaſion of the former diſeaſe and remedies, apt to inflame the bloud, cannot but much ſwerve from their native temper. This may be done by diet conveniently appointed, by purging and altering Medicins, bleeding, Bathing, applying of Cupping-glaſſes and horns. For topick, or particular Medicins, waſh ſuch as are newly or lately bred with the following water which dries, and is of ſubtil parts. ℞ *Aq. roſ. & pariet. an.* ʒ j. *aq. alum.* ʒ ij. *calc.* ʒ ij. *alum.* ʒ iij. *pul. ſubl.* ℈ iv. *fiat lenis, & minim. ebul. in baln. mar.* This water ſhall be made more or leſs forcible, according to the condition of the diſeaſe. Or, ℞ *Ol. tart.* ʒ ij. *ſep. com.* ʒ iv. *miſc. fiat unguent. ad uſum.* If the Phyſician ſhall thing good, let the Patient uſe a decoction of *Guaiacum*, but that very weak. But old Tetters and Chops muſt be ſoftned with emollient, attenuating, and inciding decoctions, as alſo with Liniments, Ointments, and Plaſters having the ſame effect. Then let the reſidue of the cure be performed by Fumigations, ſuch as this which follows: ℞ *Pul. cinab.* ʒ ij. *lad. aſſ. odor. ſtyrac. cal. an.* ʒ ß. *olib. maſtic. an.* ʒ iij. *olei tart. & theriac. q. ſ. fiant trochiſci*; uſe at each time ſome ʒ ſ. of them, and let onely the affected parts receive the ſmoak. Some commend the rubbing of the hands with the following Medicin. Take the aſhes of Wine-lees, make thereof a lee, and ſtrain it through an hypocras-bag, then put thereto ſome rennet; let them be well mixed together in a mortar, and herewith let the hands be rubbed or waſhed. Or, ℞ *unguent. enul.* ʒ iij. *fugit.* ʒ ij. Or elſe, ℞ *Reſ. pini.* ʒ j. *ceruſ. an.* ʒ ſ. *argent. viv.* ʒ iij. *ſucci citri & lapath. acut. an.* ʒ . Let them be incorporated, and make a Liniment to be uſed to the part. If to this you add *ſublimate* ſo waſhed and prepared, as women uſe for their Faces, you ſhall make it more effectual. Others take burnt alum made into Powder, and incorporated with the yolk of an Egg, the juice of Citrons, and a little Aloes diſſolved in *Oxymel ſciliticum.*

CHAP. XXX.

Of curing the Lues Venerea *in Infants, and little children.*

INfants oft-times conceive the ſeeds of this diſeaſe in the wombs of their mothers, and are born infected therewithall, puſtles preſently ariſing over all the bodies, infecting with the like diſeaſe as many Nurſes as give them ſuck; they ſcarce ever recover thereof, for that they contracted the diſeaſe from their firſt conformation. But ſuch as are ſomewhat bigger, if they chance to catch the diſeaſe after they are born, by ſucking ſome infected Nurſe, or by any other occaſion or kind of contagion, oftentimes receive cure. For firſt, you ſhall cauſe the Nurſe to uſe the *Aqua theriacalis* here-under deſcribed, for the ſpace of twenty or more days, that ſo ſhe may the better arm her ſelf againſt the contagion of this diſeaſe, and yield Milk which may have the faculty of meat and medicin; ſhe ſhall be careful, as often as ſhe gives the child ſuck, to waſh and dry her teat or pap, leſt the virulency that the child breaths out at his mouth, be impact in the little holes of the teat through which the milk flows out. Now the puſtles of little children ſhall be anointed with ſome ointment that receives *Argentum vivum* in ſome ſmall quantity, as *Ungiuentum enulatum cum mercurio*, or the like. Then ſhall it be ſwathed or bound up in ſwaths and cloths aired with the formerly deſcribed Fumigations. For the reſt, it ſhall be kept as warm as you can in ſome warm place. Theſe and the like muſt be done, not in one continued courſe, but at ſeveral ſeaſons, otherwiſe it is to be feared that it would cauſe ulcers to ariſe in the mouth, or elſe ſalivation. If any Ulcers ariſe in the mouth, and ſpread therein, they ſhall be touched with the formerly deſcribed waters, but made ſomewhat weaker, having regard to the tender age of the Patient; if the Infant ſhall get this diſeaſe of its Nurſe, let the Nurſe be preſently changed, for it being otherwiſe nouriſhed with tainted and virulent bloud, can never be healed. Many have by theſe means recovered; but ſuch as have periſhed, have not periſhed by the default of Medicins, but by the malignity and vehemency of the diſeaſe.

The Cure.

A deſcription of the Aqua Theriacalis, *or Treacle-water formerly mentioned.*

℞ *Raſor. interior. ligni ſancti gummoſi*, ℔ ij. *polypod. querni*, ʒ iv. *vini albi dulcedinis expertis* ℔ ij. *aqua fontan. puriſſ.* ℔ viij. *aquar. cichor. & fumar. an.* ʒ iv. *ſem. junip. heder. & baccar. lauri an.* ʒ ij. *caryophil. & macis, an.* ʒ . *cort. citri ſaccaro condit. conſ. roſ. anthos. cichor. bugloſ. borag. an.* ʒ ſ. *conſ. ænulæ camp. theriac. vet. & mithrid. an.* ʒ ij. diſtil them all in *Balneo Mariæ*, after the following manner. Let the *Guaiacum* be infuſed in equal parts of Wine, and the fore-mentioned waters for the ſpace of twelve hours, and the reſidue of the things in that which remains, of the ſame Wine and Waters for ſix hours ſpace, beating ſuch things as may require it, then let them be mixed together. that ſo the liquor may be endued with all their faculties. Which, that it may be the more effectually performed, let them be boiled, put up in glaſs bottles cloſely ſtopped for ſome three or four hours ſpace, in a large Kettle filled with boiling water; then let them be put into a Glaſs Alembick, and ſo diſtilled. Give ʒ iv. of this diſtilled liquor at once, being aromatized with ʒ j. of Cinamon, and ʒ j. of *Diamargariton*, and ʒ ß of Sugar, to give it a pleaſing taſte. Such a drink doth not onely retund the virulency of the *Lues Venerea*, but ſtrengthens the noble parts. *Rondeletius* makes an *Aqua Theriacalis* after this manner: ℞ *Theriac. vet.* ℔ j. *acetoſ.* m. iij. *rad. gram.* ℥ iij. *puleg. card. ben. an.* m. ij. *flor. chamæm.* p. ij. *temperentur omnia in vino albo, & diſtillantur in vaſe vitreo:* reſerve the water for uſe; where-

The manner making it.

Rondeletius his Treacle-water.

whereof let the Patient take ʒ ij. with ʒ iij. of Sorrel and Bugloſs water: he wiſheth this to be done when he ſhall enter into bed or a ſtove, for ſo this diſtilled liquor will cauſe ſweat more eaſily, and mitigate pain, whether given by it ſelf, or with a decoction of grommel, or of *China*, or Burdock-roots; yet if the Patient be of a phlegmatick conſtitution, he ſhall uſe a decoction of *Guaiacum* in ſtead of a decoction of *China*, for it penetrates more ſpeedily, by reaſon of its ſubtilty of parts, and alſo expels the dolorifick matter.

The End of the Nineteenth Book.

BOOK XX.

Of the SMALL POX and MEAZLES:

As alſo of WORMS, *and the* LEPROSIE.

CHAP. I.

Of the cauſes of the Small Pox and Meazles.

FOr that the Small Pox and Meazles are diſeaſes which uſually are fore-runners and fore-tellers of the Plague, not onely by the corruption of humours, but oft-times by default of the air. Moreover, for that Worms are oft-times generated in the Plague, I have thought good to write of theſe things, to the end, that by this Treatiſe the young Surgeon may be more amply and perfectly inſtructed in that peſtilent diſeaſe. Alſo I have thought good to treat of the Leproſie, as being the off-ſpring of the higheſt corruption of humours in the body. Now the ſmall Pox are puſtiles, and the Meazles ſpots which ariſe in the top of the skin by reaſon of the impurity of the corrupt bloud ſent thither by the force of Nature. Moſt of the Ancients have delivered that this impurity is the reliques of the menſtruous bloud remaining in the body of the Infant, being of that matter from whence it drew nouriſhment in the womb, which lying ſtill or quiet for ſome ſpace of time, but ſtirred up at the firſt opportunity of a hotter Summer, or a ſoutherly or rainy ſeaſon, or a hidden malignity in the air, and boiling up, or working with the whole maſs of the bloud, ſpread or ſhew themſelves upon the whole ſurface of the body. An argument hereof is, there are few or none who have not been troubled with this diſeaſe, at leaſt once in their lives, which when it begins to ſhew it ſelf, not content to ſet upon ſome one, it commonly ſeizeth upon more: now commonly there is as much difference between the ſmall Pox and Meazles, as there is between a Carbuncle and a peſtilent Bubo: for the Small Pox ariſes of a more groſs and viſcous matter; to wit of a Phlegmatick humour: but the Meazles of a more ſubtil and hot; that is, a cholerick matter, therefore this yields no marks, but certain ſmall ſpots without any tumour, and theſe either red, purple, or black. But the Small Pox are extuberating puſtles, white in the midſt, but red in the circumference, an argument of bloud mixed with choler, yet they are ſcarce known at the beginning, that is, on the firſt or ſecond day they appear; but on the third and fourth day they bunch out and riſe up into a tumour, becoming white before they turn into a ſcab; but the Meazles remain ſtill the ſame. Furthermore, the ſmall Pox prick like needles by reaſon of a certain acrimony, and cauſe an itching; the Meazles do neither, either becauſe the matter is not ſo acrid and biting, or elſe for that it is more ſubtil, it eaſily exhales, neither is it kept ſhut up under the skin. The Patients often ſneeze when as theſe matters ſeek paſſage out, by reaſon of the putrid vapours aſcending from the lower parts upwards to the brain. They are held with a continual Fever, with pains in their backs, itching of their noſe, head-ach, and a vertiginous heavineſs, and with a kind of ſwounding or fainting, a nauſeous diſpoſition, and vomiting, a hoarſneſs, difficult and frequent breathing, an inclination to ſleep, a heavineſs of all the members, their eyes are fiery and ſwollen, their urin red and troubled. For Prognotticks we may truly ſay thus much, That the matter whence this affect takes its original, partakes of ſo malign, peſtilent and contagious a quality, that not content to mangle and ſpoil the fleſhy part, it alſo eats and corrupts the bones like the *Lues Venerea*, as I obſerved not onely in *Anno Dom.* 1568. but alſo in divers other years, whereof I think it not amiſs to ſet down this notable example.

What the Small Pox and Meazles are. Their matter.

Why the Meazles do not itch.

An Hiſtory.

The daughter of *Claude Pique* a Book-ſeller, dwelling in St. *James* his ſtreet in *Paris*, being ſome four or five years old, having been ſick of the Small Pox for the ſpace of a Moneth, and Nature could not overcome the malignity of the diſeaſe, there roſe abſceſſes upon the *ſternon*, and the joints of the ſhoulders, whoſe eating and virulent matter, corroded the bones of the *ſternon*, and divided them in ſunder; alſo it conſumed a great part of the top of the ſhoulder-bone, and the head of the blade-bone: of this thing I had witneſſes with me, *Marcus Myron* Phyſician of *Paris*, and at this preſent the Kings chief Phyſician, *John Doreau* Surgeon to the *Conte de Bryane*, the body being diſſected in their preſence. Alſo you may obſerve in many killed by the malignity of this diſeaſe and diſſected, that it cauſeth ſuch impreſſion of corruption in the principal parts, as brings the Dropſie, Ptiſick, Hoarſneſs, Aſthma, Bloudy-flux ulcerating the Guts, and at length bringeth death, as the puſtles have raged or reigned over theſe or thoſe entrails, as you ſee them do over the ſurface of the body; for they do not onely moleſt the external parts, by leaving the impreſſions and ſcars of the puſtles and ulcers, rooting

What grievous and pernicious ſymtoms may happen by the Small Pox.

rooting themſelves deep in the fleſh, but alſo oft-times then take away the faculty of motion, eating aſunder, and weakning the joints of the Elbow, Wriſt, Knee, and Ankle. Moreover ſundry have been deprived of their ſight by them, as the Lord *Guymenay*, others have loſt their hearing, and otherſome the ſmelling, a fleſhy excreſcence growing in the paſſages of the noſe and ears. But if any relique of the diſeaſe remain, and that the whole matter thereof be expelled by the ſtrength of Nature, then ſymptoms afterwards ariſe, which ſavour of the malignity of the humour, yea and equal the harm of the ſymptoms of the *Lues Venerea*.

CHAP. II.

Of the Cure of the Small Pox and Meazles.

The Cure.

THe Cure of this Diſeaſe uſeth to be diverſe, according to the condition of the humour free from, or partaker of the venenate quality: For if it partake of malignity, and the child be a ſucking child, ſuch things ſhall be given to the Nurſe as may infringe and overcome the ſtrength of the malignity, as we ſhall ſhew more at large when we come to treat of the Cure of children which are ſick of the Plague; howſoever it be, the child muſt be kept in a warm room free from wind, and muſt be wrapped and covered with ſcarlet cloths, until the Pox come forth. There ſhall be provided for the Nurſe medicated Broths, with Purſlain, Lettuce, Sorrel Succory, Borage, and French-Barley bound up in a cloth. She ſhall ſhun all ſalt, ſpiced and baked Meats, and in ſtead of Wine, drink a decoction of Licorice, Raiſins, and Sorrel-roots. She ſhall alſo take purging Medicins, as if ſhe were ſick of the ſame diſeaſe, that ſo her milk may become medicinable. Laſtly, She ſhall obſerve the ſame diet as is uſually preſcribed to ſuch as have the Plague. You ſhall give the child no Pap, or if you give it any, let it be very little. But if the child be weaned, let him abſtain from fleſh until the Fever have left him, and the Pox be fully come forth: in ſtead of fleſh let him feed on Barley and Almond Creams, Chicken Broths, wherein the fore-named Herbs have been boiled, Panadoes, Gellies, Cullaſſes, Prunes, and Raiſins. Let his drink be a Ptiſan made of French-Barley, Graſs and Sorrel-roots or with a Nodula containing the four Cold Seeds, the pulp of Prunes and Raiſins, with the ſhavings of Ivory and Harts-horn; between meals the ſame decoction may be mixed with ſome Syrup of Violets, but not of Roſes or any other aſtringent Syrup, leſt we hinder the courſe and inclination of the humour outwards. Let his ſleep be moderate, for too ſound ſleep draws back the matter to the center, and increaſeth the Fever; you muſt neither purge, nor draw bloud, the diſeaſe increaſing or being at the height, unleſs peradventure there be a great plenitude, or elſe the diſeaſe complicate with other, as with a Pleuriſie, inflammation of the eyes, or a ſquinancy which require it, leſt the motion of Nature ſhould be diſturbed; but you ſhall think it ſufficient to looſe the belly with a gentle Clyſter: but when the height of the diſeaſe is over, and in the declenſion thereof, you may with *Caſſia* or ſome ſtronger Medicin evacuate part of the humours, and the reliques of the diſeaſe. But in the ſtate and increaſe, it is better to uſe Sudoriſicks, which by attenuating the humours and relaxing the pores of the skin may drive the cauſe of the diſeaſe from the center to the circumference, which otherwiſe reſiding in the body might be a cauſe of death; as I and *Richard Hubert* obſerved in two Maids, whereof one was four, and the other ſeventeen years old; for we diſſecting them both being dead, found their entrails covered with ſcabby or cruſted puſtles, like thoſe that break forth upon the skin. We muſt not think that a bleeding at noſe at the beginning of the diſeaſe, or in the firſt four or five days, ſhould carry away the matter and original of the diſeaſe, for nevertheleſs the Pox will come forth; but for that this is a true and natural *Criſis* of this diſeaſe, as that which is carried to the ſurface and circumference of the body, ſuch bleeding muſt not be ſtopped, unleſs you fear it will cauſe ſwounding. The matter ſhall be drawn forth with a decoction of Figs, husked Lentils, Citron-ſeeds, the Seeds of Fennel, Parſly, Smallage, roots of Graſs, Raiſins, and Dates. For ſuch a decoction, certainly if it have power to cauſe Sweat, hath alſo a faculty to ſend forth unto the skin the morbifick humour; the Seeds of Fennel, and the like opening things relax and open the pores of the skin; Figs leniſie the acrimony of the matter, and gently cleanſe, the Lentils keep the jaws and throat, and all the inward parts from puſtles, and hinder a flux by reaſon of their moderate aſtriction, but having their husks on, they would bind more then is required in the diſeaſe; Dates are thought to comfort the ſtomach, and Citron Seeds to defend the heart from malignity; Licorice to ſmooth the throat, and hinder hoarſneſs and cauſe Sweat. But theſe things ſhall be given long after meat, for it is not fit to ſweat patiently after meat; ſome there be who would have the child wrapped in linnen cloths ſteeped in this decoction being hot, and afterwards hard wrung forth. Yet I had rather to uſe bladders or ſponges, or hot bricks for the ſame purpoſe; certainly a decoction of Millet, Figs and Raiſins, with ſome Sugar, cauſeth Sweat powerfully. Neither is it amiſs whileſt the Patient is covered in all other parts of the body, and ſweats, to fan his face, for thus the native heat is kept in, and ſo ſtrengthened, and fainting hindered, and a greater excretion of excrementitious humours cauſed. To which purpoſe you may alſo put now and then to the Patients noſe a *Nodulus* made with a little Vinegar and Water of Roſes, Camphire, the Powder of Sanders, and other odoriferous things which have a cooling faculty; this alſo will keep the noſe from puſtles.

The Child muſt have no Pap.

How ſound ſleep doth harm in this diſeaſe.

Of purging, bleeding, and ſudoriſicks.

An Hiſtory.

A ſudorifick decoction.

When it is beſt to procure Sweat.

CHAP.

CHAP. III.

What parts muſt be armed againſt, and preſerved from the Pox.

How to defend the Eyes.

THe eyes, noſe, throat, lungs, and inward parts ought to be kept freer from the eruption of puſtles than the other parts, for that their nature and conſiſtence is more obnoxious to the malignity of this virulency, and they are eaſilier corrupted and blemiſhed. Therefore leſt the eyes ſhould be hurt, you muſt defend them when you firſt begin to ſuſpect the diſeaſe, with the eye-lids, alſo moiſtning them with Roſe-water, Verjuice or Vinegar, and a little Camphire. There are ſome alſo who for this purpoſe make a decoction of Sumach, Berbery-ſeeds, Pomgranat-pills. Aloes, and a little Saffron, the juice of ſower Pomgranats, and the water of the Whites of Eggs dropped in with Roſe-water are good for the ſame purpoſe, alſo Womens milk mixed with Roſe-water and often renewed, and laſtly all ſuch things as have a repercuſſive quality. Yet if the eyes be much ſwollen and red, you ſhall not uſe repercuſſives alone, but mix therewith diſcuſſers and cleanſers, ſuch as are fit by a familiarity of Nature to ſtrengthen the ſight; and let theſe be tempered with ſome Fennel or Eye-bright water. Then the Patient ſhall not look upon the light, or red things, for fear of pain and inflammation; wherefore in the ſtate of the diſeaſe, when the pain and inflammation of the eyes are at their height, gently drying and diſcuſſive things properly conducing to the eyes, are moſt convenient, as waſhed Aloes, Tutty, and Antimony, in the Water of Fennel, Eye-bright, and Roſes.

When the Eyes muſt not be defended by repercuſſives onely.

How to defend the Noſe.

The formerly mentioned *Nodulus* will preſerve the noſe, and linnen cloths dipped in the fore-ſaid aſtringent decoction, put in the noſtrils, and outwardly applied.

How the Mouth.

We ſhall defend the jaws, throat, and throtle, and preſerve the integrity of the voice by a gargle of oxycrate, or the juice of ſower Pomgranats, holding alſo the grains of them in their mouths, and often rouling them up and down therein,

How the Lungs.

as alſo by Nodulaes of the ſeeds of *Pſilum*, Quinces, and the like cold and aſtringent things. We muſt provide for the lungs and reſpiration by ſyrups of Jujubes, Violets, Roſes, white Poppies, Pomgranats, Water-Lillies, and the like. Now when as the Pox are throughly come forth, then may you permit the Patient to uſe ſomewhat a freer diet, and you muſt wholly buſie your ſelf in ripening and evacuating the matter, drying and ſcaling them. But for the Meazles, they are cured by reſolution onely, and not by ſuppuration; the Pox may be ripened by anointing them with freſh butter, by fomenting them with a decoction of the Roots of Mallows, Lillies, Figs, Line-ſeeds, and the like.

How to prevent Pock-arrs

After they are ripe, they ſhall have their heads clipped off with a pair of Sciſſers, or elſe be opened with a golden or ſilver needle, leſt the matter contained in them ſhould corrode the fleſh that lies thereunder, and after the cure, leave the prints or pock-holes behind it, which would cauſe ſome deformity; the *pus* or matter being evacuated, they ſhall be dried up with *unguent. roſat.* adding thereto Ceruſs, Litharge, Aloes, and a little Saffron in Powder; for theſe have not onely a faculty to dry, but alſo to regenerate fleſh; for the ſame purpoſe the flower of Barley and Lupines are diſſolved and mixed with Roſe-water, and the affected parts anointed therewith with a fine linnen rag; ſome anoint them with the ſward of Bacon boiled in Water and Wine, then preſently ſtrew upon them the flower of Barly or Lupines, or both of them. Others mix crude Hony newly taken from the Comb, with Barly-flower, and therewithal anoint the puſtles ſo to dry them; being dried up like a ſcurf or ſcab, they anoint them with Oil of Roſes, Violets, Almonds, or elſe with ſome Cream, that they may the ſooner fall away, the puſtles being broken; tedious itching ſolicits the Patient to

Remedies for excoriation.

ſcratch, whence happens excoriation and filthy ulcers, for ſcratching is the occaſion of greater attraction. Wherefore you ſhall bind the ſick childs hands, and foment the itching parts with a decoction of Marſh-mallows, Barly and Lupines, with the addition of ſome ſalt. But if it be already excoriated, then ſhall you heal it with *unguentum album camphorat.* adding thereto a little Powder of Aloes or *Cinnabaris*, or a little *deſiccativum rubrum.* But if notwithſtanding all your application of repelling medicins, puſtles nevertheleſs break forth at the Eyes, then muſt they be diligently cured with all manner of *Collyria*, having a care that the inflammation of that part grow not to that bigneſs as to break the Eyes, and that which ſometimes happens to drive them forth of their proper orbs. If any cruſty ulcers ariſe in the noſtrils, they may be dried and cauſed to fall away by putting up of Ointments. Such as ariſe in the Mouth, Palate, and throat, with hoarſneſs and difficulty of ſwallowing, may be helped by Gargariſms made with Barly-water, the Waters of Plantain and Chervil, with ſome ſyrup of Roſes, or *Diamoron* diſſolved therein; the Patient ſhall hold in his mouth Su-

For the ulcers of the mouth and jaws.

gar of Roſes, or the Tablets of *Elect. diatragacanth. frigid.* The Pock-arrs left in the Face, if they bunch out undecently, ſhall be clipped away with a pair of Sciſſers, and then anointed with freſh *Unguent. citrin.* or elſe with this liniment. ℞ *Amyli triticei & amygdalar. excorticatarum an.* ʒ j ß. *gum. tragacanth.* ʒ ½. *ſeminis melonum, fabarum ſiccarum excorticat. farinæ hordei, an.* ʒ iv. Let them

To help the unſightly ſcars of the Face.

all be made into fine Powder, and then incorporated with Roſe-water, and ſo make a Liniment, wherewith anoint the face with a feather; let it be wiped away in the morning, waſhing the face with ſome water and wheat-bran; hereto alſo conduceth *lac virginale*; Gooſe, Ducks, and Capons greaſe are good to ſmooth the roughneſs of the skin, as alſo of Oil of Lillies; Hares bloud of one newly killed and hot, is good to fill and plain, as alſo whiten the Pock-holes, if they be often rubbed therewith. In ſtead hereof many uſe the ſward of Bacon rubbed warm thereon; alſo the diſtilled Waters of Bean-flowers, Lilly-roots, Red-roots, Egg-ſhells, and Oil of Eggs are thought very prevalent to waſte and ſmooth the Pock-arrs.

A Diſcourſe of certain monſtrous Creatures which breed againſt Nature in the bodies of Men, Women, and little Children, which may ſerve as an Induction to the enſuing Diſcourſe of WORMS.

AS in the *Macrocoſmos* or bigger World, ſo in the *Microcoſmos* or leſſer World there are Winds, Thunders, Earthquakes, Showrs, Inundations of Waters, Sterilities, Fertilities, Stones, Mountains, and ſundry ſorts of Fruits and Creatures thence ariſe. For who can deny but that there is Wind contained and ſhut up in flatulent abſceſſes, and in the guts of thoſe that are troubled with the Colick? Flatulencies make ſo great a noiſe in divers womens bellies, if ſo be you ſtand near them, that you would think you heard a great number of Frogs croaking in the night time. That Water is contained in watery abſceſſes, and the belly of ſuch as have the dropſie, is manifeſted by that cure which is performed by the letting forth of the water. In fits of Agues the whole body is no otherwiſe ſhaken and trembles, than the Earth when it is heard to bellow, and felt to ſhake under our feet. He which ſhall ſee the Stones which are taken out of the bladder, and come from the kidnies and divers other parts of the body, cannot deny but that Stones are generated in our bodies. Furthermore we ſee both Men and Women, who in their Face or ſome other parts ſhew the impreſſion or imprinted figure of a Cherry, Plumb, Service, Fig, Mulberry, and the like Fruit; the cauſe hereof is thought to be the power of the Imagination concurring with the formative faculty, and the tenderneſs of the yielding and wax-like *Embryon*, eaſie to be brought into any form or figure, by reaſon of the proper and native humidity. For you ſhall find that all their Mothers whileſt they went with them have earneſtly deſired or longed for ſuch things, which, whileſt they have too earneſtly agitated in their minds, they have transferred the ſhape unto the child, whileſt that they could not enjoy the things themſelves. Now who can deny but that the Bunches of the Back and large Wens reſemble Mountains? Who can gain-ſay, but that the ſqualid Sterility may be aſſimilate to the hectick drineſs of waſted and conſumed perſons? and Fertility deciphered by the body diſtended with much fleſh and fat, ſo that the legs can ſcarce ſtand under the burden of the belly? But that divers Creatures are generated in one Creature, that is in Man, and that in ſundry parts of him, the following Hiſtories ſhall make it evident.

A compariſon between the bigger and leſſer World.

The anergation of wind in mans body.

Of Water.

Of Stones.

Of fruits from the firſt conformation.

Hollerius tells that a certain *Italian* by frequent ſmelling to the Herb Baſil, had a Scorpion bred in his Brain, which cauſed long and vehement pain, and at length death; therefore I have here expreſt the figure of that Scorpion, found when as his Brain was opened. *Lib. de morb. inter. cap. 1.*

The Figure of a Scorpion.

It makes *Hollerius* conjecture of the cauſe and original of this Scorpion probable, for that *Chryſippus*, *Diophanes*, and *Pliny* write, that of Baſil beaten between two ſtones, and laid in the Sun, there will come Scorpions.

Fernelius writes that in a certain Souldier who was flat noſed, upon the too long reſtraint or ſtoppage of a certain filthy matter that flowed out of the noſe, that there were generated two hairy worms of the bigneſs of ones finger, which at length made him mad; he had no manifeſt Fever, and he died about the twentieth day. This was their ſhape, by as much as we can gather by *Fernelius* his words. *Lib. 5. de part. morbic. cap. 7.*

The Effigies of Worms mentioned by Fernelius.

The ſhape of a Millepes caſt forth by Urin.

Lues Duret, a man of great learning and credit, told me that he had come forth with his Urin, after a long and difficult diſeaſe, a quick Creature, of colour red, but otherwiſe in ſhape like a Millepes, that is, a Cheſlop, or Hog-louſe. An Hiſtory.

Count *Charles* of *Mansfieldt* laſt Summer troubled with a grievous and continual Fever, in the Duke of *Guiſes* place caſt forth a filthy matter at his Yard, in the ſhape of a live thing almoſt juſt in this form. An Hiſtory.

The

The ſhape of a thing caſt forth by Urin.

Nicolaus Flor. God. lib. 7 c. 18.

Monſtrous Creatures alſo of ſundry forms are alſo generated in the wombs of women; ſomewhiles alone, otherwhiles with a *Mola*, and ſometimes with a Child naturally and well made; as Frogs, Toads, Serpents, Lizzards: which therefore the Ancients have termed the Lombards brethren, for that it was uſual with their Women, that together with their natural and perfect iſſue, they brought into the World Worms, Serpents, and monſtrous Creatures of that kind generated in their wombs, for that they always more reſpected the decking of their bodies than they did their diet. For it happened whileſt they fed on Fruits, Weeds and Traſh, and ſuch things as were of ill juice, they generated a putrid matter, or certainly very ſubject to putrefaction and corruption, and conſequently opportune to generate ſuch unperfect creatures. *Jouhartas* telleth that there were two *Italian* women that in one moneth brought forth each of them a monſtrous birth; the one that married a Tailor, brought forth a thing ſo little, that it reſembled a Rat without a tail; but the other a Gentlewoman, brought forth a larger, for it was of the bigneſs of a Cat; both of them were black, and as ſoon as they came out of the Womb, they ran up high on the wall, and held faſt thereon with their nails. *Lycoſthenes* writes that in *Anno Dom.* 1494. a woman in *Cracovia*, in the ſtreet which taketh name from the Holy Ghoſt, was delivered of a dead child who had a Serpent faſtned upon his back, which fed upon this dead child, as you may perceive by this following Figure.

Lib. error. popul.

The Figure of a Serpent faſtned to a Child.

Lib. de occult. nat. mir. cap. 8.

Levinus Lemnius tells a very ſtrange Hiſtory to this purpoſe. Some few years agone (ſaith he) a certain woman of the Iſle in *Flanders*, which being with child by a Sailor, her belly ſwelled up ſo ſpeedily, that it ſeemed ſhe would not be able to carry her burden to the term preſcribed by Nature; her nineth moneth being ended, ſhe calls a Midwife, and preſently after ſtrong throws and pains, ſhe firſt brought forth a deformed lump of fleſh, having as it were two handles on the ſides, ſtretched forth to the length and manner of arms, and it moved and panted with a certain vital motion, after the manner of Sponges and Sea-nettles; but afterwards there came forth of her womb a monſter with a crooked noſe, a long and round neck, terrible eyes, a ſharp tail, and wonderful quick of the feet: it was ſhaped much after this manner.

The ſhape of a Monſter that came forth of a Womans Womb.

As ſoon as it came into the light, it filled the whole room with a noiſe and hiſſing, running to every ſide to find out a lurking hole wherein to hide its head, but the Women which were preſent, with a joint conſent fell upon it, and ſmothered it with cuſhions, at length the poor woman wearied with long travel, was delivered of a Boy, but ſo evilly entreated and handled by this Monſter, that it died as ſoon as it was chriſtened.

Corne-

Cornelius Gemma, a Phyſician of *Lovain*, telleth that there were many very monſtrous and ſtrange things caſt caſt forth, both upwards and downwards out of the belly of a certain Maid of *Lovain*, of the age of fifteen years. Amongſt the reſt, ſhe caſt forth at her fundament, together with her excrements, a living creature ſome foot and half long, thicker then ones thumb, very like an Eel, but that it had a very hairy tail. I have here given you the figure of the Monſter, as it was expreſſed by him. *Lib. de diviniſ. natur. Characte riſmis.*

The Figure of a Monſter that came forth of a Maids Belly.

Maſter *Peter Barque* and *Claude le Grand*, Surgeons of *Verdun*, lately affirmed to me, that they cured the wife of a certain Citizen of *Verdun*, which out of an Abſceſs broken in the belly, caſt forth a great number of Worms, together with the quitture; and theſe were of the thickneſs of ones finger, with ſharp heads, which ſo gnawed her guts, that the excrements for a long time came forth at the ulcer, but now ſhe is perfectly recovered. An Hiſtory.

Anthony Benenius a Phyſician of *Florence*, telleth that one *John Menuſierus*, a man of forty years of age, troubled with continual pains at his ſtomach, was often at the point of death, neither found he any help by the counſels of many Phyſicians which he uſed. At length coming to have his advice, he gave him a vomit, by means whereof he caſt up a great quantity of corrupt and putrid matter, yet was he not thereby eaſed of his pain: Therefore he gave him another vomit, by force whereof he caſt up much matter like to the former, and together therewith a Worm of four fingers long, having a red round head, of the bigneſs of a great Peaſe, covered over the body with a ſoft downineſs, with a forked tail in manner of a half Moon, going upon four feet, two before, and two behind. An Hiſtory.

The Figure of a Worm caſt forth by Vomit.

Why ſhould I mention the prodigious bodies which are found in Abſceſſes, as Stones, Chalk, Sand, Coals, Snail-ſhells, Straws, Hay, Horns, Hairs, and many kinds of living and dead creatures? For there is nothing in the generation of theſe things (cauſed by corruption, preceded by much alteration) which may make us admire, or hold us in ſuſpence, eſpecially if we ſhall conſider that Nature, the fruitful Parent of all things, hath put divers portions and particles of the univerſal matter whereof the greater World is compoſed into this *Microcoſmos*, or little World, Man; whereby he might the rather ſeem to be made to the reſemblance and form of the greater. Wherefore it ſo diſports it ſelf here, that it may counterfeit and reſemble all the actions and motions which it uſeth to perform in the Scene of the greater World in this little one, if ſo be that matter be not wanting. The efficient and material cauſes of ſuch things as are preternaturally generated in our bodies.

CHAP. IV.

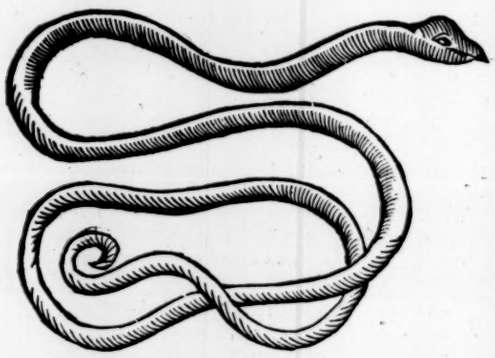
Of the Worms which uſe to breed in the Guts.

A Groſs viſcid and crude humour is the material cauſe of Worms, which having got the beginning of corruption in the Stomach, is quickly carried into the Guts, and there it putrefies, having not acquired the form of laudable *Chylus* in the firſt concoction. This, for that it is viſcid, tenaciouſly adheres to the Guts, neither is it eaſily evacuated with the other excrements; therefore by delay it further putrefies, and by the efficacy of heat, it turns into the matter and nouriſhment for Worms. This alimentary humour being conſumed, unleſs ſome freſh ſupply the want thereof, which may eaſe their hunger, they move themſelves in the Guts with great violence, they cauſe grievous and great pains, yea, and oft-times they creep up to the Stomach, and ſo come forth by the Mouth, and ſometimes they aſcend into the holes of the Palat, and come forth at the Noſe. Worms are of three ſorts, for ſome are round and long, others broad and long, others ſhort and ſlender. The firſt are called by the Ancients *Teretes*, that is round, for that they are long and round. The ſecond are named *Teniæ*, for that their bodies are long and broad, like a Rowler or Swathe. The third are termed *Aſcarides*, for that they commonly wrap themſelves up round. Other differences of Worms are taken from their colours, as red, white, black, aſh-coloured, yellowiſh. Some alſo are hairy, with a great head like the little Fiſh which the *French* call *Chabot*, we a *Millers Thumb*; in ſome diſeaſes many worms are generated and caſt forth by the Fundament, as ſmall as hairs, and uſually of colour white, and theſe are they which are called *Aſcarides*. The diverſity of colours in Worms proceedeth not from the like diſtinct diverſity of humours whereof they are generated. For the melancholick and cholerick humour by their qualities are wholly unfit to generate Worms. But this manifold variety in colour, is by reaſon of the different corruption of the *chylus* or phlegmatick humour whereof they are bred. The long and broad Worms are often-times ſtretched alongſt all the Guts, being like to a mucous or albuminous ſubſtance; and How Worms are generated. The reaſon that they ſome times come forth at the mouth. The differences of Worms.

An Hiſtory. verily I ſaw one voided by a Woman which was like to a Serpent, and ſome ſix foot long, which ought not to ſeem ſtrange, ſeeing it is noted by the Ancients, that they have ſeen Worms ſo long

An Hiſtory. as the length of the whole Guts, that is ſeven times the length of ones body. *Wierus* writes, that he ſaw a Country-man who voided a Worm eight foot and one inch long, in head and mouth reſembling a Duck, which therefore I have thought good here to expreſs.

The Figure of a Worm, generated in, and caſt forth of the Gut.



In obſervat. *Valeriola* affirmeth, that he ſaw a Worm above nine foot long Now as Worms differ in ſhape, ſo are their places of generation alſo different. For the round and long Worms are commonly gene-

In what places of the belly worms are generated. rated in the ſmaller guts, the reſt in the greater, but eſpecially the *Aſcarides:* none breed in the Stomach, as that which is the place of the firſt concoction. There truly the matter which breedeth theſe Worms, gets the firſt rudiment of corruption, but comes to perfection onely in the guts; they breed in ſome Infants in their mothers bellies, by the pravity and corrupt nature of the humour flowing from the Mother for the nouriſhment of the Child, which for that then they do not expel it by ſiege, it by delay putrefieth the more, and yields fit matter for the breeding of Worms, as ſome

Ad finem lib. 4. de morbis. have obſerved out of *Hippocrates*. Laſtly, Worms breed in people of any age that are Belly-gods and given to gluttony, as alſo in ſuch as feed upon meats of ill juice, and apt to corrupt, as crude Summer-fruits, Cheeſe, and Milk-meats. But to know in what part of the guts the Worms do lurk, you muſt

Signs of Worms in the ſmall guts. note that when they are in the ſmall guts, the Patients complain of a pain in their Stomach, with a dog-like appetite, whereby they require many and ſeveral things without reaſon, a great part of the nouriſhment being conſumed by the Worms lying there; they are alſo ſubject to often fainting, by reaſon of the ſympathy which the ſtomach, being a part of moſt exquiſit ſenſe, hath with the heart, the noſe itches, the breath ſtinks, by reaſon of the exhalations ſent up from the meat corrupting in the ſtomach; through which occaſion they are alſo given to ſleep, but are now and then waked therefrom by ſudden ſtartings and fears; they are held with a continued and ſlow fever, a dry cough, a winking with their eye-lids, and often changing of the colour of their faces. But long and broad

Signs of worms in the great guts. Worms, being the innates of the greater guts, ſhew themſelves by ſtools repleniſhed with many ſloughs, here and there reſembling the ſeeds of a Muſk-melon or Cucumer. *Aſcarides* are known by the itching they cauſe in the Fundament, cauſing a ſenſe as if it were Ants running up and down; cauſing alſo

Signs of *Aſcarides.* a *tenaſmus*, and falling down of the Fundament. This is the cauſe of all theſe ſymptoms; their ſleep is turbulent and often clamorous, when as hot, acrid and ſubtil vapours, raiſed by the Worms from the like humour and their food, are ſent up to the head; but ſound ſleep by the contrary, as when a miſty vapour is ſent up from a groſs and cold matter. They dream they eat in their ſleep, for that while the Worms do more greedily conſume the chylous matter in the guts, they ſtir up the ſenſe of the like action in the phantaſie. They grate or gnaſh their teeth by reaſon of a certain convulſifick repletion, the muſcles of the temples and jaws being diſtended by plenty of vapours. A dry cough comes by the conſent of the vital parts ſerving for reſpiration, which the natural, to wit, the *Diaphragma*, or Midriff, ſmit upon by acrid vapours, and irritated as though there were ſome humour to be expelled by coughing. Theſe ſame acrid fumes aſſailing the orifice of the ventricle, cauſe either an hicketting, or elſe a fainting, according to the condition of their conſiſtence, groſs or thin; theſe carried up to the parts of the Face cauſe an itching of the Noſe, a darkneſs of the Sight, and a ſudden changing of the colour in the cheeks. Great Worms are worſe than little ones, red than white, living than dead, many than few, variegated than thoſe of one colour, as thoſe which are

Why worms of divers colours are more dangerous. ſigns of a greater corruption. Such as are caſt forth bloudy and ſprinkled with bloud, are deadly, for they ſhew that the ſubſtance of the guts is eaten aſunder; for oft-times they corrode and perforate the body of the gut wherein they are contained, and thence penetrate into divers parts of the belly; ſo that they have come forth ſometimes at the navel, having eaten themſelves a paſſage forth, as *Hollerius* affirmeth. When as children troubled with the Worms draw their breath with difficulty, and wax moiſt over all their bodies, it is a ſign that death is at hand. If at the beginning of ſharp Fevers, round worms come forth alive, it is ſign of a peſtilent Fever, the malignity of whoſe matter they could not endure, but were forced to come forth. But if they be caſt forth dead, they are ſigns of greater corruption in the humours, and of a more venenate malignity.

CHAP.

CHAP. V.

What Cure to be uſed for the Worms.

IN this diſeaſe there is but one Indication, that is, the excluſion or caſting out of the Worms either alive or dead forth of the body, as being ſuch that in their whole kind are againſt Nature; all things muſt be ſhunned which are apt to heap up putrefaction in the body by their corruption, ſuch as are crude Fruits, Cheeſe, Milk-meats, Fiſhes; and laſtly ſuch things as are of a difficult and hard digeſtion, but prone to corruption. Pap is fit for children, for that they require moiſt things; but theſe ought to anſwer in a certain ſimilitude to the conſiſtence and thickneſs of Milk, that ſo they may be the more eaſily concocted and aſſimilated, and ſuch onely is that pap which is made with Wheat-flower, not crude, but baked in an Oven, that the Pap made therewith may not be too viſcid nor thick, if it ſhould onely be boiled in a Pan as much as the Milk would require; or elſe the Milk would be too terreſtrial or too wateriſh, all the fatty portion thereof being reſolved, the cheeſie and whayiſh portion remaining, if it ſhould boil ſo much as were neceſſary for the full boiling of the crude meat; they which uſe meal otherwiſe in pap, yield matter for the generating of groſs and viſcid humours in the ſtomach, whence happens obſtruction in the firſt veins and ſubſtance of the liver; by obſtruction worms breed in the guts, and the ſtone in the kidnies and bladder. The Patient muſt be fed often, and with meats of good juice, leſt the worms through want of nouriſhment ſhould gnaw the ſubſtance of the guts. Now when as ſuch things breed of a putrid matter, the Patient ſhall be purged, and the putrefaction repreſt by Medicins mentioned in our Treatiſe of the Plague. For the quick killing and caſting of them forth, Syrup of Succory or of Limmons with Rubarb, a little Treacle or Mithridate, is a ſingular Medicin, if there be no Fever. You may alſo for the ſame purpoſe uſe this following Medicin. ℞ *Cornu cervi, pul. raſur. eboris, an.* ʒ j. ſ. *ſem. tanacet. & contra verm. an.* ʒ j. *fiat decoct. pro parva doſi, in colat. infunde rhei optimi,* ʒ j. *cinam.* ℈ j. *diſſolve ſyrupi de abſinth.* ℥ ß. make a potion, give it in the morning three hours before any broth. Oil of Olives drunk, kills Worms; as alſo Water of Knotgraſs drunk with Milk; and in like manner all bitter things. Yet I could firſt wiſh them to give a Clyſter made of Milk, Honey, and Sugar, without Oils and bitter things, leſt ſhunning thereof they leave the lower guts and come upwards; for this is natural to Worms to ſhun bitter things, and follow ſweet things. Whence you may learn, that to the bitter things which you give by the mouth, you muſt always mix ſweet things, that allured by the ſweetneſs, they may devour them more greedily, that ſo they may kill them. Therefore I would with Milk and Sugar mix the ſeeds of Centaury, Rue, Womwood, Aloes, and the like: Harts-horn is very effectual againſt Worms, wherefore you may infuſe the ſhavings thereof in the Water or Drink that the Patient drinks, as alſo to boil ſome thereof in his broths. So alſo Treacle drunk or taken in broth, killeth the Worms; Purſlain boiled in broths, and diſtilled and drunk, is alſo good againſt the Worms; as alſo Succory and Mints; alſo a decoction of the leſſer Houſleek and Sebettens given with Sugar before meat; it is no leſs effectual to put Worm-ſeeds in their Pap, and in roaſted Apples, and ſo to give them it. Alſo you may make ſuppoſitories after this manner, and put them up into the Fundament. ℞ *Coralli ſubalbi, raſuræ eboris, corn. cerv. uſti, ireos, an.* ℈ ij. *mellis albi* ℥ ij. ſ. *aquæ centinodiæ q.ſ. ad omnia concorporanda, fiant Glandes:* let one be put up every day, of the weight of ʒ ij. for children; theſe ſuppoſitories are chiefly to be uſed for *Aſcarides*, as thoſe which adhere to the right gut. To ſuch children as can take nothing by the mouth, you ſhall apply Cataplaſms to their navels made of the Powder of Cummin-ſeeds, the flower of Lupines, Wormwood, Southernwood, Tanſie, the leaves of Artichokes, Rue, the Powder of *Coloquintida*, Citron-ſeeds, Aloes, Arſeſmart, Horſe-mint, Peach-leaves, *Coſtus amarus*, *Zedoaria*, Sope, and Ox-gall. Such Cataplaſms are oft-times ſpread over all the belly, mixing therewith aſtringent things for the ſtrengthening of the part, as Oil of Myrtils, Quinces and Maſtich; you may alſo apply a great Onion hollowed in the the midſt, and filled with Aloes and Treacle, and ſo roaſted in the Embers, then beaten with bitter Almonds, and an Ox gall. Alſo you may make Emplaſters of bitter things, as this which follows: ℞ *Felis bubuli, ſucci abſinth. an.* ℥ ij. *colocyn.* ʒ j. *terantur & miſceantur ſimul, incorporentur cum farina lupinorum:* make hereof an Emplaſter to be laid upon the navel.

Liniments and Ointments may be alſo made for the ſame purpoſe, to anoint the belly; you may alſo make Plaſters for the navel of *Pilulæ Ruf.* anointing in the mean time the Fundament with Honey and Sugar, that they may be chaſed from above with bitter things, and allured downwards with ſweet things. Or elſe take Worms that have been caſt forth, dry them in an iron pan over the fire, then powder them, and give them with Wine or ſome other liquor to be drunk, for ſo they are thought quickly to kill the reſt of the Worms. Hereto alſo conduceth the juice of Citrons drunk with the Oil of bitter Almonds or Sallet-oil. Alſo ſome make Baths againſt this affect, of Wormwood, Galls, Peach-leaves boiled in Water, and then bathe the child therein.

But in curing the Worms, you muſt obſerve that this diſeaſe is oft-times entangled with another more grievous diſeaſe, as an acute and burning Fever, a flux or ſcouring, and the like; in which (as for example ſake) a Fever being preſent and conjoined therewith, if you ſhall give Worm-ſeeds, old Treacle, Myrrh, Aloes, you ſhall increaſe the Fever and Flux, for that bitter things are very contrary to theſe affects. But if on the contrary, in a Flux whereby the Worms are excluded, you ſhall give Corral, and the Flower of Lentils, you ſhall augment the Fever, making the matter more contumacious by dry and aſtringent things. Therefore the Phyſician ſhall be careful in conſidering whether the Fever be a ſymptom of the Worms, or on the contrary it be eſſential, and not ſymptomatick; that this being known, he may principally inſiſt in the uſe of ſuch Medicins as reſiſt both affects, as Purging and bitteriſh in a Fever and Worms, but bitter and ſomewhat aſtrictive things in the Worms and Flux.

The general Indications of curing the Worms.

Wherefore, and wherewith ſuch as have the Worms muſt be purged.

Harts-horn good againſt the Worms.

A Plaſter againſt the Worms.

A Fever ſometimes a ſymptom, and ſometimes a diſeaſe.

CHAP. VI.

A ſhort deſcription of the Elephantiaſis *or Leproſie, and of the Cauſes thereof.*

THis diſeaſe is termed *Elephantiaſis*, becauſe the skin of ſuch as are troubled therewith is rough, ſcabious, wrinkled, and unequal, like the skin of an Elephant. Yet this name may ſeem to be impoſed thereon, by reaſon of the greatneſs of the diſeaſe. Some from the opinion of the *Arabians*, have termed it *Lepra*, or Leproſie (but unproperly, for the *Lepra* is a kind of ſcab and diſeaſe of the skin, which is vulgarly called *Malum ſancti manis*) which word for the preſent we will uſe, as that which prevails by cuſtom and antiquity. Now the Leproſie (according to *Paulus*) is a Cancer of the whole Body, the which (as *Avicen* adds) corrupts the complexion, form and figure of the members. *Galen* thinks the cauſe ariſeth from the error of the ſanguifying faculty, through whoſe default the aſſimilation in the fleſh and habit of the body is depraved, and much changed from it ſelf, and the rule of Nature. But *ad Glauconem*, he defines this diſeaſe, An effuſion of troubled or groſs bloud into the veins and habit of the whole body. This Diſeaſe is judged great, for that it partakes of a certain venenate virulency, depraving the members and comelineſs of the whole body. Now it appears that the Leproſie partakes of a certain venenate virulency by this, that ſuch as are melancholick in the whole habit of their bodies, are not leprous. Now this diſeaſe is compoſed of three differences of Diſeaſes: Firſt, it conſiſts of a diſtemper againſt Nature, as that which at the beginning is hot and dry, and at length the ebullition of the humours ceaſing, and the heat diſperſed, it becomes cold and dry, which is the conjunct cauſe of this ſymptom. Alſo it conſiſts of an evil compoſition or conformation, for that it depraves the figure and beauty of the parts. Alſo it conſiſts of a ſolution of continuity, when as the fleſh and skin are cleft in divers parts with ulcers and chops. The Leproſie hath for the moſt part three general cauſes, that is, the Primitive, Antecedent, and Conjunctive. The Primitive cauſe is either from the firſt conformation, or comes to them after they are born. It is thought to be in him from the firſt conformation, who was conceived of depraved and menſtruous bloud, and ſuch as are inclined to melancholy; who was begot of the leprous ſeed of one or both his Parents, for leprous perſons generate leprous, becauſe the principal parts being tainted and corrupted with a melancholick and venenate juice, it muſt neceſſarily follow, that the whole maſs of bloud and ſeed that falls from it, and the whole body ſhould alſo be vitiated. This cauſe happens to thoſe that are already born, by long ſtaying, and inhabiting in Maritime Countries, whereas the groſs and miſty air, in ſucceſs of time, induceth the like fault into the humours of the body; for that, according to *Hippocrates*, ſuch as the air is, ſuch is the ſpirit, and ſuch the humours. Alſo long abiding in very hot places, becauſe the bloud is torrified by heat, but in cold places, for that they incraſſate, and congealing the ſpirits, do after a manner ſtupifie, may be thought the primitive cauſes of this diſeaſe. Thus in ſome places of *Germany* there are divers leprous perſons; but they are more frequent in *Spain*, and over all *Africa*, than in all the World beſide, and in *Languedoc*, *Provence*, and *Guyenne*, are more than in whole *France* beſides. Familiarity, copulation, and cohabitation with leprous perſons may be reckoned amongſt the cauſes thereof, becauſe they transfer this diſeaſe to their Familiars by their breath, ſweat, and ſpittle, left on the edges of the Pots or Cups. This diſeaſe is alſo cauſed by the too frequent uſe of ſalt, ſpiced, acrid and groſs meats, as the fleſh of Swine, Aſſes, Bears, Pulſe, Milk-meats; ſo alſo groſs and ſtrong Wines, Drunkenneſs, Gluttony, a laborious life, full of ſorrow and cares, for that they incraſſate, and as it were burn the bloud. But the retention of melancholick excrements, as the ſuppreſſion of the Hemorrhoids, Courſes, Small Pox, and Meazles, as alſo a Quartan Fever accuſtomed to come at ſet times; the drying up of old ulcers, for that they defile the maſs of the bloud with a melancholick droſs and filth. Now you muſt underſtand, that the cauſe of the Leproſie by the retention of the ſuperfluities, happens, becauſe the corrupt bloud is not evacuated, but regurgitates over the whole body, and corrupts the bloud that ſhould nouriſh all the members; wherefore the aſſimilative faculty cannot well aſſimilate by reaſon of the corruption and default of the juice; and thus in concluſion the Leproſie is cauſed. The Antecedent cauſes are the humours diſpoſed to aduſtion and corruption into melancholy, by the torrid heat; for in bodies poſſeſſed with ſuch heat, the humours by aduſtion eaſily turn into melancholy, which in time acquiring the malignity and corruption of a virulent and venenate quality, yields a beginning and eſſence to the Leproſie. The Conjunct cauſes are the melancholick humours, which are now partakers of a venenate and malign quality, and ſpread over the whole habit of the body, corrupting and deſtroying it firſt by an hot and dry diſtemper, and then by a cold and dry, contrary to the beginnings of life. For hence inevitable death muſt enſue, becauſe our life conſiſts in the moderation of heat and moiſture.

CHAP. VII.

The ſigns of a Leproſie, breeding, preſent, and already confirmed.

THe diſpoſition of the body and humours to a Leproſie, is ſhewed by the change of the native and freſh colour of the Face, by that affect of the Face, which is commonly called *Gutta roſacea*, red and blackiſh ſuffuſions and puſtles, the falling away of the hairs, and a great thirſt, and a drineſs of the mouth both by night and day, a ſtinking breath, little ulcers in the mouth, the change of the voice to hoarſneſs, a deſire of venery above nature and cuſtom. Now there are four times of this diſeaſe, the beginning, increaſe, ſtate, and declenſion. The beginning is, when as the malignity hath not gone further than the inner parts and bowels, whereupon the ſtrength

The beginning of a Leproſie.

ſtrength muſt needs be more languid. The increaſe is, when as the virulency comes forth, and the ſigns and ſymptoms are every day increaſed in number and ſtrength. The ſtate is, when as the members are exulcerated. The declenſion is, when as the aſpect of the Face is horrid, the extreme parts fall away by the profundity and malignity of the ulcers, ſo that none, no not of the common ſort of People, can doubt of this diſeaſe. According to the doctrin of the Ancients, we muſt in ſearching out of the ſigns of this diſeaſe being preſent, have chief regard to the head. For the ſigns of diſeaſes more properly and truly ſhew themſelves in the Face by reaſon of the ſoftneſs and rarity of the ſubſtance thereof, and the tenuity of the skin that covers it; wherefore a black and aduſt humour diffuſed thereunder, eaſily ſhews it ſelf, and that not onely by the mutation of the colour, but alſo of the character, and bulk, and oft-times by manifeſt hurting it. Wherefore you muſt obſerve in the head, whether it have ſcales, and whether in the place of thoſe hairs that are fallen away, others more tender, ſhort and rare grow up, which is likely to happen through defect of fit nouriſhment to preſerve and generate hairs through corruption of the hairy ſcalp that ſhould be ſtored with ſuch nouriſhment, and of the habit it ſelf, and through the unfitneſs thereof to contain hairs: laſtly, by the acrimony of the vapours ſent up from the aduſt humours and entrails, fretting aſunder the roots of the hairs. But if not onely the hair, but alſo ſome portion of the skin and fleſh about the roots of the hair, come away by pulling, it is an argument of perfect corruption: let this therefore be the firſt ſign of a Leproſie. A ſecond and very certain ſign, is a numerous and manifeſt circumſcription of round and hard puſhes or puſtiles under the eye-brows, and behind the ears, and in ſeveral places of the Face, reſembling round and hard kernels, occaſioned by the default of the aſſimilating faculty. The cauſe of this default is the groſsneſs of the flowing nouriſhment, by which means it being impact, and ſtopping in the ſtraitneſs of the way, it grows round, as it were compaſſed about in the place whereas it ſticks, and by the means of the crudity, for that it is not aſſimilated, and by delay, it is further hardned. The third ſign is, the more contract and exact roundneſs of the ears, their groſsneſs, and as it were grainy ſpiſſitude or denſneſs; the cauſe of their roundneſs is the conſumption of the flaps and fleſhy part through want of nouriſhment, and exceſs of heat; but the occaſion of their grainy ſpiſſitude is the groſsneſs of the earthy nouriſhment flowing thither. The fourth ſign is a Lion-like wrinkling of the fore-head, which is the reaſon that ſome term this diſeaſe *Morbus Leoninus*; the cauſe hereof is the great drineſs of the habit of the body, which alſo is the reaſon that the bark of an old Oak is rough and wrinkled. The fifth is, the exact roundneſs of the eyes, and their fixt and immoveable ſteddineſs; verily the eyes are naturally almoſt round, yet they appear obtuſe, and ſomewhat broad on the foreſide, but end in a *Conus* on the hind part, by reaſon of the concourſe and figure of the muſcles and fat inveſting them. Therefore theſe being conſumed either through defect of laudable nouriſhment, or elſe by the acrimony of the flowing humour, they are reſtored to their proper figure and roundneſs. Now the muſcles which moved the eyes being conſumed, and the fat which facilitated their motion waſted, it comes to paſs that they ſtand ſtiff and unmovable, being deſtitute of the parts yielding motion, and the facility thereof. The ſixth ſign is, the Noſtrils flat outwardly, but inwardly ſtraight and contracted, that is, an earthy and groſs humour forced from within outwards, which ſwells the ſides or edges of the Noſtrils; whence it is, that the paſſages of the Noſe appear as it were obſtructed by the thickneſs of this humour, but they are depreſſed and flatted by reaſon of the reſt of the Face and all the neighbouring parts ſwollen more than their wont; add hereto that the partition is conſumed by the acrimony of the corroding and ulcerating humour. The ſeventh is, the lifting up, thickneſs and ſwelling of the lips, the filthineſs, ſtench and corroſion of the gums by acrid vapours riſing to the mouth; but the lips of leprous perſons are more ſwollen by the internal heat burning and incraſſating the humours, as the outward heat of the Sun doth in the Moors. The eighth ſign is, the ſwelling and blackneſs of the Tongue, and as it were varicous veins lying under it; becauſe the Tongue being by nature ſpongeous and rare, is eaſily ſtored with excrementitious humours, ſent from the inner parts unto the habit of the body: which ſame is the cauſe why the glandules placed about the Tongue above and below, are ſwollen hard and round, no otherwiſe then ſcrophulous or meazled Swine. Laſtly, All their Face riſeth in red bunches or puſhes, and is over-ſpread with a dusky and obſcure redneſs; the eyes are fiery, fierce and fixed, by a melancholick cachectick diſpoſition of the whole body, manifeſt ſigns whereof appear in the Face, by reaſon of the fore-mentioned cauſes, yet ſome leprous perſons have their Faces tinctured with a yellowiſh, others with a whitiſh colour, according to the condition of the humour, which ſerves for a *baſis* to the leprous malignity. For hence Phyſicians affirm that there are three ſorts of Leproſies, one of a reddiſh black colour, conſiſting in a melancholick humour; another of a yellowiſh green, in a cholerick humour; another in a whitiſh yellow, grounded upon aduſt phlegm. The ninth ſign is a ſtinking of the breath, as alſo of all the excrements proceeding from leprous bodies, by reaſon of the malignity conceived in the humours. The tenth is, a hoarſneſs, a ſhaking, harſh and obſcure voice, as it were coming out of the Noſe, by reaſon of the Lungs, recurrent Nerves and Muſcles of the Throttle tainted with the groſsneſs of a virulent and aduſt humour; the fore-mentioned conſtriction and obſtruction of the inner paſſage of the Noſe; and laſtly, the aſperity and inequality of the Weazon by immoderate drineſs, as it happens to ſuch as have drunk plentifully of ſtrong Wines without any mixture. This immoderate drineſs of the Muſcles ſerving for reſpiration makes them to be troubled with a difficulty of breathing. The eleventh ſign is very obſervable, which is a Morphew or defedation of all the skin, with a dry roughneſs and grainy inequality, ſuch as appears in the skins of plucked Geeſe, with many tetters on every ſide, a filthy ſcab, and ulcers not caſting off onely a bran-like ſcurff, but alſo ſcales and cruſts. The cauſe of this dry ſcab is the heat of the burning bowels and humours unequally contracting and wrinkling the skin, no otherwiſe than as leather is wrinkled by the heat of the Sun or Fire. The cauſe of the filthy ſcab and ſerpiginous ulcers, is the eating and corroding condition of the melancholick humour, and the venenate corruption, it alſo being

being the author of corruption, ſo that it may be no marvel, if the digeſtive faculty of the liver being ſpoiled, the aſſimilative of a malign and unfit matter ſent into the habit of the body, cannot
XII. well nor fitly perform that which may be for the bodies good. The twelfth is, the ſenſe of a certain pricking as it were of Goads or Needles over all the skin, cauſed by an acrid vapour hindred from
XIII. paſſing forth, and intercepted by the thickneſs of the skin. The thirteenth is a conſumption and emaciation of the muſcles which are between the thumb and fore-finger, not onely by reaſon that the nouriſhing and aſſimilating faculties want fit matter wherewith they may repair the loſs of theſe parts, for that is common to theſe with the reſt of the body; but becauſe theſe muſcles naturally riſe up unto a certain mountainous tumour, therefore their depreſſion is the more manifeſt. And this is the cauſe that the ſhoulders of leprous perſons ſtand out like wings; to wit, the emaciation of
XIV. the inward part of the muſcle *Trapezites*. The fourteenth ſign is, the diminution of ſenſe, or a numbneſs over all the body by reaſon that the nerves are obſtructed by the thickneſs of the melancholick humour hindring the free paſſage of the animal ſpirit, that it cannot come to the parts that ſhould receive ſenſe, theſe in the interim remaining free which are ſent into the muſcles for motions ſake, and by this note I chiefly make trial of leprous perſons, thruſting a ſomewhat long and thick needle ſomewhat deep into the great tendon endued with moſt exquiſit ſenſe, which runs to the heel, which if they do not well feel, I conclude that they are certainly leprous. Now for that they thus loſe their ſenſe, their motion remaining entire; the cauſe hereof is, that the nerves which are diſſeminated to the skin, are more affected, and thoſe that run into the muſcles are not ſo much, and therefore when as you prick them ſomewhat deep, they feel the prick, which they do not in the ſurface
XV. of the skin. The fifteenth is, the corruption of the extreme parts poſſeſſed by putrefaction and a Gangrene, by reaſon of the corruption of the humours ſent thither by the ſtrength of the bowels, infecting with the like tainture the parts wherein they remain: add hereto that the animal ſenſitive faculty is there decayed, and as often as any faculty hath forſaken any part, the reſt preſently after a
XVI. manner neglect it. The ſixteenth is, they are troubled with terrible dreams; for they ſeem in their ſleep to ſee Devils, Serpents, Dungeons, Graves, dead bodies, and the like, by reaſon of the black vapors of the melancholick humour troubling the phantaſie with black and diſmal viſions, by which reaſon alſo
XVII. ſuch as are bitten of a mad Dog fear the water. The ſeventeenth is, that at the beginning and increaſe of the diſeaſe they are ſubtil, crafty and furious, by reaſon of the heat of the humours and bloud; but at length in the ſtate and declenſion, by reaſon of the heat of the humours, and bloud, and entrails decaying by little and little; therefore then fearing all things whereof there is no cauſe, and diſtruſting of their own ſtrength, they endeavour by craft maliciouſly to circumvent thoſe with whom
XVIII. they deal, for that they perceive their powers to fail them. The eighteenth, is a deſire of venery above their nature, both for that they are inwardly burned with a ſtrange heat; as alſo by the mixture of flatulencies therewith (for whoſe generation the melancholick humour is moſt fit) which are agitated, and violently carried through the veins and genital parts by the preternatural heat; but at length, when this heat is cooled, and that they are fallen into an hot and dry diſtemper, they mightily abhor venery, which then would be very hurtful to them, as it is alſo at the beginning of the diſeaſe, becauſe they have ſmall ſtore of ſpirits and native heat, both which are diſſipated by venery. The nineteenth is, the ſo great thickneſs of their groſs and livid bloud, that if you waſh it,
XIX. you may find a ſandy matter therein, as ſome have found by experience, by reaſon of the great aduſtion and aſſation thereof. The twentieth is, the languidneſs and weakneſs of the pulſe (by reaſon
XX. of the oppreſſion of the vital and pulſifick faculty by a cloud of groſs vapours.) Herewith alſo their urin ſometimes is thick and troubled, like the urin of carriage-beaſts, if the urinary veſſels be permeable and free, otherwiſe it is thin, if there be obſtruction, which onely ſuffers that which is thin to flow forth by the urinary paſſages; now the urin is oftentimes of a pale aſh-colour, and oft-times it ſmells like as the other excrements do in this diſeaſe. Verily there are many other ſigns of the Leproſie, as the ſlowneſs of the belly by reaſon of the heat of the Liver, often belchings by reaſon that the ſtomach is troubled by the reflux of a melancholick humour, frequent ſneezing by reaſon of the fulneſs of their brain; to theſe this may be added moſt frequently, that the face and all the skin
Why their Faces ſeem to be greaſie. is unctuous or greaſie, ſo that water poured thereon, will not in any place adhere thereto: I conceive it is by the internal heat diſſolving the fat that lies under the skin, which therefore always looks as if it were greaſed or anointed therewith in leprous perſons. Now of theſe fore-mentioned ſigns, ſome are univocal, that is, which truly and neceſſarily ſhew the Leproſie: other ſome are equivocal or common, that is, which conduce as well to the knowledge of other diſeaſes as this. To conclude, that aſſuredly is a Leproſie which is accompanied with all, or certainly the moſt part of theſe fore-mentioned ſigns.

CHAP. VIII.

Of Prognoſticks in the Leproſie; and how to provide for ſuch as ſtand in fear thereof.

Why the Leproſie is incurable. THe Leproſie is a diſeaſe which paſſeth to the iſſue, as contagious almoſt as the Plague, ſcarce curable at the beginning, incurable when as it is confirmed, becauſe it is a Cancer of the whole body; now if ſome one Cancer of ſome one part ſhall take deep root therein, it is judged incurable. Furthermore, the remedies which to this day have been found out againſt this Diſeaſe are judged inferiour and unequal in ſtrength thereto. Beſides, the ſigns of this diſeaſe do not outwardly ſhew themſelves before that the bowels be ſeized upon, poſſeſſed and corrupted by the malignity of the humour, eſpecially in ſuch as have the white Leproſie, ſundry of which you may ſee about *Bourdeaux*, and in *Little-Britain*, who notwithſtanding inwardly burn with ſo great heat, that it will ſuddenly wrinkle and wither an Apple held a ſhort time in their hand, as if it had laid for many days

days in the Sun. There is another thing that increaseth the difficulty of this disease, which is an equal pravity of the three principal faculties whereby life is preserved. The deceitful and terrible visions in the sleep, and numbness in feeling, argue the depravation of the animal faculty; now the weakness of the vital faculty is shewed by the weakness of the pulse, the obscurity of the hoarse and jarring voice, the difficulty of breathing, and stinking breath; the decay of the natural is manifested by the depravation of the work of the Liver in sanguification, whence the first and principal cause of this harm ariseth. Now because we cannot promise cure to such as have a confirmed Leprosie, and that we dare not do it to such as have been troubled therewith but for a short space, it remains that we briefly shew how to free such as are ready to fall into so fearful a disease. Such therefore must first of all shun all things in diet and course of life, whereby the bloud and humours may be too vehemently heated, whereof we have formerly made some mention. Let them make choice of meats of good or indifferent juice, such as we shall describe in treating of the diet of such as are sick of the Plague; Purging, Bleeding, Bathing, Cupping, to evacuate the impurity of the bloud, and mitigate the heat of the Liver, shall be prescribed by some learned Physician. *Valesius de Tarenta* much commends gelding in this case, neither do I think it can be disliked; for men subject to this disease may be effeminated by the amputation of their testicles, and so degenerate into a womanish nature, and the heat of the Liver boiling the bloud, being extinguished, they become cold and moist, which temper is directly contrary to the hot and dry distemper of leprous persons; besides the leprous being thus deprived of the faculty of generation, that contagion of this disease is taken away which spreadeth, and is diffused amongst mankind, by the propagation of their issue.

Gelding good against the Leprosie.

The End of the Twentieth Book.

BOOK XXI.

Of Poysons, *and of the* Biting *of a* Mad Dog; *And the* Bitings *and* Stingings *of other Venomous Creatures.*

CHAP. I.

The cause of writing this Treatise of Poysons.

Five Reasons have principally moved me to undertake to write this Treatise of Poysons, according to the opinion of the Ancients. The first is, that I might instruct the Surgeon what remedies must presently be used to such as are hurt by poisons, in the interim whilest greater means may be expected from a Physician. The second is, that he may know by certain signs and notes such as are poisoned or hurt by poysonous meats, and so make report thereof to the Judges, or to such as it may concern. The third is, that those Gentlemen and others who live in the Country, and far from Cities, and store of greater means, may learn something by my labour, by which they may help their friends bitten by an Adder, mad Dog, or other poysonous creatures, in so dangerous, sudden and unusual a case. The fourth is, that every one may beware of poysons, and know their symptoms when present, that being known, they may speedily seek for a remedy. The fifth is, that by this my labour all men may know what my good will is, and how well-minded I am towards the Common-wealth in general, and each man in particular, to the glory of God. I do not here so much arm malicious and wicked persons to hurt, as Surgeons to provide to help and defend each mans life against poyson; which they did not understand, or at least seemed not so to do, which taking this my labour in evil part, have maliciously interpreted my meaning.

But now at length, that we may come to the matter, I will begin at the general division of Poysons, and then handle each *species* thereof severally; but first let us give this Rule, That poyson is that which either outwardly applied or struck in, or inwardly taken into the body, hath power to kill it, no otherwise than meat well dresst is apt to nourish it. For *Conciliator* writes that the properties of Poyson are contrary to nourishments in their whole substance; for as nourishment is turned into bloud, and in each part of the body whereto it is applied to nourish, by perfect assimilation substituted in the place of that portion which flies away each moment. Thus on the contrary Poyson turns our bodies into a nature like it self and venenate, for as every agent imprints the force and qualities thereof in the subject patient, thus Poyson by the immoderation of faculties in their whole nature contrary to us, changeth our substance into its nature, no otherwise then fire turneth chaff in a moment into its own nature, and so consumes it. Therefore it is truly delivered by the Ancients, who have diligently pried into the faculties of Natural things, that it is poyson that may kill men by destroying and corrupting their temper, and the composure and conformation of the body. Now all poysons are said to proceed either from the corrupt Air, or from living Creatures, Plants and Minerals, or by any artificial malignity in distilling, subliming, and diversly mixing of poysonous and fuming things. Hence arise sundry differences of Poysons, neither do they all work after the same manner; for some corrupt our nature by the unmeasurableness of the manifest and elementary qualites whereof they consist, others from a specifick and occult property. Hence it is that

What is to be accounted Poyson.

The differences of Poysons.

All poysons have not a peculiar antipathy with the heart.

that some kill sooner than other some; neither is it true that all of them presently assail the heart, but others are naturally at deadly strife with other parts of the body; as *Cantharides* with the bladder, the Sea-Hare with the Lungs, the *Torpedo* with the hands, which it stupefieth, though the Fishers rod be betwixt them. Thus of Medicins, there are some which are apt presently to comfort and strengthen the heart, others the brain, as *stœchas*; others the Stomach, as Cinamon. Also there are some poysons which work both ways, that is, by manifest and occult qualities, as *Euphorbium*; for that both by the excessive heat and the whole substance, or the discord of the whole substance with ours, corrupts our nature. An argument hereof is, that Treacle, which by its quality is manifestly hot, infringeth the force thereof, as also of all others of an occult property. Poysons which work by an occult and specifick property, do not therefore do it, because they are too immoderately hot, cold, dry, moist; but for that they are absolutely such, and have that essence from the Stars and celestial influence, which is apt to dissolve and destroy the strength of mans body, because being taken but even in a small quantity, yet are they of so pernicious a quality that they kill almost in a moment. Now Poysons do not only kill being taken into the body, but some being put or applied outwardly; neither do venomous creatures onely harm by their stinging and biting, but also by their excrements, as Spittle, Bloud, the Touch and Breath.

CHAP. II.

How Poysons being small in quantity, may by their onely touch cause so great alterations.

IT seemeth strange to many how it may come to pass, that poyson taken or admitted in small quantity, may almost in a moment produce so pernicious effects over all the body, and all the parts, faculties, and actions; so that being admitted but in a little quantity, it swells up the body into a great bigness. Neither ought it to seem less strange, how Antidotes and Counter-poysons, which are opposed to poyson, can so suddenly break and weaken the great and pernicious effects thereof, being it is not so likely that so small a particle of poyson or antidote can divide it self into so many, and so far severed particles of our body. There are some (saith *Galen*) who think that some things by touch onely, by the power of their quality, may alter those things which are next to them; and that this appears plainly in the Fish *Torpedo*, as that which hath so powerful a quality, that it can send it along the Fishers rod to the hand, and so make it become torpid or numb. But on the contrary, Philosophers teach that accidents, such as qualities are, cannot without their subjects remove and diffuse themselves into other subjects. Therefore *Galen*'s other answer is more agreeable to reason, that so many and great affects of poysons, and remedies arise either from a certain spirit or subtil humidity; not truly, for that this spirit and subtil humidity may be dispersed over the whole body and all the parts thereof which it affects, but that little which is entered the body, as cast in by the stroak of a Spider, or the sting of a Scorpion, infects and corrupts all the next parts by contagion with the like quality, these other that are next to them, until from an exceeding small portion of the bloud, if the stroak shall light into the veins, it shall spread over the whole mass of bloud; or of phlegm, if the poyson shall chance to come to the Stomach, and so the force thereof shall be propagated and diffused over all the humours and bowels. The doubt of Antidotes is less, for these being taken in greater quantity, when they shall come into the stomach, warmed by the heat of the place they become hot, and send forth vapours, which suddenly diffused over the body by the subtilty of their substance, do by their contrary forces dull and weaken the malignity of the poyson. Wherefore you may often see, when as Antidotes are given in less quantity than is fit, that they are less prevalent, neither do they answer to our expectation in overcoming the malignity of the poyson so that it must necessarily follow that these must not onely in qualities, but also in quantity be superiour to Poysons.

Cap. 5. lib. 6. de loc. affect.

The true reason of the wondrous effects of poysons.

CHAP. III.

Whether there be any such Poysons as will kill at a set time?

No poysons kill in a set time.

TO the propounded Question: Whether there may be Poysons which within a certain and definite time (put case a Moneth or Year) may kill men? *Theophrastus* thus answers; of Poysons some more speedily perform their parts, others more slowly; yet may you find no such as will kill in set limits of time, according to the will and desire of men: For that some kill sooner or later than others; they do not this of their own or proper nature, as Physicians rightly judge, but because the subject upon which they light, doth more or less resist or yield to their efficacy. Experience sheweth the truth thereof; for the same sort of poyson in the same weight and measure, given to sundry men of different tempers and complexions, will kill one in an hour, another in six hours, or in a day, and on the contrary, will not so much as hurt some third man. You may also observe the same in purging Medicins. For the same Purge given to diverse men in the same proportion, will purge some sooner, some later, some more sparingly, others more plentifully, and othersome not at all; also with some it will work gently, with othersome with pain and gripings. Of which diversity, there can be no other cause assigned, than mens different natures in complexion and temper, which no man can so exactly know and comprehend, as to have certain knowledge thereof, how much and how long the native heat can resist and labour against the strength of poyson, or how pervious or open the passages of the body may be, whereby the poyson may arrive at the heart and principal parts. For in such (for examples sake) as have the passages of their arteries more large, the poyson may more readily and speedily enter into the heart, together with the air that is continually drawn into the body.

How poysons come to kill sooner or later.

CHAP.

CHAP. IV.

Whether such Creatures as feed upon poysonous things, be also poysonous? and whether they may be eaten safely and without harm.

DUcks, Storks, Herons, Peacocks, Turkies, and other Birds, feed upon Toads, Vipers, Asps, Snakes, Scorpions, Spiders, Caterpillers, and other venemous things: Wherefore it is worthy the questioning, whether such like Creatures nourished with such food, can kill or poyson such persons as shall afterward eat them? *Matthiolus* writes, that all late Authors, who have treated of Poysons, to be absolutely of this opinion, That men may safely and without any danger feed upon such Creatures, for that they convert the Beasts into their nature after they have eaten them, and on the contrary are not changed by them. This reason though very probable, yet doth it not make these Beasts to be wholly harmless, especially if they be often eaten or fed upon. *Dioscorides* and *Galen* seem to maintain this opinion, whereas they write that the milk, which is nothing else then the relented bloud of such beasts as feed upon Scammony, Hellebore, and Spurge, purgeth violently. Therefore Physicians desirous to purge a sucking child, give Purges to the Nurses, whence the milk becoming purging, becomes both Meat and Medicin to the Child. The flesh of Thrushes which feed upon Juniper-berries, savours of Juniper. Birds that are fed with Wormwood or Garlick, either taste bitter, or have the strong scent of Garlick. Whitings taken with Garlick, so smell thereof, that they will not forego that smell or taste by any salting, frying, or boiling; for which sole reason, many who hate Garlick, are forced to abstain from these Fishes. The flesh of Rabbits that feed upon Penny-royal and Juniper, savour of them; Physicians wish that Goats, Cows, and Asses whose Milk they would use for Consumptions, or other diseases, should be fed some space before, and every day with these or these herbs which they deem fit for the curing this or that disease: For *Galen* affirms that he doubts not, but that in succes of time the flesh of Creatures will be changed by the meats whereon they feed, and at length savour thereof. Therefore I do not allow that the flesh of such things as feed upon venemous things, should be eaten for food, unless it be some long space after they have disused such repast, and that all the venom be digested and overcome by the efficacy of their proper heat, so that nothing thereof may remain in taste, smell, or substance, but be all vanished away. For many die suddenly, the cause of whose deaths are unknown, which peradventure was from nothing else but the sympathy and antipathy of bodies, for that these things cause death and disease to some, that nourish othersome (according to our vulgar English Proverb, *That which is one mans meat, is another mans poyson.*)

Such things as feed upon poyson may be eaten without danger.

The occasion of sudden death in many.

CHAP. V.

The general signs of such as are poysoned.

WE will first declare what the general signs of poyson are, and then we will descend to particulars, whereby we may pronounce that one is poysoned with this or that poyson. We certainly know that a man is poysoned, when as he complains of a great heavines of his whole body, so that he is weary of himself, when as some horrid and loathsom taste sweats out from the orifice of the stomach to the mouth and tongue, wholly different from that taste that meat, howsoever corrupted, can send up: when as the colour of the Face changeth suddenly, somewhiles to black, sometimes to yellow, or any other colour, much differing from the common custom of man; when nauseousnes with frequent vomiting troubleth the Patient, and that he is molested with so great unquietnes, that all things may seem to be turned upside down. We know that the poyson works by the proper, and from the whole substance, when as without any manifest sense of great heat or coldnes the Patient swounds often with cold sweats, for usually such poysons have no certain and distinct part wherewith they are at enmity, as *Cantharides* have with the bladder. But as they work by their whole substance, and an occult propriety of form, so do they presently and directly assail the heart, our essence and life, and the fortres and beginning of the vital faculty. Now will we shew the signs whereby poysons that work by manifest and elementary qualities may be known. Those who exceed in heat, burn or make an impression of heat in the tongue, the mouth, throat, stomach, guts, and all the inner parts, with great thirst, unquietnes, and perpetual sweats. But if to their exces of heat they be accompanied with a corroding and putrefying quality, as Arsenick, Sublimate, Rose-ager, or Rats-bane, Verdegrease, Orpiment, and the like, they then cause in the stomach and guts intolerable pricking pains, rumblings in the belly, and continual and intolerable thirst. These are succeeded by vomitings, with sweats somewhiles hot, somewhiles cold, with swounings, whence sudden death ensues. Poysons that kill by too great coldnes, induce a dull or heavy sleep, or drowzines, from which you cannot easily rowze or waken them; sometimes they so trouble the brain that the Patients perform many undecent gestures and antick tricks with their mouths, eyes, arms, and legs, like as such as are frantick; they are troubled with cold sweats, their Faces become blackish or yellowish, always ghastly, all their bodies are benumbed, and they die in a short time, unless they be helped; poysons of this kind are Hemlock, Poppy, Night-shade, Henbane, Mandrag. Dry poysons are usually accompanied by heat with moisture, for although Sulphur be hot and dry, yet hath it moisture to hold the parts together, as all things which have a consistence have; yet they are called dry, by reason that drines is predominant in them: such things make the tongue and throat dry and rough, with unquenchable thirst; the belly is so bound, that so much as the urin cannot have free passage forth; all

Common signs of such as are poysoned.

Signs of hot poysons.

Signs of cold Poysons.

Signs of dry Poysons.

all the members grow ſqualid by drineſs, the Patients cannot ſleep: poyſons of this kind are Litharge, Ceruſs, Lime, Scales of Braſs, Filings of Lead, prepared Antimony. On the contrary, moiſt poiſons induce a perpetual ſleep, a flux or ſcouring, the reſolution of all the nerves and joints, ſo that not ſo much as the eyes may be faithfully contained in their orbs but will hang as ready to fall out; the extreme parts, at the Hands, Feet, Noſe, and Ears corrupt and putrifie, at which time they are alſo troubled with thirſt by reaſon of their ſtrong heat, always the companion of putrefaction and oft-times the author thereof: now when this cometh to paſs death is at hand. Very many deny that there can be any moiſt poyſons found, that is, ſuch as may kill by the efficacy of their humidity, becauſe there are no ſuch things to be found as may come to the fourth degree of moiſture. Yet there is an example that averrs the contrary, which was of one, who ſleeping on the night, was bitten by a Serpent, as *Gilbertus Anglicus* affirmeth; for dying thereof, when as his ſervant, deſirous to awaken his Maſter out of his ſleep, took him by the arm, all the fleſh being putrefied, fell off, and preſently the bones alſo fell aſunder, being deprived of their fleſh, which could not happen unleſs by exceſs of the venemous humidity which lay hid in the teeth and ſpittle of the Serpent. Alſo we have found it noted by *Hippocrates*, that in a rainy, humid, and ſoutherly conſtitution of the Year, it happened by the malign violence of the venenate and putrefying humidity, that the fleſh of the arms and legs becoming rotten, fell away by piece-meal, and the bones remained bare; yea alſo and the bones themſelves in ſome, putrefied and fell away: neither certainly doth the *Lues Venerea* kill by any other means than by a fretting and putrefying force of humidity, by whoſe efficacy the ſolidity of the bones is diſſolved, then much more the fleſh may be tainted and conſumed by putrefaction.

Signs of moiſt Poiſons.

An Hiſtory.

Sect. 3. *lib.* 3. *Epid.*

The *Lues Venerea* kills by exceſs of moiſture.

To theſe and ſuch poyſons which work by a manifeſt and elementary faculty, when as they ſhall be received into the body after what manner ſoever, you ſhall forthwith oppoſe their contraries; and if by chance it be not manifeſt what, and of what diſtinct kind of poiſon that is, you muſt know that ſuch poiſons as work by occult properties, it is not by Reaſon as yet found out how they will affect the body, but onely by Experience. Therefore to theſe you muſt oppoſe their like Antidotes, which may by their whole ſubſtance ſtrengthen the heart and vital faculty, and withſtand the ſtrength of the poiſon. But to this our diſtinction of poiſons, working by a manifeſt and elementary quality, their opinion is contrary, who affirm that the venom of all poiſonous Beaſts are therefore cold, for that ſuch as are bitten or ſtung with them, are forthwith felt to be colder than a ſtone. And that Serpents for fear of cold, when as Winter is at hand keep themſelves in holes and dens under ground, or elſe as Vipers uſe to do, lie under ſtones, under which you may often find them ſtiff and numb, and ſo unapt for motion, that you may eaſily take them up in your hand. But the coldneſs that is perceived or felt in ſuch as are bitten or ſtung, is not occaſioned by the coldneſs of the poiſon, but by the abſence of the natural heat, withdrawing it ſelf in the very inſtant of the ſtroak, from the ſurface into the center of the body, both for the defence of the heart, as the principal part, as alſo for that there is nothing which ſo much diſſipates, or ſo much oppugns the vital heat as poiſon (of what kind ſoever it be) doth.

All poiſons are not cold.

Why ſuch as are poyſoned or ſtung, are cold.

CHAP. VI.

How, or by what means to ſhun or eſchew Poyſons.

IT is a matter of much difficulty to avoid poiſons, becauſe ſuch as at this time temper them, are ſo throughly prepared for deceit and miſchief, that they will deceive even the moſt wary and quick-ſighted; for they ſo qualifie their ingrate taſte and ſmell, by the admixture of ſweet and well ſmelling things, that they cannot eaſily be perceived even by the skilful. Therefore ſuch as fear poiſoning, ought to take heed of meats cooked with much Art, very ſweet, ſalt, ſowre, or notably endued with any other taſte. And when they are oppreſt with hunger or thirſt, they muſt not eat nor drink too greedily, but have a diligent regard to the taſte of ſuch things as they eat or drink; beſides, before meat let them take ſuch things as may weaken the ſtrength of the poyſons, ſuch as is the fat broth of good nouriſhing fleſh meats; in the morning let them arm themſelves with Treacle or Mithridate, and conſerve of Roſes, or the leaves of Rue, a Walnut, and dry Figs; beſides, let him preſently drink a little draught of Muskedine, or ſome other good Wine; when one ſuſpects he hath taken any poiſon in meat or drink, let him forbear ſleeping. For beſides that the force of poiſon is oft-times ſo rapid, that it conſumes our life in a ſhort ſpace, as Fire doth Stubble, as alſo for that it is drawn more inwardly into the ſecret paſſages of the body by ſleep. Wherefore in ſuch a caſe it is better to procure Vomit by drinking *Hydræleum* warm, or Butter diſſolved in warm Oil, or a decoction of Line, or Fenugreek ſeeds, or fat Broth, for thus the received poiſon is alſo caſt forth therewith, or elſe the acrimony thereof retunded, and the belly looſed.

What ſuch as fear poiſoning muſt obſerve in their diet.

Why ſleep is hurtful.

Why and how Vomit muſt be procured.

You may ſee this by dayly experience, for Cauſticks, Veſicatories, and the like acrid things being applied to the anointed part, will not bliſter nor exulcerate the part. Neither doth the Vomit conduce onely in this, that it excludeth the poiſon, but it ſhews either by the Taſte, Smell, or Colour, the kind of the taken poiſon; ſo that then by uſing the proper Antidote, it may be the more eaſily and ſpeedily reſiſted, yet notwithſtanding if you conceive that the poiſon have deſcended deeper into the Guts, you may with a Clyſter draw away the reſt thereof which adheres to the Coats of the Guts. But if the Patient cannot vomit, then ſhall ſome purging Medicin be given him forthwith, and ſuch as are thought more particularly to reſiſt poiſon; ſuch as are Agarick, Aloes, the leſſer Centaury, Rubarb, and other things, according to the direction of the learned Phyſician. Then ſhall you adminiſter Clyſters made with

When and wherewith they ſhall be purged.

with *Caſſia*, fatty decoctions, Sheeps Suet, or Butter, or Cows Milk, with the mucilages of Line ſeed, *Pſilium* ſeeds, Quince ſeeds, and other ſuch things as are uſually given in a Dyſentery, or bloudy flux, that ſuch things may hinder the adheſion of the poyſon to the coats of the guts, and by their unctuouſneſs retund the acrimony of the poyſon, and mitigate if any thing ſhall already be ulcerated, and abſolutely defend the ſound parts from the malign effects of the poyſon. But let this be a perpetual rule, that the poyſon be ſpeedily drawn back by the ſame way it entered into the body; as if it entered by ſmelling, in at the Noſtrils, let it be drawn back by ſneezing; if by the mouth into the ſtomach, let it be excluded by vomit; if by the fundament into the belly then by clyſter; if by the Privities into the Womb, then by metrenchites or injections made thereinto; if by a bite, ſting, or wound, let revulſion be made by ſuch things as have a powerful attractive faculty: for thus we make diverſions, that by theſe we may not onely hinder the poyſon from aſſailing the heart, but alſo that by this means we may draw it from within outwards. Wherefore ſtrong ligatures caſt about the arms, thighs and legs, are good in this caſe. Alſo large Cupping-glaſſes applied with flame to ſundry parts of the body are good. Alſo baths of warm water, with a decoction of ſuch things as reſiſt Poyſon, Southern-wood, Calamint, Rue, Betony, Horehound, Penny-royal, Bays, Scordium, Smallage, Scabious, Mints, Valerian, and the like, are good in this caſe. Alſo Sweats are good, being provoked ſo much as the ſtrength of the Patient can endure. But if he be very wealthy, whom we ſuſpect poyſoned, it will be ſafer to put him into the belly of an Ox, Horſe, or Mule, and then preſently into another as ſoon as the former is cold, that ſo the poyſon may be drawn forth by the gentle and vaporous heat of the new killed Beaſt; yet do none of theſe things without the advice of a Phyſician, if it may conveniently be had.

The cure of poyſoned wounds.

CHAP. VII.

How the corrupt or venemous Air may kill a man.

THe Air is infected and corrupted by the admixture of malign vapours, either ariſing from the unburied bodies of ſuch as are ſlain in great conflicts, or exhaling out of the earth after Earthquakes; for the air, long pent up in the cavities and bowels of the earth, and deprived of the freedom and commerce of the open air, is corrupted, and acquires a malign quality, which it preſently transferreth unto ſuch as meet therewith. Alſo there is a certain malignity of the air, which accompanies Thunders and Lightnings, which ſavours of a ſulphureous virulency, ſo that whatſoever wild Beaſts ſhall devour the Creature killed therewith, they become mad, and die immediately; for the fire of Lightning hath a far more rapid, ſubtil, and greater force than other fires, ſo that it may rightly be termed a Fire of Fires.

By how many, and what means the air may be infected.

How Thunders and Lightnings may infect the Air.

An argument hereof is, that it melteth the head of a Spear, not harming the Wood, and Silver and Gold, not hurting the Purſe wherein it is contained. Alſo the air is infected by fumigations which preſently admitted into the body and bowels by the mouth and noſe in reſpiration, by the skin and arteries in perſpiration, doth eaſily kill the ſpirits and humours being firſt infected, and then within a ſhort ſpace after the ſolid ſubſtance of the principal parts, and chiefly of the heart being turned into their nature, unleſs the man be firſt provided for by Sneezing, Vomiting, Sweating, purging by the belly, or ſome other excretion. For that poyſon which is carried into the body by ſmell, is the moſt rapid and effectual, by ſo much as a vapour or exhalation is of more ſubtil and quicklier-piercing eſſence than an humour. Yet notwithſtanding, wilt thou ſay, it is not credible, that any be killed by any vapour raiſed by the force of fire, as of a Torch or Warming-pan, for that the venenate quality of the thing that is burnt, is diſſipated and conſumed by the force of the fire, purging and cleanſing all things. This reaſon is falſly feigned to the deſtruction of the lives of careleſs people; for ſulphurcous brands kindled at a clear fire, do notwithſtanding caſt forth a ſulphurous vapour. Whether do not *Lignum aloes* and Juniper, when they are burnt in a flame, ſmell leſs ſweetly?

Whether the vapour that ariſeth from a burnt thing may poyſon one.

Pope *Clement*, the ſeventh of that name, the Uncle of our Kings Mother, was poyſoned by the fume of a poyſonous Torch that was carried lighted before him, and died thereof. *Matthiolus* telleth, that there were two Mountebanks in the Market-place of *Sienna*, the one of which but ſmelling to a poyſoned Gilly-flower given him by the other, fell down dead preſently.

An Hiſtory.

A certain man not long ago, when he had put to his noſe, and ſmelled a little unto a pomander, which was ſecretly poyſoned, was preſently taken with a *Vertigo*, and all his face ſwelled, and unleſs that he had gotten ſpeedy help by Sternutatories and other means, he had died ſhortly after of the ſame kind of death that Pope *Clement* did.

The ſafeſt preſervative againſt ſuch poyſons is, not to ſmell to them: moreover ſome affirm, that there are prepared ſome Poyſons of ſuch force, that being anointed but on the Saddle, they will kill the Rider; and others, that if you but anoint the Stirrups therewith, they will ſend ſo deadly poyſonous a quality into the Rider through his Boots, that he ſhall die thereof within a ſhort time after: which things, though they be ſcarce credible, becauſe ſuch poyſons touch not the naked skin, yet have they an example in Nature, whereby they may defend themſelves; for the *Torpedo* ſends a narcotick, and certainly deadly force into the arm, and ſo into the body of the Fiſher, the cords of the Net being between them.

CHAP.

CHAP. VIII.

That every kind of Poyſon hath its proper and peculiar Signs and Effects.

AS Poyſons are diſtinct in *ſpecies*, ſo each *ſpecies* differs in their Signs and Effects; neither is it poſſible to find any one kind of poyſon which may be accompanied with, or produce all the ſigns and effects of all poyſons, otherwiſe Phyſicians ſhould in vain have written of the ſigns and effects of each of them, as alſo of their proper remedies and antidotes. For what kind of poyſon ſhall that be which ſhall cauſe a burning heat in the Stomach, Belly, Liver, Bladder, and Kidnies, which ſhall cauſe a hicketting, which ſhall cauſe the whole body to tremble and ſhake, which ſhall take away the voice and ſpeech, which ſhall cauſe convulſions, ſhall weaken the pulſifick faculty, which ſhall intercept the freedom of breathing, which ſhall ſtupifie and caſt into a dead ſleep, which ſhall together and at once cauſe a *Vertigo* in the head, dimneſs in the ſight, a ſtrangling or ſtoppage of the breath, thirſt, bleeding, fever, ſtoppage of the urin, perpetual vomiting, redneſs, lividneſs, and paleneſs of the face, reſolutions of the powers, and many other things, all which are cauſed by all ſorts of poyſon. Laſtly, No body will deny but that hot poyſons may kill more ſpeedily than cold, for that they are more ſpeedily actuated by the native heat.

Hot poyſons kill ſooner than cold.

CHAP. IX.

The Effects of Poyſons from particular venemous things, and what Prognoſticks may thence be made.

Lib. 2. cap. 27. IT is the opinion of *Cornelius Celſus*, and almoſt of all the Ancients, that the bite of every Beaſt hath ſome virulency, but yet ſome more than otherſome. They are moſt virulent that are inflicted by Venemous Beaſts, Aſps, Vipers, Water-Snakes, and all kinds of Serpents, Baſilisks, Dragons, Toads, mad Dogs, Scorpions, Spiders, Bees, Waſps, and the like. They are leſs malign, which are of Creatures wanting Venom, as of Horſes, Apes, Cats, Dogs not mad, and many other things, which though of their own nature they are without poiſon, yet in their bites there is ſomething more dolorifick and ill-natured than in common wounds inflicted by other occaſions: I believe, that in their ſlaver or *ſanies*, there is ſomething, I know not how to term it, contrary to our nature, which imprints a malign quality in the ulcer, which alſo you may obſerve in the tearings or ſcratchings of ſuch Creatures as have ſharp claws, as Lions and Cats. Moreover many affirm, that they have found by experience, that the bites of Men are not altogether without virulency, eſpecially of ſuch as are red haired and freckled, chiefly when as they are angred; it is probable that the bites of other perſons want this malignity, ſeeing that their ſpittle will cure ſmall ulcerations. Wherefore if there ſhall happen difficulty of cure in a wound, cauſed by a mans biting, which is neither red haired, nor freckled, neither angry, this happens not by means of the ſpittle, nor by any malign quality, but by reaſon of the contuſion, cauſed by the bluntneſs of the teeth, not cutting, but bruiſing the part; for being not ſharp they cannot ſo eaſily enter the fleſh, unleſs by bruiſing and tearing, after the manner of heavy and blunt ſtroaks and weapons, wounds being occaſioned by ſuch, are more hard to be cured than ſuch as are made by cutting and ſharp Weapons. But of the fore-ſaid bitings of Venemous Creatures, there are few which do not kill in a ſhort ſpace, and almoſt in a moment, but principally if the poyſon be ſent into the body by a live Creature, for in ſuch poyſon there is much heat, ; alſo there is therein a greater tenuity, which ſerves as *vehicles* thereto, into what place or part ſoever of the body they tend, the which the poyſons taken from the dead Creatures are defective of. Wherefore ſome of theſe kill a man in the ſpace of an hour, as the poyſon of Aſps, Baſilisks, and Toads; others not unleſs in two or three days ſpace, as of Water-Snakes; a Spider and Scorpion require more time to kill, yet all of them admitted but in the leaſt quantity, do in a ſhort ſpace cauſe great and deadly mutations in the body, as if they had breathed in a peſtiferous air, and with the like violence taint and change into their own nature all the members and bowels, by which theſe ſame members do in the time of perfect health change laudable meats into their nature and ſubſtance. The place whereas theſe poiſonous Creatures live, and the time, conduce to the perniciouſneſs of the poyſon; for ſuch as live in dry mountains and Sun-burnt places, kill more ſpeedily than ſuch as be in moiſt and mariſh grounds; alſo they are more hurtful in Winter than in Summer; and the poyſon is more deadly which proceeds from hungry, angry, and faſting Creatures, than that which comes from ſuch as are full and quiet; as alſo that which proceeds from young things, chiefly when as they are ſtimulated to Venery, is more powerful than that which comes from old and decrepit; from Females worſe than from Males; from ſuch as have fed upon other venemous things, rather than from ſuch as have abſtained from them, as from Snakes which have devoured Toads, Vipers which have fed upon Scorpions, Spiders and Caterpillers. Yet the reaſon of the efficacy of poyſons depends from their proper, that is, their ſubtil or groſs conſiſtence, and the greater or leſs aptneſs of the affected body to ſuffer. For hot men that have larger and more open veins and arteries, yield the poyſon freer paſſage to the heart: Therefore they which have more cold and ſtrait veſſels, are longer ere they die of the like poiſon; ſuch as are full, are not ſo ſoon harmed as thoſe that are faſting: for meats, beſides that by filling the veſſels, they give not the poyſon ſo free paſſage, they alſo ſtrengthen the heart by the multiplication of ſpirits, ſo that it more powerfully reſiſts pernicious venom. If the poyſon work by an occult and ſpecifick property, it cauſeth the Cure and Prognoſtick to be difficult, and then muſt we have recourſe to Antidotes, as theſe which have their whole ſubſtance reſiſt poyſons; but principally to Treacle, becauſe there enter into the Compoſition thereof Medicins which are hot, cold, moiſt, and dry: whence it is, that it retunds and withſtands all poyſons, chiefly ſuch

The bites of all wild Beaſts are virulent.

The bites of a red-haired man virulent

Contuſed wounds harder to heal than ſuch as are cut.

Why Treacle retunds the force of all ſimple poyſons.

as

as consist of a simple nature: such as these which come from venemous Creatures, Plants, and Minerals, and which are not prepared by the detestable Art of empoisoners.

CHAP. X.

What Cure must be used to the bitings and stingings of venemous Beasts.

CUre must speedily be used without any delay to the bites and stingings of venemous Beasts which may by all means disperse the poison, and keep it from entering into the body; for when the principal parts are possessed, it boots nothing to use Medicins afterwards. Therefore the Ancients have propounded a double Indication to lead us to the finding out of Medicins in such a case, to wit, the evacuation of the virulent and venenate humour, and the change or alteration of the same and the affected body. But seeing evacuation is of two sorts, to wit, Universal, which is by the inner parts; and Particular, which is by the outward parts: We must begin at the particular, by such to pick Medicins as are fit to draw out and retund the venom; for we must not always begin a Cure with general things, as some think, especially in external diseases, as Wounds, Fractures, Dislocations, Venemous Bites and Punctures. Wherefore hereto as speedily as you may, you shall apply remedies fit for the Bites and Punctures of venemous Beasts; as for example, the Wounds shall be presently washed with Urin, with Sea-water, *Aqua Vitæ*, or Wine, or Vinegar wherein old Treacle or Mustard shall be dissolved. Let such washing be performed very hot, and strongly chafed in, and then leave upon the Wound and round about it, linnen rags, or lint steeped in the same liquor. There be some who think it not fit to lay Treacle thereto, because as they say, it drives the poison in. But the authority of *Galen* convinceth that opinion, for he writeth that if the Treacle be applied to this kind of wounds before that the venom shall arrive at the noble parts, it much conduceth. Also reason confutes it, for Vipers flesh enters the composition of Treacle which attracts the venom by the similitude of substance, as the Load-stone draweth Iron, or Amber-straws. Moreover, The other simple Medicins which enter this composition, resolve and consume the virulency and venom, and being inwardly taken, it defendeth the heart and other noble parts, and corroborateth the spirits. Experience teacheth that Mithridate fitly given in the stead of Treacle worketh the like effect. The Medicins that are taken inwardly and applied outwardly for evacuation, must be of subtil parts, that they may quickly insinuate themselves into every part to retund the malignity of the poison; wherefore Garlick, Onions, Leeks, are very good in this case, for that they are vaporous; also *Scordium*, *Rue*, *Dictamnus*, the lesser Centaury, Hore-hound, Rocket, the milky juice of unripe figs, and the like, are good; there is a kind of wild Bugloss amongst all other Plants, which hath a singular force against venemous bites, whence it is termed *Echium* and *Viperium*, and that for two causes; the first is, because in the purple flowers that grow amongst the leaves, there is a resemblance to the head of a Viper or Adder. Another reason is, because it heals the biting of a Viper, not onely applied outwardly, but also helpeth such as are bitten being drunk in Wine, yea and will not suffer those that have lately drunk thereof to be bitten at all. Wild *Tyme* hath the like effect, though these oft-times agree with the poison in quality as in heat, yet do they help in discussing and resolving it; yet, as much as we may, we must labour to have evacuation and alteration together. It is most convenient, if the part affected will permit, to apply large Cupping-glasses with much flame and horns; also sucking is good, the mouth being first washed in Wine wherein some Treacle is dissolved, and with Oil, lest any thing should adhere thereto, for it will hinder it, if so be the mouth be no where ulcerated. It is good also to apply Horse-leeches, some wish to apply to the wound the fundaments of Hens or Turkies that lay Eggs, for that such are opener behind, first putting salt upon them that they may gape the wider, shutting their beaks and opening them now and then, lest they should be stifled, and ever and anon to substitute others in stead of such as die or are suffocated; for thus it is thought the poison is drawn forth, and passeth into the Bird by the fundament. There be others which had rather apply to the wound live Birds cut asunder in the midst, and so laid to the wound hot, for that they guess these resist poison by a natural discord. But certainly it is by their heat, whereby they do not onely digest Toads, Asps, Vipers, Scorpions, and other venemous things, but also wear asunder and sotten Sand, Stones, and most dry and stony seeds in their gizzards; wherefore we must think them very good to draw out the poison and dissipate it. But nothing is so forcible to disperse and retund the venom, as the impression of Cauteries, especially actual, for a hot iron works more effectually and speedily, and causeth an ulcer which will remain open a longer time. Wherefore to cause the speedier falling away of the Eschar, you shall scarifie it to the quick, and then plentifully anoint the place. For thus the poison will the sooner pass forth. But this must be done before the poison enters far into the body, for otherwise Cauteries will not onely do no good, but further torment the Patient, and weaken him to no purpose. Let drawing plasters be laid to the wound and neighbouring parts, made of *Galbanum*, Turpentine, black Pitch, and other gummy and resinous things. After the falling away of the Eschar *Basilicon* shall be applied, quickned with a little *Precipitate*, for it is very effectual in these cases, for that it draweth forth the virulent *sanies* out of the bottom of the wound, neither doth it suffer the wound to be closed speedily. To which purpose they put in a piece of sponge, or a root of Gentian or Hermodactyl, or some acrid Medicin, as *Ægyptiacum* or *Precipitate* mixed with the powder of Alum, or a caustick beaten to powder. But you must always observe this, that with your ointments you must always mix some Treacle or Mithridate, or the juice of *Hypericon*, or the like, which have power to attract and disperse the poison, and cleanse the ulcer; yet if too vehement heat shall cause such pain as is likely to bring a Gangrene by the dissipation of the spirits, then neglecting the cure of the proper disease for a time, we must labour to correct the symptom. But in this case you must observe this rule, that you let no bloud, give no purging Medicin nor Clyster,

A double indication in the cure of venemous bites.

Lotions fit for venemous bites.

Lib. de Theriac.

Treacle outwardly applied and inwardly taken good against venomous bites.

The force of *Echium*.

The force of *Precipitate* against venemous wounds.

When hot things are not convenient for poisoned wounds.

Clyſter, nor Vomit, nor uſe no Bath, nor other thing that may procure ſweat, until three days be paſt after the bite or ſting. In the mean ſpace let the Patient ſhun all manner of labour, but chiefly Venery, leſt by cauſing an agitation of the humours, the poiſon get ſooner to the heart. Therefore then it is time to uſe univerſal evacuations, when as you ſhall ſuſpect that the poiſon is diffuſed over the veins and whole inner part of the body beſides. Before you ſhall give nothing, unleſs Medicins of Treacle and Mithridate, and the like things, which have a faculty to reſiſt poiſon, and ſtrengthen the whole body by their benign and vital vapour, although their ſubſtance go no further than the ſtomach. Thus Pills when they are ſwallowed, though they go no further than the ſtomach, yet do they draw matter out of the joints and head; and ſtrong Clyſters, though they paſs no further than the guts, yet by their quality diffuſed further with the vapour, they draw from the moſt diſtant parts; yet you muſt give an Antidote, not onely more powerful than the poiſon in quality, but alſo greater in quantity, that ſo it may the more eaſily overcome and expel the poiſon. Wherefore you muſt give it twice in a day, and continue it ſo long until you ſhall know that the ſtrength of the poiſon is weakned and overcome by the remiſſion and decay of the malign ſymptoms. Yet in the mean while you muſt not neglect the diſtemper cauſed in the part by the poiſon, but muſt rather correct it by the application of the remedies contrary to the diſtemper, as by cold things if great heat afflict the affected part and whole body; by hot things on the contrary, if it ſeem as cold as a ſtone, which oft-times happens. And let thus much ſuffice for the general cure of Poiſons: now will we come to their particular Cure.

Antidotes muſt be given in great quantities.

CHAP. XI.

Why Dogs ſooner become mad than other Creatures, and what be the ſigns thereof.

Dogs naturally ſubject to madneſs.

DOgs become mad ſooner than any other Creatures, becauſe naturally they enjoy that temper and condition of humours which hath an eaſie inclination to that kind of diſeaſe, and as it were a certain diſpoſition, becauſe they feed upon Carrion, and corrupt, putrid and ſtinking things, and lap Water of the like condition; beſides the trouble and vexation of loſing their Maſters makes them to run every way, painfully ſearching and ſmelling to every thing and neglecting their meat. An heating of the bloud enſues upon this pain, and by this heat it is turned into a melancholy, whence they become mad. But yet Dogs do not always become mad by means of heat, but alſo by occaſion of cold, that is, by contrary cauſes; for they fall into this diſeaſe not onely in the Dog-days, but alſo in the depth of Winter: For Dogs abound with melancholick humours, to wit, cold and dry. But ſuch humours as in the Summer through exceſs of heat, ſo in the depth of Winter by conſtipation and the ſuppreſſion of fuliginous excrements, they eaſily turn into melancholy. Hence follows a very burning and continual Fever, which cauſeth or bringeth with it a madneſs. Add hereto, that in the depth of Winter the heat which is contained within is redoubled, and in like manner as the ſcorching heat in Summer, it breeds and turns the humours into melancholy. Alſo Dogs become mad by contagion, as ſuch as are bitten by another mad Dog. A mad Dog hath ſparkling and fiery eyes, with a fixed look, cruel and aſquint, he carries his head heavily, hanging down towards the ground, and ſomewhat on one ſide, he gapes and thruſts forth his tongue, which is livid and blackiſh; and being ſhort breathed, caſts forth much filth at his noſe, and much foaming matter at his mouth; in his gate, as if he ſuſpected and feared all things, he keepeth no one or certain path, but runs one while to this ſide, another while to that, and ſtumbling like one that is drunk, he oft-times falleth down on the ground; he violently aſſails whatſoever he meets withall, whether it be Man, Tree, Wall, Dog, or any thing elſe; other Dogs ſhun and preſently ſent him afar off. But if another unawares chance to fall foul upon him, he yields himſelf to his mercy, fawns upon him, and privily labours to get from him, though he be the ſtronger and greater. He is unmindful of eating and drinking, he barks not, yet bites he all he meets, without any difference, not ſparing his Maſter, as who at this time he knows not from a ſtranger or enemy. For it is the property of Melancholy to diſturb the underſtanding, ſo that ſuch perſons as are melancholick, do not onely rage againſt, and uſe violence to their Friends and Parents, but alſo upon themſelves. But when as he ſees Water, he trembles and ſhakes, and his hairs ſtand up on end.

Dogs become mad, not onely in the heat of Summer, but alſo in the depth of Winter.

Why melancholick perſons hurt themſelves.

CHAP. XII.

By what ſigns we may know a man is bitten by a mad Dog.

The bite of a mad Dog not very painful at the firſt.

IT is not ſo eaſie at the firſt to know that a man is bitten with a mad Dog, and principally for this reaſon, becauſe the wound made by his teeth cauſeth no more pain than other wounds uſually do; contrary to the wounds made by the ſting or bite of other poiſonous Creatures, as thoſe which preſently after they are inflicted, cauſe ſharp pain, great heat, ſwelling, and abundance of other malign accidents according to the nature of the poiſon; but the malignity of the bite of a mad Dog appears not before that the venom ſhall invade the noble parts. Yet when you are ſuſpicious of ſuch a wound, you may acquire a certain knowledge and experience thereof by putting a piece of bread into the quitture that comes from the wound. For if a hungry Dog neglect, yea more fly from it, and dare not ſo much as ſmell thereto, it is thought to be a certain ſign that the wound was inflicted by a mad Dog. Others add, That if any give this piece of bread to hens, that they will die the ſame day they have eaten it; yet this latter I making experiment thereof, failed; for devouring this virulent bread, they became not a jot the worſe. Wherefore I think the former ſign to be the more certain, for Dogs have a wonderful and ſure ſmelling faculty, whereby they eaſily ſcent and perceive the malignity of the like Creature. But when as

Signs of the bite of a mad Dog.

the

the raging virulency hath invaded the noble parts, then the Patients, becoming silent and sorrowful, think of many things, and at the beginning make a noise with their teeth; they make no answer to the purpose, they are more testy than ordinary, and in their sleeps they are troubled with dreams and strange phantasies, and fearful vitions; and lastly, they become afraid of the water. But after that the poison hath fixed it self into the substance of the noble parts, then all their faculties are disturbed, all the light of their memory, senses, reason, and judgment is extinguished. Wherefore becoming stark mad, they know not such as stand by them, nor their friends, no nor themselves, falling upon such as they meet withall, and themselves with their teeth and nails and feet. Often twitchings like Convultions do suddenly rise in their limbs; I judge them occasioned by extraordinary drineſs, which hath as it were wholly drunk up all the humidity of the nervous parts; there is a great drineſs of the mouth with intolerable thirst, yet without any desire of drink, because the mind being troubled, they become unmindful and negligent of such things as concern them, and are needful for them; the eyes look fiery and red, and all the face is of the same colour; they still think of Dogs, and seem to see them, yea and desire to bark and bite just after the manner of Dogs. I conjecture that the virulent humour hath changed all the humours and the whole body into the like nature, so that they think themselves also Dogs; whence their voice becomes hoarse by much endeavouring to bark, having forgot all decency, like impudent Dogs, to the great horrour of the beholders. For their voice grows hoarse by reason of the great drineſs of the *aspera arteria*; they shun the light, as that which is enemy to melancholy, wherewith the whole substance of the Brain is repleniſhed; on the contrary they desire darkneſs, as that which is like and friendly to them. But they are afraid of the water (though good to mitigate their great distemper of heat and drineſs) and they fly from Looking-glasses, because they imagine they see Dogs in them, whereof they are much afraid, by reason whereof they shun the Water and all polite and clear bodies which may supply the use of a Looking-glass; so that they throw themselves on the ground, as if they would hide themselves therein, lest they should be bitten again: for they affirm that he which is bitten by a mad Dog, always hath a Dog in his mind, and so remains fixed in that sad cogitation. Wherefore thinking that he sees him in the Water, he trembles for fear, and therefore shuns the Water. Others write that the body by madneſs becometh wondrous dry, wherefore they hate the Water, as that which is contrary thereto, being absolutely the moistest element; and so they say that this is the reason of their fearing the Water. *Ruffus* writes that madneſs is a kind of melancholy, and that fear is the proper symptom thereof, according to *Hippocrates*; wherefore this or that kind of melancholy begets a fear of these or these things, but chiefly of bright things, such as Looking-glasses and Water, by reason that melancholy persons seek darkneſs and solitarineſs, by reason of the black corruption of the humour wherewith they abound. They fall into cold sweats, a foamy, stinking, and greenish matter flows from the ulcer, by reason of the heat of the antecedent cause and ulcerated part. The urin most commonly appears watery, by reason that the strainers, as it were of the Kidnies, are straitned by the heat and drineſs of the venom. Yet sometimes also it appears more thick and black, as when Nature powerfully using the expulsive faculty, attempts to drive forth by urin the melancholy humour, the seat of the venom. Also sometimes it is wholly suppreſt, being either incrassated by hot drineſs, or else the mind being carried otherways and forgetful, of its own duty, until at length the Patients, vexed by the cruelty of so many symptoms, and overcome by the bitterneſs of pain, die frantick, by reason that Medicins have not been speedily and fitly applied. For few of those who have used remedies in time, have perished of this disease.

Signs by which you may gather that the noble parts are tainted.

Why men becoming mad, bark like dogs.

Why they shun the light.

Why they are afraid of the Water.

Aphor. 25. *sect.* 6

The bite of a mad dog taken in hand in time, is for the most part curable.

CHAP. XIII.

Prognosticks.

WE cannot so easily shun the danger we are incident to by mad Dogs, as that of other Beasts, by reason he is a domestick creature, and housed under the same roof with us. The virulency that resides in his foam or slaver is hot and dry, malign venenate and contagious, so that it causeth a distemper like it self, in the body whereto it shall apply it self and spread it self over the whole body by the arteries; for it doth not only hurt when as it is taken in by a bite or puncture, but even applied to the skin, unless it be forthwith washed away with salt water or urin. Neither doth this venom hurt equally, or at all times alike, for it harms more or less, according to the inclination of the air to heat or cold, the depth of the wound, the strength of the Patients Body, and the ill humours thereof, and their disposition to putrefaction, the freedom and largeneſs of the passages. Now malign symptoms happen sooner or later, as in some about the fortieth day, in others about six moneths, and in others a year after. There be some who thereupon are troubled with the falling sickneſs, and at length grow mad; such as fall into a fear of the Water, never recover. Yet *Avicen* thinks their case is not desperate, if as yet they can know their face in a Glass; for hence you may gather, that all the animal faculties are not yet overthrown, but that they stand in need of strong purgations, as we shall shew hereafter. *Aetius* tells that there was a certain Philosopher, who taken with this disease, and a fear of Water, when as he descended with a great courage unto the Bath, and in the Water beholding the shape of the Dog that bit him, he made a stand, but ashamed thereof, he forthwith cried out, *Quid Cani cum Balneo? i. e.* What hath a Dog to do with a Bath? which words being uttered, he threw himself forcibly into the Bath, and fearlesly drank of the Water thereof, and so was freed from his disease together with his erroneous opinion. It is a deadly sign to tumble themselves on the ground to have an hoarse voice, for that is an argument that the weazon is become rough, by reason of too excessive

The venom of a mad dog applied outwardly onely, may cause madneſs.

Whether the *Hydrophobia*, or fear of Water be incurable.

An History.

drineſs. Finally, The principal parts being poſſeſſed, there is no recovery or life to be hoped for. Men may well fall mad, though they be not bit by a mad dog. For as the humours are often inflamed of themſelves, and cauſe a Cancer or Leproſie, ſo do they alſo Madneſs in melancholick perſons. The bites of Vipers and other venemous creatures cauſe not like ſymptoms to theſe that come by the biting of a mad Dog, becauſe they die before ſuch can come forth or ſhew themſelves. Great wounds made by mad Dogs are not equally ſo dangerous as little, for from the former great plenty of venemous matter flows out, but in the latter it is almoſt all kept in.

CHAP. XIV.

What cure muſt be uſed to ſuch as are bitten by a mad Dog.

An Hiſtory. THis caſe alſo requires ſpeedy remedies; for ſuch things are in vain which come long after the hurt. The Lawyer *Baldus* experienced this to his great harm, for being by chance lightly bit in the lip by a little Dog wherewith he was delighted, not knowing that he was mad, and neglecting the wound by reaſon of the ſmalneſs thereof, after ſome four moneths ſpace he died mad, having then in vain aſſayed all manner of Medicins. Wherefore obſerving theſe things both for evacuation, as alſo for alteration, which we have formerly mentioned in the general Cure of Wounds inflicted by the bite or ſting of venemous Creatures, and by all the means there ſpecified, we muſt draw forth the venom, and if the wound be large, then ſuffer it to bleed long and much, for ſo ſome part of the poiſon will be exhauſted; if it be not great it ſhall be enlarged by ſcarification, or an occult cautery, neither ſhall it be healed or cloſed up at the ſoo-

The force of Sorrel. neſt till forty days be paſſed. Sorrel beaten and applied to the wound, and the decoction thereof taken inwardly, is very effectual in this caſe, as *Aetius* affirms. To the ſame purpoſe you may with good ſucceſs make a lotion and friction with Muſtard diſſolved in Urin or Vinegar, leaving upon the wound a double cloth moiſtned in the ſame decoction: laſtly, all acrid, biting, and very attractive Medicins are convenient in this caſe. Wherefore ſome apply Rocket boiled and beaten with Butter and Salt, others take the flower of *Orobus*, and temper it with Honey, Salt, and Vinegar, and apply it hot. Horſe-dung boiled in ſharp Vinegar, or Brimſtone beaten to powder, and tempered with ones ſpittle, is good. Alſo black pitch melted with ſome ſalt, and a little *Euphorbium* mixed therewith, and ſo applied, is good. Some write that the hairs of the Dog whoſe bite cauſed the madneſs, applied by themſelves, by their ſympathy or ſimilitude of ſubſtance, draw the venom from within outwards; for ſo a Scorpion beaten and applied to the place whereas it ſtung, by drawing out the poiſon that it ſent in, reſtores the Patient to health, both theſe by often experience are affirmed to have certain event. Others chew unground Wheat, and lay it up-

The force of Docks. the wound, other roaſt Beans under hot Embers, then huſk them and cleave them, and ſo apply them. Alſo the wound may be wholſomly waſhed and fomented with a decoction of Docks, and then the herb beaten may be applied thereto; alſo the Patient may drink the decoction; and by this one remedy *Aetius* affirms that he hath recovered divers; for thus it moves Urin plentifully, which is thought much to conduce to the cure of this diſeaſe. There be ſome who apply the leaves of Betony and Nettles beaten with common Salt; others make a Medicin to the ſame purpoſe, and after the ſame manner, of an Onion, the leaves of Rue, and Salt. Yet the reſt are exceeded by Treacle diſſolved in *Aqua Vitæ* or ſtrong Wine, and rubbed hard upon the part, ſo that bloud may follow, laying upon the wound when you have wiped it, cloths dipped in the ſame Medicin;

An Hiſtory. then preſently apply Garlick or Onions beaten with common Salt and Turpentine. By this onely remedy I freed one of the daughters of *Madamoiſella de Gron* from the ſymptoms of madneſs, and healed the wound, when as a mad Dog had bit her grievouſly in the calf of the right leg. Alſo it is good preſently to eat Garlick with bread, and then to drink after it a draught of good Wine, for Garlick by its ſpirituous heat will defend the noble parts from poiſon. There be ſome who wiſh to eat the roaſted liver of the Dog that hurt them, or elſe the liver of a Goat, of which remedies, as yet I have had no experience. Others preſcribe a dram of the ſeeds of *Agnus caſtus* to be drunk with Wine and Butter. Others the powder of River-Crabs burnt and drunk in Wine. Or, ℞ *Rad. gent.* ʒ ij. *aſtacorum fluviat. in fumo combuſt. & in pollinem redact.* ʒ iij. *terræ ſigill.* ʒ ß. *miſce.* Give ʒ j. of this ſame Powder in the decoction of River-Crabs, and let them drink thereof oft, at ſundry times.

Leaping into the Sea no certain remedy againſt Madneſs. Many have caſt themſelves into the Sea, neither have they thence had any help againſt Madneſs, as *Ferrand Pozet* the Cardinal teſtifieth in his Book of Poiſons; wherefore you muſt not rely upon that remedy, but rather you muſt have recourſe to ſuch things as are ſet in the Books of Phyſicians, and approved by certain and manifold experience. But ſeeing that no poiſon can kill, unleſs it be taken or admitted into the body, we muſt not fear any harm by ſprinkling our bodies with the *ſanies* of a mad Dog, Viper, Toad, or any other ſuch like venemous Creature, if ſo be that it be preſently wiped or waſhed clean away.

CHAP. XV.

What Cure muſt be uſed to ſuch as fear the Water, but yet are able to know themſelves in a Glaſs.

The force of Antimony againſt madneſs. SUch as have not their animal faculty as yet overcome by the malignity of the raging venom, muſt have ſtrong purgations given them. Wherefore if in any caſe Antimony be uſeful, then is it in this, as that which cauſeth ſweats, looſeth the belly, and procures vomiting: For it is a part of extreme and dangerous madneſs to hope to overcome the cruel malignity of this poiſon already admitted into the bowels, by gentle purging Medicins. Aſſuredly, Such and ſo great danger is never overcome without danger. Baths alſo conduce, which may diſperſe and draw forth the

poiſon

poiſon by cauſing ſweats. Alſo many and frequent Treacle-potions are good to retund the venom, and ſtrengthen the bowels; alſo it will be fitting to give them Water and all other liquid things, which they ſo much abhor, in a cup with a cover. Always let ſuch as are poiſoned, or ſtung, or bitten by a mad Dog or other venemous Beaſt, keep themſelves in ſome warm and light place, that the poiſon which by coldneſs is forced in, may be the readilier drawn out by the means of heat, and the ſpirits be recreated by the brightneſs of the air and therefore move from the center to the circumference of the body, and let the room be perfumed with ſweet things. To eat very hot and ſalt things preſently at the beginning, as Onions, Leeks, all ſpiced meats, and ſtrong Wine not allayed, ſeem not to be beſides reaſon; becauſe ſuch things by their ſpirituous heat hinder the diffuſion of the poiſon over the body, and ſtrengthen the filled entrails. There be ſome alſo that would have them to feed upon groſs and viſcous meats, which by obſtructing the veſſels, may hinder the paſſage of the poiſon to the heart and other parts; and by the ſame reaſon it will be better to fill themſelves with meat to ſatiety than otherwiſe, becauſe the malignity of humours is increaſed by hunger, than which nothing can be more harmful to venemous wounds. Yet within a ſhort while after, as within five or ſix days they muſt return to a mediocrity, and uſe all things temperate, boiled meats rather than roaſted, and that in a decoction of opening things, ſo to move urin. Laſtly, They muſt keep ſuch a diet as melancholick perſons ought to do; neither ſhall they let bloud, leſt ſo the poiſon ſhould be further drawn into the veins; but it is good that the Patients body be ſoluble from the very firſt. Let their drink be Wine indifferently allayed with Water, *Oxymel ſimplex*, or the Syrup of the juice of Citron with boiled Water; or elſe this following Julip: ℞ *Succi limonum, & malorum citri, an.* ℥ ij. *ſuc. gran. acid.* ℥ ij. *aquæ acetoſæ, min. & roſ. an.* ℥ j. *aq. font. coq. quantum ſufficit, fiat Julep. ut artis eſt.* Sleep is to be avoided until the force of the poiſon be abated, for by ſleep the humours flow back into the bowels. All things that reſiſt poiſon muſt be given any way whatſoever, as Limons, Oranges, Angelica-roots, Gentian, Tormentil, Burnet, Vervain, *Carduus Benedictus*, Borage, Bugloſs, and the like. Let all things that are afterwards ſet before the Patient, be meats of good juice, ſuch as are Veal, Kid, Mutton, Partridge, Pullets, Capons, and the like.

Why ſleep is hurtful to ſuch as are bitten by a mad dog, and all ſuch as are poiſoned.

CHAP. XVI.

Of the biting of a Viper or Adder, and the ſymptoms and cure thereof.

THe remedies that were formerly mentioned againſt the bitings of mad Dogs, the ſame may be uſed againſt all venemous bites and ſtings, yet nevertheleſs each poiſon hath his peculiar antidote. Vipers or Adders (as we vulgarly term them) have in their gums, or the ſpaces between their teeth, little bladders filled with a virulent *ſanies*, which is preſſed out into the part that they bite with their teeth. There forthwith ariſeth a pricking pain, the part at the firſt is much ſwollen, and then the whole body, unleſs it be hindred: groſs and bloudy filth ſweats out of the wound, little bliſters ariſe round about it, as if it were burnt, the wound gnaws, and as it were feeds upon the fleſh, great inflammation poſſeſſeth the Liver and the Guts, and the whole body becomes very dry, becoming of a pale or yellowiſh colour, with thirſt unquenchable; the belly is griped by fits, a cholerick vomiting moleſteth them, the Stomach is troubled with a hicketing, the Patients are taken with often ſwounings, with cold ſweat, the fore-runner of death, unleſs you provide by fit Medicins for the noble parts, before the poiſon ſhall invade them. *Matthiolus* tells, that he ſaw a Country man, who as he was mowing a Meadow, by chance cut an Adder in two with his Sithe, which when he thought it was dead, he took the one half, whereon the head remained, without any fear in his hand, but the enraged creature turning about her head, cruelly bit him by one of his fingers, which finger, as men uſually do (eſpecially when as they think of no ſuch thing) he put into his mouth, and ſucked out the bloud and poiſon, and preſently fell down dead.

The bites of Vipers how virulent.

The ſymptom

An Hiſtory.

When as *Charles* the ninth was at *Montpelier*, I went into the ſhop of one *Farges* an Apothecary, who then made a ſolemn diſpenſation of Treacle, where not ſatisfying my ſelf with the looking upon the Vipers that were there in a glaſs, ready for the compoſition, I thought to take one of them in my hands, but whileſt that I too curiouſly and ſecurely handled her teeth which were in her upper jaw, covered with a skin, as it were a caſe to keep the poiſon in, the beaſt catched hold of the very end of my fore-finger, and bit me in the ſpace between the nail and the fleſh; whence preſently there aroſe great pain, both by reaſon of the part endued with moſt exquiſit ſenſe, as alſo by the malignity of the poiſon: forthwith I exceeding ſtraightly bound my finger above the wound, that ſo I might preſs forth the bloud and poiſon, leſt they ſhould diffuſe themſelves further over the body. I diſſolved old Treacle in *Aqua vitæ*, wherein I dipped and moiſtned Cotton, and ſo put it to the wound, and within a few days I thorowly recovered by this onely Medicin. You may uſe in ſtead of Treacle, Mithridate and ſundry other things, which by reaſon of their heat are powerful drawers, as a Quill roaſted in hot Embers, Garlick and Leeks beaten and applied, Barley-flour tempered with Vinegar, Honey, and Goats-dung, and ſo applied like a pultis. Some think it ſufficient forthwith to waſh and foment the wound with Vinegar, Salt, and a little Honey. *Galen* writes, that the poiſon inflicted by the bite of a Viper, may be drawn forth by the applying to the wound the head of a Viper, but other-ſome apply the whole Viper beaten to maſh.

An Hiſtory.

Remedies for the bite of a Viper.

Lib. de Theriac.

CHAP. XVII.

Of the Serpent called Hæmorrhous.

The *Hæmorrhous* why ſo called.

THe Serpent *Hæmorrhous* is ſo called, becauſe by biting he cauſeth bloud to drop out of all the paſſages of the wounded body; he is of a ſmall body, of the bigneſs of a Viper, with eyes burning with a certain fiery brightneſs, and a moſt beautiful skin. The back of him (as *Avicen* writes) is ſpotted with many black ſpots, his neck little, and his tail very ſmall: the part which he bites forthwith grows blackiſh, by reaſon of the extinction of the native heat, which is extinguiſhed by ſuch poiſon which is contrary thereto in its whole ſubſtance. Then follows a pain of the ſtomach and heart, theſe parts being touched with the peſtiferous quality of the poiſon. Theſe pains are ſeconded by vomiting, the orifice of the ventricle being relaxed by a *Diarrhœa*, the retentive faculty of all the parts of the belly being weakned, and the veins which are ſpread through the guts, not being able to retain the bloud contained in them. For the bloud is ſeen to flow out, as in ſtreams, from the Noſe, Mouth, Ears, Fundament, Privities, corners of the Eyes, roots of the Nails, and Gums, which putrefie, the Teeth falling out of them. Moreover there happens a difficulty of breathing, and ſtoppage of the urin, with a deadly convulſion.

Wonderful bleedings.

The Cure is forthwith to ſcarifie and burn the bitten part, or elſe to cut it quite off, if that it may be done without danger of life, and then to uſe powerfully drawing Antidotes.

The Figure of the Serpent Hæmorrhous.

CHAP. XVIII.

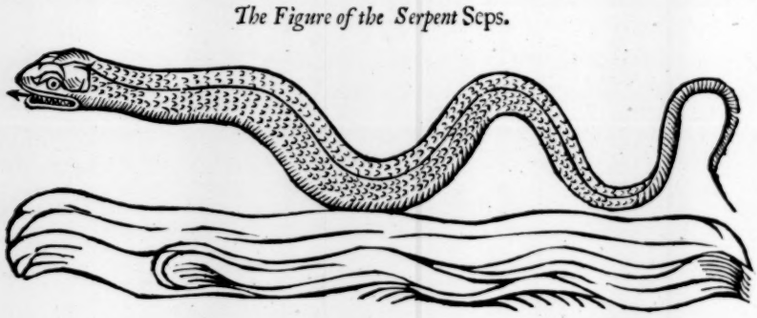
Of the Serpent called Seps.

The reaſon of the name, and deſcription of the *Seps*.

THe Serpent *Seps* is ſo called, becauſe it cauſeth the part which it bites, forthwith to putrefie by reaſon of the cruel malignity of its poiſon. It is not much unlike the *Hæmorrhous*, but that it curls or twines up the tail in divers circles. *Pauſanias* writes that this Serpent is of an aſh-colour, a broad head, ſmall neck, big belly, writhen tail, and as he goes he runs aſide like a Crab; but his skin is variegated and ſpotted with ſeveral colours, like to Tapiſtry. By the cruelty of his cauſtick and putrefying venom he burns the part which he hath bit, with moſt bitter pain; he cauſeth the ſhedding of the hairs, and as *Aetius* addeth, the wound at the firſt caſteth forth manifeſt bloud, but within a little while after, ſtinking filth. The putrefied affected parts wax white, and the body all over becomes of the colour of that ſcurff which is termed *Alphos*, ſo that by the wickedneſs of this putrefactive poiſon, not onely the ſpirits are reſolved, but alſo the whole body conſumed, as by fire, a peſtilent carbuncle, and other putrid tumors, ariſing from an hot and humid or ſuffocating conſtitution of the air. Now for the remedies, they muſt be ſuch as are formerly preſcribed againſt the bitings of a Viper.

The ſymptoms.

The Figure of the Serpent Seps.



CHAP. XIX.

Of the Baſilisk, or Cockatrice.

The efficacy of the poiſon of the Baſilisk

THe Baſilisk far exceeds all kinds of Serpents in the curſtneſs of its poiſon. Therefore it is affirmed by *Nicander*, that into what place ſoever he comes, other venemous creatures do forthwith flie thence, for that none of them can ſo much as endure his hiſſing; for he is thought to kill all things even with this, and not with his biting and touch onely; beſides, if any of them

them haſten to get any meat or drink, and perceive that the Baſilisk is not far from thence, he flies back, and neglects the getting of nouriſhment neceſſary for life. *Galen* writes, that the Baſilisk is a yellowiſh Serpent, with a ſharp head, and three riſings diſtinguiſhed with white ſpots, and riſing up in form of a Crown, by reaſon whereof he is ſtiled the King of Serpents. Certainly the violence of his poiſon in killing men is ſo great, that he is therefore thought to kill men and other creatures by his ſight only. *Solinus* affirms, that the body of a Baſilisk hath wondrous faculties: Wherefore the Inhabitants of *Pergamum*, in ancient times gave a mighty price for one to hang upon the Joiſts of the Temple of *Apollo*, ſo to drive away the Spiders and Birds, leſt they ſhould weave their webs, or the other build their neſts in that ſacred place. Verily no ravenous creature will touch their carkaſs; but if conſtrained by hunger, they do touch it, then they forthwith fall down dead in the ſame place: and this happens not onely by eating their body, but alſo by devouring of the bodies of ſuch Beaſts as are killed by their bitings. They kill the Trees and Shrubs by which they paſs, not onely by their touch, but even with their breath. Among the Weſtern Æthiopians is the Fountain *Nigris*, near which there is a Serpent called *Catablepas*, ſmall in body, and ſlow, having a great head, which it ſcarce can carry, but that it lies always upon the ground, otherwiſe it would kill abundance of people, for it forthwith kills all that ſees the eyes thereof, the Baſilisk hath the ſame force; he is bred in the Province of *Cyrene*, of the length of ſome twelve fingers, with a white ſpot in his head, reſembling a Crown; he chaſeth away all ſorts of Serpents with his hiſs. Weaſels are the deſtruction of ſuch monſters: thus it pleaſed Nature that nothing ſhould be without its equal; they aſſail them in their dens, being eaſily known by the barrenneſs or conſumption of the ſoil. Theſe kill them alſo by their ſent, and they die, and the ſight of Nature is ended. Thus Nature to the magnanimous Lion, leſt there ſhould be nothing which he might fear, hath oppoſed the weak creature the Cock, by whoſe crowing onely he is terrified and put to flight. *Eraſiſtratus* writes, that a golden yellowneſs affects the bitten part of ſuch as are hurt by a Baſilisk, but a blackneſs and tumour poſſeſſeth the reſt of the body, all the fleſh of the muſcles within a while after falling away by piece-meal. An Antidote againſt this muſt be made of a dram of *Caſtoreum*, diſſolved in wine and drunken, or in the juice of poppy. But *Aetius* thinks it ſuperfluous to write remedies againſt the Baſilisk, when as the ſight and hearing onely kills ſuch as either ſee or hear her.

Lib. de Theriac.

Why the Baſilisk is thought to kill by his onely ſight.

The *Catablepas*.

Nothing in Nature without its equal.

Symptoms.

Cure.

The Figure of a Baſilisk.

CHAP. XX.

Of the Salamander.

THe Salamander kills not onely ſuch as it bites, by making a venemous impreſſion, but it alſo infects the Fruits and Herbs over which it creeps, with a ſpittle or groſs moiſture which ſweats out of all the body, to the great danger of the health and life of ſuch as eat theſe things at unawares: wherefore it need not ſeem ſtrange, which is received by ſome late Writers, that ſome Families have all died by drinking Water out of the Pits whereinto a Salamander by accident was fallen. For if it ſhall creep upon a Tree, it infects all the Fruit with the qualities of cold and moiſt poiſon, wherein it yields not to Aconite.

The malignity of a Salamander.

The temper of her.

Aetius writes, that ſuch as are infected with the poiſon of a Salamander, certain parts of their body grow livid, ſo that they fall away often, being putrefied. At the firſt there appear white ſpots, over the body, then red, afterwards black with putrefaction; and the falling away of the hairs. The Cure is to procure vomit, to looſe the belly with a Clyſter, and to give them Treacle and Mithridate in potions. *Avicen* preſcribes the ſame things againſt this kind of poiſon as againſt *Opium*, by reaſon of the cold nature of them both; the proper Antidote is Turpentine, *Styrax*, Nettle-ſeeds, and Cypreſs-leaves. *Dioſcorides* writes, that the Salamander is a kind of Lizard, dull, variegated, and which is falſly reputed, not to be burnt by fire. But *Pliny* ſaith ſhe is ſo cold, that ſhe extinguiſheth the fire by her touch onely, being laid upon hot Coals. On the contrary, *Matthiolus* ſaith, that caſt into a great flame they are quickly conſumed. It is eaſie out of *Aetius* to reconcile theſe diſagreeing opinions. This creature ſaith he, paſſeth through a burning flame and is not hurt, the flame dividing it ſelf, and giving her way, but if ſhe continue any time in the fire, the cold humour being conſumed in her, ſhe is burnt. Now the Salamander is black, variegated with yellow ſpots Star-faſhion.

CHAP. XXI.

Of the Torpedo.

The craft of the *Torpedo*.

THe *Torpedo* hath his name from the effect, by reaſon that by his touch and power the members become torpid and numb. In muddy ſhores it lives upon fiſh, which ſhe catcheth by craft. For lying in the mud, ſhe ſo ſtupefies thoſe that are nigh her, that ſhe eaſily preys upon them. She hath the ſame power over men, for ſhe ſends a numbneſs not onely into the arm of the Fiſher-man, but alſo over all his body, although his Fiſhers Pole be between them.

His ſtupefying force.

The Effigies of a Torpedo.

CHAP. XXII.

Of the bitings of Aſps.

Symptoms.

THe wound which is made by an Aſp is very ſmall, as if a needle were thruſt into the part, and without any ſwelling. Theſe ſymptoms follow upon her bite, ſudden darkneſs clouds their eyes, much agitation in all their bodies, but gentle notwithſtanding; a moderate pain of the ſtomach troubles them, their fore-heads are continually troubled with convulſive twitchings, their cheeks tremble, and their eye-lids fall gently to reſt and ſleep; the bloud which flows from the wound is little, but black; death no longer deferred then the third part of a day, will take them away by convulſions, unleſs you make reſiſtance with fitting remedies. The male Aſp makes two wounds, the female four, as it alſo happens in the bitings of Vipers. Now for that the poiſon of Aſps congeals the bloud in the veins and arteries, therefore you muſt uſe againſt it ſuch things as are hot and ſubtil of parts, as Mithridate or Treacle diſſolved in *Aqua Vitæ*, and the ſame poured into the wound; the Patient muſt be warmed by baths, frictions, walking and the like. When as the hurt part becometh purple, black, or green, it is a ſign that the native heat is extinct and ſuffocated by the malignity of the venom. Therefore then it is beſt to amputate the member, if the Patient be able to endure it, and there be nothing which may hinder. *Vigo* writes that he ſaw a Mountebank at *Florence*, who that he might ſell the more of his Antidotes, and at the better rate, let an Aſp to bite him by the finger, but he died thereof ſome four hours after. To the ſame purpoſe you may read *Matthiolus*, whereas he writes that thoſe Impoſtors or Mountebanks to cozen the better, and deceive the people uſe to hunt and take Vipers and Aſps long after the Spring, that is, then when as they have caſt forth their moſt deadly poiſon; then they feed them meats formerly unuſual to them, ſo that by long keeping and care, and at length they bring it to paſs, that they put off a great part of their venemous Nature; neither being thus ſatisfied, they make them oftentimes to bite upon pieces of fleſh, that ſo they may caſt forth into them their venom which is contained in the membrane between their teeth and gums. Laſtly, they force them to bite, lick, and ſwallow down an aſtringent medicin, which they compoſe and carry about for the ſame purpoſe, that ſo they may obſtruct the paſſages by which the venom uſed to flow out, for thus at length their bites will be harmleſs, or without great danger. This therefore is their Art, that ſo they may ſell their counterfeit Treacle to the people at a high rate, as that which is a moſt ſafe remedy againſt all poiſonous bites. *Chriſtopher Andrew* in his Book called *Oicoiatria*, writes, that the Iſlands of *Spain* are every where full and ſtored with Serpents, Aſps, and all ſorts of venemous Beaſts, againſt whoſe bites they never obſerved or found any benefit in Treacle. But the efficacy of the following Antidote is ſo certain and excellent, and approved by ſo manifold experience, that in the confidence thereof, they will not be afroid to let themſelves be bitten by an Aſp. Now this Medicin is compoſed of the leaves of Mullet, Avens, and red Stock-gillyflowers in like quantity, which they boil in ſharp

Curing.

An Hiſtory.

By what means Aſps may be made leſs hurtful. *Gal. lib. de Ther. ad Piſonem.*

Againſt the bites of what Serpents Treacle doth no good.

A certain remedy againſt the biting of Aſps.

ſharp Vinegar and the Urin of a ſound man, and therewith foment the wounded part. Yet if he have not taken nor uſed any thing of a good while after the wound, it will be better and more certain, if the Patient drink three ounces of this decoction faſting two hours before meat.

CHAP. XXIII.

Of the biting of a Snake.

An Hiſtory. I Have thought good in a true Hiſtory to deliver the virulent malignity of the bite of a Snake, and the remedies thereof. When as King *Charles* the nineth was at *Moulins*, Mouſieur *le Feure* the Kings Phyſician and I were called to cure the Cook of the Lady of *Caſtelphers*, who gathering Hops in a hedge to make a Sallet, was bit on the hand by a Snake that there lay hid, he putting his hand to his mouth, ſucked the wound to eaſe the pain by ſucking forth the venom; but his Tongue forthwith ſwelled ſo big, that he could not ſpeak his mind: beſides, his whole arm, even to his ſhoulder, was in like ſort much ſwelled, his pain was ſo vehement, that it hath made him ſwoun twice in my preſence, his face was wan and livid like to a dead body; and though I deſpaired of his recovery, yet not ſuffering him to be quite forſaken, I waſhed his mouth with Treacle diſſolved in white Wine, and gave him ſome thereof to drink, adding thereto ſome *Aqua Vitæ*. I opened his ſwollen arm with many and deep ſcarifications, eſpecially in the place where he was hurt I ſuffered the bloud which was wholly ſerous and ſanious, to flow more plentifully, I waſhed the wounds with Treacle and Mithridate diſſolved in *Aqua Vitæ*, and then I put him exceeding warm in bed, procuring ſweat, and making him to lie awake, leſt ſleep ſhould draw the poiſon inwards to the entrails. I by theſe means ſo far prevailed, that on the day after he was freed from all his malign ſymptoms. Therefore I judged it onely remained for a perfect cure, that the wound ſhould be long kept open and waſhed with Treacle; neither was I deceived, for within a few days he was perfectly recovered. The Cure.

CHAP. XXIV.

Of the bitings of Toads.

THough Toads want teeth, yet with their hard and rough gums they ſo ſtraitly preſs or pinch the part which they ſhall take hold on, that they will force their poiſon thereinto, and ſo over the whole body by the pores of the preſſed part. Moreover they caſt forth their venom by urin, ſpittle, and vomit upon herbs, but chiefly upon Straw-berries, the which they are reported greatly to affect. Hence many ſuddenly and ignorantly catch their deaths. The bites of Toads how harmful.

An Hiſtory. I heard from a man of very good credit, that there were two Merchants not far from the City *Tholouſe*, who whileſt dinner was providing, walked into the Garden that belonged to the Inn, where they gathered ſome Sage leaves, and unwaſhed as they were, put them in their Wine. They had not as yet dined, when being taken with a ſudden *Vertigo*, the whole Inn ſeemed to run round, then loſing their ſight, they fell into a ſwoun, intermixed now and then with convulſions. But they ſtammered with their lips and tongues becoming black; a froward and horrid look, with continual vomiting and a cold ſweat, the fore-runner of death, which preſently ſeized upon them, their bodies becoming exceedingly much ſwollen. But the Juſtices of the place ſuſpecting that they were poiſoned, made the Inn-keeper and the Gueſts to be apprehended; being examined they all conſtantly and with one voice, anſwered, That the dead parties ate of the ſame meat and drink which the reſt did, but onely they put Sage into their Wine. A Phyſician was asked the queſtion whether Sage might be poiſoned? he anſwered it might: but to come to the purpoſe, it muſt appear whether any venemous Creature hath poiſoned the Plant with her ſpittle or venemous ſanies. This which was lightly pronounced, and onely by conjecture, was by the eye found to be true. For at the root thereof there was found a hole in the ground full of Toads, who got out by putting in of warm Water, made it credible that the Plant was poiſoned by their ſpittle and urin, whereby you may underſtand how unwiſely they do, who devour herbs and fruits newly gathered without waſhing. Alſo we muſt take heed leſt falling aſleep in the fields, we lie not near the holes which Toads or other venemous beaſts of the ſame nature, have made their habitation. For thence a venemous or deadly air may be drawn into the Lungs. For the ſame cauſe we muſt abſtain from eating of Frogs in the Moneth of *May*, becauſe then they engender with Toads. Oxen in feeding ſometimes lick up ſmall Toads together with the Graſs, which preſently will breed their great harm, for thereupon the Oxen ſwell ſo big, they often burſt withall. Neither is the venom of Toads deadly onely being taken inwardly, but even ſprinkled upon the skin, unleſs they forthwith wipe the place, and waſh it with urin, water and ſalt. Such as are poiſoned by a Toad turn yellow, ſwell over all their bodies, are taken with an Aſthmatick difficulty of breathing, a *Vertigo*, Convulſion, Swouning, and laſtly by death it ſelf. Theſe ſo horrid ſymptoms are judged inherent in the poiſon of Toads, not onely by reaſon of the elementary qualities thereof, coldneſs and moiſture, which are chiefly predominant therein; but much rather by the occult property which is apt to putrefie the humours of that body whereto it ſhall happen. Therefore it will be convenient to procure vomit, eſpecially if the poiſon be taken by the mouth, to give Clyſters, and to weaken the ſtrength of the poiſon by hot and attenuating Antidotes, as Treacle and Mithridate diſſolved in good Wine; but in concluſion to digeſt it by Baths, Stoves, and much and great exerciſe. *Rondeletius* in his Book *De Piſcibus*, affirms the ſame things of the curſed venom of Toads, as we have formerly delivered: yet that they ſeldom bite, but that they caſt forth either their urin, the which they gather in a great quantity in a large Bladder, or elſe their venemous ſpittle or breath, againſt ſuch as they meet withall or aſſail: beſides the herbs which are tainted by their poiſonous The ſymptoms occaſioned by the poiſon of Toads. May-Frogs. The Cure.

breath,

breath, but much more such as are sprinkled with their spittle or urin, are sufficient to kill such as eat them. The Antidotes are juice of Betony, Plantain, Mugwort, as also the bloud of Tortoises made with flour into Pills, and forthwith dissolved in Wine, and drunken. *Pliny* writes, that the hearts and spleens of Toads resist poison. The vulgar opinion is false, who think that the Toad-stone is found in their heads, which is good against poison.

Antidotes against the poison of Toads.

CHAP. XXV.

Of the stinging of a Scorpion.

A Scorpion is a small creature with a round body, in form of an Egg, with many feet, and a long tail consisting of many joints, the last whereof is thicker, and a little longer than the rest, at the very end thereof is a sting it casts, in some two, hollow and replete with cold poison, the which by the sting, it casts into the obvious body; it hath five legs on each side forked with strong Claws not unlike to a Crab or Lobster, but the two foremost are bigger then the rest; they are of a blackish or sooty colour, they go aside, aside; and oft-times fasten themselves with their mouths and feet so fast to them, that they can scarce be plucked there-hence. There be some who have wings like the wings of Locusts, wasting the Corn and all green things with their biting and burning. Such are unknown in *France*. These fly in divers Countries, like winged Ants. This is likely to be true by that which *Matthiolus* writes, That the Husband-men in *Castile* in *Spain*, in digging the Earth oft-times find a swarm of Scorpions, which betake themselves thither against Winter. *Pliny* writes, that Scorpions laid waste a certain part of *Ethiopia*, by chasing away the Inhabitants. The Ancients made divers kinds of Scorpions, according to their variety or difference of colours, some being yellow, others brown, reddish, ash-coloured, green, whitish, black, dusky; some have wings, and some are without. They are more or less deadly, according to the Countries they inhabit. In *Tuscany* and *Scythia* they are absolutely deadly, but at *Trent*, and in the Island *Pharos* their stinging is harmless. The place stung by a Scorpion presently begins to be inflamed, it waxeth red, grows hard, and swells, and the Patient is again pained; he is one while hot, another while cold; labour presently wearies him, and his pain is some whiles more and some whiles less; he sweats and shakes as if he had an Ague, his hair stands upright, paleness discolours his members, and he feels a pain, as if he were pricked with Needles over all his skin, wind flieth out backwards; he strives to vomit and go to stool, but doth nothing; he is molested with a continual Fever and swouning, which at length proves deadly, unless it be remedied. *Dioscorides* writes, that a Scorpion beaten and laid to the place where he is stung, is a remedy thereto; as also eaten roasted to the same purpose. It is an usual, but certain remedy to anoint the stung place with the oil of Scorpions. There be some who drop into the wound the milky juice of Figs, others apply Calamint beaten, other some use Barly-meal mixed with a decoction of *Rue*. Snails beaten together with their shells, and laid thereon, presently asswage pain. *Sulphur vivum* mixed with Turpentine, and applied Plaster-wise is good, as also the leaves of *Rue* beaten, and laid thereto. In like sort also the herb *Scorpioides*, which thence took its name, is convenient, as also a Briony-root boiled and mixed with a little Sulphur and old Oil. *Dioscorides* affirms, Agarick in Powder, or taken in Wine, to be an Antidote against poisons; verily it is exceeding good against the stingings or bitings of Serpents. Yet the continual use of a Bath stands in stead of all these, as also sweat, and drinking Wine somewhat allaid. Now Scorpions may be chased away by a fumigation of Sulphur and Galbanum; also oil of Scorpions dropped into their holes, hinders their coming forth. Juice of Raddish doth the same. For they will never touch one that is besmeared with the juice of Raddish or Garlick, yea verily, they will not dare to come near him.

CHAP. XXVI.

Of the stingings of Bees, Wasps, &c.

Bees, Wasps, Hornets, and such like, cause great pain in the skin wounded by their stinging, by reason of the curstness of the venom which they send into the body by the wound, yet are they seldom deadly, but yet if they set upon a man by multitudes, they may come to kill him. For thus they have sometimes been the death of Horses: Wherefore because such as are stung by these, by reason of the cruelty of pain, may think they are wounded by a more virulent and deadly Creature, I think it not amiss to set down what signs follow upon their stingings. Great pain presently ariseth, which continueth, until the sting left in the part is taken forth, the part becomes red and swollen, and there riseth a push or little blister. The Cure is, forthwith to suck the wound very hard, and thereby to draw forth the stings, which if they cannot thus be gotten out, the place, if nothing hinder, is to be cut, or else temper Ashes with Leven or Oil, and so apply them: the part also may be very conveniently put into hot Water, and there fomented for an hours space, and at length washed in Sea water. Cresses beaten and applied, asswage the pain and discuss the humour causing the tumor. Ox dung macerated in Oil and Vinegar, and applied hot, doth the same. There are some who apply to the part the same Creatures beaten, as we formerly said of Scorpions; Beans chawed and laid to the part asswage pain. Vinegar, Honey, and Salt, applied exceeding hot, are good, if besides, you dip a cloth therein, and lay it upon the place; *Sulphur Vivum* tempered with spittle hath the same effect. The milky juice of unripe Figs incorporated with Honey, is judged very effectual, but it is much the better, mixed with Treacle. Wasps will not sting nor bite such as anoint their bodies with the juice of Mallows mixed with Oil. They may be quickly chased away with the fume of Brimstone and such like things. A Wasp is said, if she

Symptoms. The Cure.

tipd

find a Viper dead, to dip her ſting in the others poiſon, and thence men learned to empoiſon the heads of their arrows. The rough and hairy Worms, which are commonly called Bear-worms, eſpecially thoſe which breed about a Pine-tree, cauſe great itching, redneſs and ſwelling in the part which they bite, touch, or grate upon very hard. A remedy hereof is Onions beaten with Vinegar, and the reſt of the things formerly mentioned. The bites of Bear-worms.

CHAP. XXVII.

Of the bite of a Spider.

SPiders weave Webs with various art, yet in theſe they always make a lurking hole to lie in wait to catch the intrapped Flies, and ſo to prey upon them. There are many ſorts of Spiders, one is termed *Rhagium*, round and like a Black-berry, whence it taketh the name; it hath a very ſmall mouth under the midſt of the belly, and moſt ſhort feet, as if they were imperfect, her bite is as painful as the ſting of a Scorpion. Another is called *Lupus*, or the Wolf-Spider, becauſe ſhe doth not onely lie in wait to catch Flies, but alſo Bees and Waſps, and all ſuch things as may flee into her Web. The third is named *Myrmecion*, it is larger then an Ant, but headed like one, the body thereof is black, and hath white ſpots or ſtreaks running towards the back. The fourth kind may be called *Veſparium*, in other things reſembling a Waſp, but that it wants the wings; of a reddiſh colour and living onely on herbs. The Ancients have thought their bitings to be venemous. Now their poiſon is therefore thought to be cold, becauſe the ſymptoms thence ariſing are, wind in the belly, refrigerations of the extreme parts of the body, numneſs in the bitten part, with ſenſe of cold and ſhaking. The wound muſt forthwith be waſhed with very hot Vinegar, then muſt you lay thereto Onions, and ſuch like things beaten, then procure ſweat by art, as by Baths and Stoves; yet nothing is more effectual than Treacle and Mithridate. Differences of Spiders.

CHAP. XXVIII.

Of Cantharides *and* Bupreſtes.

C*Antharides* ſhine as it were with a golden colour, acceptable to the eye, by reaſon of the commixture of a blewiſh or greeniſh colour therewith, yet their ſmell is ungrateful. They are hot and dry in the fourth degree, and ſo cauſtick, corroſive and venemous, not onely by reaſon of their cauſtick quality, but becauſe of a ſecret antipathy which they naturally have againſt the urinary parts; which effects they produce not onely if they be taken by the mouth into the body, but even applied outwardly to raiſe bliſters. Such as have taken them inwardly, have the taſte of Pitch, or ſomething like *Cedria*, or Roſin of Cedars in their mouths; it is likely that this taſte proceeds from the humours diſſolved by the putredinous heat in the ſtomach, guts, and liver, and the vapours that there-hence ariſe; for taken inwardly they gnaw, exulcerate and burn all parts from the mouth even to the belly, whence enſueth a bloudy flux, excrements flowing out, which reſemble the waſhings of new killed fleſh. Then follows a burning Fever, *Vertigo*, Madneſs, Reſtleſsneſs, the Brain being diſturbed by the plenty of vapors lifted up from the corroded and burnt parts and humours, which therefore when as they appear, you may know the affect is uncurable. In the parts appointed for the receiving and conveyance of the urin they cauſe a burning inflammation, excoriation, ſtrong and continual erection of the Yard, whence enſues a bloudy and painful ſtrangury, in ſtead of which there oft-times happens or ſucceeds an *Iſchury*, or ſtoppage of the water, whence a gangrene and mortification of the part, and ſo in concluſion of the whole body beſides. When as *Cantharides* are taken inwardly, the remedy is vomiting, drinking of Cows-milk to correct the heat and drineſs, good alſo to mitigate the ulcers, and ſtay the dyſentery; it is good alſo to inject it into the guts by Clyſter. In ſtead thereof Sallet-oil or oil of ſweet Almonds is convenient to retund the acrimony of the poyſon faſtned to the ſides of the ſtomach. The reſt and whole cure of this poiſon you may learn by the following Hiſtory. A certain Whore, the better to enjoy the company of a young Abbot who loved her, entertained him with a banquet, and ſprinkled divers of their Cakes with the powder of *Cantharides*, to incite him the more to Venery. The next day, when as the Abbot caſt forth pure bloud at his Fundament and Yard which ſtood very ſtiff, he called ſome Phyſicians, who preſently by the fore-mentioned ſymptoms, which were all very apparent in him, underſtood that he had *Cantharides* given him: wherefore they purged him upwards with Vomits, and downwards by Clyſters made with French-barley, Rice, a decoction of Mallows, ſeeds of Line and Fœnugreek, Oil of Lillies, Goats ſuet: then preſently after they gave him a little Treacle with a good quantity of Conſerve of Violets, which might draw the poiſon outwards, they gave him Milk to drink, and cauſed him to uſe injections into the urinary paſſage and guts made of refrigerating things, as the juice of Lettuce, Purſlain, Cucumers, Gourds, Melons, ; of tough and viſcid things: that ſo they might ſtick the more eaſily and longer to the ulcerated parts, as the mucilages of *Pſilium*, Mallows, Quince-ſeeds, Syrup of Water-lillies, Poppies, and Violets, freſh Butter, and Oil of ſweet Almonds; and they made him drink onely Barley-water, or the common Ptiſan; they let him feed on Veal, Kid, and Pork boiled with Lettuce, Purſlain, Barley and Violet leaves, the which by their humidity might relax the belly, and by their toughneſs lenifie the roughneſs of aſperity; they applied alſo refrigerating things to the Loins, Share, and *Perinæum* to aſſwage the heat of the urin. At length they put him into a warm Bath, and to conclude, they left nothing unattempted to draw forth or weaken the poiſon. But all their endeavours were in vain, for the Abbot died, not being deſtitute of remedies conveniently preſcribed, but overcome by the contumacious malignity of the poiſon. The Phyſicians pains had far better ſucceſs in a certain Gentlewoman againſt this kind of affect; her

The deſcription of *Cantharides*. Enemies to the bladder. Symptoms. An Hiſtory. The Cure. An Hiſtory.

her whole face was deformed with red, fiery and filthy puſtles, ſo that all ſhunned her company as if ſhe had been troubled with a Leproſie, and were ready to forbid her the ſociety of men; ſhe came to *Paris*, and calling for *Hollerius* and *Grealmus* Phyſicians, my ſelf and *Caballus* being Surgeons, ſhe made a grievous complaint, and beſought us earneſtly for ſome remedy againſt ſo great a deformity of her face; having diligently conſidered her caſe, we pronounced her free from a Leproſie, but we judged it fit to apply to her whole face a veſicatory of *Cantharides*, three or four hours after the application whereof, the Medicin being come to work its effect, her bladder began to burn exceedingly, and the neck of her womb to ſwell with gripings, continual vomitings, making of water and ſcouring, a troubleſome agitation of the body and members, a burning and abſolutely fiery Fever. I forthwith called the Phyſicians, it was decreed that ſhe ſhould drink Wine plentifully, and that it ſhould be injected by the fundament into the guts, and by the urinary paſſage into the bladder and the neck of the womb, and that ſhe ſhould keep her ſelf, until the pain were mitigated, in a warm Bath made of the decoction of Line-ſeeds, the roots and leaves of Mallows, Marſh-mallows, Violets, Henbane, Purſlain, and Lettuce; and her loins and genitals ſhould be anointed with *unguentum roſatum* and *populeon* ſtirred and incorporated with *oxycrate*. By theſe means all the ſymptoms were mitigated. Her face in the interim roſe all in a bliſter, and much purulent matter came out thereof, and ſo the deformity wherewith ſhe was formerly troubled, vaniſhed away for ever, ſo that within a while after ſhe was married, and had many children, and is yet living in perfect health.

Cantharides applied to the head, ulcerate the bladder.

A remedy againſt Leprous puſtles.

Bupreſtes alſo are of the kind of *Cantharides*, being like unto them in ſhape and faculty. If an Ox or Sheep or any other Creature ſhall in feeding devour one of them, he ſhall preſently ſwell up like a Tun; whence alſo they take their name: if a Man take them inwardly, he ſhall endure the like ſymptoms as in taking *Cantharides*; and over and beſides, both his ſtomach and his whole belly ſhall be wonderfully puffed up, as if he had a Dropſie. It is probable that this inflation like a Tympany happeneth by humours diffuſed and reſolved into vapours by the fiery acrimony of the venom. They are to be cured after the ſame manner as ſuch as have drunk *Cantharides*. Laſtly, As in all other poiſons which are taken into the body, ſo alſo here, if the poiſon taken by the mouth be thought as yet to be in the ſtomach, you muſt then procure vomit. If it be gotten into the guts, then muſt it be drawn away by Clyſters. If diffuſed over all the body, then muſt you make uſe of ſuch things as may drive the poiſon forth from the center to the circumference, ſuch as are Baths and Stoves.

The reaſon of the name.

CHAP. XXIX.

Of Horſe-Leeches.

HOrſe-Leeches are alſo venemous, eſpecially ſuch as live in muddy ſtinking ditches, for thoſe are leſs hurtful which reſide in clear and pure waters. Wherefore, before they are to be uſed in caſes of Phyſick, they muſt be kept for ſome days ſpace in clean water, that ſo they may purge themſelves; otherwiſe they may chance to leave ulcers hard to cure in the places whereto they ſhall be applied, and the rather, if they be violently plucked off, becauſe they by that means leave their teeth faſtned in the part. Now he which by chance hath ſwallowed a Horſe-leech, muſt be asked in what part he feeleth her, that is, the ſenſe of her ſucking: For if ſhe ſtick in the top of the throat or gullet, or in the midſt thereof, the part ſhall be often waſhed with muſtard diſſolved in vinegar. If ſhe be near the orifice of the ventricle, it is fit that the Patient by little and little ſwallow down Oil with a little Vinegar. But if ſhe faſten to the ſtomach, or the bottom of the ventricle, the Patient, by the plucking off the part, ſhall perceive a certain ſenſe of ſucking, the Patient will ſpit bloud, and will for fear become Melancholick. To force her thence, he ſhall drink warm Water with Oil; but if ſhe cannot ſo be looſed, then ſhall you mix aloes therewith, or ſomething endued with the like bitterneſs, for ſhe will by that means leave her hold and ſo be caſt forth by vomit. You may perceive this by ſuch as are applied to the skin, on the external parts; for by the aſperſion of bitter things, whether they be full or empty, they will forſake their hold. Then ſhall the Patient take aſtringent things which may ſtop the bloud flowing forth of the bitten part, ſuch is Conſerve of Roſes, with *Terra ſigillata*, Bole-Armenick, and other more aſtringent things, if need ſo require. For if they ſhall adhere to ſome greater branch of ſome Vein or Artery, it will be more difficult to ſtop the flowing bloud.

What Horſe-leeches moſt virulent.

Divers remedies according to the diverſity of the parts.

But for that not the Earth onely, but the Sea alſo produceth venemous Creatures, we will in like ſort treat of them, as we have already done of the other, beginning with the Lampron.

CHAP. XXX.

Of the Lampron.

THe *Lampron*, called in Latin *Muræna*, is a Sea-fiſh, ſomething in ſhape reſembling a Lamprey, but ſhe is bigger and thicker, and hath a larger mouth, with teeth long, ſharp, and bending inwards, ſhe is of a dusky colour, diſtinguiſhed with whitiſh ſpots, and ſome two cubits length. The Ancients had them in great eſteem, becauſe they yield good nouriſhment, and may be kept long alive in Pools or Ponds, and ſo taken as the owners pleaſe, to ſerve their Table, as it is ſufficiently known by the Hiſtory of the *Roman Craſſus*. She by her biting induceth the ſame ſymptoms as the Viper, and it may be helped by the ſame means. Verily the Lampron hath ſuch familiarity with the Viper, that leaving her natural element the Sea, ſhe leapeth athore, and ſeeketh out the Viper in her den to join with her in copulation, as it is written by *Ælian* and *Nicander*.

The deſcription of the Lampron.

The natural friendſhip of the Lampron and Viper.

CHAP.

CHAP. XXXI.

Of the Draco marinus, *or ſea-Dragon.*

THe ſea-Dragon, called by the French *viva*, for his vivacity (and by the Engliſh a *Viver*, or as ſome ſay, a *Qua-viver*) becauſe being taken in fiſhing, and drawn out of the ſea, ſhe is ſaid long to ſurvive. Her pricks are poiſonous; but chiefly thoſe that are at the edges of her gills. Which is the reaſon that Cooks cut off their heads before they ſerve them up to the table; and at *Roven* the fiſhermen lay them not upon their ſtalls to ſell before they have cut off their head. The wounded part of ſuch as are hurt, pains them much with inflammation, a feaver, ſwouning, gangrene and deadly mortification, unleſs it be quickly withſtood. Not very long ago the wife of *Mounſieur Fromaget*, Secretary of the requeſts, was wounded with a prick of this fiſh in her middle finger, there followed a ſwelling and redneſs of the part; without much pain; but perceiving the ſwelling to increaſe, being made more wary by the miſchance of her neighbour the wife of *Mounſieur Bargelonne*, Lieutenant particular in the Chaſtelet of *Paris*, who died not long before by the like accident being neglected, ſent for me; I underſtanding the cauſe of her diſeaſe, laid to her pained finger and her whole hand, beſides a pultis made of a great Onion roſted under the coals, leaven, and a little treacle. The next day I wiſhed her to dip her whole hand into warm water, ſo to draw forth the poyſon, then I divided the skin about it with much ſcarification but only ſuperficiarily; to the gaſhes I applied Leeches, which by ſucking drawing a ſufficient quantity of blood, I put thereto treacle diſſolved in *aqua vitæ*. The next day the ſwelling was aſſwaged, and the pain eaſed, and within a few days ſhe was perfectly well. *Dioſcorides* writes, that this fiſh divided in the midſt, and applied to the wound, will cure it.

Symptoms. An hiſtory. The cure.

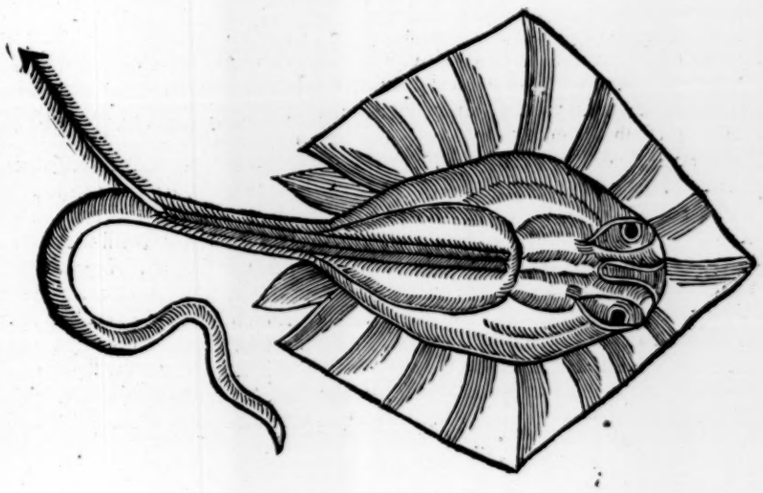
CHAP. XXXII.

Of the Paſtinaca marina, *or Sting-Ray, which ſome call the* Fierce-claw.

SUch as are ſtung by a Sting-Ray (as *Aetius* hath written) the place of the wound doth manifeſtly appear; there enſues thereon laſting pain and the numneſs of the whole body. And ſeeing that it hath a ſharp and firm ſting, whereby the nerves by the deepneſs of the ſtroke may be wounded, it ſo happpens that ſome die forthwith, their whole bodies ſuffering convulſions. Moreover, it will kill even the very trees into whoſe roots it is faſtned. Yet *Pliny* affirms, that it is good againſt the pain of the teeth, if the gums be ſcarified therewith, yea, and it being made into powder with white Hellebore, or of it ſelf, will cauſe teeth to fall out without any pain, or any violence offered to them. This fiſh is good meat, the head and tail excepted; ſome of them have two ſtings, other-ſome but one; theſe ſtings are ſharp like a ſaw with the teeth turning towards their heads. *Oppianus* writes, that their ſtings are more poyſonous than the Perſians arrows, for the force of the poyſon remaineth, the fiſh being dead; which will kill not only living creatures, but plants alſo. Fiſhermen, when they catch this fiſh, preſently ſpoil him of his ſting, leſt they ſhould be hurt therewith. But if by chance they be hurt therewith, then take they forth his liver, and lay it to the wound; furthermore, the fiſh being burnt and made into powder, is the true Antidote of his wound. The Sting-Ray lives in muddy places near the ſhore, upon the fiſhes that he hunteth and catcheth with his ſting, having the teeth thereof turned towards his head for the ſame purpoſe. He is not unlike a Ray, and I have here given you his figure.

The ſymptoms. *Lib. 9. cap. 48.* The virulency of her ſting.

The figure of a Sting-Ray.



CHAP. XXXIII.

Of the Lepus Marinus, *or Sea-hare.*

The deſcription of the Sea-hare.

Pliny calls the Sea-hare, a maſs or deformed piece of fleſh. *Galen* ſaith it is like a Snail taken forth of the ſhell. It is exceedingly poyſonous in the judgment of the Ancients, wherefore it is not amiſs to ſet down the deſcription of it, leſt we might eat it at unawares, too earneſtly view it, or ſmell thereto, as alſo that we may uſe it againſt the poyſon thereof; it is an inhabitant not only of the ſea, but alſo of lakes of ſea-water, eſpecially ſuch as are muddy; it is of the ſame colour as the hair of the land-hare is, it hath a whole in the head, out of which he putteth a certain piece of fleſh, and plucks it back again when as he is ſeen, *Paulus*, *Aetius*, *Pliny*, *Galen* and *Nicander* are of one opinion, and agree in this, that if a woman big with child do too earneſtly look upon one, ſhe will vomit, and preſently after abort. They which have drunk this poyſon, ſaith *Dioſcorides*, are troubled with pain in the belly, and their urine is ſtopped. If they do make water, then is it bloody; they run down with ſtinking ſweat, which ſmells of fiſh; a cholerick vomiting ſometimes mixed with blood enſues thereon.

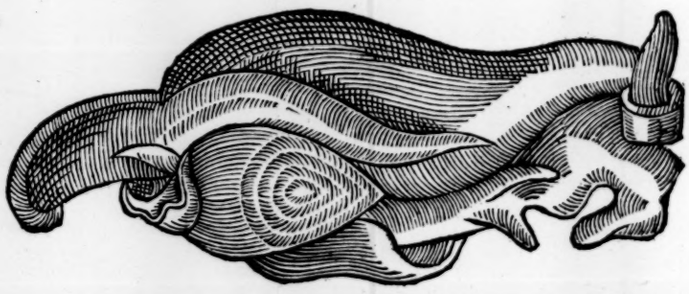
The earneſt beholding of a Sea-hare will cauſe abortion.

The ſymptoms.

Aetius writes, that all their bodies turn yellow, their faces ſwell, and their feet, but chiefly their genital member, which is the cauſe they cannot make water freely. *Galen* writes that it is the property of the Sea-hare to exulcerate the lungs. Their Antidote is Aſſes-milk, muskadine, or honied wine continually drunken, or a decoction of the roots and leaves of Mallows. It is good for the falling away of the hair. I have here given you the figure thereof out of *Rondeletius* his book of Fiſhes.

The Antidote.

The figure of a Sea-hare.



CHAP. XXXIV.

Of the Poyſon of Cats.

A Cats hair moſt ſubject to choak.

NOt only the brain of a Cat, being eaten, is poyſonous and deadly to man, but alſo their hair, their breath, yea and their very preſence to ſome prove deadly. For although any hair devoured unawares, may be enough to choak one, by ſtopping the inſtruments of reſpiration; yet the hairs of a Cat by a certain occult property, are judged moſt dangerous in this caſe: beſides alſo, their breath is infected with a certain hurtful malignity. For *Matthiolus* ſaith, that he knew ſome, who being ſo delighted with Cats, that they would never go to bed without them, have by ſo often drawing in the air with their breath, fallen into a conſumption of the lungs, which occaſioned their death. Moreover, it is manifeſt that the very ſight of their eyes is hurtful, which appears by this, that ſome but ſeeing or hearing them, preſently fall down in a ſwound; yet I would not judge that to happen by the malicious virulency of the Cat, but alſo by the peculiar nature of the party, and a quality generated with him, and ſent from heaven. When as, ſaith *Matthiolus*, a certain *German* in winter-time, came with us into a ſtove to ſupper, whereas were divers of our acquaintance, a certain woman, knowing this mans nature, leſt that he ſhould ſee her kitling which ſhe kept, and ſo ſhould go away in chaſe, ſhe ſhut her up in a cup-board in the ſame chamber: But for all that he did not ſee her, neither heard her cry, yet within a little ſpace, when he had drawn in the air, infected with the breath of the Cat, that quality of temperament, contrary, or enemy to Cats, being provoked, he began to ſweat, to look pale, and to cry out (all of us admiring it) *Here lies a Cat in ſome corner or other*; neither could he be quiet till the Cat was taken away. But ſuch as have eaten the brains of a Cat, are taken with often *Vertigoes*, and now and then become fooliſh and mad: they are helped by procuring vomit, and taking the Antidote againſt this poyſon, that is, half a ſcruple of Musk, diſſolved and drunk in wine. There be ſome who preſcribe the confection *Diamoſcum* to be taken every morning four hours before meat. By this you may gather, that it is not ſo fabulous that the common ſort report, that Cats will kill or harm children; for lying to their mouths with the weight of their whole bodies, they hinder the paſſage forth of the fuliginous vapors, and the motion of the cheſt, and infect and ſtifle the ſpirits of tender infants by the peſtiferous air aad exhalation which they ſend forth.

The breath of a Cat moſt hurtful to the lungs.

An hiſtory.

A wonderful antipathy between a man and a Cat.

The Antidote againſt the brains of a Cat.

Cats dangerous for children.

CHAP.

CHAP. XXXV.

Of certain Poysonous Plants.

HAving described the poysons that come from living creatures, I come to speak of such as are from Plants, beginning with the *Sardonian* herb, which is also also called *Apium risus*: this is a kind of *Ranunculus*, or Crow-foot: (and, as it is thought, the round leaved water Crow-foot, called Marsh-Crow-foot, or Spear-wort) it taketh away the understanding of such as have eaten thereof, and by a certain distention of the nerves, contracts the cheek, so that it makes them look as if they laughed; from this affect came that proverbial speech of the *Sardonian laughter*, taken in evil part. His *Bezoar*, as one may term it, is the juice of Balm. *Apium risus.* His Antidote

The juice, fruit, and substance of *Napellus* taken inwardly, killeth a man the same day, or at the fartherst in three days: yea and such as escape the deadly force thereof by the speedy and convenient use of Antidotes, fall into an hectick feaver, or consumption, and become subject to the falling-sickness, as *Avicen* affirmeth. And hence it is, that barbarous People poyson their arrows therewith: For the lips are forthwith inflamed, and the tongue so swells, that by reason thereof, it cannot be contained in the mouth, but hangs out with great horror; their eys are inflamed, and stand forth of their head, and they are troubled with a *Vertigo* and swounding; they become so weak that they cannot stir their legs, they are swoln and puffed in their bodies, the violence of poyson is so great. The Antidote thereof is a certain little creature like a * Mouse, which is bred, and lives on the root of *Napellus*, being dried and drunk in powder, to the weight of two drams. In want hereof you may use the seed of Raddish or Turnips to drink, and anoint the body also with oil of Scorpions. *Napellus*, or Monks-hood. * Our Author deceived by the *Arabians*. who (it may be) mistook

the Greek word μῦα and instead thereof read μυῖ for a Flie, a Mouse: for there is no Mouse to be found, but whole swarms of Flies, which feed thereon, you may find the description of an Antidote made with them in *Lobels Stirp. adverſ. Pag.* 303.

Doricinum and *Solanum Manicum*, or deadly Night-shade, are not much different in their mortal symptoms or effects. *Doricinum* being drunk, resembleth milk in taste, it causeth continual hicketting, it troubleth the tongue with the weight of the humor, it causeth blood to be cast forth of the mouth, and certain mucous matter out of the belly, like that which cometh away in the bloudy flux. A remedy hereto are all shell-fishes, as well crude as rosted, also Sea-Lobsters and Crabs, as the broth or liquor wherein they are boyled, being drunk. Now the root of *Solanum Manicum* drunk in the weight of one dram in wine, causeth vain and not unpleasing imaginations, but double this quantity causes a distraction or alienation of the mind for three days, but four times so much kills. The remedies are the same as these prescribed against *Doricinum*. *Doricinum* and *Solanum Manicum*, or deadly Night-shade. The symptoms.

Hen-bane drunken, or otherwise taken inwarly by the mouth, causeth an alienation of the mind of like drunkenness; this also is accompanied with an agitation of the body, and exsolution of the spirits like swounding. But amongst others, this is a notable symptom, that the patients so dote, that they think themselves to be whipped: whence their voice becomes so various, that sometimes they bray like an Ass or Mule, neigh like an Horse, as *Avicen* writes. The Antidote is Pistick nuts eaten in great plenty, treacle also and mithridate dissolved in sack, also wormwood, *rue* and milk. Hen-bane. The Antidote.

Of mushroms, some are deadly and hurtful of their own kind and nature, as those, which broken presently become of divers colous, and putrefie: (such, as *Avicen* saith, those are which be found of a grayish or blewish colour) others though not hurtful in quality, yet eaten in greater measure than is fitting, become deadly; for seeing by nature they are very cold and moist, and consequently abound with no small viscosity, as the excrementitious phlegm of the earth or trees whereon they grow, they suffocate and extinguish the heat of the body, as overcome by their quantity, and strangle as if one were hanged, and lastly kill. Verily I cannot chuse, but pitty Gourmondizers, who though they know that Mushroms are the seminary and gate of death, yet do they with a great deal of do, most greedily devour them; I say, pittying them, I will shew them, and teach them the art, how they may feed upon this so much desired dish, without the endangering of their health. Know therefore that Mushroms may be eaten without danger, if that they be first boyled with wild pears: but if you have no wild pears, you may supply that defect with others which are the most harsh, either newly gathered, or dried in the Sun. The leaves, as also the bark of the same tree, are good, especially of the wild; for pears are their Antidote: yet *Conciliator* gives another, to wit, garlick eaten crude; whereunto in like sort vinegar may be fitly added, so to cut and attenuate the tough, viscous and gross humors, heaped up, and in danger to strangle one by the too plentiful eating of Mushroms, as it is delivered by *Galen*. Mushroms. Their Antidote. *In 5. Epidem.*

Ephemerum, which some call *Colchicum* or *Bulbus silvestris*, that is, medow saffron, being taken inwardly, causeth an itching over all the body, no otherwise than those that are nettled, or rubbed with the juice of a Squill. Inwardly they feel gnawings, their stomach is troubled with a great heavines, and in the disease increasing, there are strakes of blood mixed with the excrements. The Antidote thereof is womans milk, Asses or Cows-milk drunken warm, and in a large quantity. *Colchicum*, or Medow-saffron. The Antidote.

Mandrag taken in great quantity, either the root or fruit causeth great sleepines, sadnes, resolution and languishing of the body, so that after many scritches and gripings, the patient falls asleep in the same posture that he was in, just as if he was in a Lethargy. Wherefore in times past they gave Mandrag to such as were to be dismembred. The apples, when as they are ripe, and their seeds taken forth, may be safely eaten, for being green and with their seeds in them, they are deadly. For their ariseth an intolerable heat, which burns the whole surface of the body, the tongue and mouth wax dry, by reason whereof they gape continually, so take in the cold air; and in which Mandrag.

The cure. caſe unleſs they be preſently helped, they die with convulſions. But they may eaſily be helped, if they ſhall preſently drink ſuch things as are convenient therefore. Amongſt which, in *Conciliators* opinion, excel raddiſhſeeds eaten with ſalt and bread for the ſpace of three days. Sneeſing ſhall be procured, if the former remedy do not quickly refreſh them, and a decoction of Coriander or Penny-royal in fair water ſhall be given them to drink warm.

Opium. The ungrateful taſte of the juice of black poppy, which is termed *Opium*, as alſo of Mandrag, eaſily hinders them from being put into meat or drink, but that they may be diſcerned, and chiefly for that neither of them can kill, unleſs they be taken in a good quantity. But becauſe there is danger, leſt they be given in greater quantity than is fitting by the ignorance of Phyſicians, or Apothecaries, you may by theſe ſigns find the error.

Why not uſed in poyſonings.

The ſymptoms. There enſues heavy ſleep, with a vehement itching, ſo that the patient oft-times is forced thereby to caſt off his dull ſleep wherein he lay, yet he keeps his eye-lids ſhut being unable to open them. By this agitation there flows out ſweat, which ſmells of *opium*, the body waxeth pale, the lips burn, the jawbone is relaxed, they breath little and ſeldom. When as their eyes wax livid, unleſs they be drawn aſide, and that they are depreſſed from their orb, we muſt know that death is at hand. The remedy againſt this is two drams of the powder of *Caſtoreum* given in wine.

Hemlock. Hemlock drunken, cauſeth *Vertigoes*, troubleth the mind, ſo that the patients may be taken for mad men; it darkneth the ſight, cauſeth hicketting, and benums the extreme parts, and laſtly ſtrangles with convulſions, by ſuppreſſing or ſtopping the breath of the Artery. Whereof at the firſt, as in other poyſons, you muſt endeavour to expel it by vomit; then inject clyſters, to expel that which is got into the guts; then uſe wine without mixture, which is very powerful in this caſe. *Peter Aponenſis* things the Bezoar or Antidote thereof, to be a potion of two drams of Treacle, with a decoction of *Dictamnus* or *Gentian* in wine. He which further deſires to inform himſelf of the effects of Hemlock, let him read *Matthiolus* his commentary upon *Dioſcorides*, where he treats of the ſame ſubject.

The ſymptoms.

The Antidote.

In lib. 6. Dioſc.

Aconitum. *Aconitum* called of *Aconis* a town of the *Periendines*, whereas it plentifully grows. According to *Matthiolus*, it kills Wolves, Foxes, Dogs, Cats, Swine, Panthers, Leopards, and all wild beaſts, mixed with fleſh, and ſo devoured by them, but it kills mice by only ſmelling thereto. Scorpions, if touched by the root of Aconite, grow numb and torpid, and ſo die thereof; arrows or darts dipped therein, make incurable wounds. Thoſe who have drunk Aconite, their tongue forthwith waxeth ſweet with a certain aſtriction, which within a while turneth to bitterneſs; it cauſeth a *Vertigo*, and ſhedding of tears, and a heavineſs or ſtraitneſs of the cheſt and parts about the heart; it makes them break wind downwards, and makes all the body to tremble. *Pliny* attributes ſo great celerity and violence to this poyſon, that if the genitals of female creatures be touched therewith, it will kill the ſame day; there is no preſenter remedy than ſpeedy vomiting after the poyſon is taken. But *Conciliator* thinks *Ariſtolochia* to be the Antidote thereof. Yet ſome have made it uſeful for man by experimenting it againſt the ſtinging of Scorpions, being given warm in wine; for it is of ſuch a nature that it killeth the party unleſs it find ſomething in him to kill, for then it ſtrives therewith as if it had found an adverſary: But this fight is only when as it finds poyſon in the body; and this is marvelous that both the poyſons being of their own nature deadly, ſhould die together, that man may by that means live. There are divers ſorts thereof, one whereof hath a flower like an helmet, as if it were armed to mans deſtruction; but the other here delineated hath leaves like to ſows-bread or a cucumber, and a root like the tail of a Scorpion.

Lib. 27. cap 2.

Aconite good againſt the poiſon of Scorpions.

The differences.

The figure of a certain kind of Aconite.

Trees alſo are not without poyſon, as the Yew and Walnut tree may witneſs; Cattel if they feed on the leaves of Yew, are killed therewith. * But men, if they ſleep under it, or ſit under the ſhadow thereof, are hurt therewith, and oft-times die thereof. But if they eat it, they are taken with a bloudy flux, and a coldneſs over all their bodies, and a kind of ſtrangling or ſtoppage of their breath. All which things the Yew cauſeth, not ſo much by an elementary and cold quality, as by a certain occult malignity, whereby it corrupteth the humors and ſhaveth the guts. The ſame things are good againſt this, as we have ſet down againſt Hemlock; *Nicander* affirms, that good wine being drunken, is a remedy thereto. There is alſo a malignity in a Walnut-tree, which *Grevinus* affirms that he found by experience, whilſt he unawares ſate under one, and ſlept there in the midſt of Summer; For waking, he had a ſenſe of cold over all his body, a heavineſs of his head, and pain that laſted ſix days. The remedies are the ſame as againſt the Yew.

The Yew.

* This is true in ſome countries, as in *Provence*, *Italy*, *Greece*, &c. but it is not ſo here with us in *England*, as both *Lobel* and daily experience can teſtifie.

The Antidote.

The Walnut tree

CHAP.

CHAP. XXXVI.

Of Bezoar, *and Bezoartick medicines.*

FOr that we have made mention of *Bezoar*, in treating of the remedies of poysons, I judge I shall not do amiss, if I shall explain, what the word means, and the reason thereof. Poyson absolutely taken is that which kills by a certain specifick antipathy contrary to our nature. So an Antidote or Counter-poyson is by the Arabians in their mother tongue, termed *Bedezahar*, as the preservers of life. This word is unknown to the Greeks and Latines, and in use only with the Arabians and Persians, because the thing it self first came from them as it is plainly shewed by *Garcias ab horto*, Physician to the Vice-roy of the Indies, in his history of the Spices and *Simples* of the East-Indies. In *Persia* (saith he) and a certain part of *India* is a certain kind of Goat called *Pazain* (wherefore in proper speaking, the stone should be termed *Pazar* of the word *Pazain*, that signifies a Goat, but we corruptly term it *Bezar* or *Bezoar*) the colour of this beast is commonly reddish, the height thereof indifferent, in whose stomach concretes the stone called *Bezoar*; it grows by little and little about a straw or some such like substance in scales like to the scales of an onion, so that when as the first scale is taken off, the next appears more smooth and shining as you still take them away, the which amongst others, is the sign of good *Bezoar* and not adulterate. This stone is found in sundry shapes, but commonly it resembles an Acorn or Date-stone; it is sometimes of a sanguin colour, and otherwhiles of a hony-like or yellowish colour, but most frequently of a blackish or dark green, resembling the colour of mad apples, or else of a Civet-Cat. This stone hath no heart or kernel in the midst, but powder in the cavity thereof, which is also of the same faculty. Now this stone is light and not very hard, but so that it may easily be scraped or rasped like Alablaster, so that it will dissolve, being long macerated in water; at first it was common amongst us, and of no very great price, because our people who trafficked in Persia, bought it at an easie rate. But after that the faculties thereof were found out, it began to be more rare and dear, and it was prohibited by an Edict from the King of the Country, that no body should sell a Goat to the stranger-Merchants, unless he first killed him and took forth the stone, and brought it to the King. Of the notes by which the stone is tried, (for there are many counterfeits brought hither) the first is already declared; the other is, it may be blown up by the breath, like an Oxes hide; for if the wind break through, and do not stay in the density thereof, it is accounted counterfeit. They use it induced thereto by our example, not only against poysons, but also against the bites of venemous beasts, The richer sort of the Countrey purge twice a year, to wit, in *March* and *September*; and then, five days together they take the powder of this stone macerated in Rose-water, the weight of ten grains at a time: for by this remedy they think their youth is preserved, as also the strength of their members. There be some who take the weight of thirty Grains; yet the more wary exceed not twelve grains. The same Author addeth that he useth it with very good success in inveterate melancholick diseases, as the itch, scab, tetters and leprosie; therefore by the same reason it may well be given against a quartane feaver. Besides he affirmeth for certain that the powder contained in the midst of the stone, put upon the bites of venemous beasts, presently freeth the patient from the danger of the poyson, as also applied to the pestilent Carbuncles, when they are opened, it draws forth the venom. But because the small pox and meazles are familiar in the Indies, and oft-times dangerous, it is there given with good success, two grains each day in Rose-water. *Matthiolus* subscribeth to this opinion of *Garcis*, witnessing that he hath found it by frequent experience that this stone by much exceeds not onely other *simple* medicines of this kind, but also such as are termed *theriacalia*, and what other Antidotes soever, hereto also consents *Abdanalarach*; We (saith he) have seen the stone which they call *Bezahar*, with the sons of *Almarima* the observer of the Law of the God; with which stone he bought a stately and almost princely house at *Corduba*.

What poyson is.

A sign of true Bezoar.

The use of Bezoar.

Lib. 5. in Dioscor. cap. 73.

Some years ago, a certain Gentleman who had one of these stones which he brought out of *Spain*, bragged before King *Charles* then being at *Clermont* in *Avern*, of the most certain efficacy of this stone against all manner of poysons. Then the King asked of me, whether there were any Antidote which was equally and in like manner prevalent against all poysons? I answered, that nature could not admit it; for neither have all poysons the like effects, neither do they arise from one cause; for some work from an occult and specifick property of their whole nature, others from some elementary quality which is predominant. Wherefore each must be withstood with its proper and contrary Antidote; as to the hot, that which is cold, and to that which assails by an occult propriety of form, another which by the same force may oppugn it, and that it was an easie matter to make trial hereof on such as were condemned to be hanged. The motion pleased the King, there was a Cook brought by the Jaylor who was to have been hanged within a while after for stealing two silver dishes out of his masters house. Yet the King desired first to know of him, whether he would take the poyson on this condition, that if the Antidote which was predicated to have singular power against all manner of poysons, which should be presently given him after the Poyson, should free him from death, that then he should have his life saved. The Cook answered chearfully, that he was willing to undergo the hazard, yea, and greater matters, not only to save his life, but to shun the infamy of the death he was like to be adjudged to: Therefore he then had poyson given him hy the Apothecary that then waited, and presently after the poyson, some of the *Bedezahar* brought from Spain, which being taken down, within a while after he began to vomit, and to avoid much by stool with grievous torments, and to cry out that his inward parts were burnt with fire. Wherefore being thirsty, and desiring water, they gave it him; an hour after, with the good leave of the Jaylor, I was admitted to him; I find him on the

An history.

No one thing can be an Antidote against all poysons.

The cauſtick force of *ſublimate*.

ground going like a beaſt upon hands and feet, with his tongue thruſt forth of his mouth, his eyes fiery, vomiting, with ſtore of cold ſweats, and laſtly, the blood flowing forth by his ears, noſe, mouth, fundament and yard. I gave him eight ounces of oil to drink, but it did him no good, for it came too late. Wherefore at length he died in great torment and exclamation, the ſeventh hour from the time that he took the poyſon being ſcarcely paſſed. I opened his body in the preſence of the Jaylor and four others, and I found the bottom of his ſtomach black and dry, as if it had been burnt with a cautery; whereby I underſtood he had *ſublimate* given him; whoſe force the Spaniſh *Bedezahar* could not repreſs, wherefore the King commanded to burn it.

CHAP. XXXVII.

Of Mineral Poyſons.

MInerals or metals are either ſo taken forth of the bowels of the earth, or elſe from furnaces. Of theſe many are poyſonous, as arſenick, *ſublimate*, *plaſter*, ceruſs, litharge, verdegreaſe, orpiment, filings of Iron, braſs, the load-ſtone, lime and the like. Such as have taken *ſublimate*, the tongue and jaws become ſtraitned and rough, as if they had drunk the juice of unripe *ſervices*: you cannot amend this aſperity with lenitive gargariſms but with labour and time; for as ſoon as it deſcends into the ſtomach, it ſticketh to it. Therefore preſently after it frets and exulcerates; it cauſeth unquenchable thirſt, and unexplicable torments; the tongue is ſwoln, the heart faints, the urine is ſuppreſt, the cheſt can ſcarce perform the office of breathing, the belly is griped, and ſo great pains happen to other extreme parts, that unleſs they be helped, patient will die; for preſently will grow upon them, unleſs it be ſpeedily hindred, the devouring and fiery fury of the poyſon, renting or eating into the guts and ſtomach, as if they were ſeared with an hot iron, and blood floweth out of the ears, noſe, mouth, urinary paſſage and fundament, and then their caſe is deſperate. Theſe and who elſe ſoever ſhall take any corroding poyſon, ſhall be cured with the ſame remedies, as thoſe that have taken *Cantharides*.

The ſymptoms of ſuch as have taken *ſublimate*.

Verdegreaſe.

Verdegreaſe ſo ſtops the inſtruments of reſpiration that it ſtrangles ſuch as have taken it. The cure is performed by the ſame remedies as help thoſe that have taken Arſenick.

Litharge.

Litharge cauſeth a heavineſs in the ſtomach, ſuppreſſeth urine, makes the body ſwelled and livid. We remedy this, by giving a vomit preſently, then after it pigeons-dung mixed in ſtrong wine and ſo drunken. *Peter Aponenſis* wiſheth, to give oil of ſweet almonds and figs. Alſo it is good to give relaxing and humecting clyſters, and to anoint the belly with freſh butter or oil of lillies.

The ſcales of Braſs.

The ſcales of Braſs drunk, by troubling the ſtomach, cauſe a caſting and ſcouring. The remedy is, if the patient forthwith vomit, if he enter into a bath made of the decoction of Snails, if he anoint his belly and breaſt with butter or oil of lillies, and inject laxative and humecting clyſters.

The Loadſtone

The loadſtone makes them mad that take it inwardly. The Antidote thereof is the powder of gold, and an emerald drunk in ſtrong wine, and clyſters of milk and oil of ſweet almonds.

Filings of Lead and ſcales of Iron.

The filings of Lead, and the ſcales or *refuſe* of Iron, cauſe great torment to ſuch as take them down. The which we help with much milk and freſh butter diſſolved therein, or with oil of ſweet almonds drawn without fire, with relaxing and humecting clyſters uſed until the pain be perfectly aſſwaged.

Arſenick, Roſe-aker or Rats-bane.

Riſagallum, Roſe-aker or Rats-bane, becauſe it is of a moſt hot and dry nature, induces thirſt and heat over all the body, and ſo great colliquation of all the humors, that although the patients by medicines ſpeedily given eſcape death, yet can they not during the reſidue of their lives, uſe their members as they formerly did, being deſtitute of their ſtrength, by reaſon of the great drineſs and contraction of the joints. The Antdiote thereof is oil of Pine-kernels ſpeedily given, and that to the quantity of half a pint; then procure vomit, then give much milk to drink, and clyſters of the ſame, and let them ſup up fat broths.

Unquenched Lime and Orpiment.

Unquencht Lime and *Auripigmentum*, or Orpiment drunk, gnaw the ſtomach and guts with great tormenting pain, and cauſe unquenchable thirſt, an aſperity of the jaws and throat, difficulty of breathing, ſtopping of the urine, and a bloody flux, They may be helped by oil, fat, humecting, and relaxing things which retund the acrimony by lenitive potions, and ſuch as lubricate the belly; as alſo by creams, and the mucilages of ſome ſeeds, as with a decoction of the ſeeds of *Line*, mallows, marſh-mallows and other things ſet down at large in the cure of *Cantharides*.

Aqua fortis.

Thoſe exceeding acrid and ſtrong waters wherewith Goldſmiths and Chymiſts ſeparate Gold from ſilver, being taken into the body, are hard to cure, becauſe they are forthwith diffuſed over all the body, firſt burning the throat and ſtomach. Yet it may be helped by the means preſcribed againſt unquenched Lime and Orpiment.

Ceruſs.

Ceruſs cauſeth hicketting and a cough, makes the tongue dry, and the extreme parts of the body numb with cold, the eyes heavy to ſleep. The patients very often in the midſt of the day ſee ſome vain phantaſie or apparition, which indeed is nothing; they make a black and oftentimes bloody water, they die ſtrangled unleſs they be helped. The Antidote in the opinion of *Aetius* and *Avicen*, is Scammony drunk in new wine, or hony and wine, and other diuretick things, and ſuch things as procure vomit, and purge by ſtool.

Plaſter.

Plaſter, becauſe it concreteth and becometh ſtony in the ſtomach, cauſeth ſtrangulation, by ſtraitning and ſtopping the inſtruments that ſerve for breathing. The patients receive cure by the ſame remedies as thoſe who have eaten muſhroom, or drunk Ceruſs: you muſt add Gooſe-greaſe in Clyſters, and anoint the belly with oil of lillies and butter.

CHAP.

CHAP. XXXVIII.

Of Quick silver.

Quick-silver is so called because it resembleth silver in the colour, and is in perpetual motion, as if it had a spirit or living soul, there is a great controversie amongst authors concerning it, for most of them affirm it hot, among whom is *Galen*, *Halyabas*, *Rhasis*, *Aristotle*, *Constantine*, *Isaac*, *Platearius*, *Nicholas Massa*: they maintain their opinion by an argument drawn from things helping and hurting; besides from this, that it is of such subtle parts, that it penetrates, dissolves and performeth all the actions of heat upon dense and hard metals, to wit, it attenuateth, incideth, drieth, causeth salivation by the mouth, purgeth by the stool, moveth urine and sweat over all the body; neither doth it stir up the thinner humors only, but in like sort the gross tough and viscous, as those which have the *Lues venerea* find by experience, using it either in ointments or Plasters. The reason why it is so called. *Lib 4. simp. in 2. practic. c. 148. 3. ad alman. 4. Meteor.*

Others affirm it very cold and moist, for that put into emplasters and so applied, it asswageth pain by stupefaction, hindering the acrimony of pustles and cholerick inflammations. But by its humidity it softneth scirrhous tumors, dissolveth and dissipateth knots and *tophous* knobs, besides, it causeth the breath of such as are anointed therewith to stink, by no other reason, than that it putrefies the obvious humor by its great humidity. *Avicen*'s experiment confirms this opinion, who affirmeth, that the blood of an Ape that drunk Quick-silver, was found concrete about the heart, the carcass being opened. *Matthiolus* moved by these reasons, writes that Quick-silver killeth men by the excessive cold and humid quality, if taken in a large quantity, because it congeals the blood and vital spirits, and at length the very substance of the heart, as may be understood by the history of a certain Apothecary, set down by *Conciliator*; who, for to quench his feaverish heat, in stead of water, drunk a glass of Quick-silver, (for that first came to his hands;) he died within a few hours after, but first he evacuated a good quantity of the Quick-silver by stool, the residue was found in his stomach being opened, and that to the weight of one pound; besides, the blood was found concrete about his heart. Others use another argument to prove it cold, and that is drawn from the compolition thereof, because it consists of Lead and other cold metals. But this argument is very weak. For unquencht Lime is made of flints and stony matter, which is cold, yet nevertheless it exceeds in heat. *Paracelsus* affirmeth, that Quick-silver is hot in the interior substance, but cold in the exterior, that is, cold as it comes forth of the *Mine*. But that coldness to be lost as it is prepared by art, and heat only to appear and be left therein, so that it may serve instead of a tincture in the transmutation of metals. And verily it is taken for a Rule amongst Chymists, that all metals are outwardly cold, by reason of the watery substance that is predominant in them, but that inwardly they are very hot, which then appears when as the coldness together with the moisture is segregated; for by calcination they become caustick. Moreover many account quick-silver poison, yet experience denies it. For *Marianus Sanctius Boralitanus* tells that he saw a woman, who for certain causes and effects, would at several times drink one pound and a half of quick-silver, which came from her again by stool without any harm. Moreover he affirmeth that he hath known sundry who in a desperate Colick (which they commonly call *miserere mei*) have been freed from imminent death, by drinking three pounds of quick-silver with water only: For by the weight it opens and unfolds the twined or bound up gut, and thrusts forth the hard and stopping excrements; he addeth that others have found this medicine effectual against the colick, drunk in the quantity of three ounces. *Antonius Musa* writes, that he usually giveth Quick-silver to children ready to die of the worms. *Avicen* confirmeth this, averring that many have drunk Quick-silver without any harm, wherefore he mixeth it in his ointments against scales and scabs in little children; whence came that common medicine amongst country people to kill lice by anointing the head with Quick-silver mixed with butter or *axungia*, *Matthiolus* affirmeth that many think it the last and chiefest remedy to give to women in travel that cannot be delivered. I protest to satisfie my self concerning this matter, I gave to a whelp pound of Quick-silver, which being drunk down, it voided without any harm by the belly. Whereby you may understand that it is wholly without any venemous quality. Verily it is the only and true Antidote of the *Lues venerea*, and also a very fit medicine for all malign ulcers, as that which more powerfully impugns their malignity than any other medicines that work only by their first qualities. Besides, against that contumacious scab, which is vulgarly called *Malum sancti manis*, there there is not any more speedy or certain remedy. Moreover *Guido* writes, that if a plate of lead be besmeared or rubbed therewith, and then for some space laid upon an ulcer, and conveniently fastned, that it will soften the callous hardness of the lips thereof, and bring it to cicatrization, which thing I my self have often found true by experience. *In l. 6. Dios. c. 2.* An History. *Lib. 4. de nat. rerum.* *Tract. de casu & offen.* Quick-silver good for women in travel. For the disease called *Malum sancti manis.*

Certainly before *Guido*, *Galen* much commended Quick-silver against malign ulcers and cancers: Neither doth *Galen* affirm that lead is poysonous (which many affirm poysonous, because it consists of much Quick-silver) but he only saith thus much, that water too long kept in leaden pipes and cisterns by reason of the drossiness that it useth to gather in lead, causeth bloody fluxes, which also is familiar to brass and copper. Otherwise many could not without danger bear in their bodies leaden bullets during the space of so many years, as usually they do. It is reported. It is declared by *Theodoret Herey* in the following histories, how powerful Quick-silver is to resolve and asswage pain and inflammations. Not long since, (saith he) a certain Doctor of Physick his boy was troubled with *parotides*, with great swelling, heat, pain and beating; to him by the common consent of the Physicians there present, I applied an *Anodyne* medicine, whose force was so great, that the tumor manifestly subsided at the first dressing, and the pain was much asswaged. At the second dressing all the symptoms were more mitigated. At the third dressing, I wondring, at the so great effect of *Lib de comp. med. secund. loc.* Against malign ulcers. Against the *Parotides.*

an

an *Anodyne* Cataplasm, observed that there was Quick-silver mixed therewith, and this happened through the negligence of the Apothecary, who mixed the simple *Anodyne* medicine prescribed by us, in a mortar wherein but a while before he had mixed an ointment whereinto Quick-silver had entred, whose reliques, and some part thereof yet remained therein. This which once by chance succeeded well, I afterwards wittingly and willingly used to a certain Gentlewoman troubled with the like disease, possessing all the region behind the ears, much of the throat, and a great part of the cheek, when as nature helped by common remedies, could not evacuate neither by resolution nor suppuration, the contained matter greatly vexing her with pain and pulsation; I to the medicine formerly used, by the consent of the Physicians, put some Quick-silver, so within a few days, the tumor was digested and resolved. But some will say it resolves the strength of the nerves and limbs, as you may see by such as have been anointed therewith for the *Lues venerea*, who tremble in all their limbs during the rest of their lives. This is true, if any use it too intemperately without measure, and a disease that may require so great a remedy; for thus we see the Gilders, Plumbers, and such as dig in mines, by the continual ascent of the vapors of Quick silver to the brain, the fountain of the nerves, by resolving the spirits, and dissipating the radical and substantifick moisture, maketh them subject to the trembling of their joints. Verily, if it be killed and incorporate with hogs-grease, and a list besmeared therewith, which may encompass the body like a girdle, it will drive away lice, fleas and *cimices*; and anointed about the navel, it kills the worms in the guts. There are two sorts of Quick-silver, the one natural, the other artificial. The natural is found running or flowing in the veins and bowels of the earth, and amongst metals, and in the fornaces of silver-mines. The Artificial is made of *minium* (as it is in *Vitruvius*) and of the powder of Ivory. Also it is probable that by art it may be extracted out of all metals, but chiefly out of Lead and *Cinnabaris*. You may easily distinguish these kinds by the dull and blackish colour, tough and gross substance, which as it runs, leaves an impression like melted grease, being as it were the excrement of lead. The best Quick-silver of all is pure, clear, thin, and very white: it may be cleansed with the dross of lead, and becomes more then being boiled in sharp vinegar, with *sage*, *rosemary*, *tyme*, *lavender*, Or else give it by a pound at a time to a whelp to drink down, and being cast forth by it, boil it again in vinegar, for thus it hath wondrous faculties, and fitly given produceth marvelous effects; nothing is more contrary thereto than fire. For Quick-silver though of its own nature ponderous, flieth upwards by the force of the fire, and forsaketh gold by that means, than which nothing is more friendly to it.

Against lice and flies, &c. The kinds thereof.

How to purifie it.

CHAP. XXXIX.

Of the Unicorns Horn.

There are very many at this day who think themselves excellently well armed against poyson and all contagion, if they be provided with some powder of Unicorns-horn, or some infusion made therewith. Therefore I have though it good to examine more diligently how much truth this inveterate, and grounded opinion hath. The better to perform this task, I will propound three heads, whereto I will direct my whole discourse. The first shall be of the signification of this word *Unicorn*. The second, whether there be any such thing really and truly so called, or whether it be not rather imaginary; like as the *Chimera* and *Tragelaphus*? The third, whether that which is said to be the horn of such a beast, hath any force or faculty against poysons? For the first, that is, the name, it is somewhat more obscure what the word (being *Licorn*) in French may signifie, than what the Latin or Greek word is. For the French name is further from the word and signification; but it is so clear and manifest, that this word *Unicornis* amongst the Latines signifieth a beast having but one horn, as it is vulgarly known; the same thing is meant by the Greek word *Monoceros*. But now for the second, I think that beast that is vulgarly called and taken for an Unicorn, is rather a thing imaginary than really in the world. I am chiefly induced to believe thus, by these conjectures. Because of those who have travelled over the world, there is not one that professeth that ever he did see that creature. Certainly the *Romans* conquered the world, and being most diligent searchers after all things which were rare and so excellent, if any where in any corner of the world this beast could have been found, they would have found it out, and engraven it upon their coins, or arms, as they did Crocodiles, Elephants, Eagles, Panthers, Lions, Tigers, and other creatures unknown to these countries. For these that have written of the Unicorn, either that they have heard, or that hath been delivered by tradition, or what they in their minds and fancies have conceived, you shall scarce find two that agree together, either in the description of the body, or in the nature and condition of her. *Pliny* writes, that Unicorns are for the fashion of their bodies like to an horse; that is, as *Cardane* interprets it, of the bigness of an Horse, with the head of an Hart, the feet of an Elephant, the tail of a *Boar*, with one black horn in the midst of his forehead, of the length of two cubits. *Munster*, who (as *Matthiolus* jests) never saw Unicorns besides painted ones, doth on the contrary affirm them not to be of the bigness of an Horse, but of an Hind-calf of three months old, not with feet like an Elephant, but cleft like those of Goats, with an horn not only of two, but oft-times of three cubits long, of a Weazle-colour, with a neck not very long, nor very hairy, but having few and short hairs hanging to the one side of the neck, the legs are lean and small, the buttocks high, but very hairy. *Cardane* dissenting from both these, writes that he hath an horn in the midst of his forehead, but that it is only of the length of three fingers. *Andrew Thevet* mentions an Unicorn seen by a certain Turkish Sanjach, which was of the bigness of a Bull, of five or six months old, and had one horn, but that not in the midst of his forehead, but upon the top of the crown of the head; he was legged and footed like an Ass, but longer haired, and had ears not much unlike the *Rangifer*, a beast not unknown in the *subpolar* or Northern countries.

What the name imports.

That there is no such beast as an *Unicorn*.

Lib. 8. *cap.* 21.

Munsters opinion concerning *Unicorns*.

Tom. 1. *lib.* 5. *Cap.* 5. *cosmogr.*

Thus

Thus various therefore is the report concerning the shape of this Beast. Neither is there less difference concerning her nature and conditions. For *Pliny* writes, that the Unicorn is a most fierce beast, and hath a great bellowing voice, and that she cannot therefore be taken alive. *Cardane* renders a reason of this fierceness, *Because* (saith he) *it inhabits the deserts of* Æthiopia, *a region squalid, and filthy, abounding with Toads, and such like venemous creatures.* Others on the contrary affirm her to be of a most mild, amiable, and gentle nature of all others, unless one purposely offend her, or use her too harshly, for seeing she feeds not by stooping her head to the ground, because she is hindred therefrom by the length of her horn, she must necessarily feed upon the fruit that hangeth upon trees; out of cratches or mans hand she fearlesly and harmlesly takes all manner of fruits, herbs, sheaves of corn, apples, pears, oranges and pulse. And herein they have proceeded so far, that they feign they will love Virgins, entised by their beauty, so that stayed in the contemplation of them, and allured by their enticements, they by this means are often taken by hunters. In this opinion is *Lues Vartoman*, who denies that Unicorns are wild or fierce; for he saith, that he saw two, which were sent out of *Æthiopia* to the Sultan, who kept them shut up in Penns, in *Mecha*, a city of *Arabia Felix*, renowned by the Sepulcher of *Mahomet*. *Thevet* travelling thither, tells that he diligently inquired of the inhabitants, what their opinion was of such a beast, yet could he never hear any tidings thereof. Whence it is easie to discern, that such beasts have neither been in our, nor in *Vartomans* times. The so great variety of dissenting opinions, easily induceth me to believe that this word, *Unicorn*, is not the proper name of any beast in the world, and that it is a thing only feigned by Painters, and Writers of natural things, to delight the readers and beholders. For as there is but one right way, but many by-ways, and windings, so the speech of truth is but one, and that always simple and like it self; but that of a lie is diverse, and which may easily refel it self, by the repugnancy and incongruity of opinions, if one should say nothing. What therefore (will some say of what creatures) are these horns, which we see wholly different from others, if they be not of Unicorns? *Thevet* thinks them nothing else than Elephants bones turned and made into the fashion that we see them, for thus in the Eastern Countries, some crafty merchants and cunning companions turn, hollow, and being softned, draw to what length these please the teeth of the fish *Rohard*, which lives in the Red and *Æthiopian* Sea, and being so handled, they sell them for Unicorns horn. Verily that which is termed Unicorns horn, being burnt, sends forth a smell like to Ivory. Now *Cardanus* affirms that the teeth and bones of Elephants made soft by art, may be drawn forth, and brought into what form you please like as Ox-bones are. For what is there in the world which the thirsting desire of gold will not make men to adulterate and counterfeit; But it is time that we come to the third scope. Grant there be Unicorns; must it therefore follow that their horns must be of such efficacy against poysons? If we judg by events, and the experience of things, I can protest thus much, that I have often made trial thereof, yet could I never find any good success in the use thereof against poysons, in such as I have had in cure. If the matter must be tried by witnesses and authorities, a great part of the Physicians of better note have long since bid it adieu, and have detracted from the divine and admirable vertues for which it formerly was so much desired. And this they have done, moved thereto by many just, but two especial reasons. The first is of *Rondeletius*, who in this case affirms that horns are endued with no taste nor smell; and therefore have no effect in Physick, unless it be to dry: neither (saith he) am I ignorant that such as have them, much predicate their worth, so to make the greater benefit and gain by them, as of the shavings or scrapings of Unicorns horn, which they sell for the weight in gold, as that which is singular good against poysons and worms, which things, I think, Harts-horn and Ivory do no less effectually perform; which is the cause why, for the same disease, and with the like success, I prescribe Ivory to such as are poor, and Unicorns horn to the rich, as that they so much desire. This is the opinion of *Rondeletius*, who, without any difference, was wont, for Unicorns horn, to prescribe not only Harts-horn or Ivory, but also the bones of Horses and Dogs, and the stones of Myrobalanes, Another reason is, that whatsoever resists poyson is cordial, that is, fit to strengthen the heart, which is chiefly assailed by poysons; but nothing is convenient to strengthen the heart, unless it be by laudable blood or spirit, which two are only familiar to the heart, as being the work-house of the arterious blood and vital spirits: For all things are preserved by their like, as they are destroyed by their contraries, for all things that generate, generate things like themselves. But Unicorns horn, as it contains no smell, so neither hath it any aery parts, but is wholly earthy and dry; neither can it be converted into blood by the digestive faculty, for as it is without juice, so is it without flesh: For as it cannot be turned into *Chylus*, so neither is it fit to become *Chymus*, that is, juice or blood. Therefore it is joyned to the heart by no similitude, nor familiarity. Furthermore there is not a word in *Hippocrates* and *Galen* concerning the Unicorns horn, who notwithstanding have in so many places, commended Harts-horn. Therefore D. *Chapelain*, the chief Physician of King *Charles* the ninth often used to say, that he would very willingly take away that custom of dipping a piece of Unicorns horn in the Kings cup, but that he knew that opinion to be so deeply ingrafted in the minds of men, that he feared, that it would scarce be impugned by reason. Besides (he said) if such a superstitious medicine do no good, so certainly it doth no harm, unless it be to their estates that buy it with gold; or else by accident, because Princes, whilst they relie more than is fitting upon the magnified vertues of this horn, neglect to arm themselves against poysons by other more convenient means, so that death oft-times takes them at unawares. When as upon a time I inquired of *Lues Duret* the Kings Physician and Professor (by reason of the great opinion that all learned men justly had of his learning and judgment) what he thought of this horn; He answered that he attributed no faculties thereto; for the confirmation whereof he rendred the second reason I have formerly given, but more largely and elegantly; neither feared he to affirm it aloud, and in plain words to his auditory of learned men, coming from all parts to hear him. But if at any time (orecome by the fault of the times and place) he prescribed this horn; that he did it for no other intent, than to help faint-

Vartomans opinion of the nature of the *unicorn.*

What the ordinary *unicorns* horns are

The *unicorns* horn is not effectual against poyson.

Lib. de pondr. cap. 19.

Horns and bones not effectual unless to dry.

In what cases good.

ings

ings or ſwoundings that happen by the abundance of ſerous humors, floating in the orifice of the ventricle, which makes men ill diſpoſed, becauſe this mixed with other things endued with the like faculty, hath power to drink up the wateriſh humidity by its earthy drineſs. But ſome will reply, that neither the *Lemnian*, nor *Armenian* earth, have any juice in them, neither any ſmell, nor aery ſpirit. It is granted; neither truly are ſuch things truly and properly called cordial, but only by event and accident, for that by the excellent and aſtrictive faculty they have, and ſtopping the paſſages of the veſſels, they hinder the poiſon from entring into the heart. This is my opinion of the Unicorns horn, which if any do not approve of, he ſhall do me a favour, if for the publick good, he ſhall freely oppoſe his; but in the *interim* take this in good part which I have done.

The end of the one and twentieth Book.

BOOK XXII.

Of the PLAGUE.

CHAP. I.

The deſcription of the Plague.

What the Plague is.

THe Plague is a cruel and contagious diſeaſe, which every where, like a common diſeaſe, invading Man and Beaſt, kills very many; being attended, and as it were aſſociated with a continual Feaver, Botches, Carbuncles, Spots, Nauſeouſneſs, Vomitings, and other ſuch malign accidents. This diſeaſe is not ſo pernicious or hurtful, by any elementary quality, as from a certain poyſonous and venenate malignity, the force whereof exceeds the condition of common putrefaction; Yet I will not deny, but that it is more hurtful in certain bodies, times and regions, as alſo many other diſeaſes, of which *Hippocrates* makes mention. But from hence we can only collect, that the force and malignity of the plague may be encreaſed, or diminiſhed, according to the condition of the elementary qualities concurring with it; but not the whole nature and eſſence thereof to depend thereon.

Sect. 3. *aphor.*

How it comes to kill.

This peſtiferous poyſon principally aſſails the vital ſpirit, the ſtore-houſe and original whereof is the heart, ſo that if the vital ſpirit prove ſtronger, it drives it far from the heart; but if weaker, it being overcome and weakned by the hoſtile aſſault, flies back into the fortreſs of the heart, by the like contagion infecting the heart, and ſo the whole body, being ſpread into it, by the paſſages of the arteries.

Hence it is, peſtilent feavers are ſometime ſimple and ſolitary; otherwhiles aſſociated with a troop of other affects, as Botches, Carbuncles, Blanes and Spots, of one or more colours.

The original of buboes, carbuncles, &c. in the plague.

It is probable ſuch affects have their original from the expulſive faculty, whether ſtrong or weak, provoked by the malignity of the raging matter: yet aſſuredly divers ſymptoms and changes ariſe, according to the conſtitution of the body of the patient, and condition of the humor in which the virulency of the plague is chiefly inherent, and laſtly in the nature of the efficient cauſe.

I thought good, by this deſcription, to expreſs the nature of the Plague, at this my firſt entrance into this matter; for we can ſcarce comprehend it in a proper definition. For although the force thereof be definite, and certain in nature, yet it is not altogether certain and manifeſt in mens minds, becauſe it never happens after one ſort: ſo that in ſo great variety, it is very difficult to ſet down any thing general and certain.

CHAP. II.

Of the Divine cauſes of an extraordinary Plague.

IT is a confirmed, conſtant, and received opinion in all Ages amongſt Chriſtians, that the plague and other diſeaſes, which violently aſſail the life of man, are often ſent by the juſt anger of God puniſhing offences. The Prophet *Amos* hath long ſince taught it, ſaying, *Shall there be affliction? Shall there be evil in a City, and the Lord hath not done it?* On which truly we ought daily to meditate, and that for two cauſes: The firſt is, that we always bear this in mind, that we enjoy health; live, move, and have our beings from God; and that it deſcends from that Father of Light; and for this cauſe we are always bound to give him great and exceeding thanks. The other is, that knowing the calamities, by ſending whereof the Divine anger proceeds to revenge, we may at length repent, and leaving the way of wickedneſs, walk in the paths of Godlineſs. For thus we ſhall learn to ſee in God, our ſelves, the Heaven and Earth, the true knowledge of the cauſes of the plague, and by a certain Divine Philoſophy, teach God to be the beginning and cauſe of the ſecond cauſes, which we cannot well without the firſt cauſe go about nor attempt, much leſs perform any thing. For from hence they borrow their force, order, and conſtancy of order; ſo that they ſerve as inſtruments for God, who rules and governs us, and the whole world to perform all his works, by that conſtant courſe of order, which he hath appointed unchangeable from the beginning.

Amos 3. *Alis* 17.

The ſecond cauſes have their power from God as the firſt cauſe.

Wherefore

Wherefore all cauſe of a plague is not to be attributed to theſe near and inferior cauſes or beginnings, as the Epicures and Lucianiſts commonly do, who attributing too much, yea all things to Nature, hath left nothing to Gods providence. On the contrary, we ought to think, and believe in all our doings, That even as God by his omnipotent Power hath created all things of nothing, ſo he by his eternal Wiſdom preſerves and governs the ſame, leads and inclines them as he pleaſeth, yea verily at his pleaſure changeth their order, and the whole courſe of nature.

This cauſe of an extraordinary Plague, as we confeſs and acknowledge, ſo here we will not proſecute it any further, but think fit to leave it to Divines, becauſe it exceeds the bounds of Nature, in which I will now contain my ſelf. Wherefore let us come to the natural cauſes of the Plague.

CHAP. III.

Of the Natural cauſes of the Plague, and chiefly of the Seminary of the Plague by the corruption of the Air.

THE general and natural cauſes of the Plague are abſolutely two, that is, the infection of corrupt air, and a preparation and fitneſs of corrupt humors to take that infection; for it is noted before, out of the doctrine of *Galen*, that our humors may be corrupted, and degenerate into ſuch an alienation as may equal the malignity of poyſon. The general cauſes of the Plague. *Lib. 6. de loc. affectis.*

The air is corrupted, when the four ſeaſons of the year have not their ſeaſonableneſs, or degenerate from themſelves, either by alteration or by alienation: as if the conſtitution of the whole year be moiſt and rainy, by reaſon of groſs and black clouds; if the Winter be gentle and warm, without any Northerly wind, which is cold and dry, and by that means contrary to putrefaction: if the Spring which ſhould be temperate, ſhall be faulty in any exceſs of diſtemper; if the Autumn ſhall be ominous by fires in the air, with ſtars ſhooting, and as it were falling down, or terrible comets, never ſeen without ſome diſaſter; if the ſummer be hot, cloudy and moiſt, and without winds, and the clouds flie from the South into the North. Theſe and ſuch like unnatural conſtitutions of the ſeaſons of the year, were never better, or more excellently handled by any, than by *Hippocrates* in his Books *Epidemion*. Therefore the air from hence draws the ſeeds of corruption and the peſtilence, which at length, the like exceſs of qualities being brought in, it ſends into the humors of our bodies, chiefly ſuch as are thin and *ſerous*; although the peſtilence doth not always neceſſarily ariſe from hence, but ſome-whiles ſome other kind of cruel and infectious diſeaſe. How the Seaſons of the year may be ſaid to want their ſeaſonableneſs.

But neither is the air only corrupted by theſe ſuperiour cauſes, but alſo by putrid and filthy ſtinking vapors ſpread abroad through the air encompaſſing us, from the bodies and carkaſſes of things not buried, gapings and hollowneſſes of the earth, or ſinks and ſuch like places being opened: for the ſea often overflowing the land in ſome places, and leaving in the mud or hollowneſſes of the earth (cauſed by earth-quakes) the huge bodies of monſtrous fiſhes, which it hides in its waters, hath given both the occaſion and matter of a plague. For thus in our time, a Whale caſt upon the *Tuſcan* ſhore, preſently cauſed a plague over all that countrey. How the air may be corrupted.

But as fiſhes infect and breed a plague in the air, ſo the air being corrupted often cauſeth a peſtilence in the ſea among fiſhes, eſpecially when they either ſwim on the top of the water, or are infected by the peſtilent vapors of the earth lying under them, and riſing into the air through the body of the water, the latter whereof *Ariſtotle* ſaith, hapneth but ſeldom. But it often chanceth, that the plague raging in any country, many fiſhes are caſt upon the coaſt, and may be ſeen lying on great heaps. But ſulphureous vapors, or ſuch as partake of any other malign quality, ſent forth from places under ground, by gapings and gulfs opened by earth-quakes, not only corrupt the air, but alſo infect and taint the ſeeds, plants, and all the fruits which we eat, and ſo transfer the peſtilent corruption into us, and thoſe beaſts on which we feed, together with our nouriſhment. The truth whereof *Empedocles* made manifeſt, who by ſhutting up a great gulf of the earth, opened in a valley between two mountains, freed all *Sicily* from a plague cauſed from thence. *Lib. 8. hiſt. anim.*

If winds riſing ſuddenly ſhall drive ſuch filthy exhalations from thoſe regions in which they were peſtiferous, into other places, they alſo will carry the plague with them thither.

If it be thus, ſome will ſay, it ſhould ſeem that whereſoever ſtinking and putrid exhalations ariſe, as about ſtanding pools, ſinks and ſhambles, there ſhould the plague reign, and ſtraight ſuffocate with its noyſome poyſon the people which work in ſuch places: but experience finds this falſe.

We do anſwer that the Putrefaction of the Plague is far different, and of another kind than this common, as that which partakes of a certain ſecret malignity, and wholly contrary to our lives, and of which we cannot eaſily give a plain and manifeſt reaſon. Yet that vulgar putrefaction whereſoever it, doth eaſily and quickly entertain and welcome the peſtiferous contagion, as often as, and whenſoever it comes, as joined to it by a certain familiarity, and at length, it ſelf degenerating into a peſtiferous malignity, certainly no otherwiſe than thoſe diſeaſes which ariſe in the plague time, the putrid diſeaſes in our bodies, which at the firſt wanted virulency and contagion, as Ulcers, putrid Feavers, and other ſuch diſeaſes, raiſed by the peculiar default of the humors, eaſily degenerate into peſtilence, preſently receiving the tainture of the plague, to which they had before a certain preparations. Wherefore in time of the Plague, I would adviſe all men to ſhun ſuch exceeding ſtinking places, as they would the plague it ſelf, that there may be no preparation in our bodies, or humors to catch that infection (without which, as *Galen* teacheth, the Agent hath no power over the Subject, for otherwiſe in a plague-time, the ſickneſs would equally ſeize upon all) ſo that the impreſſion of the peſtiferous quality may preſently follow that diſpoſition. Peſtiferous putrefaction is far different from ordinary putrefaction. In a peſtilent conſtitution of the air, all diſeaſes become peſtilent. *Lib. 1. de diffr. feb.*

We

How the air may be ſaid to putrefie.

But when we ſay the air is peſtilent, we do not underſtand that ſincere, elementary, and ſimple, as it is of its own nature, for ſuch is not ſubject to putrefaction; but that which is polluted with ill vapors riſing from the earth, ſtanding waters, vaults, or ſea, and degenerates, and is changed from its native purity and ſimplicity. But certainly amongſt all the conſtitutions of the air, fit to receive a peſtilent corruption, there is none more fit than an hot, moiſt and ſtill ſeaſon; for the exceſs of ſuch qualities eaſily cauſeth putrefaction. Wherefore the ſouth wind reigning, which is hot and moiſt, and principally in places near the ſea, there fleſh cannot long be kept, but it preſently is tainted and corrupted

A Southerly conſtitution of the air is the fuel of the Plague.

Ferther, we muſt know, that the peſtilent malignity which riſeth from the carkaſſes or bodies of men, is more eaſily communicated to men; that which riſeth from oxen, to oxen; and that which comes from ſheep, to ſheep; by a certain ſympathy and familiarity of Nature: no otherwiſe than the Plague which ſhall ſeize upon ſome one in a Family, doth preſently ſpread more quickly amongſt the reſt of the Family, by reaſon of the ſimilitude of temper, then amongſt others of an other Family, diſagreeing in their whole temper. Therefore the air thus altered and eſtranged from its goodneſs of nature, neceſſarily drawn in by inſpiration and tranſpiration, brings in the ſeeds of the Plague, and ſo conſequently the Plague it ſelf, into bodies prepared and made ready to receive it.

CHAP. IV.

Of the preparation of humors to putrefaction, and admiſſion of peſtiferous impreſſions.

HAving ſhewed the cauſes from which the air doth putrifie, become corrupt, and is made partaker of a peſtilent and poyſonous conſtitution; we muſt now declare what things may cauſe the humors to putrifie, and make them ſo apt to receive and retain the peſtilent air and venenate quality.

Three cauſes of the putrefaction of humors.

Humors putrifie either from fulneſs, which breeds obſtruction, or by diſtemperate exceſs; or laſtly, by admixture of corrupt matter and evil juice, which ill feeding doth ſpecially cauſe to abound in the body: for the Plague often follows the drinking of dead and muſty wines, muddy and ſtanding waters, which receive the ſinks and filth of a City; and fruits and pulſe eaten without diſcretion in ſcarcity of other corn, as Peaſe, Beans, Lentils, Vetches, Acorns, the roots of Fern, and Graſs made into Bread: For ſuch meats obſtruct, heap up ill humors in the body, and weaken the ſtrength of the faculties, from whence proceeds a putrefaction of humors, and in that putrefaction a preparation and diſpoſition to receive, conceive, and bring forth the ſeeds of the Plague: which the filthy ſcabs, malign ſores, rebellious ulcers and putrid feavers, being all fore-runners of greater putrefaction and corruption, do teſtifie. Vehement paſſions of the mind, as anger, ſorrow, grief, vexation and fear, help forward this corruption of humors, all which hinder natures diligence and care of concoction: For as in the Dog-days, the lees of wine ſubſiding to the bottom, are by the ſtrength and efficacy of heat, drawn up to the top, and mixed with the whole ſubſtance of the wine, as it were by a certain ebullition, or working; ſo melancholick humors, being the dregs or lees of the blood, ſtirred by the paſſions of the mind, defile or taint all the blood with their feculent impurity.

Paſſions of the mind help forward the Putrefaction of the humors.

We found that, ſome years agon by experience, at the battel of S. *Dennis*. For all wounds, by what weapon ſoever they were made, degenerated into great and filthy putrefactions and corruptions, with feavers of the like nature, and were commonly determined by death, what medicines and how diligently ſoever they were applied; which cauſed many to have a falſe ſuſpition that the weapons on both ſides were poyſoned. But there were manifeſt ſigns of corruption and putrefaction in the bloud let the ſame day that any were hurt, and in the principal parts diſſected afterwards that it was from no other cauſe, than an evil conſtitution of the air, and the minds of the Souldiers perverted by hate, anger and fear.

CHAP. V.

What ſigns in the Air and Earth prognoſticate a Plague.

WE may know a plague to be at hand and hang over us, if at any time the air and ſeaſons of the year ſwerve from their natural conſtitution, after thoſe ways I have mentioned before; if frequent and long continuing Meteors, or ſulphureous Thunders infect the air; if fruits, ſeeds, and pulſe be worm-eaten: if birds forſake their neſts, eggs, or young, without any manifeſt cauſe; if we perceive women commonly to abort, by continual breathing in the vaporous air, being corrupted and hurtful both to the Embryon and original of life, and by which it being ſuffocated, is preſently caſt forth and expelled. Yet notwithſtanding thoſe airy impreſſions do not ſolely corrupt the air, but there may be alſo others raiſed by the Sun from the filthy exhalations and poyſonous vapors of the earth and waters, or of dead carkaſſes, which by their unnatural mixture, eaſily corrupt the air, ſubject to alteration, as that which is thin and moiſt, from whence divers Epidemical diſeaſes, and ſuch as are every where ſeize upon the common ſort, according to the ſeveral kinds of corruptions, ſuch as that famous *Catarrh* with difficulty of breathing, which in the year 1510 went almoſt all over the world, and raged over all the Cities and Towns of *France*, with great heavineſs of the head (whereupon the French named it *Cuculla*) with a ſtraitneſs of the heart and lungs, and a cough, a continual feaver, and ſometimes raving.

Why aborti-ons are frequent in a peſtilent ſeaſon.

A *Catarrh* with difficulty of breathing killing many.

This, although it ſeized upon many more than it killed, yet becauſe they commonly died who were either let bloud, or purged, it ſhewed it ſelf peſtilent by that violent and peculiar and unheard of kind of malignity.

Such

Such alſo was the Engliſh *Sweating-ſickneſs*, or *Sweating-feaver*, which unuſual, with a great deal of terror invaded all the lower parts of *Germany*, and the Low-Countries, from the year 1525 unto the year 1530, and that chiefly in Autumn. The Engliſh *Sweating-ſickneſs.*

As ſoon as this peſtilent diſeaſe entred into any City, ſuddenly two or three hundred fell ſick on one day; then it departed thence to ſome other place. The people ſtrucken with it, languiſhing, fell down in a ſwound, and lying in their beds, ſweat continually, having a feaver, a frequent, quick, and unequal pulſe; neither did they leave ſweating, till the diſeaſe left them, which was in one or two days at the moſt: yet freed of it, they languiſhed long after; they all had a beating or palpitation of the heart, which held ſome two or three years, and others all their life after.

At the firſt beginning it killed many, before the force of it was known: but afterwards very few, when it was found out by practice and uſe, that thoſe who furthered and continued their ſweats, and ſtrengthened themſelves with cordials, were all reſtored. But at certain times many other popular diſeaſes ſprung up, as putrid feavers, fluxes, bloudy-fluxes, catarrhs, coughs, phrenſics, ſquinances, plurifies, inflammations of the lungs, inflammations of the eyes, apoplexies, lethargies, ſmall pox and meazles, ſcabs, carbuncles, and malign puſtles. Wherefore the Plague is not always, nor every where of one and the ſame kind, but of divers; which is the cauſe that divers names are impoſed upon it, according to the variety of the effects it brings, and ſymptoms which accompany it, and kinds of putrefaction, and hidden qualities of the air. The Plague is not the definite name of one diſeaſe.

They affirm, when the Plague is at hand, that Muſhroms grow in greater abundance out of the Earth, and upon the ſurface thereof many kinds of poyſonous *inſecta* creep in great numbers, as Spiders, Catterpillars, Butter-flies, Graſhoppers, Beetles, Hornets, Waſps, Flies, Scorpions, Snails, Locuſts, Toads, Worms, and ſuch things as are the off-ſpring of putrefaction. And alſo wild beaſts tired with the vaporous malignity of their dens and caves in the Earth, forſake them, and Moles, Toads, Vipers, Snakes, Lizards, Aſps and Crocodiles are ſeen to flie away, and remove their habitations in great troops. For theſe, as alſo ſome other creatures, have a manifeſt power by the gift of God, and the inſtinct of Nature, to preſage changes of weather, as rains, ſhowers, and fair weather, and ſeaſons of the year, as the Spring, Summer, Autumn, Winter, which they teſtifie by their ſinging, chirping, crying, flying, playing, and beating with their wings, and ſuch like ſigns: ſo alſo they have a perception of a Plague at hand. And moreover, the carkaſſes of ſome of them which took leſs heed of themſelves, ſuffocated by the peſtiferous poyſon of the ill air contained in the earth, may be every where found, not only in their dens, but alſo in the plain fields. What ſigns in the earth foretell a plague,

Theſe vapors corrupted not by a ſimple putrefaction, but an occult malignity, are drawn out of the bowels of the earth into the air, by the force of the Sun and Stars, and thence condenſed into clouds, which by their falling upon corn, trees and graſs, infect and corrupt all things which the earth produceth, and alſo kills thoſe creatures which feed upon them; yet brute beaſts ſooner than men, as which ſtoop and hold their heads down towards the ground (the maintainer and breeder of this poyſon) that they may get their food from thence. Therefore at ſuch times, skilful husbandmen, taught by long experience, never drive their Cattel or Sheep to paſture, before that the Sun, by the force of his beams, hath waſted and diſſipated into air, this peſtiferous dew hanging and abiding upon the boughs and leaves of trees, herbs, corn and fruits. How peſtilent vapors may kill plants and trees.

But on the contrary, that peſtilence which proceeds from ſome malign quality from above, by reaſon of evil and certain conjunction of the Stars, is more hurtful to men and birds, as thoſe who are nearer to Heaven.

CHAP. VI.

By uſing what cautions in Air and diet, one may prevent the Plague.

HAving declared the ſigns foreſhewing a Peſtilence: now we muſt ſhew by what means we may ſhun the imminent danger thereof, and defend our ſelves from it. No prevention ſeemed more certain to the Antients, than moſt ſpeedily to remove into places far diſtant from the infected place, and to be moſt ſlow in their return thither again. But thoſe, who by reaſon of their buſineſs or imployments, cannot change their habitation, muſt principally have a care of two things. The firſt is, that they ſtrengthen their bodies, and the principal parts thereof, againſt the dayly imminent invaſions of the poyſon, or the peſtiferous and venenate Air. The other, that they abate the force of it, that it may not imprint its virulency in the body; which may be done by correcting the exceſs of the quality inclining towards it, by the oppoſition of its contrary: For if it be hotter than is meet, it muſt be tempered with cooling things; if too cold, with heating things: yet this will not ſuffice: For we ought beſides, to amend and purge the corruptions of the venenate malignity diffuſed through it, by ſmells and perfumes reſiſting the poyſon thereof. The body will be ſtrengthened and more powerfully reſiſt the infected Air, if it want excrementitious humors, which may be procured by purging and bleeding; and for the reſt a convenient diet appointed, as ſhunning much variety of meats, and hot and moiſt things, and all ſuch which are eaſily corrupted in the ſtomach, and cauſe obſtructions, ſuch as thoſe things which be made by Comfit-makers; we muſt ſhun ſatiety and drunkenneſs, for both of them weaken the powers, which are preſerved by the moderate uſe of meats of good juice. Change of places the ſureſt prevention of the Plague. Two things of chief account for prevention Diet for prevention of the Plague.

Let moderate exerciſes in a clear Air, and free from any venemous tainture, precede your meals.

Let the belly have due evacuation either by Nature or Art.

Let the heart, the ſeat of life, and the reſt of the bowels be ſtrengthened with Cordials and Antidotes applied and taken (as we ſhall hereafter ſhew) in the form of epithems, ointments, emplaſters, waters, pills, powders, tablets, opiates, fumigations, and ſuch like.

Make choice of a pure air, and free from all pollution, and far remote from ſtinking places, for

Diſcommodities of a cloudy or foggy Air.

ſuch as is moſt fit to preſerve life, to recreate and repair the ſpirits, whereas on the contrary, a cloudy, or miſty Air, and ſuch as is infected with groſs and ſtinking vapors, dulls the ſpirits, dejects the appetite, makes the body faint and ill coloured, oppreſſeth the heart, and is the breeder of many diſeaſes.

Why the South wind is peſtilent.

The Northern wind is healthful, becauſe it is cold and dry. But on the contrary, the Southern wind becauſe it is hot and moiſt, weakens the body by ſloth or dulneſs, opens the pores, and makes them pervious to the peſtiferous malignity. The Weſtern wind is alſo unwholſome, becauſe it comes near to the nature of a Southern: wherefore the windows muſt be ſhut up on that ſide of the houſe on which they blow, but open on the North and Eaſt ſide, unleſs it happen that the Plague come from thence.

The efficacy of fire againſt the Plague.

Kindle a clear fire in all the lodging Chambers of the houſe, and perfume the whole houſe with Aromatick things, as Frankincenſe, Myrrh, Benzoin, *Ladanum*, *Styrax*, Roſes, Myrtle-leaves, Lavender, Roſemary, Sage, Savory, wild Tyme, Marjoram, Broom, Pine-apples, pieces of Fir, Juniper-berries, Cloves, Perfumes: and let your cloaths be aired in the ſame.

There be ſome, who think it a great preſervative againſt the peſtilent Air, to keep a Goat in their houſes, becauſe the capacity of the houſe, filled with a ſtrong ſent which the Goat ſends forth, prohibits the entrance of the venomous Air: which ſame reaſon hath place alſo in ſweet ſmells; and beſides it argues, that ſuch as are hungry are apter to take the Plague than thoſe who have eaten moderately: for the body is not only ſtrengthened with meat, but all the paſſages thereof are full by the vapors diffuſed from thence, by which otherwiſe, the infected Air would find a more eaſie entrance to the heart.

Moderate repletion good for prevention

Yet the common ſort of people yield another reaſon for the Goat, which is, that one ill ſent drives away another, as one wedge drives forth another; which calleth to my mind that which is recorded by *Alexander Benedictus*, that there was a Scythian Phyſician, which cauſed a Plague, ariſing from the infection of the Air, to ceaſe, by cauſing all the Dogs, Cats, and ſuch like beaſts, which were in the City to be killed, and caſt their carkaſſes up and down the ſtreets, that ſo by the coming of this new putrid vapor as a ſtranger, the former peſtiferous infection, as an old gueſt was put out of its lodging, and ſo the Plague ceaſed. For Poyſons have not only an antipathy with their Antidotes, but alſo with ſome other poyſons.

A ſtrange Art to drive away the Plague.

The antipathy of poiſons with poiſons.

Whilſt the Plague is hot, it is good not to ſtir out of door before the riſing of the Sun: wherefore we muſt have patience, until he hath cleanſed the Air with the comfortable light of his beams, and diſperſed all the foggy and nocturnal pollutions, which commonly hang in the Air in dirty, and eſpecially in low places and Vallies.

All publick and great meetings and aſſemblies muſt be ſhunned.

Whether in the Plague-time one muſt travel by night or by day.

If the Plague begin in Summer, and ſeem principally to rage, being helped forward by the Summers heat, it is beſt to perform a journy begun, or undertaken for neceſſary affairs, rather upon the night time, than on the day; becauſe the infection takes force, ſtrength and ſubtility of ſubſtance, by which it may more eaſily permeat and enter in by the heat of the Sun; but by night mens bodies are more ſtrong, and all things are more groſs and denſe. But you muſt obſerve a clean contrary courſe, if the malignity ſeem to borrow ſtrength and celerity from coldneſs: But you muſt always eſchew the beams of the Moon, but eſpecially at the Full: for then our bodies are more languid and weak, and fuller of excrementitious humors. Even as trees which for that cauſe muſt be cut down in their ſeaſon of the Moon, that is, in the decreaſe thereof.

Why the Moon is to be ſhunned.

After a little gentle walking in your Chamber, you muſt preſently uſe ſome means that the principal parts may be ſtrengthned by ſuſcitating the heat and ſpirits, and that the paſſages to them may be filled, that ſo the way may be ſhut up from the infection coming from without. Such as by the uſe of garlick have not their heads troubled, nor their inward parts inflamed, as Country People and ſuch as are uſed to it: to ſuch there can be no more certain preſervative and Antidote againſt the peſtiferous fogs or miſts, and the nocturnal obſcurity, than to take it in the morning with a draught of good wine; for it being abundantly diffuſed preſently over all the body, fills up the paſſages thereof, and ſtrengthneth it in a moment.

Garlick good againſt the Plague.

For water; if the Plague proceed from the tainture of the Air, we muſt wholly ſhun and avoid Rain-water, becauſe it cannot but be infected by the contagion of the Air. Wherefore the water of Springs and of the deepeſt Wells are thought beſt. But if the malignity proceed from the vapors contained in the Earth, you muſt make choice of Rain-water. Yet it is more ſafe to digeſt every ſort of water by boyling it, and to prefer that water before other; which is pure and clear to the ſight, and without either taſte or ſmell, and which beſides ſuddenly takes the extremeſt mutation of heat and cold.

What water to be made choice of in the Plague time.

CHAP. VII.

Of the Cordial Remedies by which we may preſerve our Bodies in fear of the Plague, and cure thoſe already infected therewith.

Aqua Theriacalis good againſt the Plague both inwardly taken and outwardly applied.

Such as cannot eat without much labour, exerciſe and hunger, and who are no lovers of Breakfaſts, having evacuated their excrements, before they go from home muſt ſtrengthen the heart with ſome Antidote againſt the virulency of the infection. Amongſt which *Aqua Theriacalis*, or Treacle-water, two ounces, with the like quantity of Sack, is much commended being drunk, and rubbing the Noſtrils, Mouth and Ears with the ſame; for the Treacle-water ſtrengthens the heart, expels poyſon, and is not only good for a preſervative, but alſo to cure the diſeaſe it ſelf: For by ſweat it drives forth the poyſon contained within. It ſhould be made in *June*, at which time all ſimple medicines, by the vital heat of the Sun, are in their greateſt efficacy.

The

The compoſition whereof is thus: Take the roots of *Gentian*, *Ciperus*, Tormentil, Diptam, or *Fraxalla* Elecampane, of each one ounce; the leaves of Mullet, *Carduus Benedictus*, Devils-bit, Burnet, Scabious, Sheeps-ſorrel, of each half a handful; of the tops of *Rue* a little quantity; of Myrtle-berries one ounce; of red Roſe-leaves, the flowers of Bugloſs, Borage and S. *Johns* wort, of each one ounce; let them be all cleanſed, dried and macerated for the ſpace of twenty four hours in one pound of white wine or Malmſie, and of Roſe-water or Sorrel-water; then let them be put in a veſſel of glaſs, and add thereto of Treacle and Mithridate, of each four ounces: then diſtill them in *Balneo Mariæ*, and let the diſtilled water be received in a Glaſs-Viol, and let there be added thereto of Saffron two drams, of Bole-Armenick, *Terra Sigillata*, yellow Sanders, ſhavings of Ivory and Harts-horn, of each half an ounce; then let the Glaſs be well ſtopped, and ſet in the Sun for the ſpace of eight or ten days. Let the preſcribed quantity be taken every morning ſo oft as ſhall be needful. It may be given without hurt to ſucking children, and to Women great with child. But that it may be the more pleaſant, it muſt be ſtrained through an Hippocras-bag, adding thereto ſome ſugar and cinnamon. The compoſition thereof.

Some think themſelves ſufficiently defended with a root of Elecampane, Zedoary, or Angelica, rowled in their mouth, or chawed between their teeth.

Others drink every morning one dram of the root of *Gentian* bruiſed, being macerated for the ſpace of one night in two ounces of white wine.

Others take Wormwood-wine.

Others ſup in a rear egg one dram of *Terra Sigillata*, or of Harts-horn, with a little Saffron, and drink two ounces of wine after it

There be ſome that do infuſe Bole-Armenick, the roots of *Gentian*, Tormentil, Diptam, the berries of Juniper, Cloves, Mace, Cinnamon, Saffron, and ſuch like, in *aqua vitæ* and ſtrong white wine, and ſo diſtil it in *Balneo Mariæ*.

This Cordial water that followeth is of great vertue. Take of the roots of the long and round *Ariſtolochia*, Tormentil, Diptam, of each three drams, of Zedoary two drams, *Lignum Aloes*, yellow Sanders, of each one dram, of the leaves of Scordium, S. Johns-wort, Sorrel, Rue, Sage, of each half an ounce, of Bay and Juniper-berries, of each three drams, Citron-ſeeds one Dram, Cloves, Mace, Nutmegs, of each two drams, Maſtick, *Olibanum*, Bole-Armenick, *Terra Sigillata*, ſhavings of Harts-horn and Ivory, of each one ounce, of Saffron one ſcruple, of the Conſerves of Roſes, Bugloſs-flowers, water-lillies and old Treacle, of each one ounce, of Camphire half a dram, of *aqua vitæ* half a pint, of white wine two pints and a half; make thereof a diſtillation in *Balneo Mariæ*: The uſe of this diſtilled water is even as Treacle water is. A cordial water.

The electuary following is very effectual. Take of the beſt Treacle three ounces, Juniper-berries and Carduus-ſeeds of each one dram and a half, of Bole-Armenick prepared half an ounce, of the powder of the electuary *de gemmis* and *Diamargariton frigidum*, the powder of Harts-horn, and red Coral, of each one dram: mix them with the ſyrup of the rinds and juice of Pome-Citrons as much as ſhall ſuffice, and make thereof a liquid Electuary in the form of an Opiate, let them take every morning the quantity of a Filberd, drinking after it two drams of the water of Scabious, Cherries, *Carduus Benedictus*, and of ſome ſuch like cordial thing, or of ſtrong wine. A Cordial Electuary.

The folowing Opiate is alſo very profitable, which alſo may be made into tablets. Take of the roots of Angelica, Gentian, Zedoary, Elecampane, of each two drams; of Citron and Sorrel-ſeeds, of each half a dram; of the dried rinds of Citrons, Cinnamon, Bay and Juniper-berries, and Saffron, of each one ſcruple; of conſerve of Roſes and Bugloſs, of each one ounce; and fine hard Sugar as much as is ſufficient; make thereof Tablets of the weight of half a dram, let him take one of them two hours before meat: or make thereof an Opiate with equal parts of conſerves of Bugloſs and *Mel Anthoſatum*, and ſo adding all the reſt dry and in powder. An Opiate. Another. Or take of the roots of Valerian, Tormentil, Diptam, of the leaves of Rue, of each half an ounce; of Saffron, Mace, Nutmegs, of each half a dram; of Bole-Armenick prepared half an ounce; of conſerve of Roſes and ſyrup of Limons as much as will be ſufficient to make thereof an Opiate liquid enough. Or take of the roots of both the *Ariſtolochias*, of Gentian, Tormentil, Diptam, of each one dram and a half; of Ginger three drams; of the leaves of Rue, Sage, Mints and Penny-royal, of each two drams; of Bay and Juniper-berries, Citron-ſeeds, of each four ſcruples; of Mace, Nutmegs, Cloves, Cinnamon, of each two drams; of *Lignum aloes*, and yellow Sanders, of each one dram; of Male-Frankincenſe, *i. Olibanum*, Maſtich, ſhavings of Harts-horn and Ivory, of each two ſcruples: of Saffron half a dram; of Bole-Armenick, *Terra Sigillata*, red Coral, Pearl, of each one dram; of conſerves of Roſes, Bugloſs-flowers, water-lillies and old Treacle, of each one ounce; of Loaf-ſugar one pound and a quarter: a little before the end of the making it up, add two drams of *Confectio Alkermes*, and of Camphire diſſolved in Roſe-water one ſcruple, make thereof an Opiate according to art, the doſe thereof is from half a dram, to half a ſcruple. Another.

Treacle and Mithridate faithfully compounded, excel all Cordial medicines, adding for every half ounce of them, one ounce and an half of Conſerves of Roſes, or of Bugloſs, or of Violets, and three drams of Bole-Armenick prepared: Of theſe being mixt with ſtirring, and incorporated together, make a conſerve: it muſt be taken in the morning the quantity of a Filberd. You muſt chuſe that treacle that is not leſs than four years old, nor above twelve: that which is ſomewhat new, is judged to be moſt meet for cholerick perſons; but that which is old, for phlegmatick and old men. For at the beginning the ſtrength of the *Opium* that enters into the compoſition thereof, remains in its full vertue for a year: but afterwards the more years old it waxeth, the ſtrength thereof is more aboliſhed, ſo that at length the whole compoſition becometh very hot.

The confection of *Alkermes* is very effectual both for a preſervative againſt this diſeaſe, and alſo for the cure.

The quantity of a Filberd of Rubarb, with one Clove chawed or rowled in the mouth, is ſuppoſed

to repel the coming of the peſtilent air: as alſo this compoſition following.

A Confection to be taken in the morning againſt the peſtilent Air.

Take of preſerved Citron and Orange pills, of each one dram; of *conſerve* of Roſes, and of the roots of Bugloſs, of each three drams; of Citron-ſeeds half an ounce; of Anniſe-ſeeds and Fennel-ſeeds, of each one dram; of Angelica-Roots four ſcruples; ſugar of Roſes as much as ſufficeth: Make a Confection, and cover it with leaves of Gold, to take a little of it upon a ſpoon before you go abroad every morning.

A March-pane

Or take of Pine-apple-kernels, and Piſtick-nuts, infuſed for the ſpace of ſix hours in the water of Scabious and Roſes, of each two ounces; of Almonds blanched in the fore-named waters half a pound: of preſerved Citron and Orange pills, of each one dram and a half: of Angelica-roots four ſcruples: make them according to art, unto the form of March-pane, or of any other ſuch like confection, and hold a little piece thereof often in your mouth.

The Tablets following are moſt effectual in ſuch a caſe. Take of the roots of Diptam, Tormentil, Valerian, Elecampane, Eringoes, of each half a dram; of *Bole-Armenick*, *Terra Sigillata*, of each one ſcruple; Camphire, Cinnamon, Sorrel-ſeeds, and Zedoary of each one ſcruple, of the *ſpecies* of the electuary *Diamargariton frigidum*, two ſcruples; of *conſerve* of Roſes, Bugloſs preſerved, Citron-pills, Mithridate, Treacle of each one dram; of fine Sugar diſſolved in *Scabious* and *Carduus*-water, as much as ſhall ſuffice: Make thereof Tablets of the weight of a dram, or half a dram: take them in the morning before you eat.

Pills of *Ruffus*.

The pills of *Ruffus* are accounted moſt effectual preſervatives, ſo that *Ruffus* himſelf ſaith, that he never knew any to be infected that uſed them: the compoſition of them is thus.

Take of the beſt Aloes half a dram, of *Gum-Ammoniacum* two drams, of Myrrh two drams and an half, of Maſtich two drams, of Saffron ſeven grains: put them all together, and incorporate them with the juice of Citrons, or the ſyrup of Limons, and make thereof a maſs, and let it be kept in leather: Let the patient take the weight of half a dram every morning two or three hours before meat, and let him drink the water of Sorrel after it, which through its tartneſs, and the thinneſs of its parts, doth infringe the force and power of the malignity or putrefaction: For experience hath taught us, that Sorrel being eaten or chawed in the mouth, doth make the pricking of Scorpions unhurtful. And for thoſe ingredients which do enter into the compoſition of thoſe pills, Aloes doth cleanſe and purge, Myrrh reſiſts putrefaction, Maſtich ſtrengthens, Saffron exhilarates and makes lively the ſpirits that govern the body, eſpecially the vital and animal.

Other pills.

Thoſe pills that follow are alſo much approved. Take of Aloes one ounce, of Myrrh half an ounce, of Saffron one ſcruple, of Agarick in Trochiſces two drams, of Rubarb in powder one dram, of Cinnamon two ſcruples, of Maſtich one dram and a half, of Citron-ſeeds twelve grains: powder them all as is requiſite; and make thereof a maſs with the ſyrup of Maiden-hair: let it be uſed as aforeſaid.

If the maſs begin to wax hard, the pills that muſt preſently be taken, muſt be mollified with the ſyrup of Limons.

Other pills.

Take of waſhed Aloes two ounces, of Saffron one dram, of Myrrh half an ounce, of *Ammoniacum* diſſolved in white wine one ounce, of hony of Roſes, Zedoary, red Sanders, of each one dram, of *Bole-Armenick* prepared two drams, of red coral half an ounce, of Camphire half a ſcruple: make thereof pills according to art. But thoſe that are ſubject or apt to the hemorrhoids ought not at all, or very ſeldom to uſe thoſe kinds of pills that do receive much Aloes.

They ſay, that King *Mithridates* affirmed by his own writing, that whoſoever took the quantity of an hazel-nut of the preſervative following, and drank a little wine after it, ſhould be free from poyſon that day, Take two Wall-nuts, thoſe that be very dry, two Figs, twenty leaves of *Rue*, and three grains of ſalt: beat them and incorporate them together, and let them be uſed as is aforeſaid.

This remedy is alſo ſaid to be profitable for thoſe that are bitten or ſtung by ſome venomous beaſt, and for this only, becauſe it hath *Rue* in the compoſition thereof. But you muſt forbid women that are with child the uſe of this medicine; for *Rue* is hot and dry in the third degree, and therefore it is ſaid to purge the womb, and provoke the flowers, whereby the nouriſhment is drawn away from the child. Of ſuch variety of medicines, every one may make choice of that is moſt agreeable to his taſte, and as much thereof as ſhall be ſufficient.

CHAP. VIII.

Of local medicines to be applied outwardly.

THoſe medicines that have proper and excellent vertues againſt the peſtilence, are not to be neglected to be applied outwardly, or carried in the hand. And ſuch are all aromatical, aſtringent, or ſpirituous things, which therefore are endued with vertue to repel the venomous and peſtiferous air, from coming and entring into the body, and to ſtrengthen the heart and brain. Of this kind are *Rue*, Balm, Roſemary, *Scordium*, *Sage*, Worm-wood, Cloves, Nutmegs, Saffron, the roots of Angelica, and Lovage, and ſuch like, which muſt be macerated one night in ſharp Vinegar and *Aqua vitæ*, and then tied in a knot as big as an egg, or rather let it be carried in a ſponge made wet, or ſoaked in the ſaid infuſion. For there is nothing that doth ſooner and better hold the ſpirituous virtue and ſtrength of aromatick things, than a ſponge. Wherefore it is of principal uſe either to keep or hold ſweet things to the noſe, or to apply Epithems and fomentations to the heart.

Of what nature the medicines outwardly uſed ought to be.

Thoſe ſweet things ought to be hot or cold, as the ſeaſon of the year, and kind of the peſtilence is: As for example, in the Summer you ought to infuſe and macerate Cinnamon and Cloves, beaten together: with a little Saffron in equal parts, of vinegar of Roſes, and Roſe-water, into which you muſt dip a ſponge, which rowled in a fair linnen cloth, you may carry in your hand, and often ſmell to.

Take

Take of Worm-wood half a handful; ten Cloves, of the roots of *Gentian* and Angelica, of each two drams; of vinegar and Roſewater, of each two ounces; of Treacle and Mithridate, of each one dram; beat and mix them well all together, and let a ſponge be dipped therein, and uſed as above ſaid. They may alſo be incloſed in boxes made of ſweet wood, as of Juniper, Cedar, or Cypreſs, and ſo carried for the ſame purpoſe.

But there is nothing more eaſie to be carried than Pomanders: the form of which is thus: Take of yellow Sanders, *Mace*, Citron-pills, Roſe and Myrtle-leaves, of each two drams; of Benzoin, *Ladanum*, *Storax*, of each half a dram; of Cinnamon and Saffron, of each two ſcruples; of Camphire and Amber-Greece, of each one ſcruple; of Musk three grains. Make thereof a Pomander, with Roſe-water, with the infuſion of Tragacanth. Or take red-Roſe-leaves, the flowers of Water-lillies and Volets, of each one ounce; of the three Sanders, Coriander-ſeeds, Citron-pills, of each half an ounce; of Camphire, one dram; let them all be made into powder, and with Water of Roſes and Tragacanth make a pomander. Pomanders.

In the Winter it is to be made thus. Take of *Storax*, Benzoin, of each one dram and a half; of Musk half a ſcruple, of Cloves, Lavander and *Ciperus*, of each two drams; of the root of Orris, *i.e. Flower-de-luce*, and *Calamus aromaticus*, of each two drams and a half; of Amber-Greece, three drams; of Gum-Tragacanth diſſolved in Roſe-water and *aqua vitæ*, as much as ſhall ſuffice, make thereof a Pomander.

And for the ſame purpoſe you may alſo uſe to carry about with you ſweet powders, made of Amber-Greece, *Storax*, Orris, Nutmegs, Cinnamon, *Mace*, Cloves, Saffron, Benzoin, Musk, Camphire, Roſes, Violets, *Juncus odoratus*, Marjoram, and ſuch like, of which being mixed together, Powders may be compounded and made. Sweet powders.

Take of the roots of Orris two drams; of *Cyperus*, *Calamus aromaticus*, red Roſes, of each half an ounce, of Cloves half a dram, of *Storax*, one dram; of Musk, eight grains: mix them, and make a powder for a bag; or take the roots of Orris two ounces; red-Roſe-leaves, white Sanders, *Storax*, of each one dram; of *Cyperus* one ounce; of *Calamus aromaticus*, one ounce; of Marjoram, half an ounce; of Cloves, three drams; of Lavander, half a dram; of Coriander-ſeeds, two drams; of good Musk, half a ſcruple; of *Ladanum* and Benzoin, of each a dram; of Nutmegs and Cinnamon, of each two dram: Make thereof a fine powder, and ſow it in a bag.

It will be very convenient alſo to apply to the *region* of the heart, a bag filled with yellow Sanders, *Mace*, Cloves, Cinnamon, Saffron and Treacle ſhaken together, and incorporated, and ſprinkled over with ſtrong vinegar and Roſe-water in Summer, and with ſtrong wine and Muskadine in the Winter. Bags.

The ſweet Aromatick things that are ſo full of ſpirits, ſmelling ſweetly and ſtrongly, have admirable vertues to ſtrengthen the principal parts of the body, and to ſtir up the expulſive faculty to expel the poyſon.

Contrariwiſe, thoſe that are ſtinking and unſavory, procure a deſire to vomit, and diſſolution of the powers, by which it is manifeſt how fooliſh and abſurd their perſwaſion is, that counſel ſuch as are in a peſtilent conſtitution of the Air, to receive and take in the ſtinking and unſavoury vapours of *ſinks* and *privies*, and that eſpecially in the morning. Unſavory things to be eſchewed.

But it will not ſuffice to carry thoſe preſervatives alone, without the uſe of any other thing, but it will be alſo very profitable to waſh all the whole body in Vinegar of the decoction of Juniper and Bay-berries, the Roots of *Gentian*, Marigolds, S. Johns-Wort, and ſuch like, with Treacle or Mithridate alſo diſſolved in it. For vinegar is an enemy to all poyſons in general, whether they be hot or cold: for it reſiſteth and hindereth putrefaction. Neither is it to be feared, that it ſhould obſtruct the pores, by reaſon of its coldneſs, if the body be bathed in it: for it is of ſubtil parts, and the ſpices boiled in it, have virtue to open.

Whoſoever accounteth it hurtful to waſh his whole body therewith, let him waſh only his armholes, the *region* of his heart, his *temples*, groins, parts of generation; as having great and marvelous ſympathy with the principal and noble parts.

If any miſlike bathing, let him anoint himſelf with the following Unguent. Take oyl of Roſes, four ounces; oyl of Spike, two ounces; of the powder of Cinnamon and Cloves, of each, one ounce and a half; of Benzoin, half an ounce; of Musk, ſix grains; of Treacle, half a dram; of Venice-Turpentine, one dram and a half; of Wax, as much as ſhall ſuffice: make thereof a ſoft Unguent. An Unguent.

You may alſo drop a few drops of oyl of Maſtich, of *Sage*, or of Cloves, and ſuch like, into the ears, with a little Civet or Musk.

CHAP. IX.

Of other things to be obſerved for prevention in fear of the Plague.

VEnery is chiefly to be eſchewed, for by it the powers are debilitated, the ſpirits diſſipated, and the breathing places of the body diminiſhed, and laſtly, all the ſtrength of nature weakned. A ſedentary life is to be ſhunned, as alſo exceſs in diet, for hence proceeds obſtruction, the corruption of the juices, and preparation of the body to putrefaction and the peſtilence. Why Venery is to be ſhunned.

Women muſt be very careful that they have their courſes duely, for ſtopping beſides the cuſtom, they eaſily acquire corruption, and draw by contagion the reſt of the humors into their ſociety. Such as have fiſtulaes, or otherwiſe old ulcers, muſt not heal them up in a peſtilent ſeaſon; for it is then more convenient rather to make new ones and theſe in convenient and declining places; that as by theſe channels, the ſink of the humors of the body may be emptied. Running ulcers good in time of peſtilence.

The Hemorrhoids, bleedings, and other the like accuſtomed evacuations, muſt not be ſtopped, unleſs

leſs they exceed meaſure. Moreover, they muſt at ſuch times take heed that they touch or handle not any of thoſe things wherein the ſeeds or fuel of the peſtilence may lie hid; ſuch as are hemp, flax, quilts and coverings wherein ſuch as have had the plague have lain; skins and all leather things, hangings and cloaths. You muſt dwell far from Church-yards, eſpecially from thoſe where-in the corps of ſuch as have died of the plague are not buried deep in the ground, as in the Church of *Innocents* in *Paris*, in which place by the ſame reaſon it ſundry times happens that the bodies are plucked up, rent and torn by dogs. Alſo let them dwell far from places of execution, ſhambles of fleſh and fiſh, from tan-houſes, diers, tallow-chandlers, cloth-dreſſers, farriers, skinners, and from the places wherein metals are caſt or wrought. The filth and dung, eſpecially of Swine, Privies, ſtanding and muddy waters, and laſtly all things of the like evil ſmell, muſt be far remote from your habitation; the belly muſt not be emptied into thoſe places, into which the excrements of ſuch as have the plague are caſt. The company of ſuch as uſually viſit thoſe ſick of the plague, muſt be eſchewed, as of Phyſicians, Apothecaries, Surgeons, Nurſe-keepers, Grave-makers, and Bearers: For though they have not the plague, yet coming out of a peſtilent place, they may carry with them lying in their garments, the ſeeds thereof. You may gather this by ſuch as have for a little while ſtayed in a perfumers ſhop, for the perfume diffuſed in the air, beſtows the ſmell upon the garments of ſuch perſons, ſo that gone from thence, ſuch as meet them, will judg them to carry perfumes with them. They ſhall alſo ſhun long watchings, ſound ſleeping, all paſſions of the mind, eſpecially, anger, hunger, thirſt, journying in the Sun, for that hath oft times occaſioned a diary feaver, which hath not ſeldom been ſeen to turn into a peſtilent one: for by dilating the pores of the skin, they have given entrance to the peſtilent air, which by that means hath eaſily taken hold of the humor diſpoſed to putrefaction.

Places to be ſhunned in time of plague

What company to be avoided.

You muſt do nothing in a peſtilent ſeaſon whereby you may grow too hot.

CHAP. X.

Of the Office of Magiſtrates in time of the Plague.

MAgiſtrates ought to have a ſpecial care that no filth be heaped up, either in private or publick places: let all things be kept neat in every houſe, and let all the ſtreets be kept clean, the dung and filth be carried forth of the City, as alſo the dead carkaſſes of killed dogs and cats, for becauſe they oft-times lick and devour the excrements of ſuch as have the ſickneſs, therefore they may by their familiar entry into ſound houſes, there propagate the plague: Wherefore they muſt either be driven forth of the City, or killed, and ſo be carried forth and buried deep in the ground. Wells, ſprings, and rivers themſelves, muſt be freed and cleanſed from all impurity. Care muſt be had that muſty corn, tainted fleſh, nor ſtinking fiſh be not ſet to ſale. Publick baths and hot-houſes muſt be prohibited, for that in theſe, mens bodies are weakned, and made more yielding and pervious to the peſtiferous air. They ſhall commit the cure of ſuch as have the plague, to learned, skilful and honeſt Phyſicians, Apothecaries and Surgeons.

Why dogs and cats muſt be killed in a Plague-time.

Why Baths and hot-houſes are not then to be allowed.

Such as are known to have the Plague, ſhall be ſeparated from ſuch as are free there-from, and be ſent to ſuch fit places as ſhall be provided for them; for this is better and more humanely done than to ſhut up every man in his own houſe. They ſhall provide and fore-ſee that the houſhold-ſtuff of ſuch as have the plague be not ſet to ſale. They ſhall ſet ſigns and noted marks upon the houſes ſeized upon by this diſeaſe, leſt they ſhould unawares run into danger: Wherefore to the ſame purpoſe they ſhall procure that the Surgeons and others that viſit the ſick of the Plague may be known by ſome conſpicuous mark, that ſuch as paſs by them may be admoniſhed of the danger; they ſhall alſo take care that the bodies of the dead be buried as ſpeedily as may be. For they ſooner and more grievouſly putrefie in a ſhort time, than the bodies of others of what death ſoever they die Wherefore, neither birds, nor ravenous beaſts dare once touch their Bodies, though unburied; for by taſting them they ſhould quickly come to their deaths. The keepers of the gates of the City ſhall be admoniſhed, that they take ſpecial care that ſuch as are infected, or come from a viſited place, do not enter into the City; for from one, the evil may come to ſpread it ſelf further: for one ſpark may ſet a whole City on fire, and one ſcabby ſheep infect a whole flock. And becauſe there is nothing which may more perfectly purge the air, and cleanſe it from all manner of noiſomneſs and infection, than fire; they ſhall command that there be kindled and perpetually kept burning, fires made with odoriferous and ſtrong ſmelling things, as Juniper, Turpentine, Broom, and the like.

Such as die of the Plague do quickly putrefie.

In ſtead hereof *Levinus* tells, that the Souldiers of the Garriſon of *Torny* uſed in a Plague-time, to diſcharge their Cannons laded only with powder, turning their mouths upon the City, and that morning and evening; that by the vehemency of the moved air, the peſtiferous fogs might be chaſed away; and by the heat of the burned powder, the venenate and noiſom quality of the air might be amended. Laſtly, I judge it fit to admoniſh Magiſtrates, that they have their eyes and minds attentive upon a murderous and impious kind of Bearers and Nurſe-keepers; which allured with a deſire of gain (which whilſt the Plague reigns, they get abundantly) anoint the walls, doors, threſholds, knockers of gates and locks with the filth and ointments taken from ſuch as have the Plague, that the Plague within a while after ſeizing upon theſe alſo, the maſters of them flying away, and the family diſperſed, they may there reign alone, and freely and without puniſhment carry thence what they pleaſe oft-times ſtrangling ſuch as lie ready to die, leſt recovering, they might be their accuſers. This I remember, happened at *Lions*, *Anno Dom.* 1565.

Lib. 2. de occult. mat. mirac.

CHAP. XI.

What caution muſt be uſed in chuſing Phyſicians, Apothecaries and Surgeons, who may have a care of ſuch are taken with the Plague.

IT is the part of Magiſtrates in the ſo great neceſſity of the afflicted Common-wealth, to appoint learned, skilful and honeſt Phyſicians, Surgeons, and Apothecaries, and ſuch as have more regard to the Law of God than to gain, to have the care and cure of ſuch as are viſited: But principally let them not take Surgeons and Apothecaries called by proclamation with ſound of trumpet, that if they will take this charge, they ſhall become free without examination or reward. But let them rather be allured by gifts and honeſt rewards, not only then when as neceſſity urgeth, but alſo after the plague is over. For ſuch ſervant-Surgeons and Apothecaries as are called by proclamation, ſo to gain freedom, are moſt commonly unskilful and unexperienced Dunces, who, conſcious of their own ignorance, and fearing to undergo the examination of the Maſters of their Companies, refuſe no hazard, however dangerous, with deſire to obtain their freedom.

It is far worſe and more dangerous to fall into the hands of ſuch, than into the hands of thieves and murderers; for theſe by providence of ſtrength, we may chance to eſcape; but we ſeek for and embrace the other, and having found them, lay our throats bare unto them, ſo by their unskilfulneſs to be butchered. Certainly by the fault of the times, and the neglect of Magiſtrates, it is almoſt come to this paſs, that if any honeſt and learned Phyſicians and Surgeons ſhall undertake this cure, they are commonly forced thereto by the Magiſtrate, for fear of baniſhment or fining: Therefore becauſe they do it againſt their wills, they ſhew themſelves leſs vigilant, cheerful and painful about the ſick. They come unwillingly, and compelled thereto, becauſe by the memory of the fore-paſt time, they ſufficiently know, how ſordid and baſely Magiſtrates, when the Plague hath been over-paſt, have been in paying the promiſed reward to men of their condition, who have ſtoutly run into danger; for thence it happens, that during the reſt of their lives they may ſit idle at home, for that they are infamous, and feared by the people only for this, that a while agon they viſited ſuch as had the Plague. Therefore I would have Magiſtrates prudent, faithful, and free in chuſing honeſt, learned and skilful men, who may undergo this ſo difficult and dangerous a charge.

CHAP. XII.

How ſuch as undertake the cure of the Plague ought to arm themſelves.

FIrſt they muſt think and hold for certain, that they are not called to this office by men, but by God, ſo directing the counſels and actions of men as he thinketh fit. Therefore they ſhall confidently enter into the cure thereof; for that our lot, life and death are in the hands of the Lord: but notwithſtanding they ought not to neglect remedies, which are given to men for prevention, leſt by the neglecting the gifts of God, they may ſeem to neglect him alſo that is the giver of ſo many good and excellent benefits. Therefore, firſt let them by purging and bleeding, evacuate the humors ſubject to putrefaction, and to conceive the ſeeds of the peſtilence. Let them make two fontanels by application of cauteries, to be as rivulets to evacuate the excrementitious humors which are daily by little and little heaped up in us; let one of them be in the right arm a little below the muſcle *Epomis*; the other the ſpace of three fingers under the knee on the inſide of the left leg. This is found by experience a very certain means of prevention. Let them waſh their whole bodies with the following lotion. ℞. *aquæ roſ. aceti roſati, aut ſambucini, vini albi aut malvatici, an.* lb. vi. *rad. enulæ camp. angelicæ, gentian. biſtortæ, zedoar. an.* ℥iii. *baccar. juniperi, & hederæ, an.* ℥ii. *ſalviæ, roriſmar. abſinth. rutæ, an.* m. j. *corticis citri,* ℥ ß. *theriacæ & mithridat. an.* ℥j. *conquaſſanda conquaſſentur, bulliant lento igni, & ſerventur ad uſum ante commemoratum.* The epithems, unguents and Bags formerly deſcribed ſhall be applied to the region of the heart. I have read it noted by *John Baptiſt Theodoſius*, that amongſt other things, Arſenick may be profitably applied tothe region of the heart, that ſo it may by little and little accuſtom it ſelf to poyſons, that afterwards it may be leſs harmed by their incurſion, firſt making their aſſault upon it.

Our lots are in the hands of the Lord.

Where to make iſſues in the time of the Plague.

Cap. 8. *Epiſt.* 2.

Let their garments be made of Chamlet, Dutch Serge, Satin, Taffaty, or the like. Or elſe if they cannot of theſe, let them be of ſome other handſom Stuff, but not of Cloth, Freeze or the like, that they may take the venenate air, and carry it with them to the infection of the ſound. They ſhall oft-times change their cloaths, ſhirts and other linnen, and perfume them with aromatick things; let them warily approach the ſick, more warily ſpeak unto him, with their faces looking away from him rather than toward him, ſo that they may not receive the breath of his mouth, neither the vapour nor ſmell of any of his excrements.

What to wear.

How to viſit your patients.

When as I upon a time being called to viſit one that lay ſick of the Plague, came too near and heedleſly to him, and preſently by ſudden caſting off the cloaths he laid him bare, that ſo I might the better view a *Bubo*, that he had in his right groin, and two Carbuncles that were on his belly, then preſently a thick, filthy and putrid vapour ariſing from the broken abſceſs of the Carbuncle, as out of a raked puddle, aſcended by my noſtrils to my brain, whereupon I fainted, and fell down ſenſleſs upon the ground; raiſed up a little after, all things ſeemed to me to run round, and I was ready to fall again, but that I ſtayed my ſelf by taking hold of the bed-poſt. But one thing comforted me, that there appeared no ſigns that my heart was affected, either by pain or panting, or the ſtrong and contumacious failing of my powers. An Argument that the animal ſpirits were only diſſipated by a venenate vapor, and that the ſubſtance of the heart was no way wronged, was a ſneeſing which took me ſo violently, that I ſneeſed ten times, and then fell a bleeding at the noſe;

An hiſtory.

which

which excretion, I believe, freed me from all the impreſſion of the malignity. Let others, warned by this mine example, learn to be wiſer and more wary in this caſe, leſt they come to worſe miſhap than befel me.

CHAP. XIII.

Of the ſigns of ſuch as are infected with the Plague.

Whence certain ſigns of the Plague may be taken.

WE muſt not ſtay ſo long before we pronounce one to have the Plague until there be pain and a tumor under his arm-holes, or in his groin, or ſpots (vulgarly called *Tokens*) appear over all the body, or Carbuncles ariſe: for many die through venenate malignity, before theſe ſigns appear. Wherefore the chiefeſt and trueſt ſigns of this diſeaſe are to be taken from the heart, being the manſion of life, which chiefly and firſt of all is wont to be aſſailed by the force of the poyſon. Therefore they that are infected with the Peſtilence, are vexed with often ſwoundings and faintings; their pulſe is feebler and ſlower than other, but ſometimes more frequent, but that is eſpecially in the night ſeaſon; they feel prickings over all their body, as if it were the pricking of needles; but their noſtrils do itch eſpecially by occaſion of the malign vapours ariſing upwards from the lower and inner, into the upper parts, their breaſt burneth, their heart beateth with pain under the left dug, difficulty of taking breath, ptiſſick, cough, pain of the heart, and ſuch an elation or puffing up of the *Hypochondria*, or ſides of the belly, diſtended with the abundance of vapours raiſed by the force of the feaveriſh heat, that the patient will in a manner ſeem to have the Tympany. They are moleſted with a deſire to vomit, and oftentimes with much and painful vomiting, wherein green and black matter is ſeen, and always of divers colours, anſwering in proportion to the excrements of the lower parts, the ſtomack being drawn into a conſent with the heat, by reaſon of the vicinity and communion of the veſſels; oftentimes blood alone, and that pure, is excluded and caſt up in vomiting; and is not only caſt up by vomiting out of the ſtomach, but alſo very often out of the noſtrils, fundament; and in women, out of the womb; the inward parts are often burned, and the outward parts are ſtiff with cold, the whole heat of the patient being drawn violently inward, after the manner of a Cupping-glaſs, by the ſtrong burning of the inner parts; then the eye-lids wax blew, as it were through ſome contuſion, all the whole face hath an horrid aſpect, and as it were the colour of lead, the eyes are burning red, and as it were ſwoln, or puffed up with blood, or any other humor, ſhed tears; and to conclude, the whole habit of the body is ſomewhat changed, and turned yellow.

The cauſe of vomiting in ſuch as have the Plague.

Their looks are ſuddenly changed.

Many have a burning feaver, which doth ſhew it ſelf by the patients ulcerated jaws, unquenchable thirſt, drineſs and blackneſs of the tongue and it cauſeth ſuch a phrenſie by inflaming the brain, that the patients, running naked out of their beds, ſeek to throw themſelves out of windows into the pits and rivers that are at hand. In ſome the joints of the body are ſo weakned, that they cannot go nor ſtand; from the beginning, they are as it were buried in a long ſwound and deep ſleep, by reaſon that the feaver ſendeth up to the brain, the groſs vapors from the crude and cold humors, as it were from green woody newly kindled to, make a fire.

Why ſome that are taken with the plague are ſleepy.

Such ſleeping doth hold him eſpecially while the matter of the ſore or carbuncle is drawn together, and beginneth to come to ſuppuration. Oftentimes when they are awaked out of ſleep, there do ſpots and marks appear diſperſed over the skin, with a ſtinking ſweat. But if thoſe vapors be ſharp that are ſtirred up unto the head, inſtead of ſleep they cauſe great waking, and always there is much diverſity of accidents, in the urine of thoſe that are infected with the Plague, by reaſon of the diverſe temperature and condition of bodies: neither is the urine at all times, and in all men of the ſame conſiſtence and colour: For ſometimes they are like unto the urine of thoſe that are ſound and in health, that is to ſay, laudable in colour and ſubſtance; becauſe that when the heart is affected by the venemous air, that entreth in unto it, the ſpirits are more greatly grieved and moleſted than the humors: but thoſe, *i. e.* the ſpirits, are infected and corrupted when theſe do begin to corrupt.

Why their urines are like thoſe that are ſound.

But Urines only ſhew the diſpoſitions of the humors or parts in which they are made, collected together, and through which they paſs.

This reaſon ſeemeth truer to me than theirs which ſay, that nature terrified with the malignities of the poyſon avoids contention, and doth not reſiſt or labour to digeſt the matter that cauſeth the diſeaſe.

Many have their appetites ſo overthrown, that they can abſtain from meat for the ſpace of three days together.

And to conclude, the variety of accidents is almoſt infinite, which appear and ſpring up in this kind of diſeaſe, by reaſon of the diverſity of the poyſon, and condition of the bodies and grieved parts: but they do not all appear in each man; but ſome in one, and ſome in another.

CHAP. XIV.

What ſigns in the Plague are mortal.

IT is a moſt deadly ſign in the Peſtilence, to have a continual and burning Feaver, to have the tongue dry, rough, and black, to breath with difficulty, and to draw in a great quantity of breath, but breath out little; to talk idly; to have Phrenſie and Madneſs together, with unquenchable thirſt and great watching; to have Convulſions, the Hicket, Heart-beating, and to ſwound very often and vehemently: further, toſſing and turning in the bed, with a loathing of meats, and dayly vomits of a green, black, and bloudy colour; and the face pale, black, of an horrid and cruel aſpect, bedewed with a cold ſweat, are very mortal ſigns.

There are ſome which at the very beginning have ulcerous and painful wearineſs, pricking under the skin, with great torment of pain; the eyes look cruelly and ſtaringly, the voice waxeth hoarſe, the tongue rough and ſtutting, and the underſtanding decaying the patient uttereth and talketh of frivolous things. Truly thoſe are very dangerouſly ſick, no otherwiſe than thoſe whoſe urine is pale, black, and troubled like unto the urine of carriage-beaſts, or lee, with divers coloured clouds or contents; as blew, green, black, fatty and oily, as alſo reſembling in ſhew, a Spiders web, with a round body ſwimming on the top. An ulcerous and painful wearineſs from the beginning ſheweth the Plague to be deadly.

If the fleſh of the carbuncle be dry and black, as it were ſeared with an hot iron, if the fleſh about it be black and blew, if the matter do flow back, and turn in, if they have a lask with greatly ſtinking, liquid, thin, clammy, black, green or blewith ordure; if they avoid Worms, by reaſon of the great corruption of the humors, and yet for all this the patient is never the better; if the eyes wax often dim, if the noſtrils be contracted or drawn together, if they have a grievous cramp, the mouth be drawn aſide, the muſcles of the face being drawn or contracted equally or unequally; if the nails be black; if they be often troubled with the Hicket, or have a Convulſion and reſolution over all the body, then you may certainly prognoſticate that death is at hand, and you may uſe cordial medicines only, but it is too late to purge, or let bloud.

CHAP. XV.

Signs of the Plague coming by contagion of the air without any fault of the humors.

YOu ſhall underſtand, that the Peſtilence proceeds from the corruption of the air, if it be very contagious, and diſperſeth it ſelf into ſundry places in a moment. If it kill quickly and many, ſo that whilſt ſundry perſons go about their uſual buſineſs, walk in the places of common reſort, and through the ſtreets, they ſuddenly fall down and die, no ſign of the diſeaſe or harm appearing, nor any pain oppreſſing them; for the malignity of the corrupt air is quick and very ſpeedy in infecting our ſpirits, overthrowing the ſtrength of the heart, and killing the Patient. The Patients are not troubled with great agitation, becauſe the ſpirits diſſipated by the rapid malignity of the poyſon, cannot endure that labour; beſides they are taken with frequent ſwoundings, few of them have Buboes, few have Blains come forth; and by the ſame reaſon their urines are like to thoſe of ſound men. Why they have no ſores.

CHAP. XVI.

Signs of the Plague drawn into the body by the fault and putrefaction of humors.

FOrmerly we have reckoned up the cauſes of the corruption of humors from plenitude, obſtruction, diſtemper, and the ill juice of meats. Now muſt we deliver the ſigns of each corrupt humor which reigns in us, that it may be reduced to ſoundneſs and perfection of nature, by the oppoſition of its contrary, or elſe be evacuated by Phyſick. Therefore if the body be more yellow than uſual, it is a ſign of choler offending in quantity and quality. If more black, then of melancholy; if more pale, then of phlegm; if more red, with the veins ſwoln up and full, then of blood. Alſo the colour of the riſing blains, tumors and ſpots, expreſs the colour of the predominant humor, as alſo the excrements caſt forth by vomit, ſtool, and otherwiſe; the heavineſs and cheerfulneſs of the affected body; the manner of the preſent Feaver; the time of the year, age, region, diet. Such things as have a cutting, penetrating, attenuating, and cleanſing faculty, take away obſtruction. By means of obſtruction, Feavers oft-times accompany the Plague, and theſe not only continual, but alſo intermitting, like tertians or quartans. Therefore that Plague that is fixed in the infection or corruption of a cholerick humor, ſhews it ſelf by the forementioned ſigns of predominating choler, to wit, the heat of the ſkin, blains, and excrements; as alſo in the quickneſs of killing, and vehemency of the ſymptoms, bitterneſs of the mouth, a painful and continual endeavour of going to ſtool, by reaſon of the acrimony of choler ſtimulating and raking the guts in the paſſage forth. That which reſides in the corrupt ſubſtance of groſs humors, as of bloud, ſheweth it ſelf by many and plentiful ſweats, by a ſcouring, by which are avoided many and various humors; and oft-times alſo bloudy matter that proceeds from corrupt phlegm, it invades with more ſound ſleep, and cauſleſs wearineſs of all the members; when they are awakened out of their ſleep, they are not ſeldom troubled with a trembling over all their joints, the entrance and way of the ſpirits into the members being obſtructed by the groſneſs of the humors. That which is ſeated in the corruption of a melancholick humor, is accompanied with heavineſs and pain of the head, much penſiveneſs, a deep and ſmall pulſe. But the moſt certain ſign of the Plague reſiding in the corruption of the humors, is to be taken from the urine. For the ſigns of the vitiated humors cannot but ſhew themſelves in the urines: therefore troubled urines, and ſuch as are like thoſe of carriage-beaſts, as alſo black and green, give certain notice thereof. But ſome are much troubled with thirſt, others not at all; becauſe choler or phlegm ſometimes only putrifie in the ſtomach or orifice of the ventricle; ſometimes beſides, they will weaken the government of the natural faculties of the part, as of the appetite. But if the Feaver happen by the default and infection both of the air and humors; then will there be a great confuſion of the forementioned ſigns and ſymptoms. Signs of choler. When the urine is to be looked upon. Why ſome are much troubled with thirſt, others not at all.

CHAP.

CHAP. XVII.

Of the Prognoſtication that is to be inſtituted in the Plague.

No certain prediction in the Plague.

YOu may well fore-tell the future motions and events of diſeaſes, when you throughly know the nature of the diſeaſe, and accidents thereof, and the condition, function, and excellency of the body and grieved parts: Although that this may be ſpoken in general, that there is no certain prediction in peſtilent diſeaſes, either to health or death, for they have very unconſtant motions, ſometimes ſwift and quick, ſometimes ſlow, and ſometimes choaking or ſuffocating in a moment, while one breaths in the venomous air, as he is going about any of his neceſſary affairs, having puſtles riſing in the skin with ſharp pain, and as though the whole body was pricked all over with needles or the ſtings of Bees. Which I have ſeen with mine eyes in the Plague that was at *Lions* when *Charles* the French King lay there. It many times cometh to paſs that the accidents that were very vehement and raging a little before, are ſuddenly aſſwaged, and the patients do think themſelves better, or almoſt perfectly ſound. Which happens to *Mary* one of the Queen-mother her maids, in that notable peſtilent conſtitution of the air, that year when *Charles* the French King lay at the Caſtle of *Roſſilion*: for when ſhe was infected, a great tumor or *Bubo* aroſe in her groin, and ſuddenly it went in again, ſo that the third day of her ſickneſs, ſhe ſaid ſhe was without any grief or diſeaſe at all, but that ſhe was troubled with the difficulty of making water; and I think it was becauſe the bladder was inflamed by the reflux of the matter; that ſhe was ſound in mind and body, and walked up and down the chamber on the ſame day that ſhe died. The ſtrangeneſs of which thing made the King ſo fearful, that he haſted to depart thence.

An hiſtory.

Why young men ſooner take the plague than old.

Although this diſeaſe doth ſpare no man of what age, temperature, complexion, diet and condition ſoever, yet it aſſaulteth young men that are cholerick and ſanguine, more often than old men that are cold and dry, in whom the moiſture, that is the nouriſher of putrefaction by reaſon of their age, is conſumed, and the ways, paſſages and pores of the skin, whereby the venomous air ſhould enter and pierce in, are more ſtrait and narrow. And moreover, becauſe old men do always ſtay at home, but young men for their neceſſary buſineſs, and alſo for their delight and pleaſure, are always more abroad in the day time, in the air, where-hence the pollution of the Peſtilence cometh more often.

What Plague moſt contagious.

That peſtilence that comes by the corruption of the humors, is not ſo contagious as that which cometh by the default of the air. But thoſe that are Phlegmatick and Melancholick, are moſt commonly grieved with that kind of Peſtilence; becauſe in them the humors are more clammy and groſs, and their bodies more cold and leſs perſpirable, for which cauſes the humors ſooner and more ſpeedily putrefie.

Men that are of an ill juice, are alſo moſt apt to this kind of Peſtilence, for in the naughty quality of the juice there is a great preparation of the humors unto putrefaction: You may know it by this, that when the Peſtilence reigneth, there are no other diſeaſes among the common people, which have their original of an ill juice, but they all degenerate into the Plague. Therefore when they begin to appear and wander up and down, it is a token that the Peſtilence will ſhortly ceaſe or is almoſt at an end.

Who leaſt ſubject to take the Plague.

But here alſo I would have you to underſtand thoſe to be of an ill juice, which have no pores in their skin, by which, as it were by rivers, the evil juice which is contrary to nature, may be evacuated and purged. And I have noted and obſerved, that thoſe are leſs in danger of the Peſtilence which have Cancerous Ulcers and ſtinking ſores in their Noſes, and ſuch as are infected with the French-Pox, and have by reaſon thereof, tumors and rotten Ulcers, or have the Kings-evil running upon them, the Leproſie or the Scab: and to conclude: all thoſe that have Fiſtulaes and running in their bodies.

I think thoſe that have quartane Feavers are the better priviledged for the ſame, becauſe that by the fit cauſing ſweat, that cometh every fourth day, they avoid much of the evil juice that was engendred.

This is more like to be true, than to think that the poyſon that cometh from without, may be driven away by that which lurketh within.

Who ſubject thereto.

Contrariwiſe, women that are great with child, as I have noted, becauſe they have much ill juice being prohibited from their accuſtomed evacuations, are very apt to take this diſeaſe, and ſo ſeldom recover after they are infected.

Signs the diſeaſe is incurable.

Black or blew impoſtumes, and ſpots and puſtles of the ſame colour, diſperſed over the skin, argue that the diſeaſe is altogether incurable and mortal.

A good ſign.

When the ſwelling or ſore goeth or cometh before the Feaver, it is a good ſign; for it declareth that the malignity is very weak and feeble, and that nature hath overcome it, which of it ſelf is able to drive ſo great portion thereof from the inner parts. But if the ſore or tumor come after the Feaver,

A deadly ſign.

it is a mortal and deadly ſign, for it is certain that it cometh of the venomous matter not tranſlated, but diſperſed; not by the victory of nature, but through the multitude of the matter, with the weight whereof nature is overcome.

When the Moon decreaſeth, thoſe that are infected with the Peſtilence, are in great doubt and danger of death, becauſe then the humors that were collected and gathered together before the Full of the Moon, through delay and abundance, do ſwell the more, and the faculties by which the body is governed, become more weak and feeble, becauſe of the imbecillity of the native heat, which before was nouriſhed and augmented by the light, and ſo conſequently by the heat of the Full Moon: For as it is noted by *Ariſtotle*, the Wainings of the Moon are more cold and weak: and thence it is that women have their menſtrual fluxes chiefly, or commonly, at that time.

In a groſs and cloudy air, the peſtilent infection is leſs vehement and contagious, than in a thin

and

and ſubtil air; whether that thinneſs of the air proceed from the heat of the Sun, or from the North wind and cold. Therefore at *Paris*, where naturally, and alſo through the abundance of filth that is about the City, the air is dark and groſs, the peſtilent infection is leſs fierce and contagious than it is in *Provence*, for the ſubtilty of the air ſtimulates or helps forward the Plague. In what air moſt contagious.

But this diſeaſe is mortal and pernicious whereſoever it be, becauſe it ſuddenly aſſaulteth the heart, which is the Manſion, or as it were the fortreſs or caſtle of life: but commonly not before the ſigns and tokens of it appear on the body: and yet you ſhall ſcarce find any man that thinketh of calling the Phyſician to help to preſerve him from ſo great a danger, before the ſigns thereof be evident to be ſeen and felt; but then the heart is aſſaulted: And when the heart is ſo aſſaulted, what hope of life is there, or health to looked for? Therefore becauſe medicines come oft-times too late, and this malady is as it were a ſudden and winged meſſenger of our death, it cometh to paſs, that ſo many die thereof. And moreover, becauſe of the firſt ſuſpicion of this ſo dire and cruel a diſeaſe, the imagination and mind (whoſe force in the diverſly much ſtirring up of the humors, is great and almoſt incredible) is ſo troubled with fear of imminent death, and deſpair of health, that together with the perturbed humors, all the ſtrength and power of nature falleth and ſinketh down. What effects fear and confidence produce in the Plague.

This you may perceive and know, by reaſon that the keepers of ſuch as are ſick, and the bearers which are not fearful, but very confident, although they do all the baſeſt offices which may be for the ſick, are commonly not infected, and ſeldom die thereof, if infected.

CHAP. XVIII.

How a peſtilent Feaver comes to be bred in us.

THe Plague oft-times findeth fuel in our bodies, and oft-times allurements, to wit, the putrefaction of humors, or aptneſs to putrefie: but it never thence hath its firſt original, for that comes always from the defiled air; therefore a peſtilent Feaver is thus bred in us: The peſtilent air drawn by inſpiration in the lungs, and tranſpiration into the utmoſt mouths of the veins and arteries ſpread over the skin, the bloud or elſe the humors already putrefying or apt to putrefie therein, are infected or turned into a certain kind of malignity reſembling the nature of the agent. Theſe humors, like unquencht lime when it is firſt ſprinkled with water, ſend forth a putrid vapor, which carried to the principal parts and heart eſpecially, infecteth the ſpirituous bloud boiling in the ventricles thereof, and therewith alſo the vital ſpirits; and hence proceeds a certain feaveriſh heat. This heat diffuſed over the body by the arteries, together with a malign quality, taints all, even the ſolid parts of the bones, with the peſtiferous venom; and beſides, cauſeth divers ſymptoms, according to the nature thereof, and the condition of the body and the humors wherein it is. Then is the conflict of the malignity aſſailing, and nature defending, manifeſt; in which, if nature prevail, it uſing the help of the expulſive faculty, will ſend and drive it far from the noble parts, either by ſweats, vomits, bleeding, evacuation by ſtool or urine, buboes, carbuncles, puſtles, ſpots, and other ſuch kinds of breakings out, over the skin, but on the contrary, if the malignity prevail, and nature be too weak, and yield, and that firſt he be troubled with often panting, or palpitation of the heart; then preſently after with frequent faintings, the patient then at length will die. For this is a great ſign of the Plague or a peſtilent Feaver, if preſently at the firſt, with no labour, nor any evacuation worth the ſpeaking of, their ſtrength fail them, and they become exceeding faint. You may find the other ſigns mentioned in our preceeding diſcourſe. The original of the Plague always from the air. Signs that nature is orecome.

CHAP. XIX.

Into what place the Patient ought to betake himſelf ſo ſoon as he finds himſelf infected.

WE have ſaid, that the perpetual and firſt original of the peſtilence cometh of the Air; therefore ſo ſoon as one is blaſted with the peſtiferous Air, after he hath taken ſome preſervative againſt the malignity thereof, he muſt withdraw himſelf into ſome wholeſom Air, that is, clean and pure from any venomous infection or contagion; for there is great hope of health by the alteration of the Air; for we do moſt frequently and abundantly draw in the Air of all things, ſo that we cannot want it for a minute of time: therefore of the Air that is drawn in, dependeth the correction, amendment, or increaſe of the poyſon or malignity that is received, as the Air is pure, ſincere, or corrupted. Change of the Air conduceth to the cure of the Plague.

There be ſome that do think it good to ſhut the patient in a cloſe chamber, ſhutting the windows to prohibit the entrance of the Air as much as they are able: But I think it more convenient that thoſe windows ſhould be open from whence that wind bloweth that is directly contrary unto that which brought in the venomous Air: For although there be no other cauſe, yet if the Air be not moved, or agitated, but ſhut up in a cloſe place, it will ſoon be corrupted. Therefore in a cloſe and quiet place that is not ſubject to the entrance of the Air, I would wiſh the Patient to make wind, or to procure Air with a thick and great cloth, dipped or macerated in water and vinegar mixed together, and tied to a long ſtaff, that by toſſing it up and down the cloſe chamber, the wind or air thereof may cool and recreate the Patient. The Patient muſt every day be carried into a freſh chamber, and the beds and the linnen cloaths muſt be changed: there muſt always be a clear and bright fire in the Patients chamber, and eſpecially in the night, whereby the air may be made more pure, clean, and void of nightly vapors, and of the filthy and peſtilent breath proceeding from the Patient, or his excrements. In the mean time, leſt (if it be in hot weather) the Patient ſhould be weakned or made more faint, by reaſon that the heat of the fire doth diſperſe and waſte his ſpirits, the floor or ground of his chamber muſt be ſprinkled or watered with vinegar and water, or ſtrowed with the branches Air pent up is apt to putrefie.

branches of Vines made moiſt in cold water, with the leaves and flowers of Water-lillies, or Poplar, or ſuch like. In the fervent heat of Summer he muſt abſtain from Fumigations that do ſmell too ſtrongly, becauſe that by aſſaulting the head, they increaſe the pain.

If the Patient could go to that coſt, it were good to hang all the chamber where he lieth, and alſo the bed, with thick or coarſe linnen cloaths moiſtned in vinegar and water of Roſes. Thoſe linnen cloaths ought not to be very white, but ſomewhat brown, becauſe much and great whiteneſs doth diſperſe the ſight, and by waſting the ſpirits, doth increaſe the pain of the head: for which cauſe alſo the chamber ought not to be very lightſome.

Contrariwiſe, on the night ſeaſon there ought to be fires and perfumes made, which by their moderate light, may moderately call forth the ſpirits.

The materials for ſweet fires.

Sweet fires may be made of little pieces of the wood of Juniper, Broom, Aſh, Tamariſk, of the rind of Oranges, Limons, Cloves, Benzoin, Gum-Arabick, Orris-roots, Myrrh, groſly beaten together, and laid on the burning coals put into a chafing-diſh. Truly the breath or ſmoak of the wood or berries of Juniper, is thought to drive ſerpents a great way from the place where it is burnt. The virtue of the Aſh-tree againſt venom is ſo great, as *Pliny* teſtifieth, that a Serpent will not come under the ſhadow thereof, no, not in the morning, nor evening, when the ſhadow of any thing is moſt great and long, but he will run from it. I my ſelf have proved, that if a circle or compaſs be made with the boughs of an Aſh-tree, and a fire made in the midſt thereof, and a Serpent put within the compaſs of the boughs, that the Serpent will rather run into the fire than through the Aſh-boughs.

Lib. 16. cap. 13.

There is alſo another means to correct the Air. You may ſprinkle Vinegar of the decoction of Rue, Sage, Roſemary, Bay-berries, Juniper-berries, Cyprus-nuts, and ſuch like, on ſtones or bricks red hot, and put in a pot or pan, that all the whole chamber where the Patient lieth, may be perfumed with the vapor thereof.

Perfumes.

Alſo Fumigations may be made of ſome matter that is more groſs and clammy, that by the force of the fire the fume may continue the longer; as of *Ladanum*, Myrrh, Maſtich, Roſin, Turpentine, *Storax*, *Olibanum*, Benzoin, Bay-berries, Juniper-berries, Cloves, Sage, Roſemary, and Marjoram, ſtamped together, and ſuch like.

Sweet candles.

Thoſe that are rich and wealthy, may have Candles and Fumes made of Wax, or Tallow mixed with ſome ſweet things.

A ſponge macerated in Vinegar of Roſes, and Water of the ſame, and a little of the decoction of Cloves, and of Camphire added thereto, ought always to be ready at the Patients hand, that by often ſmelling unto it, the animal ſpirits may be recreated and ſtrengthened.

A ſweet water to ſmell to.

The water following is very effectual for this matter. Take of Orris four ounces, of Zedoary, Spikenard, of each ſix drams; of *Storax*, Benzoin, Cinnamon, Nutmegs, Cloves of each one ounce and half; of old Treacle, half an ounce: bruiſe them into groſs powder, and macerate them for the ſpace of twelve hours, in four pound of white and ſtrong wine; then diſtil them in a Lembick of glaſs on hot aſhes, and in that liquor wet a ſponge, and then let it be tied in a linnen cloth, or cloſed in a box, and ſo often put into the noſtrils. Or take of the vinegar and water of Roſes, of each four ounces; of Camphire, ſix grains; of Treacle, half a dram, let them be diſſolved together, and put into a viol of glaſs, which the patient may often put into his noſe.

A *Nodula* to ſmell to.

This *Nodula* following is more meet for this matter. Take of Roſe-leaves, two pugils; of Orris, half an ounce; of *Calamus aromaticus*, Cinnamon, Cloves, of each two drams; of *Storax* and Benzoin, of each one dram and a half; of Cyprus, half a dram; beat them into a groſs powder, make thereof a *Nodula* between two pieces of Cambrick or Lawn of the bigneſs of an hand-ball; then let it be moiſtned in eight ounces of Roſe-water, and two ounces of Roſe-vinegar, and let the patient ſmell to it often. Thoſe things muſt be varied according to the time: For in the Summer you muſt uſe neither Muſk nor Civet, nor ſuch like hot things: and moreover women that are ſubject to *fits* of the *Mother*, and thoſe that have Feavers or the head-ach, ought not to uſe thoſe things that are ſo ſtrong ſmelling and hot, but you muſt make choice of things more gentle: Therefore things are made with a little Camphire and Cloves bruiſed and macerated together in Roſe-water and vinegar of Roſes, ſhall be ſufficient.

CHAP. XX.

What Diet ought to be obſerved, and firſt of the choice of Meat.

Why ſuch as have the Plague may feed more fully.

THe order of Diet in a peſtilent diſeaſe ought to be cooling and drying; not ſlender, but ſomewhat full; becauſe by this kind of diſeaſe there cometh waſting of the ſpirits, and exſolution of the faculties, which inferreth often ſwounding, therefore that loſs muſt be repaired as ſoon as may be, with more quantity of meats that are of eaſie concoction and digeſtion; Therefore I never ſaw any being infected with the Peſtilence, that kept a ſlender diet, that recovered his health, but died; and few that had a good ſtomach, and fed well, died.

Sweet, groſs, moiſt and clammy meats, and thoſe which are altogether, and exquiſitely of ſubtil parts, are to be avoided, for the ſweet do eaſily take fire, and are ſoon inflamed; the moiſt will putrefie, the groſs and clammy obſtruct, and therefore engender putrefaction; thoſe meats that are of ſubtil parts, over much attenuate the humors, and inflame them; and do ſtir up hot and ſharp vapours into the brain, whereof cometh a Feaver. Therefore we muſt eſchew Garlick and Onions, Muſtard, ſalted and ſpiced Meats, and all kind of pulſe muſt alſo be avoided, becauſe they engender groſs winds, which are the authors of obſtruction: but the decoction of them is not always to be refuſed, becauſe it is a provoker of urine. Therefore let this be their order of diet: let their bread be of Wheat or Barly, well wrought, well leavened and ſalted, neither too new, nor too ſtale: let them be fed with ſuch meat as may be eaſily concocted and digeſted, and may engender

Pulſe muſt be ſhunned.

The manner of Diet.

gender much laudable juice, and very little excremental, as are the fleſh of Wether-Lambs, Kids, Leverets, Pullets, Partridges, Pigeons, Thruſhes, Larks, Quails, Black-birds, Turtle-doves, Moor-Hens, Pheaſants and ſuch like; avoiding Water-Fowls. Let the fleſh be moiſtned in Verjuice of unripe Grapes, Vinegar, or the juice of Limmons, Oranges, Citrons, tart Pomgranats, Barberies, Gooſeberries, or red Currans, or of Garden and Wild Sorrel: for all theſe ſowre things are very wholſom in this kind of diſeaſe, for they do ſtir up the appetite, reſiſt the venomous quality and putrefaction of the humours, reſtrain the heat of the Fever, and prohibit the corruption of the meats in the ſtomach. Although thoſe that have a more weak ſtomach, and are indued with a more exact ſenſe, and are ſubject to the Cough and diſeaſes of the Lungs, muſt not uſe theſe, unleſs they be mixed with Sugar and Cinamon.

If the Patient at any time be fed with ſodden meats, let the broths be made with Lettuce, Purſlain, Succory, Borage, Sorrel, Hops, Bugloſs, Creſſes, Burnet, Marigolds, Chervil, the cooling Seeds, French-Barly, and Oat-meal, with a little Saffron, for Saffron doth engender many ſpirits, and reſiſteth poiſon. To theſe opening roots may be added, to avoid obſtruction; yet much broth muſt be refuſed by reaſon of moiſture. The fruit of Capers eaten at the beginning of the meal provoke the appetite and prohibit obſtructions; but they ought not to be ſeaſoned with overmuch Oil and Salt, that they may alſo with good ſucceſs be put into broths.

Fiſhes are altogether to be avoided, becauſe they ſoon corrupt in the ſtomach: but if the Patient be delighted with them, thoſe that live in ſtony places muſt be choſen; that is to ſay, thoſe that live in pure and ſandy water, and about Rocks and Stones, as are Trouts, Pikes, Pearches, Gudgeons and Crevices boiled in milk, Wilks, and ſuch like. And concerning Sea-fiſh, he may be fed with Giltheads, Gurnarts, with all the kinds of Cod-fiſh, Whitings not ſeaſoned with ſalt, and Turbuts.

Eggs potched and eaten with the juice of Sorrel are very good. Likewiſe Barly-water ſeaſoned with the grains of a tart Pomgranat, and if the Fever be vehement, with the ſeeds of white Poppy. Such Barly-water is eaſie to be concocted and digeſted, it cleanſeth greatly and moiſtens and mollifieth the belly. But in ſome it procures an appetite to vomit, and pain of the head, and thoſe muſt abſtain from it. But in ſtead of Barly-water they may uſe Pap, and Bread crummed in the decoction of a Capon.

For the ſecond Courſe let him have Raiſins of the Sun newly ſodden in Roſe-water with Sugar, ſowre Damask Prunes, tart Cherries, Pippins, and Catharine Pears. *For the ſecond Courſe.*

And in the latter end of the Meal, Quinces roaſted in the Embers, Marmalate of Quinces, and Conſerves of Bugloſs or of Roſes, and ſuch like, may be taken: or elſe this Powder following. *In the end of the Meal.*

Take of Coriander-ſeeds prepared two drams, of Pearl, of Roſe-leaves, Shavings of Harts-horn and Ivory of each half a dram, of Amber two ſcruples, of Cinamon one ſcruple, of Unicorns horn, and the bone of a Stags heart of each half a ſcruple, of Sugar of Roſes four ounces: make thereof a Powder, and uſe it after meats.

If the Patient be ſomewhat weak, he muſt be fed with Gelly made of the fleſh of a Capon, and Veal ſodden together in the water of Sorrel, *Carduus Benedictus*, with a little quantity of Roſe Vinegar, Cinamon, Sugar, and other ſuch like, as the preſent neceſſity ſhall ſeem to require.

In the night ſeaſon for all events and miſchances, the Patient muſt have ready prepared, broth of meats of good digeſtion, with a little of the juice of Citrons or Pomgranats.

This reſtaurative that followeth may ſerve for all. Take of the Conſerve of Bugloſs, Borage, Violets, Water-lillies, and Succory, of each two ounces, of the powder of the Electuary *Diamargaritum frigidum*, of the Trochiſces of Camphire of each three drams, of Citron-ſeeds, *Carduus*-ſeeds, Sorrel-ſeeds, the Roots of *Dictamnus*, Tormentil, of each two drams, of the broth of a young Capon, made with Lettuce, Purſlain, Bugloſs and Borage boiled in it, ſix pints, put them in a Limbeck of glaſs with the fleſh of two Pullets, of ſo many Partridges, and with fifteen leaves of pure Gold: make thereof a diſtillation over a ſoft fire. Then take of the diſtilled liquor half a pint, ſtrain it through a woollen bag, with two ounces of white Sugar, and half a dram of Cinamon: let the Patient uſe this when he is thirſty. Or elſe put the fleſh of one old Capon, and of a leg of Veal, two minced Partridges, and two drams of whole Cinamon without any liquor, in a Limbeck of glaſs, well luted and covered, and ſo let them boil in *Balneo Mariæ*, unto the perfect concoction. For ſo the fleſhes will be boiled in their own juice, without any hurt of the fire; then let the juice be preſſed out therehence with a Preſs: give the Patient for every doſe, one ounce of the juice with ſome cordial waters, ſome *Triſantalum* and *Diamargaritum frigidum*. *A reſtaurative drink.*

The Preſerves of ſweet fruits are to be avoided, becauſe that ſweet things turn into choler; but the Confection of tart Prunes, Cherries, and ſuch like may be fitly uſed. But becauſe there is no kind of ſickneſs that ſo weakens the ſtrength as the Plague, it is always neceſſary, but yet ſparingly and often to feed the Patient, ſtill having reſpect unto his cuſtom, age, the region, and the time: for through emptineſs there is no great danger, leſt that the venomous matter that is driven out to the ſuperficial parts of the body, ſhould be called back into the inward parts, by an hungry ſtomach, and the ſtomach it ſelf ſhould be filled with cholerick, hot, thin, and ſharp excremental humours, whereof cometh biting of the ſtomach, and gripings in the guts.

CHAP. VII.

What drink the Patient infected ought to uſe.

IF the Fever be great and burning, the Patient muſt abſtain from Wine, unleſs he be ſubject to ſwouning: and he may drink the *Oxymel* following in ſtead thereof.

An *Oxymel.* Take of fair Water three quarts, wherein boil four ounces of Honey until the third part be conſumed, ſcumming it continually; then ſtrain it, and put it into a clean veſſel, and add thereto four ounces of Vinegar, and as much Cinnamon as will ſuffice to give it a taſte. Or elſe a ſugred Water, as followeth. Take two quarts of fair Water, of hard Sugar ſix ounces, of Cinamon two ounces; ſtrain it through a woollen bag or cloth without any boiling, and when the Patient will uſe it, put thereto a little of the juice of Citrons. The Syrup of the juice of Citrons excelleth amongſt all others that are uſed againſt the Peſtilence.

A Julip. The uſe of the Julip following is alſo very wholſom. Take of the juice of Sorrel well clarified half a pint, of the juice of Lettuce ſo clarified four ounces, of the beſt hard Sugar one pound, boil them together to a perfection; then let them be ſtrained and clarified, adding a little before the end a little Vinegar, and ſo let it be uſed between meals with boiled Water, or with equal portions of the Water of Sorrel, Lettuce, Scabious and Bugloſs: or take of this former deſcribed Julip ſtrained and clarified four ounces; let it be mixed with one pound of the fore-named Cordial waters, and boil them together a little. And when they are taken from the fire, put thereto of yellow Sanders one dram, of beaten Cinnamon half a dram, ſtrain it through a cloth: when it is cold, let it be given the Patient to drink with the juice of Citrons.

Thoſe that have been accuſtomed to drink Sider, Perry, Beer or Ale, ought to uſe that drink ſtill, ſo that it be clear, tranſparent and thin, and made of thoſe fruits that are ſomewhat tart; for troubled and dreggiſh drink doth not onely engender groſs humours, but alſo crudities, windineſs, and obſtructions of the firſt region of the body, whereof comes a Fever.

The commodities of Oxycrate. To whom hurtful. Oxycrate being given in manner following, doth aſſwage the heat of the Fever, and repreſs the putrefaction of the humours, and the fierceneſs of the venom, and alſo expelleth the Water through the Veins, if ſo be that the Patients are not troubled with ſpitting of bloud, cough, yexing, and altogether weak of ſtomach, for ſuch muſt avoid tart things.

Take of fair Water one quart, of white or red Vinegar three ounces, of fine Sugar four ounces, of Syrup of Roſes two ounces: boil them a little, and then give the Patient thereof to drink. Or take of the juice of Limmons and Citrons, of each half an ounce, of the juice of ſowre Pomgranats two ounces, of the Water of Sorrel and Roſes of each an ounce, of fair Water boiled, as much as ſhall ſuffice: make thereof a Julip, and uſe it between meals. Or take the Syrup of Limmons and of red Currans of each one ounce, of the Water of Lillies four ounces, of fair Water boiled half a pint: make thereof a Julip. Or take of the Syrups of Water-lillies and Vinegar, of each half an ounce, diſſolve it in five ounces of the Water of Sorrel, of fair Water one pint; make thereof a Julip.

The drinking of cold water, to whom, and when profitable. *Lib. 3. cap. 7.* But if the Patient be young, and have a ſtrong and good ſtomach, and cholerick by nature, I think it not unmeet for him to drink a full and large draught of Fountain water, for that is effectual to reſtrain and quench the heat of the Fever; and contrariwiſe, they that drink cold water often, and a very ſmall quantity at a time, as the Smith doth ſprinkle Water on the Fire at his Forge, do increaſe the heat and burning, and thereby make it endure the longer. Therefore by the judgment of *Celſus*, when the diſeaſe is in the chief increaſe, and the Patient hath endured thirſt for the ſpace of three or four days, cold water muſt be given unto him in great quantity, ſo that he may drink paſt his ſatiety, that when his belly and ſtomach are filled beyond meaſure, and ſufficiently cooled he may vomit.

Some do not drink ſo much thereof as may cauſe them to vomit, but do drink even unto ſatiety, and ſo uſe it for a cooling Medicin; but when either of theſe is done, the Patient muſt be covered with many cloths, and ſo placed that he may ſleep; and for the moſt part after long thirſt and watching, and after long fulneſs, and long and great heat, ſound ſleep cometh; by which great ſweat is ſent out, and that is a preſent help.

But thirſt muſt ſometimes be quenched with little pieces of Melons, Gourds, Cucumers, with the leaves of Lettuce, Sorrel and Purſlain made moiſt or ſoaked in cold Water, or with a little ſquare piece of a Citron, Limmon, or Orange, macerated in Roſe Water, and ſprinkled with Sugar, and ſo held in the mouth, and then changed.

But if the Patient be aged, his ſtrength weak, phlegmatick by nature, and given to Wine, when the ſtate of the Fever is ſomewhat paſt, and the chief heat beginning to aſſwage, he may drink Wine very much allaid at his meat, for to reſtore his ſtrength, and to ſupply the want of the waſted ſpirits. The Patient ought not by any means to ſuffer great thirſt, but muſt mitigate it by drinking, or elſe allay it by waſhing his mouth with oxycrate and ſuch like; and he may therein alſo waſh his hands and his face, for that doth recreate the ſtrength. If the flux or lask trouble him, he may very well uſe to drink ſteeled Water, and alſo boiled milk wherein many ſtones coming red hot out of the fire have been many times quenched. For the drineſs and roughneſs of the mouth, it is very good to have a cooling, moiſtening, and lenifying lotion of the mucilaginous water of the infuſion of the ſeeds of Quinces, *Pſilium, id eſt*, Flea-wort, adding thereto a little Camphire, with the Water of Plantain and Roſes, then cleanſe and wipe out the filth, and then moiſten the mouth by holding therein a little Oil of ſweet Almonds mixed with a little Syrup of Violets. If the roughneſs breed or degenerate into Ulcers, they muſt be touched with the Water of the infuſion of *ſublimate*, or *Aqua fortis*.

For drineſs or roughneſs of the mouth.

For the Ulcers thereof. But becauſe we have formerly made frequent mention of drinking of Water, I have here thought good to ſpeak ſomewhat of the choice and goodneſs of Waters. The choice of Water is not to be neglected,

neglected, becauſe a great part of our diet depends thereon; for beſides that we uſe it either alone or mixed with Wine for drink, we alſo knead bread, boil meat, and make broths therewith. Many think that rain-water which falls in Summer, and is kept in a Ciſtern well placed and made, is the wholeſomeſt of all. Then next thereto they judge that Spring-water which runs out of the tops of Mountains, through Rocks, Cliffs, and Stones: in the third place they put Well-water, or that which riſeth from the foots of Hills. Alſo the River-water is good, that is taken out of the midſt or ſtream. Lake or Pond-water is the worſt, eſpecially if it ſtand ſtill, for ſuch is fruitful of and ſtored with many venemous Creatures, as Snakes, Toads, and the like. That which comes by the melting of Snow and Ice is very ill, by reaſon of the too refrigerating faculty and earthly nature. But of Spring and Well-waters theſe are to be judged the beſt which are inſipid, without ſmell and colour, ſuch as are clear, warmiſh in Winter, and cold in Summer, which are quickly hot and quickly cold, that is, which are moſt light, in which all manner of Pulſe, Turnips and the like, are eaſily and quickly boiled. Laſtly, When as ſuch as uſually drink thereof, have clear voices and ſhrill, their cheſts ſound, and a lively and freſh colour in their faces.

The choice of Waters.

Hip. ſect. 3. Aph. 26.

CHAP. XXII.

Of Antidotes to be uſed in the Plague.

NOw we muſt treat of the proper cure of this diſeaſe, which muſt be uſed as ſoon as may be poſſible, becauſe this kind of poiſon, in ſwiftneſs exceedeth the celerity of the Medicin. Therefore it is better to err in this, that you ſhould think every diſeaſe to be peſtilent in a peſtilent ſeaſon, and to cure it as the Peſtilence: becauſe that ſo long as the Air is polluted with the ſeeds of the Peſtilence, the humours in the body are ſoon infected with the vicinity of ſuch an Air, ſo that then there happeneth no diſeaſe void of the Peſtilence, that is to ſay, which is not peſtilent from the beginning by his own nature, or which is not made peſtilent.

Many begin the cure with Bloud-letting, ſome with Purging, and ſome with Antidotes. We taking a conſideration of the ſubſtance of that part that is aſſaulted, firſt of all begin the cure with an Antidote; becauſe that by its ſpecifick property it defends the heart from poiſon, as much as it is offended therewith. Although there are alſo other Antidotes which preſerve and keep the heart and the Patient from the danger of Poiſon and the Peſtilence, not only becauſe they do infringe the power of the poiſon in their whole ſubſtance, but alſo becauſe they drive and expel it out of all the body by ſweat, vomiting, ſcouring, and ſuch other kinds of evacuations.

The beginning of the cure muſt be by Antidotes.

The Antidote muſt be given in ſuch a quantity as may be ſufficient to overcome the poiſon; but becauſe it is not good to uſe it in greater quantity than needeth, leſt it ſhould overthrow our Nature, for whoſe preſervation onely it is uſed; therefore that which cannot be taken together at once, muſt be taken at ſeveral times, that ſome portion thereof may daily be uſed ſo long, until all the accidents, effects and impreſſions of the poiſon be paſt; and that there be nothing to be feared. Some of thoſe Antidotes conſiſt of portions of venemous things being tempered together, and mixed in an apt proportion with other Medicins whoſe power is contrary to the venom: as Treacle, which hath for an ingredient the fleſh of Vipers, that it being thereto mixed may ſerve as a guide to bring all the Antidote unto the place where the venenate malignity hath made the chief impreſſion, becauſe by the ſimilitude of Nature and Sympathy, one poiſon is ſuddenly ſnatched and carried into another. There are other abſolutely poiſonous, which nevertheleſs are Antidotes one unto another; as a Scorpion himſelf cureth the pricks of a Scorpion. But Treacle and Mithridate excell all other Antidotes, for by ſtrengthening the nobleſt part, and the manſion of life, they repair and recreate the waſted ſpirits, and overcome the poiſon, not onely being taken inwardly, but alſo applied outwardly to the region of the heart, Botches and Carbuncles: for by an hidden property they draw the poiſons unto them, as Amber doth Chaff, and digeſt it when it is drawn, and ſpoil and rob it of all its deadly force; as it is declared at large by *Galen*, in his Book *De Theriaca ad Piſonem*, by moſt true reaſons and experiment. But you will ſay that theſe things are hot, and that the Plague is often accompanied with a burning Fever. But thereto I anſwer, there is not ſo great danger in the Fever as in the Peſtilence, although in the giving of Treacle, I would not altogether ſeem to neglect the Fever, but think it good to miniſter or apply it mixed with cordial-cooling Medicins, as with the Trochiſces of Camphire, Syrup of Limmons, of Water-lillies, the Water of Sorrel and ſuch like. And for the ſame cauſe we ought not to chuſe old Treacle, but that which is of a middle age, as of one or two years old: to thoſe that are ſtrong you may give half a dram; and to thoſe that are more weak, a dram.

In what quantity they muſt be taken.

Why poyſonous things are put into Antidotes.

Some poiſons Antidotes to other ſome.

The Patient ought to walk preſently after he hath taken Treacle, Mithridate, or any other Antidote, but yet as moderately as he can: not like unto many, which when they perceive themſelves to be infected, do not ceaſe to courſe and run up and down, until they have no ſtrength to ſuſtain their bodies; for ſo they diſſolve Nature, ſo that it cannot ſuffice to overcome the contagion. After moderate walking the Patient muſt be put warm to bed, and covered with many cloaths, and warm Brick-bats or Tiles applied to the ſoles of his feet; or in ſtead thereof you may uſe Swines bladders filled with hot Water, and apply them to the groins and arm-holes, to provoke ſweat: for ſweating in this diſeaſe is a moſt excellent remedy, both for to evacuate the humours in the Fever, and alſo to drive forth the malignity in the Peſtilence, although every ſweat brings not forth the fruit of health. For *George Agricola* ſaith, that he ſaw a Woman at *Miſnia* in *Germany*, that did ſweat ſo for the ſpace of three days, that the bloud came forth at her head and breſt, and yet nevertheleſs ſhe died.

How to walk after the taking of an Antidote.

This Potion following will provoke ſweat. Take the roots of China ſhaved in thin pieces one ounce and half, of *Guaiacum* two ounces, of the bark of Tamariſk one ounce, of Angelica-roots two

A Sudorifick Potion.

two drams, of the ſhavings of Harts-horn one ounce, of Juniper-berries three drams: put them into a viol of glaſs that will contain ſix quarts, put thereto four quarts of running or river-water that is pure and clear, macerate them for the ſpace of one whole night on the aſhes, and in the morning boil them all in *Balneo Mariæ* until the half be conſumed, which will be done in the ſpace of ſix hours, then let them be ſtrained through a bag, and then ſtrained again, but let that be with ſix ounces of Sugar of Roſes, and a little Treacle: let the Patient take eight ounces or fewer of that liquor, and it will provoke ſweat. The Powder following is alſo very profitable. Take of the leaves of *Dictamnus*, the Roots of Tormentil, Betony, of each half an ounce, of Bole-Armenick prepared one ounce, of *Terra Sigillata* three drams, of Aloes and Myrrh, of each half a dram, of Saffron one dram, of Maſtich two drams, powder them all according to Art, and give one dram thereof diſſolved in Roſe-water, or the water of wild Sorrel, and let the Patient walk ſo ſoon as he hath taken that Powder, then let him be laid in his bed to ſweat, as I have ſhewed before.

A Sudorifick Powder.

A diſtilled water againſt the Plague.

The Water following is greatly commended againſt poiſon. Take the roots of *Gentian* and *Cyperus* of each three drams; of *Carduus Benedictus*, Burnet, of each one handful; of Sorrel ſeeds, and Devils-bit, of each two pugils; of Ivy and Juniper-berries, of each half an ounce; of the Flowers of Bugloſs, Violets, and red Roſes, of each two pugils: Powder them ſomewat groſly, then ſoak or ſteep them for a night in white Wine and Roſe water: then add thereto of Bole-Armenick one ounce, of Treacle half an ounce, diſtil them all in *Balneo Mariæ*, and keep the diſtilled liquor in a viol of glaſs well covered or cloſe ſtopped for your uſe: let the Patient take ſix ounces thereof with Sugar and a little Cinnamon and Saffron: then let him walk, and then ſweat as is aforeſaid: the Treacle and Cordial water formerly preſcribed, are very profitable for this purpoſe. Alſo the Water following is greatly commended. Take of Sorrel ſix handfuls, of Rue one handful, dry them and macerate them in Vinegar for the ſpace of four and twenty hours, adding thereto four ounces of Treacle: make thereof a diſtillation in *Balneo Mariæ*, and let the diſtilled water be kept for your uſe: and ſo ſoon as the Patient doth think himſelf to be infected, let him take four ounces of that liquor, then let him walk and ſweat. He muſt leave ſweating when he beginneth to wax faint and weak, or when the humour that runs down his body begins to wax cold, then his body muſt be wiped with warm cloths, and dried. The Patient ought not to ſweat with a full ſtomach, for ſo the heat is called away from performing the office of concoction, alſo he muſt not ſleep when he is in his ſweat, leſt the malignity go inwardly with the heat and ſpirits unto the principal parts: but if the Patient be much inclined to ſleep, he muſt be kept from it with hard rubbing, and bands tied about the extreme parts of his body, and with much noiſe of them that are about him, and let his friends comfort him with the good hope that they have of his recovery; but if all this will not keep him from ſleep, diſſolve *Caſtoreum* in tart Vinegar, and *Aqua Vitæ*, and let it be injected into his noſtrils: and let him be kept continually waking the firſt day, and on the ſecond, and third, even unto the fourth; that is to ſay, unto the perfect expulſion of the venom; and let him not ſleep above three or four hours on a day and a night. In the mean time let the Phyſician that ſhall be preſent conſider all things by his ſtrength; for it is to be feared that great watchings will diſſolve the ſtrength, and make the Patient weak: you muſt not let him eat within three hours after his ſweating; in the mean ſeaſon, as his ſtrength ſhall require, let him take the rind of a Preſerved Citron, Conſerve of Roſes, Bread toaſted and ſteeped in Wine, the meat of Preſerved Myrabolane, or ſome ſuch like thing.

Another.

What means to be uſed in ſweating.

CHAP. XXIII.

Of Epithemes to be uſed for the ſtrengthening of the principal parts.

Whereof they muſt be made

THere are alſo ſome topick Medicins to be reckoned amongſt Antidotes, which muſt be outwardly applied as ſpeedily as may be, as cordial and hepatick Epithems for the ſafety of the noble parts, and ſtrengthening of the faculties, as thoſe that drive the venenate air far from the bowels: they may be made of cordial things not onely hot, but alſo cold, that they may temper the heat, and more powerfully repercuſs. They muſt be applied warm with Scarlet, or a double linnen cloth, or a ſoft Sponge dipped in them, if ſo be that a Carbuncle do not poſſeſs the regions of the moſt noble parts: for it is not fit to uſe repercuſſives to a Carbuncle. You may make Epithems after the following forms: ℞ *Aquar. roſ. plantag. & ſolan. an.* ʒ iv. *aquæ acetoſ. vini granat. & aceti, an.* ʒ iij. *ſantal. rub. & coral. rub. pulveriſ. an.* ʒ iij. *theriac. vet.* ʒ ß. *camph.* ϑ j. *croci* ϑ j. *caryoph.* ʒ ß. *miſce, fiat epithema.* Or elſe, ℞ *Aq. roſ. & plantag. an.* ʒ x. *aceti roſ.* ʒ iv. *caryoph. ſant. rub. coral. rub. pulveriſ. pul. diamargarit. frigid. an.* ʒ j. ß. *camphuræ moſchi an.* ϑ j. *fiat epithema.* Or, ℞ *Aquar. roſar. & meliſſæ, an.* ʒ iv. *aceti roſ.* ʒ iij. *ſant. rub.* ʒ j. *caryophil.* ʒ ß. *croci* ϑ ij. *camphuræ* ϑ j. *boli arm. terra ſigill. & zedoar. an.* ʒ j. *fiat epithema.* Or elſe, ℞ *Aceti roſ. & aquæ roſat. an.* ℔ ß. *camphuræ* ʒ ß. *theriac. & mithrid. an.* ʒ j. *fiat epithema.* Or elſe, *Aqu. roſar. nenuph. bugloſ. acetoſæ, aceti roſar. an.* ℔ ß. *ſant. rub. roſ. rub. an.* ʒ iij. *flor. nenuph. violar. camphur. an.* ʒ ß. *mithrid. & theriac. an.* ʒ ij. *terantur & miſceantur ſimul omnia.* When you intend to uſe them take ſome portion of them in a veſſel by its ſelf, wherewith let the affected bowel be fomented warm.

Repercuſſives not fit to be applied to Carbuncles.

CHAP. XXIV.

Whether Purging and Bloud-letting be neceſſary in the beginning of Peſtilent diſeaſes.

Reaſons for and againſt Bloud-letting in the Plague.

SO ſoon as the heart is ſtrengthened and corroborated with Cordials and Antidotes, we muſt come to phlebotomy and purging. As concerning Bloud-letting in this caſe there is a great controverſie among Phyſicians. Thoſe that wiſh it to be uſed, ſay or affirm, that the Peſtilent

peſtilent Fever doth infix it ſelf in the bloud, and therein alſo the Peſtilent malignity taketh its ſeat; and therefore it will ſoon infect the other humours, unleſs that the bloud be evacuated, and the infection that remaineth in the bloud be thereby taken away. Contrariwiſe, thoſe that do not allow phlebotomy in this caſe, alledge that it often cometh to paſs that the bloud is void of malignity, when the other humours are infected with the venemous contagion. If any man require my judgment in this doubtful queſtion, I ſay, that the peſtilence ſometimes doth depend on the default of the air: this default being drawn through the paſſages of the body, doth at length pierce unto the intrails, as we may underſtand by the abſceſſes which break out, one while behind the ears, ſometimes in the arm-holes, and ſometimes in the groins, as the brain, heart or liver are infected. And hereof alſo come Carbuncles, and other collections of matter, and eruptions, which are ſeen in all parts of the body; by reaſon that Nature uſing the ſtrength of the expulſive faculty, doth drive forth whatſoever is noiſom or hurtful. Therefore if the Phyſician will follow this motion of Nature, he muſt neither purge nor let bloud, leſt that by a contrary motion, that is, by drawing in from without, the motion of Nature which proceeds outwardly from within, ſhould be troubled. So we often ſee in thoſe who are purged or let bloud for ſuch Buboes as come through unlawful copulation, that the matter is thereby made contumacious, and by drawing it inwardly, it ſpeedily cauſeth the French Pox.

The compoſing of this controverſie.

Wherefore when Buboes, Carbuncles, and other peſtilent eruptions appear, which come through the default of the air, we ought to abſtain from purging and phlebotomy; but it is ſufficient to forearm the heart inwardly and outwardly with Antidotes that are indued with a proper virtue of reſiſting the poiſon. For it is not to be doubted, but that when nature is debilitated with both kinds of evacuation, and when the ſpirits together with the bloud, are exhauſted, the venemous air will ſoon pierce, and be received into the empty body, where it exerciſeth its tyranny to the utter deſtruction thereof.

An Hiſtory.

In the year of our Lord God 1566. in which year there was great mortality throughout all *France*, by reaſon of the Peſtilence and peſtilent diſeaſes, I earneſtly, and diligently inquired of all the Phyſicians and Chirurgions of all the Cities (through which King *Charles* IX. paſſed in his progreſs unto *Bayon*) what ſucceſs their Patients had after they were let bloud and purged: whereunto they all anſwered alike, that they had diligently obſerved, that all that were infected with the Peſtilence, and were let bleed ſome quantity of bloud, or had their bodies ſomewhat ſtrongly purged, thenceforwards waxed weaker and weaker, and ſo at length died; but others which were not let bloud nor purged, but took cordial Antidotes inwardly, and applied them outwardly, for the moſt part eſcaped and recovered their health: for that kind of Peſtilence took its original of the primitive and ſolitary default of the air, and not of the corruption of the humours.

When purging and bleeding may be uſed.

The like event was noted in the hoarſneſs that we ſpoke of before; that is to ſay, that the Patients waxed worſe and worſe by purging and phlebotomy; but yet I do not diſallow either of thoſe remedies, if there be great fulneſs in the body, eſpecially in the beginning, and if the matter have a cruel violence, whereof may be feared the breaking in unto ſome noble part. For we know that it is confirmed by *Hippocrates*, that what diſeaſe ſoever is cauſed by repletion, muſt be cured by evacuation; and that in diſeaſes that are very ſharp, if the matter do ſwell, it ought to be remedied the ſame day, for delay in ſuch diſeaſes is dangerous; but ſuch diſeaſes are not cauſed or inflicted upon mans body by reaſon or occaſion of the peſtilence, but of the diſeaſed bodies, and diſeaſes themſelves commixed together with the peſtilence: therefore then peradventure it is lawful to purge ſtrongly, and to let a good quantity of bloud, leſt that the peſtilent venom ſhould take hold of the matter that is prepared, and ſo infect it with a contagion, whereby the peſtilence taketh new and far greater ſtrength; eſpecially as *Celſus* admoniſheth us, where he ſaith, that by how much the ſooner thoſe ſudden invaſions do happen, by ſo much the ſooner remedies muſt be uſed, yea, or rather raſhly applied; therefore if the Veins ſwell, the face wax fiery red; if the arteries of the Temples beat ſtrongly; if the Patient can very hardly breath by reaſon of a weight in his ſtomach, if his ſpittle be bloudy, then ought he to be let bloud without delay, for the cauſes before mentioned. It ſeems beſt to open the Liver-vein on the left arm, whereby the heart and ſpleen may be better diſcharged of their abundant matter; yet bloud-letting is not good at all times, for it is not expedient when the body beginneth to wax ſtiff by reaſon of the coming of a Fever; for then by drawing back the heat and ſpirits inwardly, the outward parts being deſtitute of bloud, wax ſtiff and cold; therefore bloud cannot be let then without great loſs of the ſtrength, and perturbation of the humours. And it is to be noted, that when thoſe plethorick cauſes are preſent, there is one Indication of bloud-letting in a ſimple peſtilent Fever, and another in that which hath a Bubo, *id eſt*, a Botch, or a Carbuncle joined therewith. For in one or both of theſe, being joined with a vehement and ſtrong burning Fever, bloud muſt be letten by opening the Vein that is neareſt unto the tumour or ſwelling againſt nature, keeping the ſtraitneſs of the fibres, that this being open the bloud might be drawn more directly from the part affected; for all and every retraction of putrefied bloud unto the noble parts, is to be avoided, becauſe it is noiſom and hurtful to Nature, and to the Patient. Therefore for example ſake, admit the Patient be plethorick by repletion, which is called *ad Vaſa*, *id eſt*, unto the Veſſels, and *ad Vires*, *id eſt*, unto the ſtrength; and therewithall he hath a tumour that is peſtilent in the parts belongingunto the head or neck; the bloud muſt be let out of the Cephalick or Median Vein, or out of one of their branches diſperſed in the arm on the grieved ſide. But if through occaſion of fat, or any other ſuch like cauſe, thoſe Veins do not appear in the arm, there be ſome that give counſel in ſuch a caſe to open the vein that is between the fore-finger and the thumb, the hand being put into warm water, whereby that Vein may ſwell and be filled with bloud gathered thither by means of the heat.

Aph. 22. *ſect.* 2. *Aph.* 10. *ſect.* 4.

Cap. 7. *lib.* 3.

Why bloud muſt be let on the left arm in the Plague.

If the tumour be under the harm-hole, or about thoſe places, the Liver-vein or the Median muſt be opened which runneth alongſt the hand: if it be in the groin, the vein of the ham, or *Saphena*;

or any other vein above the foot that appeareth well, but always on the grieved ſide. And Phlebotomy muſt be performed before the third day: for this diſeaſe is of the kind or nature of ſharp diſeaſes, becauſe that within four and twenty hours it runneth paſt help. In letting of bloud you muſt have conſideration of the ſtrength. You may perceive that the Patient is ready to ſwoun when that his forehead waxeth moiſt, with a ſmall ſweat ſuddenly ariſing by the aking or pain at the ſtomach, with an appetite to vomit, and deſire to go to ſtool, gaping, blackneſs of the lips, and ſudden alteration of the face unto paleneſs: and laſtly moſt certainly by a ſmall and ſlow pulſe: and then you muſt lay your finger on the vein, and ſtop it until the Patient come to himſelf again, either by Nature, or elſe reſtored by Art; that is to ſay, by giving unto him Bread dipped in Wine, or any other ſuch like thing: then if you have not taken bloud enough, you muſt let it go again, and bleed ſo much as the greatneſs of the diſeaſe, or the ſtrength of the Patient will permit or require: which being done, ſome of the Antidotes that are preſcribed before will be very profitable to be drunk, which may repair the ſtrength, and infringe the force of the malignity.

CHAP. XXV.

Of purging Medicins in a Peſtilent diſeaſe.

What Purges fit in the Plague.

IF you call to mind the proper Indications, purging ſhall ſeem neceſſary in this kind of diſeaſe, and that muſt be preſcribed as the preſent caſe and neceſſity requireth; rightly conſidering that the diſeaſe is ſudden, and doth require Medicins that may with all ſpeed drive out of the body the hurtful humour wherein the noiſom quality doth lurk and is hidden; which Medicins are divers by reaſon of the diverſity of the kind of the humour, and the condition or temperature of the Patient. For this purpoſe ſix grains of Scammony beaten into Powder, or elſe ten grains are commonly miniſtred to the Patient with one dram of Treacle. Alſo Pills may be made in this form: Take of Treacle and Mithridate of each one dream, of *Sulphur vivum* finely powdered, half a dram, of *Diagridium* four grains; make Pills thereof. Or take three drams of Aloes, of Myrrh and Saffron of each one dram, of white Hellebore and *Aſarabacca*, of each ℈ iv. make thereof a maſs with old Treacle, and let the Patient take four ſcrupples thereof for a doſe, three hours before meat. *Ruffus* his Pills may be profitably given to thoſe that are weak. The ancient Phyſicians have greatly commended Agarick for this diſeaſe, becauſe it doth draw the noiſom humours out of all the members: and the virtues thereof are like unto thoſe of Treacle; for it is thought to ſtrengthen the heart, and to draw out the malignity by purging. To thoſe that are ſtrong, the weight of two drams may be given, and to thoſe that are more weak, half a dram. It is better to give the infuſion in a decoction than in ſubſtance, for being elected and prepared truly into Trochiſces, it may be called a divine kind of Medicin.

Pills.

Antimonium is highly praiſed by the experience of many; but becauſe I know the uſe thereof is condemned by the Council and decree of the School of Phyſicians at *Paris*, I will here ceaſe to ſpeak of it.

Thoſe Medicins that cauſe ſweats are thought to excel all others, when the Peſtilence cometh of the venemous air; among whom the efficacy of that which followeth, hath been proved, to the great good of many in that Peſtilence which was lately throughout all *Germany*, as *Matthias Rodler* Chancelour to Duke *George* the Count Palatine ſignified unto me by Letters.

An effectual ſudorifick, and alſo purging Medicin.

They do take a bundle of Mugwort, and of the aſhes thereof after it is burnt, they make a lee with four pints of Water, then they do ſet it over the fire, and boil it in a veſſel of Earth well leaded, until the liquor be conſumed, the earthy dregs falling into the bottom like unto ſalt, whereof they make Trochiſces of the weight of a crown of gold: then they diſſolve one or two of theſe Trochiſces, according to the ſtrength of the Patient, in good Muskadine, and give it the Patient to drink, and let him walk after that he hath drunk it for the ſpace of half an hour; then lay him in his bed, and there ſweat him two or three hours, and then he will vomit, and his belly will be looſed as if he had taken Antimony; and ſo they were all for the moſt part cured, eſpecially all thoſe that took that remedy betimes: and before the diſeaſe went to their heart, as I my ſelf have proved in ſome that were ſick at *Paris*, with moſt happy ſucceſs. Truly Mugwort is moſt highly commended by the ancient Phyſicians, being taken and applied inwardly or outwardly, againſt the bitings of venemous Creatures; ſo that it is not to be doubted but that it hath great virtue againſt the Peſtilence.

The virtues of Mugwort.

Vid. Rondelet. lib. 7. de piſc. c. 3.

I have heard it moſt certainly reported by *Gilbertus Heroaldus* Phyſician of *Mompelier*, that eight ounces of the pickle of Anchovies drunk at one draught, is a moſt certain and approved remedy againſt the Peſtilence, as he and many other have often found by experience. For the Plague is no other thing but a very great putrefaction, for the correction and amendment whereof, there is nothing more apt or fit than this pickle or ſubſtance of Anchovies, being melted by the Sun and force of the ſalt that is ſtrewed thereon. There be ſome which infuſe one dram of Walwort ſeed in white Wine, and affirm that it drunk, will perform the like effect as Antimony. Others diſſolve a little weight of the ſeed of *Rue* being bruiſed in Muskadine, with the quantity of a Bean of Treacle, and ſo drink it. Others beat or bruiſe an handful of the leaves or tops of Broom in half a pint of white-Wine, and ſo give it to the Patient to drink, to cauſe him to vomit, looſe his belly and make him to ſweat. Truly thoſe that are wounded or bit with venemous Beaſts, if they bind Broom above the wound, it will prohibit or hinder the venom from diſperſing it ſelf, or going any further: therefore a drink made thereof will prohibit the venom from going any nearer the heart. Some take of the root of Elecampane, Gentian, Tormentil, Kermes-berries, and Broom, of the Powder of Ivory and Harts-horn, of each half a dram; they do bruiſe and beat all theſe, and infuſe them for the ſpace of four and and twenty hours in white Wine and *Aqua Vitæ* on the warm embers, and then ſtrain it, and give the Patient three or four ounces thereof to drink; this provokes Sweat and infringeth the power of the poiſons: and the Potion following hath the ſame virtue. Take good Muſtard half an ounce, of Trea-

A Potion.

cle

cle or Mithridate the weight of a Bean; diſſolve them in white Wine and a little *Aqua Vitæ*, and let the Patient drink it, and ſweat thereon with walking. You may alſo roaſt a great Onion made hollow, and filled with half a dram of Treacle and Vinegar under the embers, and then ſtrain it, and mix the juice that is preſſed out of it with the water of Sorrel, *Carduus Benedictus*, or any other cordial thing, and with ſtrong Wine, and give the Patient to drink thereof to provoke ſweat, and to repel the malignity. Or elſe take as much Garlick as the quantity of a Nut; of Rue and Celandine of each twenty leaves; bruiſe them all in white Wine and a little *Aqua Vitæ*; then ſtrain it and give the Patient thereof to drink. There be ſome that do drink the juice that is preſſed out of Celandine and Mallows, with three ounces of Vinegar, and half an ounce of the Oil of Wall-nuts, and then by much walking do unburthen their ſtomach and belly upwards and downwards, and ſo are helped. When the venemous air hath already crept into and infected the humours, one dram of the dried leaves of the Bay tree macerated for the ſpace of two days in Vinegar and drunk, is thought to be a moſt ſoveraign Medicin to provoke ſweat, looſeneſs of the belly and vomiting.

Matthiolus in his Treatiſe *De Morbo Gallico* writeth, that the Powder of *Mercury* miniſtred unto the Patient with the juice of *Carduus Benedictus*, or with the Electuary *De Gemmis*, will drive away the Peſtilence before it be confirmed in the Body, by provoking vomit, looſneſs of the belly and ſeat: one dram of *Calcanchum* or white Copperas diſſolved in Roſe water, performeth the like effect in the ſame diſeaſe. Some do give the Patient a little quantity of the Oil of Scorpions with white Wine, to expel the poiſon by vomit, and therewithall they anoint the region of the heart, the breſt and the wriſts of the hands. I think theſe very meet to be uſed often in bodies that are ſtrong and well exerciſed, becauſe weaker Medicins do evacuate little or nothing at all, but onely move the humours, whereby cometh a Fever. When a ſufficient quantity of the malignity is evacuated, then you muſt miniſter things that may ſtrengthen the belly and ſtomach, and with-hold the agitation or working of the humours: and ſuch is the confection of Alkermes.

CHAP. XXVI.

Of many Symptoms which happen together with the Plague: and firſt of the pain of the Head.

IF the malignity be carried into the brain, and Nature be not able to expel it, it inflames not onely it but alſo the membranes that cover it: which inflammation doth one while hurt, trouble, or aboliſh the imagination, another while the judgment, and ſometimes the memory, according to the ſituation of the inflammation, whether it be in the former, or hinder, or middle part of the head; but hereof cometh always a Phrenſie, with fiery redneſs of the eyes and face, and heavineſs and burning of the whole head. If this will not be amended with Clyſters, and with opening the Cephalick Vein in the arm, the arteries of the Temples muſt be opened, taking ſo much bloud out of them, as the greatneſs of the ſymptoms and the ſtrength of the Patient ſhall require and permit. Truly the inciſion that is made in opening an artery will cloſe and join together as readily, and with as little difficulty as the inciſion of the vein. And of ſuch an inciſion of an artery cometh preſent help, by reaſon that the tenſive and ſharp vapours do plentifully breath out, together with the arterious bloud. It were alſo very good to provoke a flux of bloud at the noſe, if Nature be apt to exonerate her ſelf that way. For as *Hippocrates* ſaith, when the head is grieved, or generally aketh, if matter, water or blood flow out at the noſtrils, mouth, or ears, it preſently cures the diſeaſe. Such bleeding is to be provoked by ſtrong blowing, or ſtriving to cleanſe the noſe by ſcratching or pricking of the inner ſide of the noſtrils, by pricking with an horſe-hair, and long holding down of the head.

The cauſe of Phrenſie in the Plague.

The benefit of opening an artery.

Aph. 10. ſect. 6.

The Lord of *Fountains*, a Knight of the Order, when we were at *Bayon*, had a bleeding at the noſe, which came naturally for the ſpace of two days, and thereby he was freed of a peſtilent Fever which he had before, a great ſweat ariſing therewithall; and ſhortly after his Carbuncles came to ſuppuration, and by Gods grace he recovered his health being under my cure. If the bloud do flow out and cannot be ſtopped when it ought, the hands, arms, and legs muſt be tied with bands, and Sponges wet in Oxycrate muſt be put under the arm-holes, Cupping-glaſſes muſt be applied unto the dugs, and to the region of the Liver and Spleen; and you muſt put into the noſtrils the doun of the Willow tree, or any other aſtringent Medicin, incorporated with the hairs pluckt from the flank, belly or throat of an Hare, Bole-Armenick, *Terra Sigillata*, the juice of Plantain and Knot-graſs mixed together; and furthermore the Patient muſt be placed or laid in a cool place. But if the Patient be nothing mitigated notwithſtanding all theſe fluxes of bloud, we muſt come to Medicins that procure ſleep, whoſe forms are theſe.

An Hiſtory.

To ſtay bleeding.

Take of green Lettuce one handful, Flowers of Water-lillies and Violets, of each two pugils; one heap of white Poppy bruiſed, of the Four cold Seeds, of each two drams; of Licorice and Raiſins of each one dram; make thereof a decoction, and in the ſtraining diſſolve one ounce and an half of *Diacodium*: make thereof a large potion to be given when they go to reſt. Alſo Barly-cream may be prepared in the water of Water-lillies and of Sorrel of each two ounces adding thereto ſix or eight grains of *Opium*, of the Four cold Seeds, and of white Poppy Seeds, of each half an ounce; and let the ſame be boiled in Broth with Lettuce and Purſlain; alſo the Pills *De Cynogloſſo*, *i. e.* Hounds-tongue may be given. Clyſters that provoke ſleep muſt be uſed, which may be thus prepared. Take of Barly-water half a pint, Oil of Violets and Water-lillies, of each two ounces; of the Water of Plantain and Purſlain, or rather of their juices, three ounces; of Camphire ſeven grains, and the Whites of three Eggs: make thereof a Clyſter. The head muſt be fomented with Roſe Vinegar, the hair being firſt ſhaved away, leaving a double cloth wet therein on the ſame, and often renewed. Sheeps-lungs taken warm out of the bodies, may be applied to the head, as long as they are warm. Cupping-glaſſes with and without ſcarification may be applied to the neck and ſhoulder-blades. The arms and legs muſt be ſtrongly bound, being firſt well rubbed, to divert the ſharp vapours and humours from

Medicins to procure ſleep.

from the head. Frontals may alſo be made on this manner. Take of the Oil of Roſes and Water-lillies, of each two ounces; of the Oil of Poppy half an ounce; of *Opium* one dram, of Roſe Vinegar one ounce, of Camphire half a dram; mix them together. Alſo Nodulaes may be made of the flowers of Poppies, Henbane, Water-lillies, Mandrags, beaten in Roſe water with a little Vinegar, and a little Camphire, and let them be often applied to the noſtrils: for this purpoſe Cataplaſms alſo may be laid to the forehead. As, Take of the mucilage of the ſeeds of *Pſilium, i. e.* Flea-wort, and Quince ſeeds extracted in Roſe water, three ounces; of Barly-meal four ounces, of the Powder of Roſe leaves, the flowers of Water-lillies and Violets, of each half an ounce; of the ſeeds of Poppies and Purſlain, of each two ounces; of the water and vinegar of Roſes, of each three ounces; make thereof a Cataplaſm, and apply it warm to the head. Or take of the juice of Lettuce, of Water-lillies, Henbane, Purſlain, of each half a pint; of Roſe leaves in powder, the ſeeds of Poppy, of each half an ounce; Oil of Roſes three ounces, of Vinegar two ounces, of Barly-meal as much as ſhall ſuffice: make thereof a Cataplaſm in the form of a liquid Pultis. When the heat of the head is mitigated by theſe Medicins, and the inflammation of the brain aſſwaged, we muſt come unto digeſting, and reſolving fomentations, which may diſperſe the matter of the vapours. But commonly in pain of the head, they do uſe to bind the forehead and hinder part of the head very ſtrongly, which in this caſe muſt be avoided.

A Cataplaſm.

CHAP. XXVII.

Of the heat of the Kidnies.

THe heat of the Kidnies is tempered by anointing with *unguent. refrigerans Galeni* newly made adding thereto the Whites of Eggs well beaten, that ſo the Ointment may keep moiſt the longer; let this liniment be renewed every quarter of an hour, wiping away the reliques of the old. Or, ℞ *Aq. roſar.* ℔ ß. *ſucci plant.* ℥ iv. *alb. ovorum* iv. *olei roſacei, & nenuph. an.* ℥ j. *aceti roſ.* ℥ iij. *miſce ad uſum.* When you have anointed the part, lay thereon the leaves of Water-lillies, or the like old herbs, and then preſently thereupon a double linnen cloth dipped in Oxycrate and wrung out again, and often changed; the Patient ſhall not lie upon a Feather-bed, but on a quilt ſtuffed with the chaff of Oats, or upon a Mat with many doubled cloths or Chamlet ſpread thereon. To the region of the heart may in the mean time be applied a refrigerating and alexiterial Medicin, as this which followeth. ℞ *Ung. roſat.* ℥ iij. *olei nenupharini,* ℥ j. *acet. roſ. & aq. roſ. an.* ℥ j. *theriacæ* ℥ j. *croci* ʒ ſ. Of theſe melted and mixed together, make a ſoft Ointment, which ſpread upon a ſcarlet cloth may be applied to the region of the heart. Or, ℞ *Theriacæ opt.* ℥ j. ſ. *ſucci citri, acidi, & limonii, an.* ℥ ſ. *coral. rub. & ſem. roſar. rub. an.* ʒ ß. *camphuræ & croci, an. gr.* iij. let them be all mixed together, and make an Ointment or Liniment.

An Ointment for the reins.

An ointment for the heart.

At the head of the Patient as he lies in his bed, ſhall be ſet an Ewer or Cock with a Baſin under it to receive the Water, which by the dropping may reſemble rain. Let the ſoles of the feet and palms of the hands be gently ſcratched, and the Patient lie far from noiſe, and ſo at length he may fall to ſome reſt.

The noiſe of dropping water draws on ſleep.

CHAP. XXVIII.

Of the Eruptions and Spots, which commonly are called by the name of Purples and Tokens.

THe skin in peſtilent Fevers, is marked and variegated in divers places with ſpots, like unto the bitings of Fleas or Gnats, which are not always ſimple, but many times ariſe in form like unto a grain of Millet. The more ſpots appear, the better it is for the Patient: they are of divers colours, according to the virulency of the malignity, and condition of the matter, as red, yellow, brown, violet or purple, blue and black. And becauſe for the moſt part they are of a purple colour, therefore we call them Purples. Others call them *Lenticulæ*, becauſe they have the colour and form of Lentils. They are alſo called *Papiliones, (i.)* Butterflies; becauſe they do ſuddenly ſeize or fall upon divers regions of the body, like unto winged Butterflies, ſometimes the face, ſometimes the arms and legs, and ſometimes all the whole body; oftentimes they do not onely affect the upper part of the skin, but go deeper into the fleſh, ſpecially when they proceed of matter which is groſs and aduſt. They do ſometimes appear great and broad, affecting the whole arm, leg or face, like unto an *Eryſipelas:* to conclude, they are diverſe, according to the variety of the humour that offends in quantity or quality.

The differences of the ſpots in the Plague.

Their ſeveral names, and reaſons of them.

If they are of a purple or black colour, with often ſwouning, and ſink in ſuddenly without any manifeſt cauſe, they fore-ſhew death.

When ſigns of death.

The cauſe of the breaking out of thoſe Spots, is the working or heat of the blood, by reaſon of the cruelty of the venom received or admitted. They often ariſe at the beginning of a peſtilent Fever: many times before the breaking out of the Sore, or Botch, or Carbuncle, and many times after: but then they ſhew ſo great a corruption of the humours in the body, that neither the ſores nor carbuncles will ſuffice to receive them; and therefore they appear as fore-runners of death. Sometimes they break out alone, without a botch or carbuncle, which if they be red, and have no evil ſymptoms joined with them, they are not wont to prove deadly: they appear for the moſt part on the third or fourth day of the diſeaſe, and ſometimes later, and ſometimes they appear not before the Patient be dead; becauſe the working or heat of the humours being the off-ſpring of putrefaction, is not as yet reſtrained and ceaſed.

Wherefore then principally the putrid heat, which is greateſt a little before the death of the Patient, drives the excremental humours, which are the matter of the ſpots, unto the skin; or elſe becauſe Nature in the laſt conflict hath contended with ſome greater endeavour than before (which

Why they ſometimes appear after the death of the Patient.

is

is common to all things that are ready to die) a little before the inſtant time of death, the Peſtilent humour being preſently driven unto the skin; and Nature thus weakned by theſe extreme conflicts falleth down proſtrate, and is quite overthrown by the remnant of the matter.

CHAP. XXIX.

Of the cure of Eruptions and Spots.

They are to be cured by driving forth.

YOu muſt firſt of all take heed leſt you drive in the humour that is coming outwards with repercuſſives: therefore beware of cold, all purging things, phlebotomy, and drowſie or ſound ſleeping. For all ſuch things do draw the humours inwardly, and work contrary to nature. But it is better to provoke the motion of Nature outwardly, by applying of drawing Medicins outwardly, and miniſtring Medicins to provoke ſweat inwardly; for otherwiſe by repelling and ſtopping the matter of the eruptions, there will be great danger, leſt the heart be oppreſſed with the abundance of the venom flowing back; or elſe by turning into the belly it infers a mortal bloudy flux: which diſcommodities that they may be avoided, I have thought good to ſet down this remedy, whoſe efficacy I have known and proved many times, and on divers perſons, when by reaſon of the weakneſs of the expulſive faculty, and the thickneſs of the skin, the matter of the ſpots cannot break forth, but is conſtrained to lurk under the skin, lifting it up into bunches and knobs.

The indication of curing taken from the like.

I was brought unto the invention of this remedy, by compariſon of the like: For when I underſtood, that the eſſence of the French Pox (and likewiſe of the Peſtilence) conſiſted in a certain hidden virulency and venemous quality, I ſoon deſcended unto that opinion, that even as by the annointing of the body with the unguent compounded of Quick-ſilver, the groſs and clammy humours which are fixed in the bones, and unmovable, are diſſolved, relaxed and drawn from the center into the ſuperficial parts of the body, by ſtrengthening and ſtirring up the expulſive faculty, and evacuated by ſweating and fluxing at the mouth; that ſo it ſhould come to paſs in peſtilent Fevers, that Nature being ſtrengthened with the ſame kind of unction, might unload her ſelf of ſome portion of the venemous and peſtilent humour, by opening the pores and paſſages and letting it break forth into ſpots and puſtles, and into all kind of eruptions. Therefore I have anointed many in whom Nature ſeemed to make paſſage for the venemous matter very ſlowly, firſt looſing their belly with a Clyſter, and then giving them Treacle-water to drink, which might defend the vital faculty of the heart, but yet not diſtend the ſtomach, as though they had the French Pox, and I obtained my expected purpoſe: In ſtead of the Treacle-water you may uſe the decoction of *Guaiacum*, which doth heat, dry, provoke ſweat, and repel putrefaction, adding thereto alſo Vinegar, that by the ſubtilty thereof, it may pierce the better, and withſtand the putrefaction. This is the deſcription of the Unguent.

An ointment to draw them forth when they appear too ſlowly.

Take of Hogs-greaſe one pound, boil it a little with the leaves of Sage, Thyme, Roſemary, of each half an handful, ſtrain it, and in the ſtraining extinguiſh five ounces of Quick-ſilver, which hath been firſt boiled in Vinegar with the fore-mentioned herbs; of *Sal Nitrum* three drams, the Yolks of three Eggs boiled until they be hard, of Treacle and Mithridate, of each half an ounce, of Venice Turpentine, oil of Scorpions and Bays, of each three ounces, incorporate them all together in a mortar, and make thereof an Unguent, wherewith anoint the Patients arm-holes and groins, avoiding the parts that belong to the head, breſt, and back-bone: then let him be laid in his bed, and covered warm, and let him ſweat there for the ſpace of two hours, and then let his body be wiped and cleanſed; and if it may be, let him be laid in another bed, and there let him be refreſhed with the decoction of a Capon, Reer-eggs, and with ſuch like meats of good juice that are eaſie to be concocted and digeſted; let him be anointed the ſecond and third day, unleſs the ſpots appear before.

If the Patient flux at the mouth, it muſt not be ſtopped: when the ſpots and puſtles do all appear, and the Patient hath made an end of ſweating, it ſhall be convenient to uſe Diuretick Medicins, for by theſe the remnant of the matter of the ſpots, which happily could not all breath forth, may eaſily be purged and avoided by urin.

If any Noble or Gentlemen refuſe to be anointed with this unguent, let them be incloſed in the body of a Mule or Horſe that is newly killed, and when that is cold let him be laid in another, until the puſtles and eruptions do break forth, being drawn by that natural heat, For ſo *Matthiolus* writeth, that *Valentinus* the ſone of Pope *Alexander* VI. was delivered from the danger of moſt deadly poiſon which he had drunk. *In Procm. lib. 6. Dioſc.*

CHAP. XXX.

Of a peſtilent Bubo, *or Plague-ſore.*

What a peſtilent *Bubo* is.

A Peſtilent *Bubo* is a tumor at the beginning long and movable, and in the ſtate and full perfection copped, and with a ſharp head, unmovable, and fixed deeply in the glandules or kernels, by which the brain exonerates it ſelf of the venemous and peſtiferous matter into the kernels that are behind the ears, and in the neck: the heart into thoſe that are in the arm-holes, and the liver into thoſe that are in the groin, that is, when all the matter is groſs and clammy, ſo that it cannot be drawn out by ſpots and puſtles breaking out on the skin; and ſo the matter of a Carbuncle is ſharp, and ſo fervent, that it maketh an Eſchar on the place where it is fixed. In the beginning, while the *Bubo* is breeding, it maketh the Patient to feel, as if it were, a cord or rope ſtretched out in the place, or a hardned nerve with pricking pain: and ſhortly after the matter is raiſed up, as it were into a knob, and by little and little it groweth bigger, and is inflamed, theſe accidents before mentioned accompanying it. If the tumor be red, and increaſed by little

and

The ſigns of Buboes ſalutary and deadly.

and little, it is a good and ſalutary ſign: but if it be livid or black, and come very ſlowly unto his juſt bigneſs, it is a deadly ſign. It is alſo a deadly ſign if it increaſe ſuddenly, and come to its juſt bigneſs as it were with a ſwift violence, and as in a moment, have all the ſymptoms in the higheſt exceſs, as pain, ſwelling, and burning. *Buboes* or Sores appear ſometimes of a natural colour, like unto the skin, and in all other things, like unto an œdematous tumor, which notwithſtanding will ſuddenly bring the Patient to deſtruction, like thoſe that are black; wherefore it is not good to truſt too much to thoſe kinds of tumors.

CHAP. XXXI.

Of the Cure of Buboes, *or Plague-ſores.*

The uſe of Cupping-glaſſes in curing of a Bubo.

SO ſoon as the Bubo appears, apply a Cupping-glaſs with a great flame unto it, unleſs it be that kind of Bubo which will ſuddenly have all the accidents of burning and ſwelling in the higheſt nature; but firſt the skin muſt be anointed with the Oil of Lillies, that ſo it being made more looſe, the Cupping-glaſs may draw the ſtronger and more powerfully: it ought to ſtick to the part for the ſpace of a quarter of an hour, and be renewed and applied again every three quarters of an hour: for ſo at length the venom ſhould be the better drawn forth from any noble part that is weak, and the work of ſuppuration or reſolution, which ſoever Nature hath aſſailed will the better and ſooner be abſolved and perfected: which may be alſo done by the application of the following Ointment.

Take of *Unguentum Dialthæa* one ounce and a half, Oil of Scorpions half an ounce, of Mithridate diſſolved in *Aqua Vitæ*, half a dram; this liniment will very well relax and looſen the skin, open the pores thereof, and ſpend forth portion of the matter which the Cupping-glaſs hath drawn thither: inſtead thereof mollifying fomentations may be made, and other drawing and ſuppurating Medicins, which ſhall be deſcribed hereafter.

A Liniment.

A Veſicatory applied in a meet place below the Bubo profits them very much, but not above; as for example: If the Bubo be in the throat, the Veſicatory muſt be applied unto the ſhoulder-blade on the ſame ſide; if it be in the arm-holes, it muſt be applied in the midſt of the arm, or of the ſhoulder-bone on the inner ſide: if in the groin, in the midſt of the thigh on the inner ſide, that by the double paſſage that is open for to draw out the matter, the part wherein the venom is gathered together, may be the better exonerated.

Spurge, Crow-foot, Arſmart, Bear-foot, Briony, the middle bark of Travellers joy, the rinds of Mullet, *Flammula*, or upright Virgins power, are fit for raiſing bliſters. If you cannot come by thoſe ſimple Medicins, you may apply this which followeth, which may be prepared at all times.

A compound Veſicatory.

Take *Cantharides*, Pepper, *Euphorbium*, Pellitory of *Spain*, of each half a dram; of ſower leaven two drams, of Muſtard one dram, and a little Vinegar; the Vinegar is added thereto, to with-hold or reſtrain the vehemency of the *Cantharides*: but in want of this Medicin it ſhall ſuffice to drop ſcalding Oil or Water, or a burning Candle, or to lay a burning Coal on the place: for ſo you may raiſe bliſters, which muſt preſently be cut away, and you muſt ſee that you keep the ulcers open and flowing as long as you can, by applying the leaves of red Colworts, Beets, or Ivy dipped in warm Water, and anointed with oil or freſh butter. Some apply Cauteries, but Veſicatories work with more ſpeed; for before the Eſchar of the Cauteries will fall away, the Patient may die, therefore the Ulcers that are made with Veſicatories will ſuffice to evacuate the peſtilent venom, becauſe that doth work rather by its quality than by its quantity. Let the abſceſs be fomented as is ſhewed before, and then let the Medicin following, which hath virtue to draw, be applied.

Why Veſicatories are better than Cauteries in a peſtilent Bubo.

Strong drawing Cataplaſms

Fill a great Onion being hollowed, with Treacle and the leaves of Rue, then roaſt it under the hot embers, beat it with a little Leaven, and a little Swines greaſe, and ſo apply it warm unto the abſceſs or ſore; let it be changed every ſix hours. Or take the roots of Marſh-mallows and Lillies of each half a pound; of Line, Fenugreek, and Muſtard ſeeds, of each half an ounce; of Treacle one dram, ten Figs, and as much Hogs-greaſe as ſhall ſuffice: make thereof a Cataplaſm according to Art. Or, Take of Onions and Garlick roaſted in the embers, of each three ounces: bruiſe them with one ounce of ſowre leaven: adding thereto *Unguentum Baſilicon* one ounce, Treacle one dram, Mithridate half a dram, of old Hogs-greaſe one ounce, of *Cantharides* in powder one ſcruple, of Pigeons dung two drams: beat them and mix them together into the form of a Cataplaſm. Hereunto old Rennet is very profitable; for it is hot, and therefore attractive, being mixed with old Leaven and *Baſilicon*: you ought to uſe this until the abſceſs be grown unto its full ripeneſs and bigneſs; but if preſently after the beginning there be great inflammation, with ſharp pain, as it often happeneth, eſpecially when the abſceſſes be of the kind of Carbuncles; we muſt abſtain from thoſe remedies that are hot and attractive, and alſo from thoſe that are very emplaſtick and clammy, becauſe they do altogether cloſe the pores of the skin; or becauſe they reſolve the thinner part of the collected matter, which if it might remain, would bring the other ſooner to ſuppuration: or elſe becauſe they may perchance draw more quantity of the hot matter than the part can bear, whereof cometh rather corruption than maturation: and laſt of all, becauſe they increaſe the Fever and Pain, which infer the danger of a Convulſion or mortal Gangrene. Therefore in ſuch a caſe it is beſt to uſe cold and temperate local Medicins, as the leaves of Henbane and Sorrel roaſted under the coals, *Galens* Pultiſe, and ſuch like.

Againſt ſuch as cut away Plague-ſores.

There are many that for fear of death, have with their own hands pulled away the Bubo with a pair of Smiths Pincers: others have digged the fleſh round about it, and ſo gotten it wholly out. And to conclude, others have become ſo mad, that they have thruſt an hot iron into it with their own hand, that the venom might have a paſſage forth: of all which I do not allow one; for ſuch abſceſſes do not come from without, as the bitings of virulent Beaſts, but from within, and more-

over

over becauſe pain is by theſe means increaſed, and the humour is made more malign and fierce. Therefore I think it ſufficient to uſe Medicins that relax, open the pores of the skin, and digeſt portion of the venom by tranſpiration, as are theſe that follow. Take the roots of Marſh-mallows and Lillies of each ſix ounces, of Camomil and Melilot-flowers of each half a handful, of Line-ſeeds half an ounce, of the leaves of Rue half an handful: boil them and ſtrain them, dip ſponges in the ſtraining, and therewith let the tumour be fomented a long time. Or take the crum of hot bread and ſprinkle it with Treacle-water, or with *Aqua Vitæ*, and Cows-milk or Goats-milk, and the yolks of three Eggs; put them all on ſtupes or flax, and apply them warm unto the place. Or, Take of ſowre Rie-leaven four ounces, of Baſilicon two ounces, three yolks of Eggs, Oil of Lillies two ounces, Treacle one dram: let it be received on ſtupes, and applied in like manner. Or, Take of *Diachylon* and *Baſilicon* of each two ounces, Oil of Lillies one ounce and a half: let them be melted and mixed together, and let it be applied as is above ſaid. When you ſee, feel and know, according to reaſon, that the Bubo is come to perfect ſuppuration, it muſt be opened with an inciſion-knife, or an actual or potential Cautery, but it is beſt to be done with a potential Cautery, unleſs that happily there be great inflammation, becauſe it doth draw the venom from beneath unto the ſuperficial parts, and maketh a larger orifice for the matter that is contained therein: neither muſt it be looked for, that Nature ſhould open it of her ſelf; for then there were danger that leſt while Nature doth work ſlowly, a venemous vapour ſhould be ſtirred up, with ſtriking the heart by the arteries, the brain by the nerves, and the liver by the veins, ſhould cauſe a new increaſe of the venemous infection. For fear whereof there be ſome that will not expect the perfect maturation and ſuppuration, but as it were in the midſt of the crudity and maturity, will make an orifice for it to paſs forth at: yet if it be done before the tumor be at his perfect maturity, Pain, a Fever, and all accidents are ſtirred up, and enraged, whereof cometh a malign ulcer that often degenerates into a Gangrene. For the moſt part about the tenth or eleventh day the work of ſuppuration ſeemeth perfected and finiſhed; but it may be ſooner or later, by reaſon of the application of Medicins, the condition of the matter, and ſtate of the part: when the matter cometh forth, you muſt yet uſe ſuppurative and mollifying Medicins, to maturate the remains thereof; in the mean while cleanſing the ulcer by putting mundificatives into it, as we ſhall declare in the cure of Carbuncles. But if the tumor ſeem to ſink in, or hide it ſelf again, it muſt be revoked and procured to come forth again, by applying of Cupping-glaſſes with ſcarification, and with ſharp Medicins, yea, and with Cauteries both actual and potential.

A digeſtive fomentation.

An anodyne Cataplaſm.

Why it is beſt to open a Plague-ſore with a potential Cautery.

How to draw forth a ſore that ſeems to go in again.

When the Cauteries are applied it ſhall be very good to apply a Veſicatory a little below it, that there might be ſome paſſage open for the venom while the Eſchar is in falling away. For ſo they that are troubled with the French Pox, ſo long as they have open and flowing ulcers, ſo long are they void of any pain that is worth the ſpeaking of; which ulcers being cloſed and cicatrized, they do preſently complain of great pain. If you ſuſpect that the *Bubo* is more malign by reaſon that it is of a green or black and inflamed colour, as are thoſe that come of a melancholick humour by aduſtion, turned into a groſs and rebellious melancholick humour, ſo that by the more copious influx thereof into the part, there is a danger of a gangrene and mortification; then the places about the abſceſs muſt be armed with repercuſſives, but not the abſceſs it ſelf: and this may be the form of the repercuſſives: Take of the juice of Houſleek, Purſlain, Sorrel, Night-ſhade, of each two ounces; of Vinegar one ounce, the Whites of three Eggs, of Oil of Roſes and Water-lillies of each two ounces and an half, ſtir them together, and apply it about the Bubo, and renew it often: or boil a Pomgranate in Vinegar, beat it with *Unguentum Roſatum*, or *Populeon* newly made, and apply it as is aforeſaid. If theſe things do not ſtop the influx of other humours, the abſceſs it ſelf and the places about it muſt be ſcarified round about, if the part will permit it; that the part exonerated of portion of the venom may not ſtand in danger of the extinction of the proper and natural heat, by the greater quantity and malignity of the humours that flow unto it. In ſcarifying you muſt have care of great veſſels, for fear of an irrepugnable flux of bloud, which in this caſe is very hard to be ſtaid or reſiſted, both becauſe the part it ſelf is greatly inflamed, and the humour very fierce; for the expulſion whereof, Nature careful for the preſervation of the part and all the body beſides, ſeemeth to labour and work. But yet you muſt ſuffer ſo much of the bloud and humour to flow out as the Patient is able to abide without the loſs of his ſtrength. Moreover, you may ſpend forth the ſuperfluous portion of the malignity, with relaxing, mollifying, and reſolving fomentations: as, Take the roots of Marſh-mallows, Lillies and Elecampane, of each one pound; of Line-ſeeds and Fenugreek, of each one ounce, of Fennel-ſeeds, and Anniſe-ſeeds, of each half an ounce, of the leaves of Rue, Sage, Roſemary, of each one handful, of Camomil and Melilot flowers, of each three handfuls; boil them all together and make thereof a decoction for a fomentation; uſe it with a Sponge according to Art. Alſo after the aforeſaid ſcarification, we may put Hens, or Turkies that lay Eggs (which therefore have their fundaments more wide and open, and for the ſame purpoſe put a little ſalt into their fundaments) upon the ſharp top of the Bubo, that by ſhutting their Bills at ſeveral times they may draw and ſuck the venom into their bodies, far more ſtrongly and better than Cupping-glaſſes, becauſe they are endued with a natural property againſt poiſon, for they eat and concoct Toads, Efts, and ſuch like virulent Beaſts: when one Hen is killed with the poiſon that ſhe hath drawn into her body, you muſt apply another, and then the third, fourth, fifth, and ſixth, within the ſpace of half an hour. There be ſome that will rather cut them, or elſe uſe whelps cut aſunder in the midſt, and applied warm to the place; that by the heat of the Creature that is yet ſcarce dead, portion of the venom may be diſſipated and exhaled. But if nevertheleſs there be any fear of a Gangrene at hand, you muſt cut the fleſh with a deeper ſcarification, not onely avoiding the great veſſels, but alſo the nerves, for fear of convulſion; and after the ſcarification and a ſufficient flux of bloud, you muſt waſh it with Ægyptiacum, Treacle and Mithridate diſſolved in Sea water, *Aqua Vitæ* and Vinegar. For ſuch a lotion hath virtue to ſtay putrefaction, repel the venom,

When repercuſſives may be applied.

Why too much bleeding is to be feared.

nom, and prohibit the bloud from concretion: but if the Gangrene cannot be avoided ſo, Cauteries may be applied to the part: eſpecially actual, becauſe they do more effectually repel the force of the poiſon, and ſtrengthen the part. Preſently after the impreſſion of the hot Iron, the Eſchar muſt be cut away even unto the quick fleſh, that the venomous vapours and the humours may have a free paſſage forth; for it is not to be looked for, that they will come forth of themſelves. With theſe inunctions they are wont to haſten the falling away of the Eſchar. Take of the mucilage of Marſh-mallows and Line-ſeeds, of each two ounces, freſh Butter or Hogs-greaſe one ounce, the yolks of three Eggs; incorporate them together, and make thereof an Ointment: Butter, Swines-greaſe, Oil of Roſes with the yolks of Eggs, perform the ſelf ſame thing. When the Eſchar is fallen away, we muſt uſe digeſtives. As, Take of the juice of Plantain, Water-Betony, and Smallage, of each three ounces, honey of Roſes four ounces, Venice Turpentine five ounces, Barly flower three drams, Aloes two drams, Oil of Roſes four ounces, Treacle half a dram: make a mundificative according to Art. Or, Take of Venice Turpentine four ounces, Syrup of dried Roſes and Wormwood, of each an ounce, of the powder of Aloes, Maſtich, Myrrh, Barly-flower, of each one dram, of Manna date half an ounce; incorporate them together. The unguent that followeth is very meet for putrified and corroding ulcers: Take red Orpiment one ounce, of unquenched Lime, burnt Alum, Pomgranat Pills, of each ſix drams, of *Olibanum*, Galls, of each two drams, of Wax and Oil as much as ſhall ſuffice: make thereof an unguent. This doth mundifie ſtrongly, conſume putrified fleſh, and dry up virulent humidities that engender Gangrenes. But there is not a more excellent unguent than *Ægyptiacum* increaſed in ſtrength, for beſides many other virtues that it hath, it doth conſume and waſte the proud fleſh; for there is neither Oil nor Wax that goeth into the compoſition thereof, with which things the virtue of ſharp Medicins convenient for ſuch Ulcers, is delaid, and as it were dulled and hindered from their perfect operation, ſo long as the ulcer is kept open. There have been many that being diſeaſed with this diſeaſe, have had much matter and venomous filth come out at their abſceſs; ſo that it ſeemed ſufficient, and they have been thought well recovered, yet have they died ſuddenly. In the mean while when theſe things are in doing, cordial Medicins are not to be omitted to ſtrengthen the heart: And Purgations muſt be renewed at certain ſeaſons, that Nature may be every way unloaded of the burthen of the venenate humours.

Liniments haſten the falling away of the Eſchar.

Againſt eating Ulcers.

The praiſe of *Ægyptiacum*.

CHAP. XXXII.

Of the Nature, Cauſes, and Signs of a Peſtilent Carbuncle.

A Peſtilent Carbuncle is a ſmall tumor, or rather a malign puſtle, hot, and raging, conſiſting of bloud vitiated by the corruption of the proper ſubſtance. It often cometh to paſs through the occaſion of this untamable malignity, that the Carbuncle cannot be governed or contained within the dominion of Nature. In the beginning it is ſcarce ſo big as a ſeed or grain of Millet or Peaſe, ſticking firmly unto the part and immovable, ſo that the skin cannot be pulled from the fleſh; but ſhortly after it increaſeth like to a Bubo, unto a round and ſharp head, with great pricking pain, as if it were with needles, burning and intolerable, eſpecially a little before night, and while the meat is in concocting, more than when it is perfectly concocted. In the midſt thereof appeareth a bladder puffed up and filled with ſanious matter. If you cut this bladder, you ſhall find the fleſh under it parched, burned and black, as if there had been a burning coal laid there, whereby it ſeemeth that it took the name of Carbuncle; but the fleſh that is about the place is like a Rainbow, of divers colours, as red, dark green, purple, livid and black; but yet always with a ſhining blackneſs, like unto Stone-Pitch, or like unto the true precious ſtone which they call a Carbuncle, whence ſome alſo ſay it took the name. Some call it a Nail, becauſe it inferreth like pain as a Nail driven into the fleſh. There are many Carbuncles which take their beginning with a crufty ulcer without a puſtle, like to the burning of an hot Iron: and theſe are of a black colour, they increaſe quickly, according to the condition of the matter whereof they are made. All peſtilent Carbuncles have a Fever joined with them, and the grieved part ſeemeth to be ſo heavy, as if it were covered or preſſed with lead tied hard with a ligature: There cometh mortal ſwounings, faintings, toſſing, turning, idle talking, raging, gangrenes and mortifications; not onely to the part, but alſo to the whole body; by reaſon (as I think) of the oppreſſion of the ſpirits of the part, and the ſuffocation of the natural heat, as we ſee alſo in many that have a peſtilent Bubo: for a Bubo and Carbuncle are tumors of a near affinity, ſo that the one doth ſcarce come without the other, conſiſting of one kind of matter, unleſs that which maketh the Bubo is more groſs and clammy, and that which cauſeth the Carbuncle more ſharp, burning and raging, by reaſon of its greater ſubtilty, ſo that it maketh an Eſchar on the place where it is, as we noted before.

What a Carbuncle is.

The ſigns of a Carbuncle.

Symptoms of Carbuncles.

How the Matter of a Bubo and Carbuncle differ.

CHAP. XXXIII.

What Prognoſticks may be made in Peſtilent Buboes and Carbuncles.

SOme having the Peſtilence have but one Carbuncle, and ſome more, in divers parts of their body, and in many it happeneth that they have the Bubo and Carbuncle before they have any Fever; which giveth better hope of health, if there be no other malign accident therewith: for it is a ſign that Nature is the Victor, and hath gotten the upper-hand, which excluded the peſtilent venom before it could come to aſſault the heart. But if a Carbuncle and Bubo come after the Fever, it is mortal; for it is a token that the heart is affected, moved and incenſed with the furious rage of the venom, whereof preſently cometh a feverilh heat or burning; and corruption of the humours, ſent as it were from the center unto the ſuperficies of the body. It is a good ſign, when the

Why it is deadly to have a ſore come after the Fever.

the Patients mind is not troubled, from the beginning until the ſeventh day; but when the Bubo or Carbuncle ſinketh down again ſhortly after that it is riſen, it is a mortal ſign, eſpecially if ill accidents follow it. If after they are brought to ſuppuration they preſently wax dry without any reaſon thereof, it is an ill ſign: Thoſe Carbuncles that are generated of bloud have a greater Eſchar than thoſe that are made of choler, becauſe that bloud is of a groſs conſiſtence, and therefore occupieth a greater room in the fleſh: contrariwiſe, a cholerick humour is more ſmall in quantity and thin, and it taketh little room in the upper part of the fleſh onely, as you may ſee in an *Eryſipelas*. And I have ſeen Carbuncles whoſe Eſchars were as broad and as large as half the back: alſo I have ſeen others, which going up by the ſhoulders to the throat, did ſo eat away the fleſh that was under them, that the rough artery or wind-pipe might be ſeen bare, when the Eſchar was fallen away. I had once a Carbuncle which was in the midſt of my belly, ſo that when the Eſchar was fallen away, I might very plainly ſee the *Peritoneum* or Rim; and the cicatrice that remaineth is as broad as my hand; but they do not ſpread themſelves ſo far, without the great danger or death of the Patient. There alſo ſome Carbuncles which beginning at the parts under the chin, diſperſe themſelves by little and little unto the battle-bones, and ſo ſtrangle the Patient. So in many the Buboes in the Groin ariſe above a great part of the muſcles of the *Epigaſtrium*. Truly of thoſe abſceſſes that are ſo large and great in quantity, and ſo terrible to be ſeen, there is great danger of death to the Patient, or at leaſt to the grieved part; for after the conſolidation the part remaineth as if it were leprous, which aboliſheth the action of the part, as I have ſeen in many. Often-times alſo the corruption of the matter is ſo great, that the fleſh leaveth the bones bare: but Carbuncles often leave the joints and ligaments quite reſolved, through the occaſion of the moiſture that is ſoaked and ſunk into them; for they often caſt out putrefied and virulent ſanious matter, whereby eating and creeping ulcers are bred, many bliſters and puſtles ariſing up in the parts round about it; which ſhortly breaking into one, make a great ulcer. Theſe come very ſeldom and ſlowly unto ſuppuration, or at leaſt to caſt out laudable matter, eſpecially if they have their original of choler; becauſe the matter is ſooner burned with heat than ſuppurated. Therefore then, if they can be brought to ſuppuration by no Medicins, if the tumor ſtill remain black, if when they are opened, nothing at all, or elſe a very little ſharp moiſture doth come forth, they are altogether mortal, and there is ſcarce one of a thouſand who hath theſe accidents that recovereth health. Diſperſed ſmall bliſters, coming of vapours ſtirred up by the matter that is under the skin, and are there ſtaid and kept from paſſage forth, do not neceſſarily fore-ſhew death in Carbuncles. But if the part be ſwollen or puffed up, if it be of a green or black colour, and if it feel neither pricking nor burning, it is a ſign of a mortal gangrene. Buboes or Carbuncles ſeldom or never come without a Fever: but the Fever is more vehement when they are in the emunctories or nervous parts, than when they are in the fleſhy parts; yet it is leſs, and all ſymptoms are leſs and more tolerable in a man that is ſtrong and of a good temperature: Carbuncles not onely affect the outward, but alſo the inward parts, and oftentimes both together. If the heart be vexed in ſuch ſort with a Carbuncle that nothing thereof appeareth forth on the ſuperficial parts, all hope of life is paſt, and thoſe ſuddenly die, eating, drinking, or walking, and not thinking any thing of death. If the Carbuncle be in the Midriff or Lungs, they are ſoon ſuffocated: if it be in the Brain, the Patient becometh frantick, and ſo dieth: if it be in the parts appointed for the paſſage of the urine, they die of the ſuppreſſion of their water, as it happened in the Queen-mothers waiting maid, at the Caſtle of *Roſſilion*, of whom I ſpake before: if it be in the Stomach, it inferreth the accidents that are ſhewed in this Hiſtory following.

Huge peſtilent abſceſſes commonly deadly.

Deadly Carbuncles.

While I was a Surgeon in the Hoſpital of *Paris*, a young and ſtrong Monk of the order of S. *Victor*, being overſeer of the Woman that kept the ſick people of that place, fell into a continual Fever very ſuddenly, with his Tongue black, dry, rough, (by reaſon of the putrefied and corrupted humours, and the vapours riſing from the whole body to that place) and hanging out like unto a Hounds, with unquenchable thirſt, often ſwouning and deſire to vomit: he had convulſions over all his body, through the vehemency and malignity of the diſeaſe, and ſo he died the third day. Wherefore thoſe that kept the ſick people in the Hoſpital, thought that he had been poiſoned, for the certain knowledge whereof the Governours of the Hoſpital commanded his body to be opened. I therefore calling to me a Phyſician and Surgeon, we found in the bottom of his ſtomach, a print or impreſſion, as if it had been with an hot iron or potential Cautery, with an Eſchar or cruſt as broad as ones nail, all the reſt of his ſtomach was greatly contracted and ſhrunk up together, and as it were horny; which we conſidering, and eſpecially the Eſchar which was deep in the ſubſtance of the ſtomach, we all ſaid with one voice, that he was poiſoned with Sublimate or Arſenick. But behold, while I was ſewing up his belly, I perceived many black ſpots diſperſed diverſly throughout the skin: then I asked my company what they thought of thoſe ſpots? truly (ſaid I) it ſeemeth unto me that they are like unto the Purple ſpots or marks that are in the Peſtilence. The Phyſician and the Surgeon denied it, and ſaid that they were the bitings of Fleas. But I perſwaded them to conſider the number of them over all the whole body, and alſo of their great depth and depreſſion into the fleſh; for when we had thruſt Needles deep into the fleſh in the midſt of them, and ſo cut away the fleſh about the needle, we found the fleſh about the needle to be black: moreover his noſtrils, nails, and ears, were livid, and all the conſtitution of his body was contrary, and far unlike to the bodies of thoſe that died of other ſickneſſes or diſeaſes. Alſo it was credibly reported unto us by thoſe that kept him, that his Face was ſo altered a little before he died, that his familiar friends could hardly know him. We perſuaded by theſe proofs, revoked our former opinion and ſentence, and made a Certificate to be ſent unto the Governours and Maſters of the Hoſpital, ſetting our hands and ſeals unto it, to certifie them that he died of a peſtilent Carbuncle.

An Hiſtory.

How to diſtinguiſh Purple ſpots from Flea-bitings.

CHAP. XXXIV.

Of the Cure of a Peſtilent Carbuncle.

Why emplaſtick, very hot, and great drawers are not good for a Carbuncle.

BY the fore-named ſigns of a peſtilent Carbuncle, and eſpecially by the bitterneſs of the pain, malignity of the venomous matter, and by the burning Fever that is therewithall annexed, I think it manifeſt, that very hot, emplaſtick, and drawing Medicins ſhould not be applied to this kind of tumor, becauſe they prohibit or hinder the exhalation, or waſting forth of the venenate malignity, becauſe that by ſtopping the pores of the skin, they increaſe and cauſe a greater heat in the part than there was before. Therefore it is better to uſe reſolving Medicins which may aſſwage heat, and reſolve the pores of the skin. Therefore firſt the place muſt be fomented with Water and Oil mixed together, wherein a little Treacle hath been diſſolved, leaving thereon *ſtupes* wet therein: you may alſo uſe the decoction of Mallows, the Roots of Lillies, Line-ſeeds, Figs, with Oil of *Hypericon*, to make the skin thin, and to draw forth the matter; and the day following you muſt apply the Cataplaſm following.

A Cataplaſm for a peſtilent Carbuncle.

Take the leaves of Sorrel and Henbane, roaſt them under the hot aſhes, afterwards beat them with four yolks of Eggs, two drams of Treacle, Oil of Lillies, three ounces, Barly-meal as much as ſhall ſuffice: make thereof a Cataplaſm in the form of a liquid Pultiſe: this aſſwageth heat and furthereth ſuppuration.

Another.

Or, Take the roots of Marſh-mallows and Lillies, of each four ounces, Line-ſeeds half an ounce, boil them, beat them, and then ſtrain them through a Serſe, adding thereto of freſh Butter one ounce and half, Mithridate one dram, of Barly-meal as much as ſhall ſuffice: make thereof a Cataplaſm according to Art. Thoſe Cataplaſms that follow, are moſt effectual to draw the venomous matter forth, and to make a perfect ſuppuration, eſpecially when the flux of the matter is not ſo great, but that the part may bear it. Take the Roots of white Lillies, Onions, Leaven, of each half an ounce; Muſtard-ſeeds, Pigeons dung, Sope, of each one dram; ſix Snails in their ſhells, of fine Sugar, Treacle and Mithridate, of each half a dram; beat them altogether and incorporate them with the yolks of Eggs: make thereof a Cataplaſm, and apply it warm.

Other Cataplaſms.

Or, Take the yolks of ſix Eggs, of Salt powdered one ounce, of Oil of Lillies and Treacle, of each half a dram; Barly-meal as much as will ſuffice: make thereof a Cataplaſm. Take of ordinary Diachylon four ounces, of *Unguentum Baſilicon* two ounces Oil of Violets half an ounce: make thereof a Medicin. Many ancient Profeſſors greatly commend Scabious ground, or brayed between two ſtones, and mixed with old Hogs-greaſe, the yolks of Eggs, and a little Salt, for it will cauſe ſuppuration in Carbuncles, alſo an Egg mixed with Barly-meal, and Oil of Violets doth mitigate pain, and ſuppurate.

The effect of Scabious againſt a peſtilent Carbuncle.

A Raddiſh root draws out the venom powerfully.

A Raddiſh-root cut in ſlices, and ſo the ſlices laid one after one unto a carbuncle or peſtilent tumor, doth mightily draw out the poiſon. The juice of Colts-foot doth extinguiſh the heat of Carbuncles: the Herb called Devils-bit being bruiſed, worketh the like effect. I have often uſed the Medicin following to the heat of Carbuncles with very good ſucceſs; it doth alſo aſſwage pain and cauſe ſuppuration. Take of the Soot ſcraped from a Chimney four ounces, of common Salt two ounces, beat them into ſmall Powder, adding thereto the yolks of two Eggs, and ſtir them well together, until it come to have the conſiſtence of a Pultiſe, and let it be applied warm unto the Carbuncle.

The top of a Carbuncle, when, why, and with what to be burned.

In the beginning the point or head of the Carbuncle muſt be burned, if it be black, by dropping thereinto ſcalding hot Oil, or *Aqua fortis*; for by ſuch a burning the venom is ſuffocated, as touched by lightning, and the pain is much leſſened, as I have proved oftentimes: neither is it to be feared leſt that this burning ſhould be too painful, for it toucheth nothing but the point of the Carbuncle, which by reaſon of the Eſchar that is there, is void of ſenſe. After this burning, you muſt go forward with the former deſcribed Medicins, until the Eſchar ſeemeth to ſeparate it ſelf from the fleſh round about it, which is a token of the Patients recovery, for it ſignifieth that Nature is ſtrong and able to reſiſt the poiſon.

The falling of the Eſchar promiſeth health.

After the fall of the Eſchar, you muſt uſe gentle mundificatives, as thoſe which we have preſcribed in a Peſtilent Bubo; not omitting ſometimes the uſe of ſuppurative and mollifying Medicins: that while the groſs matter is cleanſed, that which is as yet crude may be brought to ſuppuration: for then the indication is two-fold, the one to ſuppurate that which remains as yet crude and raw in the part, and the other to cleanſe that which remains concocted and perfectly digeſted in the ulcer.

A twofold indication.

CHAP. XXXV.

Of the itching and inflammation happening in Peſtilent Ulcers, and how to cicatrize them.

Why the adjacent parts are troubled with itching.

THe parts adjoining to a peſtilent Ulcer, oft-times are ſuperficiarily excoriated by reaſon of ulcerous puſtles, which here and there, with burning and great itching prick and vellicate the part. The cauſe may happen either externally or internally; internally, by a thin and biting *ſanies*, which ſweating from the Ulcer, moiſtens the neighbouring parts. But externally by the conſtipation of the pores of the skin, induced by the continual application of Medicins.

A fomentation for this itch.

To remedy this the place muſt be fomented with diſcuſſing and relaxing things, as *Aqua fortis*, which the Goldſmiths have uſed for ſeparating of Metals, Alum-water, the water of Lime, Brine, and the like.

Why theſe Ulcers are hard to be cicatrized.

But Ulcers left by Carbuncles and peſtilent Buboes, are difficultly cicatrized, by reaſon of the corroding *ſanies* proceeding from the cholerick or phlegmatick and ſalt bloud, which being in fault by the corruption of the whole ſubſtance, cauſeth the abſceſs: beſides, ſuch Ulcers are commonly round, and therefore hard to be cicatrized, for that the Quitture hath no free paſſage forth; ſo the *ſanies*, of its own nature acrid and corroding, doth by delay acquire greater acrimony and nitroſity; ſo by its burning touch diſſolving the adjacent fleſh, it hinders the conjunction

and

and unition of the lips of the ulcer: but in the interim, the lips of the ulcer become callous, which unleſs they be helped by cutting, or eating Medicins, the ulcer cannot be healed; for that by their denſity they hinder the ſweating out of a ſufficient quantity of the dewy glew, to heal up the ulcer. Now the ulcer being plained and brought equal to the other fleſh, we muſt uſe Epuloticks; that is, ſuch things as have a faculty to cicatrize Ulcers by condenſing and hardning the ſurface of the fleſh: Of theſe there are two kinds; for ſome without much biting bind and dry, ſuch are Pomgranat-pills, Oak-bark, Tutia, Litharge, burnt Bones, Scales of Braſs, Galls, Cypreſs-nuts, Minium, Antimony, Bole-Armenick, the burnt and waſhed ſhells of Oyſters, Lime nine times waſhed, and many Metalline things. Others are next to theſe, by which proud fleſh is conſumed; but ſuch muſt be ſparingly uſed: Of this kind is waſhed Vitriol, burnt Alum, which excelleth other Epuloticks, by reaſon of the excellent drying and aſtringent faculty conſolidating the fleſh, which by being moiſtned by an excrementitious humour, grows lank. For that the ſcar which is made, is commonly unſightly in this kind of Ulcers, as red, livid, black, ſwollen, rough, by reaſon of the great aduſtion imprinted in the part, as by a burning coal: therefore I have thought good here to ſet down ſome means, by which this deformity may be corrected or amended. If the ſcar be too big, or high, it ſhall be plained by making convenient ligation and ſtraight binding to the part a Plate of Lead rubbed over with Quick-ſilver; but you may whiten it by anointing it with Lime nine times waſhed, (that ſo it may be more gentle, and loſe the acrimony) and incorporated with Oil of Roſes. Some take two pound of Tartar or Argal, burn it, and then powder it; put it in a cloth, and ſo let it hang in a moiſt Vault or Cellar, and ſet a Veſſel under it to receive the dropping of Liquor, which is good to be rubbed for a good ſpace upon the ſcar. The ſame faculty is thought to be in that moiſture of eggs, which ſweats through the ſhell, whileſt they are roaſted at the coals; as alſo *unguentum citrinum* and *Emplaſt. de cerußa* newly made. The three following compoſitions are much approved. ℞ *Axungiæ ſuillæ nonies lotæ in aceto acerrimo* ℥ iv. *cinab. ſucci citri, & alum. uſti, an.* ℥ ß. *ſulphur. vivi ignem haud experti,* ℥ ij. *camph.* ℈ ij. *fiat pulvis*; then let them all be incorporated together, and make an Oinment: it attenuates the skin, and cleanſeth ſpots. ℞ *Olei hyoſc. olei ſemin. cucurb. an.* ℥ j. *olei tartar.* ℥ ß. *ceræ alb.* ℥ iij. *liquefiant ſimul lento igne; deinde adde ſpermat. ceti* ℥ vj. *removeantur prædicta ab igne donec infrigid. poſtea adde troch. alb. Rhaſis pul.* ℥ iij. *camph.* ℥ j. *tandem cum mali citri ſucco omnia diligent. commiſce, fiat linimentum.* Or elſe, ℞ *Rad. ſerpent.* ℥ j. *bulliat in aquæ com.* ℔ j. *ad dimid. deinde adde ſulph. vivi ignem non experti, & alum. crudi, pulveriſ. an.* ℥ j. . *colent. prædict. & addatur caph.* ℥ j. *ſucci hyoſcyami* ℥ j. ß. Let this Medicin be kept in a lead or glaſs Veſſel; and when you would uſe it, dip linnen cloths therein, and lay them to the part. You may alſo uſe theſe Medicins againſt the redneſs of the Face; and you may fetch them off in the morning by waſhing the Face with warm Water and Bran.

Two ſorts of Epuloticks.

Remedies againſt the deformity of ſcars.

Oinments to attenuate and take away ſcars.

CHAP. XXXVI.

Of ſundry kinds of Evacuations, and firſt of Sweating and Vomiting.

THe peſtilent malignity is not onely evacuated and ſent forth by the eruption of puſtles and ſpots, but alſo by Sweat, Vomit, Bleeding at Noſe, at the *Hæmorrhoids*, by the Courſes, a Flux of the Belly, and other ways; ſo that Nature by every kind of excretion may be freed from the deadly poiſon, eſpecially that which is not as yet arrived at the heart. But chief regard muſt be had to the inclination of Nature, and we muſt attend what way it chiefly aims at, and what kind of excretion it affects. Yet ſuch evacuations are not always critical, but uſually ſymptomatical; for that oft-times Nature is ſo irritated by the untamable malignity of the matter, that it can no way digeſt it, but is forced by any means to ſend it away crude as it is. Wherefore if Nature may ſeem by the moiſtneſs of the skin, the ſuppreſſion of Urin, and other ſigns to affect a *criſis* and excretion by Sweat, you then ſhall procure it by the formerly mentioned means. It is delivered by the Ancients, that all Sweats in acute diſeaſes are ſalutary, which happen upon a critical day, which are univerſal and hot, and ſignified before the critical day. But in this rapid and deadly diſeaſe of the Plage, we muſt not expect a *Criſis*, but as ſoon as we can, and by what means we may, to free Nature from ſo dire and potent an Enemy.

Why the peſtilent malignity is not carried away by one way, but by many. We muſt have chief regard to the motion of Nature. Signs of future Sweat.

A *Criſis* muſt not be expected in the Plague.

But oft-times the tough and groſs excrementitious humours may be purged by Vomit, which could not be evacuated by ſtrong Purges. Therefore alſo by this manner of excretion may we hope for the excluſion of the peſtilent venom, if there be nothing which may hinder; and Nature by frequent nauſeouſneſs may ſeem to affect this way: the endeavour thereof ſhall be helped by giving ſome half a pint of warm Water to be drunk with four ounces of common Oil, an ounce of Vinegar, and a little juice of Raddiſh: after the taking of the potion, it is fit to thruſt into the throat a Gooſe-quill dipped in the ſame Oil, or elſe a branch of Roſemary: or elſe by thruſting in the fingers, ſo to procure vomit; alſo a portion of eight ounces of the mucilaginous water of the decoction of Line-ſeeds will procure Vomit. Or elſe, ℞ *Rad. raph. in taleol. ſect. vel ſem. ejus, & ſem. atriplicis, an.* ℥ iij. *bulliant in aquæ com. quod ſufficit pro doſi. in colatura diſſolve oxym. & ſyr. acet. an.* ℥ ß. *exhibeatur potio larga & tepida.* Or elſe, ℞ *Oxym. Gal.* ℥ vj. *ol. com.* ℥ ij. *paretur potio tepid.* But Nature muſt not be forced, unleſs of its own accord it undertake this motion, for forced and violent vomiting, diſtends the nervous fibres of the ventricle, dejects the ſtrength, breaks the veſſels of the lungs, whence proceeds a deadly ſpitting of bloud. Wherefore if the ſtomach ſhall trouble it ſelf with a vain and hurtful deſire to vomit, it ſhall rather be ſtrengthened with bags of Roſes, Wormwood, and Sanders, uſing inwardly the juice of Quinces and Berberries, and Broths made for the ſame purpoſe.

How to procure Vomit.

Why Vomit muſt not be forced.

CHAP. XXXVII.

Of Spitting, Salivation, Belching, Hicketing, and making of Water.

The effect of Spitting in Peſtilent diſeaſes

THat long evacuations may be made by Spitting and Salivation, you may learn by the example of ſuch as have a Pleuriſie; for the matter of the Pleuriſie being turned into *pus*, the purulent matter ſuckt up by the rare and ſpongeous ſubſtance of the lungs, and thence drawn into the *aſpera arteria*, is laſtly caſt out by the mouth.

The force of Salivation.

There is none ignorant how much ſuch as have the *Lues Venerea* are helped by Salivation and Spitting. But theſe ſhall be procured by a Maſticatory of the roots of *Ireos*, Pellitory of *Spain*, Maſtich, and the like; the mucilage of Line-ſeed held in the mouth will work the ſame effect.

The force of Sneezing.

That ſuch as have a moiſt brain may expel their ſuperfluous humours by ſneezing and blowing their noſes; the brain, by the ſtrength of the expulſive faculty, being ſtirred up to the excluſion of that which is harmful, may be known by the example of old people and children which are daily purged by their noſes; the brain is ſtirred up to both kinds of excretion from cauſes either internal or external: from the internal, as by a phlegmatick and vaporous matter, which contained in the brain, offends it: externally, as by receiving the beams of the Sun in the noſtrils, or by tickling them with a feather, or blowing into them the powder of Hellebore, *Euphorbium*, *Pyrethrum*, Muſtard-ſeeds, and the like Sternutamentories. For then the brain is ſtraitned by its own expulſive faculty, to the excretion of that which is troublous unto it. Sneezing breaketh forth with noiſe, for that the matter paſſeth through ſtraits, to wit, by the ſtraitning paſſages of the *Os cribroſum*, which is ſeated at the roots of the noſtrils. It is not fit to cauſe ſneezing in a body very plethorick, unleſs you have firſt premiſed general Medicins, leſt the humours ſhould be more powerfully drawn into the brain, and ſo cauſe an Apoplexy, *Vertigo*, or the like ſymptoms.

The commodities of Belching.

By Belching the flatulencies contained in the ventricle, being the off-ſpring of crudity, or flatulent meats, are expelled: theſe by their taſte and ſmell, pleaſing, ſtinking, ſweet, bitter or tart, ſhew the condition and kind of crudity of the humours from whence they are raiſed: now vomiting freeth the ſtomach of crudities, but the diſtemper muſt be corrected by contraries, as altering things to be preſcribed by the Phyſician.

Hicketting is a contraction and extenſion of the nervous fibres of the ſtomach, to caſt forth ſuch things as are too contumaciouſly impact in the coats thereof; yet repletion onely is not the cauſe thereof, but ſometimes inanition alſo; ſo oft-times a putrid vapour from ſome other place, breaking into the ſtomach, as from a peſtilent Bubo or Carbuncle; alſo all acid and acrid things, becauſe they prick, vellicate and provoke the tunicles of the ventricle, as Vinegar, ſpiced things, and the like; often and contumacious hicketting after purging, a wound or vomiting, is ill; but if a convulſion preſently happen thereon, it is deadly.

Several remedies muſt be uſed according to the variety of the cauſes: for repletion helps that hicketting that proceeds from inanition, and evacuation that which happens by repletion: that which proceeds from a putrid and venemous vapour, is helped by Treacle and Antidotes; that which is occaſioned by acid and acrid things, is cured by the uſe of groſs, fatty, and cold things.

The whole body purged by urin.

Now the whole body is oft-times purged by urin, and by this way the feveriſh matter is chiefly and properly accuſtomed to be evacuated: not a few being troubled with the *Lues Venerea*, when as they could not be brought to ſalivation by unction, have been cured by the large evacuation of urin cauſed by Diuretick Medicins. Diureticks wherewithall you may move urin, are formerly deſcribed in treating of the Stone. But we muſt abſtain from more acrid Diureticks, eſpecially when as inflammation is in the bladder; for otherwiſe the noxious humours are ſent to the affected part, whence there is danger of a deadly Gangrene. Therefore then it is better to uſe diverſion by ſweat.

When we ought to abſtain from Diureticks.

CHAP. XXXVIII.

Of the Menſtrual *and* Hæmorrhoidal *Purgation.*

How to provoke the Courſes.

NOt onely Reaſon, but alſo manifold experience induceth us to believe that Women by the benefit of their menſtrual purgation, eſcape and are freed from great, peſtilent, and abſolutely deadly diſeaſes; wherefore it muſt be procured by remedies, both inwardly taken, and outwardly applied: theſe may be taken inwardly with good ſucceſs, *Caſſia Lignea*, Cinnamon, the Bark of the Root of a Mulberry, Saffron, Agarick, Nutmeg, Savine, *Diagridium*, and divers others. But if the affect require more vehement Medicins, the roots of Tithymal, Antimony, Cantharides (taken in ſmall quantity) move the Courſes moſt powerfully; frictions and ligatures made upon the thighs and legs conduce hereto, as alſo Cupping in the inner and middle part of the thighs, the opening of the Vein *Saphena*, Leeches applied to the orifice of the neck of the Womb, Peſſaries, Nodulaes, Clyſters, Baths, Fomentations made of odoriferous things, which by the fragrancy of their odour, or rather by their heat may attenuate and cut groſs humours, open the obſtructed orifices of the Veins; ſuch are the Roots of Marſh-mallows, Orris, Parſly, Fennel, Kneeholm, the Leaves and Flowers of St. *Johns* Wort, Aſparagus, Rocket, Balm, Chervile, Mugwort, Mints, Penny-royal, Savory, Roſemary, Rue, Tyme, Sage, Bay-berries, Broom, Ginger, Cloves, Pepper, Nutmegs, and the like; the vapour of the boiling whereof, let the Woman, ſitting upon a perforated ſeat, receive by a funnel into the neck of her Womb, covering her ſelf warm on all ſides, that ſo nothing may otherwiſe break forth. Of the ſame things may be made baths, as well general, as particular. Alſo Peſſaries are good made after this manner: ℞ *Theriac. Mithrid. an.* ʒ ß.

How aromatick things provoke the Courſes.

caſtor.

caſtor. gum. ammoniac. an. ʒ j. *miſce cum bombace in ſucco mercurialis tincto, fiat peſſarium.* Or elſe, ℞ *Rad. petroſelin. & fœnug. ſub cineribus coctas, deinde contuſas cum pul. ſtaphyſag. pyreth. croco & oleo liliorum*; ſo make a peſſary in the form of a ſuppoſitory or nodula. ℞ *Pulv. myrrh. & aloes, an.* ʒ j. *fol. ſabin. nigel. artheriſ. an.* ʒ ij. *rad. Helleb. nigr.* ʒ j. *croci,* ℈ j. *cum ſucco mercur. & melle communi:* make a peſſary in cotton. This which follows is more effectual. ℞ *Succi rut. abſinth. an.* ʒ ij. *myrrh. euphorb. caſtor. ſabin. diacrid. terebinth. galban. theriac. an.* ʒ j. make a peſſary according to art; let a thred hang out of the one end of the peſſaries, that ſo you may eaſily draw them forth as you pleaſe. Peſſaries to provoke the Terms.

But if this menſtruous flux once provoked, flow too immoderately, it muſt be ſtopped by uſing meats of groſſer and more viſcid juice, by opening a vein in the arm, application of Cupping-glaſſes under the duggs, frictions and ligations of the upper parts, as the arms, putting up of peſſaries, application of refrigerating and aſtringent plaſters to the lower belly, ſhare, and loins, laying the woman in a convenient place, and not upon a feather-bed. How to ſtop the Courſes flowing too immoderately

This following injection ſtoppeth the bloud flowing out of the womb. ℞ *Aquæ plant. & fabror. an.* ℔ j. *nucum cupreſ. gallar. immatur. an.* ʒ ij. *berber. ſumach. balauſt. vitriol. rom. alum. roch. an.* ʒ ij. *bulliant omnia ſimul, & fiat decoctio:* of this make injection into the womb. In the performance of all theſe things, I would have the Surgeon depend upon the advice of a Phyſician, as the occaſion and place ſhall permit.

But if Nature endeavour to free it ſelf of the peſtilent matter by the *hæmorrhoids*, you may provoke them by frictions and ſtrong ligatures in the lower parts, as if the thighs or legs were broken, by Ventoſes applied with great flame to the inner ſide of the thigh, by application of hot and attractive things to the fundament, ſuch as are Fomentations, Emplaſters, Unguents; ſuch as is uſually made of an Onion roaſted under the embers, and incorporated with Treacle and a little Oil of Rue: after the hæmorrhoid veins, by theſe means, come to ſhew themſelves, they ſhall be rubbed with rough linnen cloths, or Fig-leaves, or a raw Onion, or an Ox-gall mixt with ſome powder of *Colloquintida*. Laſtly, you may apply Horſe-leeches, or you may open them with a lancet, if they hang much forth of the fundament, and be ſwollen with much bloud. But if they flow too immoderately, they may be ſtaid by the ſame means as the Courſes. How to provoke the *Hæmorrhoids*.

CHAP. XXXIX.

Of procuring evacuation by ſtool, or a flux of the belly.

NAture oftentimes, both by its ſelf, of its own accord, as alſo helped by laxative and purging Medicins, caſts into the belly and guts, as into the ſink of the body, the whole matter of a peſtilent diſeaſe, whence are cauſed *Diarrhœaes*, *Lienteries*, and *Dyſenteries*; you may diſtinguiſh theſe kinds of fluxes of the belly, by the evacuated excrements: For if they be thin and ſincere, that is, retain the nature of one, and that a ſimple humour, as of Choler, Melancholy, or Phlegm; and if they be caſt forth in a great quantity, without the ulceration or excoriation of the guts, vehement or fretting pain, then it is a *Diarrhœa*, which ſome alſo call *Fluxus Humoralis*. It is called a *Lienteria*, when as by the reſolved retentive faculty of the ſtomach and guts cauſed by ill humours, either there collected, or flowing from ſome other place; or by a cold and moiſt diſtemper, the meat is caſt forth crude, and almoſt as it was taken. A *Dyſenteria* is, when as many and different things, and oft-times mixt with bloud, are caſt forth with pain, gripings, and an ulcer of the guts, cauſed by acrid choler, fretting in ſunder the coats of the veſſels. What a *Diarrhœa* is. What a *Dyſenteria* is.

But if in any kind of diſeaſe, certainly in a peſtilent one, fluxes of the belly happen immoderate in quantity, and horrible in the quality of their contents, as liquid, viſcous, frothy, as from melted greaſe, yellow, red, purple, green, aſh-coloured, black, and exceeding ſtinking. The cauſe is various, and many ſorts of ill humours, which taken hold of, by the peſtilent malignity, turn into divers ſpecies, differing in their whole kind, both from their particular, as alſo from Nature in general, by reaſon of the corruption of their proper ſubſtance, whoſe inſeparable ſign is ſtench, which is oft-times accompanied by Worms. The cauſe of various and ſtinking excrements in the Plague.

In the Camp at *Amiens*, a peſtilent Dyſentery was over all the Camp, in this the ſtrongeſt Souldiers purged forth meer bloud. I diſſecting ſome of their dead bodies, obſerved the mouths of the Meſaraick veins and arteries, opened and much ſwollen; and whereas they entered into the guts, were juſt like little *Catyledons*, out of which as I preſſed them, there flowed bloud. For both by the exceſſive heat of the Summers Sun, and the minds of the enraged Souldiers, great quantity of acrid and cholerick humour was generated, and ſo flowed into the belly: but you ſhall know whether the greater or leſſer guts be ulcerated, better by the mixture of the bloud with the excrements, than by the ſite of the pain; therefore in the one you muſt rather work by Clyſters; but in the other by Medicins taken by the mouth. An Hiſtory.

Therefore, if by gripings, a *Teneſmus*, the murmuring and working of the guts, you ſuſpect in a peſtilent diſeaſe, that Nature endeavours to disburden it ſelf by the lower parts, neither in the mean while doth it ſucceed to your deſire, then muſt it be helped forward by Art, as by taking a potion of ʒ ſs. of *Hiera ſimplex*, and a dram of *Diaphœnicon* diſſolved in Wormwood water. A Potion.

Alſo Clyſters are good in this caſe, not onely for that they aſſwage the gripings and pains, and draw by continuation or ſucceſſion, from the whole body, but alſo becauſe they free the Meſaraick veins and guts from obſtruction and ſtuffing; ſo that by opening, and as it were unlocking of the paſſages, Nature may afterwards more freely free it ſelf from the noxious humours. In ſuch Clyſters they alſo ſometimes mix two or three drams of Treacle, that by one and the ſame labour they may retund the venenate malignity of the matter.

Suppoſitories. There may alſo be made for the ſame purpoſe Suppoſitories of boiled Honey, ℥ j. of *Hiera picra* and common Salt, of each ʒ ß. or that they may be the ſtronger, of Honey ℥ iij. of Ox-gall ℥ j. of Scammony, *Euphorbium*, and *Coloquintida* powdered, of each ʒ ß. The want of theſe may be ſupplied by *Nodulaes* made in this form. ℞ *Vitell. ovor.* nu. iij. *fellis bubuli, & mellis, an.* ℥ ß. *ſalis com.* ʒ ß. let them be ſtirred together, and well incorporated, and ſo parted into linnen rags, and then bound up into *Nodulaes* of the bigneſs of a Filberd, and ſo put up into the fundament; you may make them more acrid, by adding ſome powder of *Euphorbium* or *Coloquintida*.

CHAP. XL.

Of ſtopping the flux of the belly.

Violent and immoderate ſcourings, for that they reſolve the faculty, and lead the Patient into a conſumption and death; if they ſhall appear to be ſuch, they muſt be ſtaid in time by things taken and injected by the mouth and fundament. To this purpoſe may a pudding be made of Wheat-flour boiled in the water of the decoction of one Pomgranat, Berberries, Bole-Armenick, *Terra ſigillata*, and white Poppy-ſeeds, of each ʒ j. The following Almond-Milk ſtrengthens the ſtomach, and mitigates the acrimony of the cholerick humour, provoking the guts to excretion. Take ſweet Almonds boiled in the water of Barly, wherein Steel or Iron hath been quenched; beat them in a marble Mortar, and ſo with ſome of the ſame water, make them into an Almond-milk, whereto adding ʒ j. of *Diarrhodon Abbatis*, you may give it to the Patient to drink.

A haſty pudding to ſtay the lask.

This following Medicin I learnt of Dr. *Chappelain*, the Kings chief Phyſician, who received it of his Father, and held it as a great ſecret, and was wont to preſcribe it with happy ſucceſs to his Patients. It is thus: ℞ *Bol. Armen. terræ ſigil. lapid. hæmat. an.* ʒ j. *picis navalis*, ʒ j. ß. *coral. rub. marg. elect. corn. cervi uſt. & liti in aq. plant. an.* ϑ j. *ſaccar. roſ.* ℥ ij. *fiat pulvis.* Of this let the Patient take a ſpoonful before meat, or with the yolk of an Egg.

D. *Chappelains* Medicin to ſtay a ſcouring.

Chriſtopher Andrew in his *Oeconiatria*, much commendeth Dogs dung, when as the Dog hath for three days before been fed onely with bones.

Quinces roaſted in Embers, or boiled in a Pot, the Conſerve of Cornelian Cherries, Preſerved Berberries and Myrabolans, roaſted Nutmeg taken before meat ſtrengthen the ſtomach and ſtay the lask; the Patient muſt feed upon good meats, and theſe rather roaſted than boiled. His drink ſhall be Calibeate-water of the decoction of ſowre Pomgranats beaten, or of the decoction of Quince, Medlars, Services, Mulberries, Bramble-berries, and the like things, endued with a faculty to bind and waſte the excrementitious humidities of the body: theſe waters ſhall be mixed with ſyrup of red Currans, Julip of Roſes, and the like.

Drink.

Ointments. Let the region of the ſtomach and belly be anointed with Oil of Maſtich, *Moſchatelium*, Myrtles, and Quince. Alſo cut of bread newly drawn forth of the Oven, and ſteeped in Vinegar and Roſe-water may be profitably applied; or elſe a Cataplaſm of red Roſes, Sumach, Berberries, Myrtles, the pulp of Quinces, Maſtich, Bean-flour, and the Honey of Roſes made up with Calibeat-water.

Clyſter to ſtay a flux. Anodyne, abſtergent, aſtringent, conſolidating and nouriſhing Clyſters ſhall be injected. Theſe following retund the acrimony of humours, and aſſwage pain. ℞ *Fol. lactuc. hyoſc. acetoſ. portul. an.* m. j. *flor. violar. & nenuph. an.* ℥ i. ß. *fiat clyſter.* Or elſe, ℞ *Roſ. rub. hord. mund. ſem. plant. an.* p. j. *fiat decoctio, in colatura adde olei roſ.* ℥ ij. *vitell. ovor.* ij. *fiat clyſter.* Or, ℞ *Decoct. capi, crur. vitellin. & capit. vervecin. una cum pelle,* ℔ ij. *in qua coquantur fol. violar. malv. mercur. plantag. an.* m. j. *hord. mund.* ℥ j. *quatuor ſem. frigid. major.* ʒ ß. *in colaturæ* ℔ ß. *diſſolve caſſ. recenter extract.* ʒ j. *ol. viol.* ℥ iv. *vitell. ovor.* ij. *ſacc. rub.* ʒ j. *fiat clyſter.* Or, ℞ *Flor. chamæm. melil. aneth. an.* p. j. *rad. biſmal.* ℥ j. *fiat decoctio in lacte, colaturæ adde mucag. ſem. lin. fænugr. extract. in aqua malv.* ℥ ij. *ſaccar. rub.* ℥ j. *olei cham. & aneth. an.* ʒ j. ß. *vitellor. ovor.* ij. *fiat clyſter.*

Such Clyſters muſt be long kept, that they may more readily mitigate pain. When ſhaving of the guts appear in the ſtools, it is an argument that there is an ulcer in the guts; therefore then we muſt uſe detergent and conſolidating Clyſters, as this which follows:

A Clyſter for ulcerated guts ℞ *Hordei integr.* p. ij. *roſ. rub. flor. chamæm. plantag. apii, an.* p. j. *fiat decoctio, in colatura diſſolve mellis roſat. & ſyr. de abſinth. an.* ʒ j. ß. *vitel. ovor.* ij. This following Clyſter conſolidateth. ℞ *Succi plantag. centinod. & portulac. an.* ʒ ij. *bol. armen. ſang. dracon. amyl. an.* ʒ j. *ſevi hircini diſſoluti,* ʒ iij. *fiat clyſter.* Alſo Cows milk boiled with Plantain, and mixed with Syrup of Roſes, is an excellent medicin for the ulcerated guts.

A very aſtringent Clyſter. This following Clyſter binds. ℞ *Caud. equin. plant polygon. an.* m. j. *fiat decoctio in lacte uſtulato ad quart.* iij. *& in colatura adde boli armen. ſigil. ſang. dracon.* ʒ ij. *albumina quatuor ovor. fiat clyſter.* Or elſe, ℞ *Suc. plant. arnogloſ. centinod. portulac. reſidentia facta depuratorum quantum ſufficit pro clyſtere, addendo pul. bol. armen. terræ ſigill. ſang. drac. an.* ʒ j. *ol. myrrh. & roſat. an.* ℥ ij. *fiat clyſter.*

If pure bloud flow forth of the guts, I could wiſh you to uſe ſtronger aſtrictives. To which purpoſe I much commend a decoction of Pomgranat pills, of Cypreſs nuts, red Roſe leaves, Sumach, Alum, and Vitriol made with Smiths water, and ſo made into Clyſters, without any Oil. It will be good with the ſame decoction to foment the fundament, *perinæum*, and the whole belly.

Aſtringent Clyſters ought not to be uſed before that the noxious humours be drawn away, and purged by purging Medicins, otherwiſe by the ſtoppage hereof, the body may chance to be oppreſſed.

A nouriſhing Clyſter. If the Patient be ſo weak that he cannot take or ſwallow any thing by the mouth, nutritive Clyſters may be given him. ℞ *Decoctionis capi pinguis, & crur. vitulini, coct. cum acetoſa, buglooſſo, boragine lactuc. pimpinella,* ℥ x. *vel* xij. *in quibus diſſolve vitellos ovorum,* nu. iij. *ſaccari roſati, & aquæ vitæ, an.* ℥ j. *butyri recentis non ſaliti,* ʒ ij. *fiat clyſter.*

CHAP.

CHAP. XLI.

Of evacuation by insensible transpiration.

THe pestilent malignity, as it is oft-times drawn by the pores, by transpiration into the body, so oft-times it is sent forth invisibly the same way again. For our native heat, that is never idle in us, dispersеth the noxious humours, attenuate into vapours and air through the unperceivable breathing-places of the skin. An Argument hereof is, we see that the tumors and abscesses against Nature, even when they are come to suppuration, are oft-times resolved and discussed by the onely efficacy of Nature, and Heat, without any help of Art: Therefore there is no doubt but that Nature, being prevalent, may free it self from the pestilent malignity by transpiration, some Abscess, Bubo, or Carbuncle being come forth, and some matter collected in some certain part of the body: For when as Nature and the native heat are powerful and strong, nothing is impossible to it, especially when the passages are also in like manner free and open.

Tumors are oft-times discussed by the force of Nature after they are suppurated.

CHAP. XLII.

How to cure Infants and Children taken with the Plague.

IF that it happen that sucking or weaned children be infected with the Pestilence, they must be cured after another order than is yet described. The Nurse of the sucking child must govern her self so in Diet, and the use of Medicins, as if she were infected with the Pestilence her self: Her Diet consisteth in the use of the six things *Not natural*. Therefore let it be moderate; for the fruit or profit of that moderation in Diet cannot chuse but come unto the Nurses milk, and so unto the Infant that liveth by the milk. And the Infant it self must keep the same Diet, as near as he can, in sleep, waking, and expulsion, or avoiding of superfluous humours and excrements of the body. Let the Nurse be fed with those things that mitigate the violence of the feverish heat: as cooling broths, cooling herbs, and meats of a moderate temperature: she must wholly abstain from Wine, and anoint her Nipples as often as she giveth the Infant suck, with water or juice of Sorrel tempered with Sugar of Roses. But the Infants heart must be fortified against the violence of the increasing venom, by giving it one scruple of Treacle in Nurses milk, the broth of a Pullet, or some other cordial Water. It is also very necessary to anoint the region of the heart, the emunctories, and both the wrists with the same Medicin: neither were it unprofitable to smell often unto Treacle dissolved in Rose-water, Vinegar of Roses, and a little *Aqua Vitæ*, that so Nature may be strengthened against the malignity of the venom. When the children are weaned, and somewhat well grown, they may take Medicins by the mouth; for when they are able to concoct and turn into bloud meats that are more gross and firm than Milk, they may easily actuate a gentle Medicin. Therefore a potion must be prepared for them of twelve grains of Treacle dissolved with a little of the Syrup of Succory in some cordial Water, or the broth of a Capon: unless that any had rather give it with Conserve of Roses, in form of a Bole: but Treacle must be given to children in very small quantity, for if it be taken in any large quantity, there is great danger lest that by inflaming the humours, it infer a Fever. Furthermore, Broth may be prepared to be taken often, made of a Capon seasoned with Sorrel, Lettuce, Purslain, and cooling Seeds, adding thereto Bole-Armenick, and *Terra Sigillata* of each one ounce, being tied in a rag, and sometimes pressed out from the decoction. For Bole-Armenick, whether it be by its marvellous facuky of drying, or by some hidden property, hath this virtue, that being drunken (according as *Galen* witnesseth) it cureth those that are infected with the Pestilence, if so be that they may be cured by Physick; so that those that cannot be cured with Bole-Armenick, cannot be preserved by any other Medicins. But because the bodies of children are warm, moist, and vaporous, they are easily delivered of some portion of the venenate matter through the pores of the skin, by provoking sweat with a decoction of Parsly-seeds, Prunes, Figs, and the Roots of Sorrel, with a little of the powders of Harts-horn, or Ivory. But that the sweat may be more abundant and copious, apply sponges dipped and pressed out in the hot decoction of Sage, Rosemary, Lavender, Bays, Cammomil, Melilot, and Mallows, or else Swines bladders half filled with the same decoction, to the arm-holes, and to the groins. In the time that they sweat, let their Faces be fanned to cool them. Also let a Nodula of Treacle, dissolved in Vinegar and water of Roses, be applied to the Nostrils, but always use a moderation in sweating, because that children are of a substance that is easie to be dissipated and resolved: so that oftentimes, although they do not sweat, yet they feel the commodities of sweating, the matter of the venom being dissipated by the force of the heat through the pores of the skin. But in the sweating while the face is fanned, and sweet and cordial things applied to the nostrils, Nature must be recreated and strengthened, which otherwise would be debilitated through sweating, that it may be better able to expel the venom. After that the sweat is wiped away, it were very profitable to take a potion of Conserve of Roses, with the powder of Harts-horn or Ivory, dissolved in the waters of Bugloss and Sorrel, the better to cool and defend the heart. If there appear any tumour under the arm-holes, or in the groin, let it be brought to maturation with mollifying relaxing, drawing, and then with a suppurative fomentation, or Cataplasm; always using and handling it as gently as you may, considering the age of the Infant. If you have need to purge the Patient, the purgation following may be prescribed with great profit. Take of Rhubarb in powder one dram, infuse it in the water of *Carduus Benedictus*, with one scruple of Cinamon, in the straining dissolve two drams of *Diacatholicon*, of syrup of Roses laxative three drams: make thereof a small potion. This is the cure

The Nurse must be dieted when as the child is sick.

Medicins may be given to such as are weaned.

Lib. 9. simp. c. 74

The benefit of children.

The form of a Purge to be given to a child.

cure of the Peſtilence, and of the Peſtilent Fever, as far as I could learn from the moſt learned Phyſicians, and have obſerved my ſelf by manifold experience by the grace and permiſſion of God; of whom alone, as the Author of all good things that mortal men enjoy, the true and certain Preſervatives againſt the Peſtilence, are to be deſired and hoped for.

The End of the Two and Twentieth Book.

BOOK XXIII.

Of the Means and Manner to repair or ſupply the Natural or Accidental Defects or Wants in Mans Body.

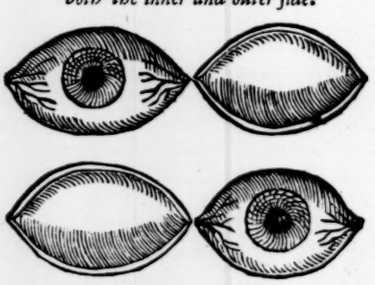
CHAP. I.

How the loſs of the Natural or true Eye may be covered, hidden or ſhadowed.

The fourth duty of a Chirurgeon.

HAving at large treated in the former Books of Tumors, Wounds, Ulcers, Fractures, and Luxations, by what means things diſſolved and diſlocated might be united, things united ſeparated, and ſuperfluities conſumed or abated: Now it remains, that we ſpeak of the fourth Office or Duty of the Chirurgeon, which is to ſupply or repair thoſe things that are wanting by Nature, through the default of the firſt conformation, or afterwards by ſome miſchance. Therefore if that through any miſchance, as by any inflammation, any mans Eye happen to be broken or put out, and the humours ſpilt or waſted; or if it be ſtrucken out of its place or cavity wherein it was naturally placed by any violent ſtroke; or if it waſte or conſume by reaſon of a conſumption of the proper ſubſtance, then there is no hope to reſtore the ſight or function of the Eye, yet you may cover the deformity of the Eye ſo loſt (which is all you can do in ſuch a caſe) by this means: If that when you have perfectly cured and healed the Ulcer, you may put another Eye artificially made of Gold or Silver, counterfeited and enamelled, ſo that it may ſeem to have the brightneſs or gemmy decency of the natural Eye, into the place of the Eye that is ſo loſt.

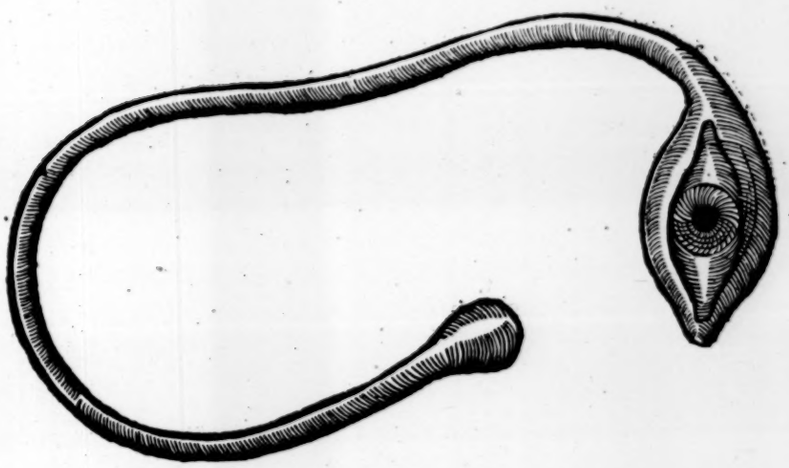
The Forms of Eyes artificially made of Gold or Silver, poliſhed and enamelled, ſhewing both the inner and outer ſide.



But if the Patient be unwilling, or by reaſon of ſome other means, cannot wear this Eye ſo prepared, in his head, you may make another on this wiſe. You muſt have a ſtring or wire of Iron bowed or crooked, like unto womens Ear-wires, made to bind the head harder or looſer, as it pleaſeth the Patient, from the lower part of the head behind above the ear, unto the greater corner of the Eye; this rod or wire muſt be covered with ſilk, and it muſt alſo be ſomewhat broad at both ends, leſt that the ſharpneſs thereof ſhould pierce or prick any part that it cometh unto. But that end wherewith the empty hollowneſs muſt be covered, ought to be broader than the other, and covered with a thin piece of leather, that thereon the colours of the eye that is loſt may be ſhadowed or counterfeited. Here followeth the Figure or portraiture of ſuch a ſtring or wire.

The

The form of an Iron Wier wherewith the deformity of an eye that is loſt, may be ſhadowed or covered.



CHAP. II.

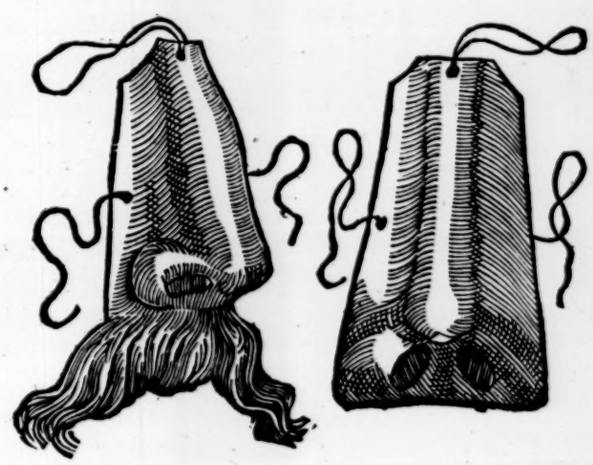
By what means a part of the Noſe that is cut off, may be reſtored; or how inſtead of the Noſe that is cut off, another counterfeit Noſe may be faſtned, or placed in the ſtead.

WHen the whole Noſe is cut off from the Face, or portion of the Noſtrils, from the Noſe, it cannot be reſtored or joined again; for it is not in Men as it is in Plants. For Plants have a weak and feeble heat; and furthermore, it is equally diſperſed into all the ſubſtance of the Plant or Tree, neither is it eaſie to be conſumed or waſted: for when the boughs or branches of Trees are broken, torn or cut away, the live nevertheleſs, and will grow again when they are ſet and grafted; neither is there any ſeat for the heart rightly prepared in them from whence the heat muſt neceſſarily run, and diſperſe it ſelf continually into all the parts thereof. But contrariwiſe, the ſeparated parts of more perfect living Creatures, as of Men, are incontinently deprived of life; becauſe they have their nouriſhment, life, ſenſe, and whole ſuſtentation not of themſelves, by faculties flowing or coming unto them from ſome other parts; neither are they governed by their own heat, as Plants, but by a borrowed heat: ſo that above or beſide the natural faculty of the liver, another vital faculty cometh unto it from the heart.

Why the parts of Plants being cut off, may grow again, but thoſe of Man cannot

Wherefore inſtead of the Noſe cut away or conſumed, it is requiſite to ſubſtitute another made by Art, becauſe that Nature cannot ſupply that defect: this Noſe ſo artificially made, muſt be of Gold, Silver, Paper, or linnen cloths glewed together, it muſt be ſo coloured, counterfeited, and made both of faſhion, figure and bigneſs, that it may as aptly as is poſſible, reſemble the natural Noſe: it muſt be bound or ſtaid with little threds or laces unto the hinder part of the head or the hat. Alſo if there be any portion of the upper lip cut off with the noſe, you may ſhadow it with annexing ſome ſuch thing that is wanting unto the noſe, and cover it with the hair on his upper lip, that he may not want any thing that may adorn or beautifie the face. Therefore I have thought it neceſſary to ſet down the figure or form of both theſe kinds.

The form of a Noſe artificially made, both alone by it ſelf, and alſo with the upper lip covered with the hair of the Beard.



There

A ſtrange cure for a cut off Noſe.

There was a Surgeon of *Italy* of late years which would reſtore or repair the portion of the Noſe that was cut away, after this manner. He firſt ſcarified the callous edges of the maimed Noſe round about, as is uſually done in the cure of Hare-lips: then he made a gaſh or cavity in the muſcle of the arm, which is called *Biceps*, as large as the greatneſs of the portion of the Noſe which was cut away did require: and into that gaſh or cavity ſo made, he would put that part of the Noſe ſo wounded, and bind the Patients head to his arm, as if it were to a poſt, ſo faſt that it might remain firm, ſtable and immovable, and not lean or bow any way; and about forty days after, or at that time when he judged the fleſh of the Noſe was perfectly agglutinated with the fleſh of the arm; he cut out as much of the fleſh of the arm, cleaving faſt unto the noſe, as was ſufficient to ſupply the defect of that which was loſt, and then he would make it even, and bring it, as by licking, to the faſhion and form of a Noſe, as near as Art would permit; and in the mean while he did feed his Patient with Panadoes, Gellies, and all ſuch things as were eaſie to be ſwallowed and digeſted. And he did this work of curing the place where the fleſh was ſo cut out, onely with certain Balms, and agglutinative liquors.

An Hiſtory.

A younger Brother of the Family of St. *Thoan*, being weary of a ſilver Noſe, which being artificially made, he had worn in the place of his Noſe that was cut off, went to this Chirurgeon into *Italy*, and the means of the foreſaid practice he recovered a Noſe of fleſh again, to the great admiration of all thoſe that knew him before. This thing truly is poſſible to be done, but it is very difficult both to the Patient ſuffering, and alſo to the Chirurgeon working. For that the fleſh that is taken out of the arm is not of the like temperature as the fleſh of the Noſe is; alſo the holes of the reſtored Noſe cannot be made as they were before.

CHAP. III.

Of the placing of Teeth artificially made, in ſtead of thoſe that are loſt or wanting.

IT oftentimes happeneth that the fore-teeth are moved, broken or ſtricken out of their places by ſome violent blow, which cauſeth deformity of the mouth, and hinders plain pronunciation. Therefore when the jaw is reſtored (if it were luxated or fractured) and the gums brought into their former hardneſs, other teeth artificially made of Bone or Ivory may be put in the place of thoſe that are wanting, and they muſt be joined one faſt unto another, and alſo ſo faſtned unto the natural teeth adjoining, that are whole: and this muſt chiefly be done with a thred of Gold or Silver, or for want of either, with a common thred of Silk or Flax, as it is declared at large by *Hippocrates*, and alſo deſcribed in this Figure following.

Sect. 2. lib. de Art. ſent. 15.

The Figure of Teeth bound or faſtned together.

CHAP. IV.

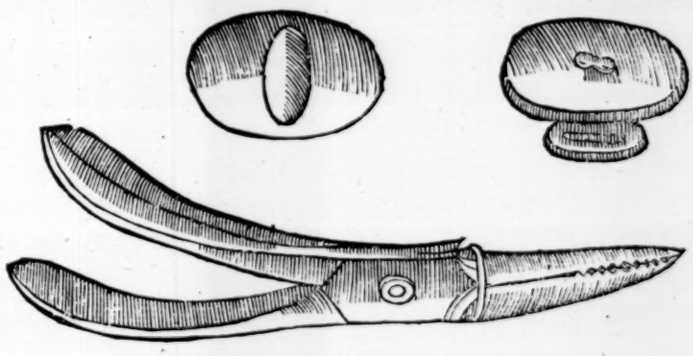
Of filling the hollowneſs of the Palat.

The cauſes and hurt that enſues of the loſt Palat.

MAny times it happeneth that a portion or part of the bone of the Palat, being broken with the ſhot of a Gun, or corroded by the virulency of the *Lues Venerea*, falls away; which makes the Patients, to whom this happeneth, that they cannot pronounce their words diſtinctly, but obſcurely and ſnuffling: therefore I have thought it a thing worthy the labour, to ſhew the means how it may be helped by Art. It muſt be done by filling the cavity of the Palat with a Plate of Gold or Silver, a little bigger than the cavity it ſelf is. But it muſt be as thick as a French Crown, and made like unto a diſh in Figure; and on the upper ſide, which ſhall be toward the brain, a little Sponge muſt be faſtned, which when it is moiſtned with the moiſture diſtilling from the brain, will become more ſwollen and puffed up, ſo that it will fill the concavity of the Palat, that the artificial Palat cannot fall down, but ſtand faſt and firm, as if it ſtood of it ſelf. This is the true Figure of thoſe Inſtruments, whoſe certain uſe I have obſerved not by once or twice, but by manifold trials in the battels fought beyond the Alps.

The Figure of Plates to fill or ſupply the defects of the Palat.

The Figure of another Plate of the Palat, on whoſe upper ſide there is a button, which may be turned when it is put into its place, with a ſmall Ravens bill, like this whoſe Figure is here expreſſed.



CHAP. V.

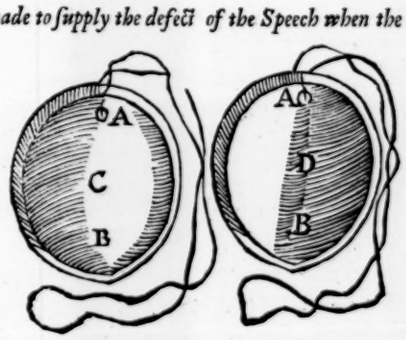
How to help ſuch as cannot ſpeak by reaſon of the loſs of ſome part of the Tongue.

CHance gave place and authority to this remedy, as to many other in our Art. A certain man dwelling in a Village named *Yvoy le Chaſteau*, being ſome four and twenty mile from *Bourges*, had a great piece of his tongue cut off; by which occaſion he remained dumb ſome three years. It happened on a time that he was in the Field with Reapers, he drinking in a woodden diſh was tickled by ſome of the ſtanders by, not enduring the tickling, he ſuddenly broke out into articulate and intelligible words. He himſelf wondring thereat, and delighted with the novelty of the thing, as a miracle, put the ſame diſh to his mouth juſt in the ſame manner as before, and then he ſpake ſo plainly and articulately, that he might be underſtood by them all. Wherefore a long time following he always carried this diſh in his boſom to utter his mind, until at length Neceſſity, the Miſtriſs of Arts and giver of Wit, inducing him, he cauſed a woodden inſtrument to be neatly cut and made for him, like that which is here delineated, which he always carried hanging at his neck, as the onely Interpreter of his mind; and the Key of his Speech.

A remedy found out by accident.

An Hiſtory.

An Inſtrument made to ſupply the defect of the Speech when the Tongue is cut off.



The uſe of the Inſtrument is this. *A* Sheweth the upper part of it which was of the thickneſs of a Nine-pence, which he did ſo hold between his cutting teeth, that it could not come out of his mouth, nor be ſeen. *B* Sheweth the lower part, as thick as a Six-pence, which he did put hard to the reſt of his tongue, cloſe to the membranous ligament which is under the tongue. That place which is depreſt and ſomewhat hollowed, marked with the letter *C*, is the inner part of the inſtrument. *D* Sheweth the out-ſide of the ſame. He hanged it about his neck with the ſtring that is tied thereto.

Textor the Phyſician of *Bourges* ſhewed me this Inſtrument: and I my ſelf made trial thereof on a young man whoſe tongue was cut off, and it ſucceeded well, and took very good effect. And I think other Surgeons in ſuch caſes may do the like.

CHAP.

CHAP. VI.

Of covering or repairing certain defects or defaults in the face.

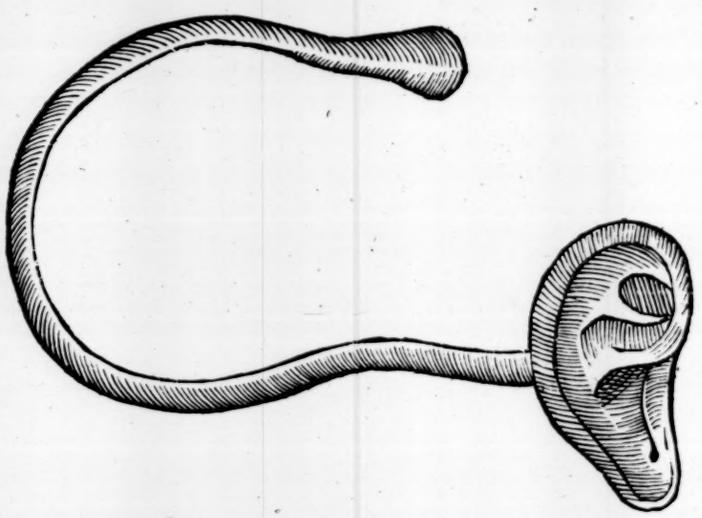
IT oftentimes happeneth, that the face is deformed by the ſudden flaſhing of Gun-powder, or by a peſtilent Carbuncle, ſo that one cannot behold it without great horrour. Such perſons muſt be ſo trimmed and ordered, that they may come in ſeemly manner into the company of others. The lips if they be either cut off with a ſword, or deformed with the eroſion or eating of a peſtilent Carbuncle or ulcerated Cancer, ſo that the teeth may be ſeen to lie bare with great deformity. If the loſs or conſumption of the lip be not very great, it may be repaired by that way which we have preſcribed in the cure of hare-lips, or of an ulcerated Cancer. But if it be great, then muſt there be a lip of gold made for it, ſo ſhadowed and counterfeited, that it may not be much unlike in colour to the natural lip, and it muſt be faſtned and tied to the hat or cap that the Patient weareth on his head, that ſo it may remain ſtable and firm.

CHAP. VII.

Of the defects of the Ears.

SUch as want their Ears, either naturally or by misfortune, as through a Wound, Carbuncle, Cancer, or the biting of wild Beaſts: if ſo be that the Ear be not wholly wanting, waſted, conſumed, or torn away; but that ſome portion thereof doth yet remain, then muſt it not be neglected, but muſt have many holes made therein with a bodkin; and after that the holes are cicatrized, let ſome convenient thing, made like unto the piece of the Ear that is loſt, be tied or faſtned unto it by theſe holes.

But if the Ear be wholly wanting, another muſt be made of Paper artificially glewed together, or elſe of leather, and ſo faſtned with laces, from the top or hinder part of the head, that it may ſtand in the appointed place; and ſo the hair muſt be permitted to grow long, or elſe ſome cap worn under the hat, which may hide or cover the deformity, unleſs you had rather have it to be ſhadowed or counterfeited by ſome Painter, that thereby it may reſemble the colour of a natural Ear; and ſo retain it in the place where it ought to ſtand, with a rod or wier coming from the top or hinder part of the head, as we have ſpoken before in the loſs of the Eye: and the form thereof is this.



CHAP. VIII.

Of amending the deformity of ſuch as are crook-backt.

Cauſes of crookedneſs.

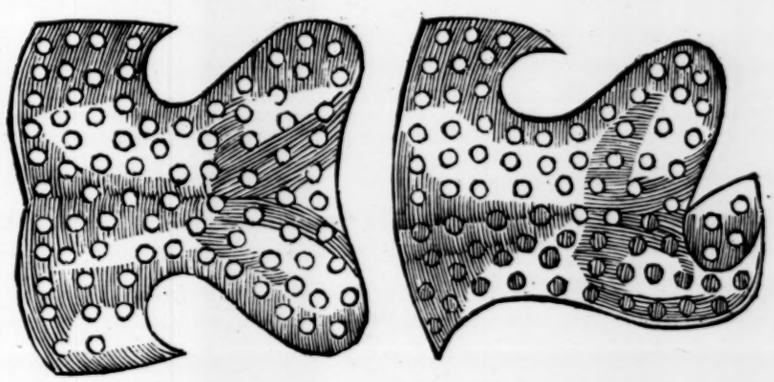
THe bodies of many, eſpecially young Maids or Girls (by reaſon that they are more moiſt and tender then the bodies of Boys) are made crooked in proceſs of time, eſpecially by the wrenching aſide and crookedneſs of the back-bone. It hath many cauſes, that is to ſay, in the firſt conformation in the womb, and afterwards by misfortune; as a fall, bruiſe, or any ſuch like accident; but eſpecially by the unhandſome and undecent ſituation of their bodies when they are young and tender, either in carrying, ſitting or ſtanding, (and eſpecially when they are taught to go too ſoon) ſaluting, ſewing, writing, or in doing any ſuch like thing.

In the mean while, that I may not omit the occaſion of crookedneſs, that happens ſeldom to the Country People, but is much incident to the Inhabitants of great Towns and Cities, which is by reaſon of the ſtraightneſs and narrowneſs of the garments that are worn by them, which is occaſioned by the folly of Mothers, who while they covet to have their young daughters bodies ſo ſmall in the middle as may be poſſible, pluck and draw their bones awry, and make them crooked. For the ligaments of the back-bone being very tender, ſoft and moiſt at that age, cannot ſtay it ſtraight and ſtrongly;

ſtrongly; but being pliant, eaſily permits the ſpondels to ſlip awry inwards, outwards, or ſidewiſe, as they are thruſt or forced.

The remedy for this deformity is to have breſt-plates of Iron, full of holes all over them, whereby they may be lighter to wear; and they muſt be ſo lined with bombaſte that they may hurt no place of the body. Every three moneths new plates muſt be made for thoſe that are not yet arrived at their full growth; for otherwiſe by the daily afflux of more matter, they would become worſe. But theſe Plates will do them ſmall good that are already at their full growth.

The form of an Iron Breſt-plate, to amend the crookedneſs of the Body.



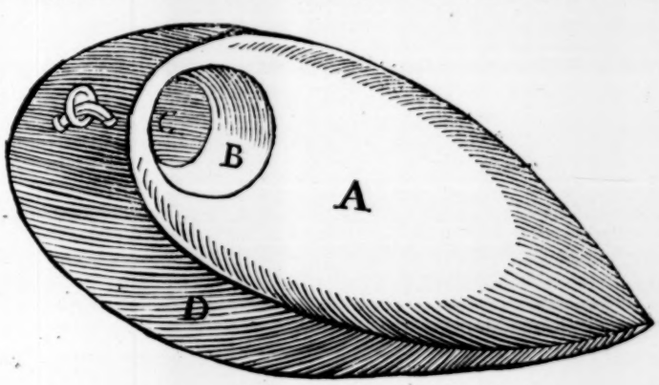
CHAP. IX.

How to relieve ſuch as have their Urin flow from them againſt their wills, and ſuch as want their Yards.

IN thoſe that have the Strangury, of what cauſe ſoever that malady cometh, the urin paſſeth from them by drops, againſt their wills and conſent. This accident is very grievous and troubleſom, eſpecially to men that travel: and for their ſakes onely I have invented the inſtrument here beneath deſcribed. It is made like unto a cloſe breech or hoſe; it muſt be of Lattin, and to contain ſome four ounces: it muſt be put into the Patients hoſe, betwixt his thighs, unto which it muſt be tied with a point by the ring. Into the open and hollow mouth of this inſtrument, which is noted with the letter C, the Patient muſt put his yard; and into this concavity or hollowneſs goeth a ſtay ſomewhat deep, it is marked with the letter B, and made or placed there, both to hold or bear the end of the yard, and alſo by his cloſe joint that it muſt have unto the veſſel, to ſtay the urin from going back again when it is once in. But the letters A and D, do ſignifie all the inſtrument; that, the former part, this the hinder part thereof. Now this is the ſhape thereof.

An Inſtrument for ſuch as cannot hold their Water.

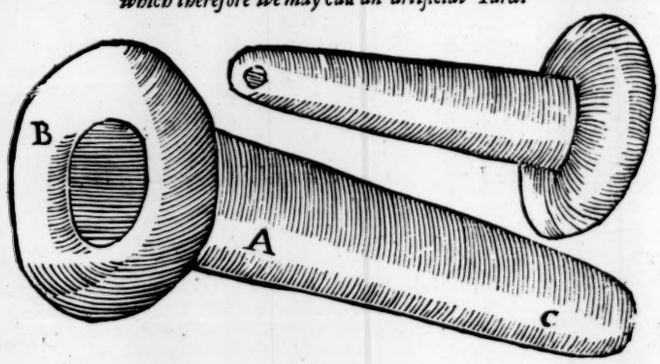
The Figure of an Inſtrument, which you may call a Baſin, *or Receptacle for the Urin.*



Thoſe that have their Yards cut off cloſe to their bellies, are greatly troubled in making of Urin, ſo that they are conſtrained to ſit down like women. For their eaſe, I have deviſed this Pipe or Conduit, having an hole through it as big as one finger, which may be made of Wood, or rather of Lattin.

A and C do ſhew the bigneſs and length of the Pipe. B Sheweth the brink on the broader end. D Sheweth the outſide of the brink. This Inſtrument muſt be applied to the lower part of *Os pectinis*: on the upper end it is encompaſſed with a brink for the paſſage of the Urin, for thereby it will receive the Urin better, and carry it from the Patient as he ſtandeth upright.

The deſcription of a Pipe or Conduit, ſerving in ſtead of the Yard in making of water, which therefore we may call an artificial Yard.



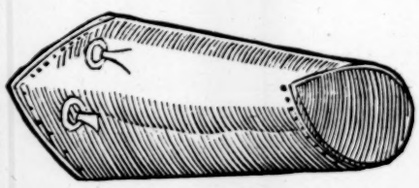
CHAP. X.

By what means the periſhed function or action of a thumb or finger may be corrected and amended.

An Hiſtory.

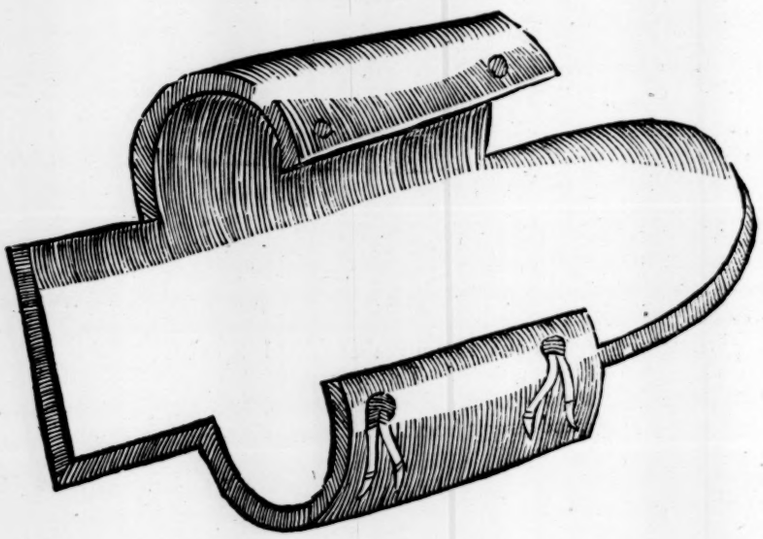
WHen a ſinew or tendon is cut clean aſunder, the action in that part, whereof it was the author, is altogether aboliſhed; ſo that the member cannot bend or ſtretch out it ſelf, unleſs it be holpen by Art: which thing I performed in a Gentleman belonging to *Annas* of *Montmorency*, General of the French Horſemen, who in the battel of *Dreux* received ſo great a wound with a Back-ſword upon the outſide of the wriſt of the right hand, that the tendons that did erect or draw up the Thumb were cut clean in ſunder; and alſo when the wound was throughly whole and conſolidated, the Thumb was bowed inwards, and fell into the palm of the hand, ſo that he could not extend or lift it up, unleſs it were by the help of the other hand, and then it would preſently fall down again; by reaſon whereof he could hold neither Sword, Spear, nor Javelin in his hand, ſo that he was altogether unprofitable for War, without which he ſuppoſed there was no life. Wherefore he conſulted with me about the cutting away of his Thumb, which did hinder his gripings, which I refuſed to do, and told him that I conceived a means how it might be remedied without cutting away. Therefore I cauſed a caſe to be made for it of Lattin, whereinto I put the Thumb: this caſe was ſo artificially faſtned by two ſtrings that were put into two rings made in it above the joint of the hand, that the Thumb ſtood upright and ſtraight out, by reaſon whereof he was able afterwards to handle any kind of weapon.

The form of a Thumb or Finger-ſtall of Iron or Lattin, to lift up or erect the Thumb, or any other Finger that cannot be erected of it ſelf.



If that in any man the ſinews or tendons which hold the hand upright, be cut aſunder with a wound, ſo that he is not able to lift up his hand, it may eaſily be erected or lifted up with this Inſtrument that followeth, being made of an equal, ſtraight, thin, but yet ſtrong plate of Lattin, lined on the inner ſide with ſilk, or any ſuch like ſoft thing, and ſo placed in the wriſt of the hand, that it may come unto the Palm, or the firſt joints of the fingers; and it muſt be tied above with convenient ſtays, and ſo the diſcommodity of the depreſſion, or hanging of the hand, may be avoided: therefore this Inſtrument may be called the Erector of the Hand.

The Erector of the Hand.



CHAP.

CHAP. XI.

Of helping thoſe that are Vari *or* Valgi, *that is, crook-legged, or crook-footed, inwards or outwards.*

THoſe that are ſaid to be *Vari*, whoſe feet or legs are bowed or crooked inwards. This default is either from the firſt conformation in the womb, through the default in the Mother, who hath her legs in like manner crooked; or becauſe that in the time when ſhe is great with child, ſhe commonly ſits with her legs acroſs; or elſe after the child is born, and that either becauſe his legs be not well ſwathed when he is laid into the Cradle, or elſe becauſe they be not well placed in carrying the infant; or if he be not well looked unto by the Nurſe when he learneth to go: for the bones are very tender, and almoſt as flexible as Wax. What *Varus* is.

But contrariwiſe, thoſe are called *Valgi* whoſe legs are crooked or bowed outwards. This may come through the default of the firſt conformation as well as the other; for by both, the feet alſo and the knees may be made crooked; which thing whoſoever will amend, muſt reſtore the bones into their proper and natural place; ſo that in thoſe that are *varous*, he muſt thruſt the bones outwards, as though he would make them *valgous*: neither is it ſufficient to thruſt them ſo, but they ought alſo to be retained there in their places after they are ſo thruſt, for otherwiſe they being not well eſtabliſhed, would ſlip back again. What *Valgus* is.

They muſt be ſtaid in their places, by applying of collars and bolſters on that ſide whereunto the bones do lean and incline themſelves; for the ſame purpoſe boots may be made of leather, of the thickneſs of a teſtone, having a ſlit in the former part all along the bone of the leg, and alſo under the ſole of the foot, that being drawn together on both ſides, they may be the better fitted and ſit cloſer to the leg. And let this Medicin following be applied all about the leg. ℞ *Thuris, maſtich. aloes, boli armeni, an.* ʒ j. *aluminis roch. reſinæ pini ſicc. ſubtiliſſime pulveriſ. an.* ʒ iij. *farinæ volat.* ʒ j. ſ. *albumovor. q. ſ.* make thereof a Medicin. You may alſo add a little Turpentine, leſt it ſhould dry ſooner, or more vehemently than is neceſſary. But you muſt beware, and take great heed, leſt that ſuch as were of late *varous* or *valgous*, ſhould attempt or ſtrain themſelves to go before that their joints be confirmed; for ſo the bones that were lately ſet in their places, may ſlip aſide again. And moreover, until they are able to go without danger, let them wear high ſhoes tied cloſe to their feet, that the bones may be ſtaid the better and more firmly in their places; but let that ſide of the ſoal of the ſhoe be under-laid whither the foot did incline before it was reſtored. A Plaſter to hold faſt reſtored bones.

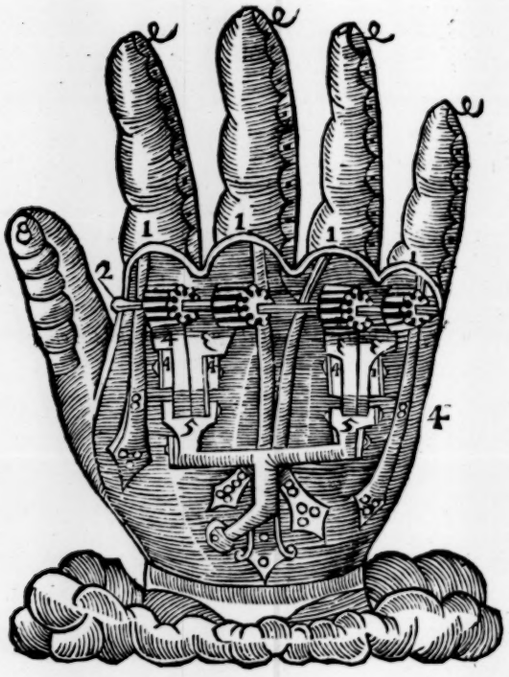
The Form of little Boots, whereof the one is open and the other ſhut.

CHAP. XII.

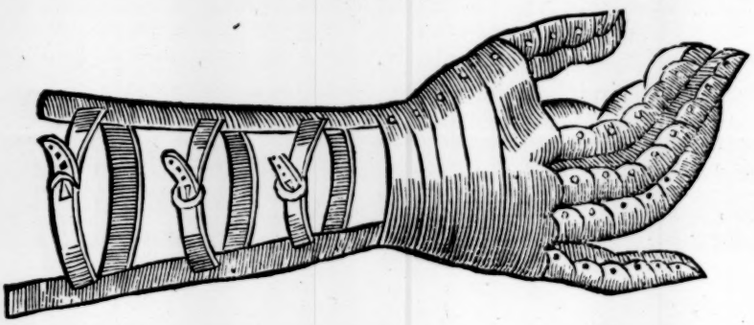
By what means Arms, Legs, and Hands may be made by Art, and placed inſtead of the natural Arms, Legs, or Hands that are cut off and loſt.

NEceſſity oftentimes conſtrains us to find out the means whereby we may help and imitate Nature, and ſupply the defect of members that are periſhed and loſt. And hereof it cometh that we may perform the functions of going, ſtanding and handling with Arms and Hands made by Art, and undergo our neceſſary flexions and extenſions with both of them. I have gotten the forms of all thoſe members made ſo by Art, and the proper names of all the Engines and Inſtruments whereby thoſe artificially made are called, to my great coſt and charges, of a moſt ingenious and excellent Smith dwelling at *Paris*, who is called of thoſe that know him, and alſo of ſtrangers, by no other name than the Little *Lorain*; and here I have cauſed them to be pourtraid, or ſet down, that thoſe that ſtand in need of ſuch things, after the example of them, may cauſe ſome Smith, or ſuch like Workman, to ſerve them in the like caſe. They are not onely profitable for the neceſſity of the body, but alſo for the decency and comelineſs thereof. And here follow their forms.

The form of an Hand made artificially of Iron.

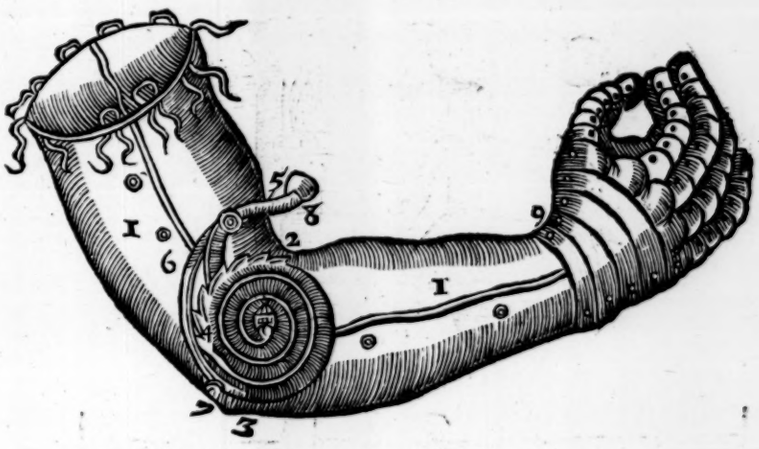


This Figure following ſheweth the back-ſide of an Hand artificially made, and ſo that it may be tied to the arm or ſleeve.

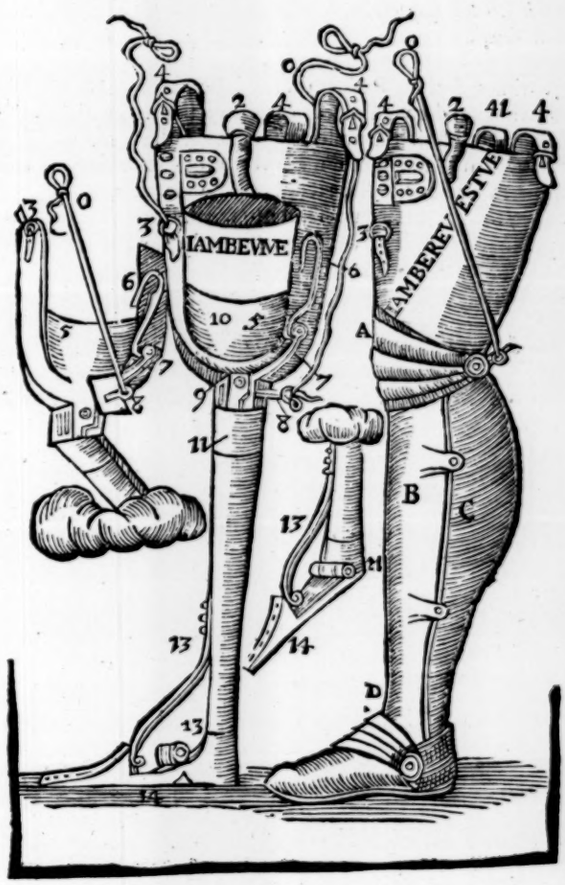


The

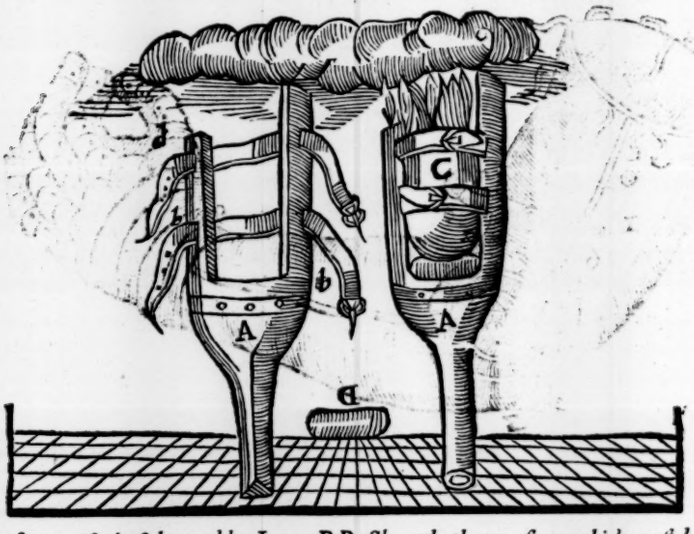
The Form of an Arm made of Iron very artificially.



The deſcription of Legs *made artificially of Iron.*

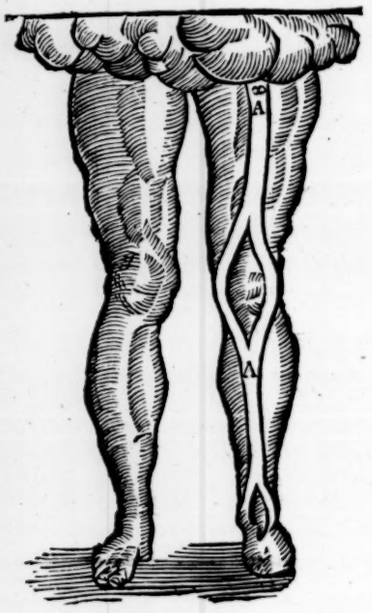


The Form of a Woodden Leg made for poor Men.



A *Sheweth the ſtump or ſtock of the woodden Leg.* B B *Sheweth the two ſtays which muſt be on both ſides of the Leg, the ſhorter of them muſt be on the inner ſide.* C C *Sheweth the Pillow or Bolſter whereon the Knee muſt reſt in the bottom between the two ſtays, that ſo it may reſt the ſofter.* D D *Sheweth the thongs or girths with their round buckles put through the two ſtays on either ſide to ſtay the Knee in his place firm and immovable, that it ſlip not aſide.* E *Sheweth the thigh it ſelf, that you may know after what faſhion it muſt ſtand.*

It happens alſo many times, that the Patient that had the nerves or tendons of his Leg wounded, long after the wound is whole and conſolidated, cannot go but with very great pain and torment, by reaſon that the foot cannot follow the muſcle that ſhould draw it up. That this malady may be remedied, you ought to faſten a linnen band made very ſtrong unto the ſhoe that the Patient weareth on that his pained foot; and at the knee it muſt have a ſlit where the knee may come forth in bowing of the Leg: and it muſt be truſſed up faſt unto the Patients middle, that it may the better lift up and erect the foot in going. This band is marked in the Figure following with the letters A A.

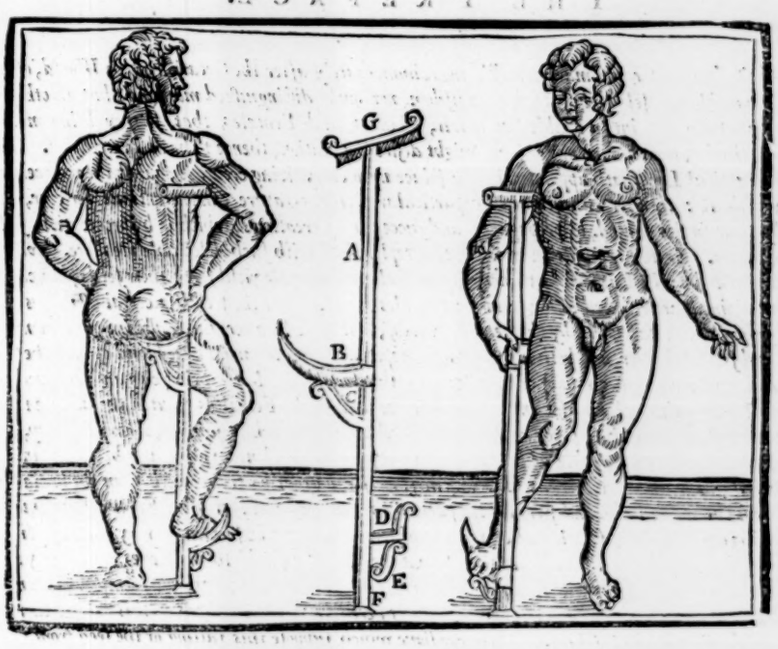


CHAP.

CHAP. XIII.

Of amending or helping of Lameneſs or Halting.

HAlting is not onely a great deformity, but alſo very troubleſom and grievous. Therefore if that any be grieved therewith by reaſon that one of his legs is ſhorter than the other, it may be holpen by putting under his ſhort foot this ſitting Crutch, which we are now about to deſcribe. For by the help of this, he ſhall not onely go upright, but alſo more eaſily and with little labour or no pain at all. It was taught me by *Nicolas Piccard* Chirurgeon to the Duke of *Lorain*. The Form thereof is this:



A *Sheweth the ſtaff or ſtilt of this Crutch, which muſt be made of Wood.* B *Sheweth the Seat of Iron whereon the thigh reſteth, juſt under the buttock.* C *Sheweth a prop which ſtayeth up the ſeat whereon all the weight of the Patients body reſteth.* D *Sheweth the ſtirrup, being made of Iron, and bowing crooked upwards, that the foot may ſtand firm, and not ſlip off it when the Patient goeth.* E *Sheweth the Prop that ſtayeth or holdeth up the ſtirrup to ſtrengthen it.* F *Sheweth the foot of the ſtilt or crutch made of Iron with many pikes, and compaſſed with a ring or ferule, ſo to keep it from ſlipping.* G *The croſs or head of the crutch which the Patient muſt put under his arm-hole to lean upon, as it is to be ſeen in the Figure.*

The End of the Three and Twentieth Book.

BOOK

BOOK XXIV.

Of the GENERATION *of* MAN.

THE PREFACE.

The distinction of Male and Female.

The cause of this distinction.

GOD the Creator and maker of all things, immediately after the Creation of the World, of his unspeakable counsel and inestimable wisdom, not onely distinguished mankind, but all other living Creatures also into a double sex, to wit, of Male and Female; that so they being moved and enticed by the allurements of Lust, might desire Copulation, thence to have Procreation. For this bountiful Lord hath appointed it as a solace unto every living creature against the most certain and fatal necessity of death: then for as much as each particular living creature cannot continue for ever, yet they may endure by their species or kind, by propagation and succession of creatures, which is by procreation, so long as the World endureth. In this conjunction or copulation replenished with such delectable pleasure, (which God hath chiefly established by the Law of Matrimony,) the Male and Female yield forth their seeds, which presently mixed and conjoined, are received and kept in the Females womb. For the seed is a certain spumous or foamy humour replenished with vital spirit, by the benefit whereof, as it were by a certain ebullition or fermentation, it is puffed up, and swollen bigger, and both the seeds being separated from the more pure bloud of both the Parents, are the material and formal beginning of the issue; for the seed of the Male being cast and received into the womb, is accounted the principal and efficient cause; but the seed of the Female is reputed the subjacent matter, or the matter wherein it worketh. Good and laudable seed ought to be white, shining, clammy, knotty, smelling like unto the Elder or Palm, delectable to Bees, and sinking down in the bottom of Water being put into it, for that which swimmeth on the water is esteemed unfruitful; for a great portion cometh from the brain, yet some thereof falls from the whole body, and from all the parts both firm and soft thereof. For unless it come from the whole body and every part thereof, all and every part of the issue cannot be formed thereby, because like things are engendred of their like: and therefore it cometh that the Child resembleth the Parent, not onely in stature and favour, but also in the conformation and proportion of his limbs and members, and complexion and temperature of his inward parts, so that diseases are oft-times hereditary, the weakness of this or that entrail being translated from the Parent to the Child. There are some which suppose this falling of the seed from the whole body not to be understood according to the weight and matter, as if it were a certain portion of all the bloud separated from the rest; but according to the power and form, that is to say, the animal, natural and vital spirits, being the framers of formation and life, and also the formative faculty to fall down from all the parts into the seed, that is wrought or perfected by the Testicles; for proof and confirmation whereof, they alledge that many perfect, sound, absolute, and well proportioned children, are born of lame and decrepit Parents.

What Seed is.

The conditions of good seed.

Seed falleth from all the parts of the body.

Wherefore many diseases are hereditary.

How seed is to be understood to fall from the whole body.

CHAP. XXIX.

Why the generative parts are endued with great pleasure.

What moveth a man to copulation.

A Certain great pleasure accompanieth the function of the parts appointed for generation; and before it in living Creatures that are of a lusty age, when matter aboundeth in those parts, there goeth a certain fervent or furious desire: the causes thereof many, of which the chiefest is, That the kind may be preserved and kept for ever, by the propagation and substitution of other living creatures of the same kind. For brute Beasts which want reason, and therefore cannot be solicitous for the preservation of their kind, never come to carnal copulation unless they be moved thereunto by a certain vehement provocation of unbridled Lust, and as it were by the stimulation of Venery. But Man that is endued with reason, being a divine and most noble creature, would never yield nor make his mind so subject to a thing so abject and filthy as is carnal copulation, but that the venereous ticklings, raised in those parts, relax the severity of his mind; or Reason admonisheth him that the memory of his name ought not to end with his life, but to be preserved unto all generations, as far as may be possible, by the propagation of his seed or issue. Therefore by reason of this profit or commodity, Nature hath endued the genitals with a far more exact or exquisite sense than the other parts, by sending the great sinews unto them, and moreover she hath caused them to be bedewed or moistned with a certain whayish humour, not much unlike the seed sent from the glandules or kernels called *prostatæ*, situated in Men at the beginning of the neck of the bladder, but in Women at the bottom of the womb: this moisture hath a certain sharpness or biting, for that kind of humour of all others can chiefly provoke those parts to their function or office, and yield them a delectable pleasure, while they are in execution of the same. For even so whayish and sharp humours, when they are gathered together under the skin, if they wax warm, tickle with a certain pleasant itching, and by their motion infer delight: but the nature of the genital parts or members is not stirred up or provoked to the expulsion of the seed with these provocations of the humours, abounding either in quantity or quality only, but a certain great and hot spirit or breath contained in those parts, doth begin to dilate it self more and more, which causeth a certain incredible excess of pleasure or voluptuousness, wherewith the genitals

genitals being replete, are ſpread forth or diſtended every way unto their full greatneſs. The Yard is given to Men whereby they may caſt out their ſeed directly or ſtraitly into the Womans womb; to Women whereby they may receive that ſeed ſo caſt forth, by the open or wide mouth of the ſame neck, and alſo that they may caſt forth their own ſeed ſent through the ſpermatick veſſels unto their teſticles; theſe ſpermatick veſſels, that is to ſay, the Vein lying above, and the artery lying below, do make many flexions or windings, yet one as many as the other, like unto the tendrils of Vines diverſly platted or folded together, and in thoſe folds or bendings the bloud and ſpirit which are carried unto the teſticles, are concocted a longer time, and ſo converted into a white ſeminal ſubſtance. The lower of theſe flexions or bowings do end in the Stones or Teſticles. But the Teſticles for as much as they are looſe, thin, and ſpongeous, or hollow, receiving the humour which was begun to be concocted in the fore-named veſſels, concoct it again themſelves: but the Teſticles of Men concoct the more perfectly for the procreation of the iſſue, and the teſticles of Women more imperfectly, becauſe they are more cold, leſs, weak, and feeble, but the Seed becometh white by the contact or touch of the Teſticles, becauſe the ſubſtance of them is white. The male is ſuch as engendereth in another, and the female in her ſelf, by the ſpermatick veſſels which are implanted in the inner capacity of the womb. But out of all doubt, unleſs Nature had prepared ſo many allurements, baits, and provocations of pleaſure, there is ſcarce any man ſo hot and delighted in venerous acts, which conſidering and marking the place appointed for humane conception, the loathſomneſs of the filth which daily falleth down into it, and wherewithall it is humected and moiſtned, and the vicinity and nearneſs of the great gut under it, and of the bladder above it, but would ſhun the embraces of Women. Nor would any Women deſire the company of Man, which once premeditates or fore-thinks with her ſelf on the labour that ſhe ſhould ſuſtain in bearing in the burthen of her child nine Moneths, and of the almoſt deadly pains that ſhe ſhall ſuffer in her delivery.

The cauſe of folding of the ſpermatick veſſels.

Womens Teſticles more imperfect.

Why many men and women abhor venerous copulapulation.

Men that uſe too frequent copulation, oftentimes in ſtead of ſeed caſt forth a crude and bloudy humour, and ſometimes meer bloud it ſelf; and oft-times they can hardly make water but with great pain, by reaſon that the clammy and oily moiſture, which Nature hath placed in the glandules called the *Proſtatæ*, to make the paſſage of the urin ſlippery, and to defend it againſt the ſharpneſs of the urin that paſſeth through it, is waſted, ſo that afterward they ſhall ſtand in need of the help of a Surgeon to cauſe them to make water with eaſe and without pain, by injecting of a little Oil out of a Syringe into the conduit of the Yard. For in generation it is fit the man caſt forth his ſeed into the womb, with a certain impetuoſity, his Yard being ſtiff and diſtended, and the Woman to receive the ſame without delay into her womb being wide open, leſt that through delay the ſeed wax cold, and ſo become unfruitful by reaſon that the ſpirits are diſſipated and conſumed. The Yard is diſtended or made ſtiff, when the nervous, ſpongeous and hollow ſubſtance thereof is replete and puffed up with a flatulent ſpirit. The womb allures or draws the maſculine ſeed into it ſelf by the mouth thereof, and it receives the womans ſeed by the horns from the ſpermatick veſſels which come from the Teſticles into the hollowneſs or concavity of the womb, that ſo it may be tempered by conjunction, commiſtion and confuſion with the mans ſeed, and ſo reduced or brought unto a certain equality: for generation or conception cannot follow without the concourſe of two ſeeds, well and perfectly wrought in the very ſame moment of time, nor without a laudable diſpoſition of the womb both in temperature and complexion: if in this mixture of ſeeds the mans ſeed in quality and quantity exceed the womans, it will be a man-child; if not, a woman-child, although that in either of the kinds there is both the mans and womans ſeed: as you may ſee by the daily experience of thoſe men who by their firſt wives have had boys onely, and by their ſecond wives had girls onely: the like you may ſee in certain women, who by their firſt husbands have had males onely, and by their ſecond husbands females onely. Moreover, one and the ſame man is not always like affected to get a man or woman-child; for by reaſon of his age, temperature and diet, he doth ſometimes yield forth ſeed endued with a maſculine virtue, and ſometimes with a feminine or weak virtue, ſo that it is no marvel if men get ſometimes men and ſometimes women-children.

Why the Strangury enſueth immoderate copulation.

What things neceſſary unto generation.

Why a male, and why a female is engendred.

CHAP. II.

Of what quality the Seed is, whereof the male, and whereof the female is engendred.

MAle Children are engendred of a more hot and dry ſeed, and women of a more cold and moiſt: for there is much leſs ſtrength in cold then in heat, and likewiſe in moiſture than in drineſs; and that is the cauſe why it will be longer before a Girl is formed in the womb than a boy. In the ſeed lieth both the procreative and the formative power: As for example, In the power of Melon-ſeed are ſituate the Stalks, Branches, Leaves, Flowers, Fruit, the Form, Colour, Smell, Taſte, Seed and all. The like reaſon is of other ſeeds; ſo Apple-grafts engrafted in the ſtock of a Pear-tree bear Apples: and we do always find and ſee by experience, that the tree (by virtue of grafting) that is grafted, doth convert it ſelf into the nature of the Siens wherewith it is grafted. But although the child that is born doth reſemble or is very like unto the Father or Mother, as his or her ſeed exceedeth in the mixture; yet for the moſt part it happeneth that the Children are more like the Father than the Mother, becauſe that in the time of copulation, the mind of the woman is more fixed on her husband, than the mind of the husband on, or towards his wife: for in the time of copulation or conception, the forms or the likeneſs of thoſe things that are conceived and kept in mind, are tranſported and impreſſed in the Child or iſſue: for ſo they affirm that there was a certain Queen of the *Æthiopians* who brought forth a white child, the reaſon was (as ſhe confeſſed) that at the time of copulation with her King, ſhe thought on a marvelous white thing,

Why men-children are ſooner formed in the womb than women.

The Seed is that in power from whence each thing cometh or floweth.

Why the children are moſt commonly like unto their Fathers.

When children should be gotten.

thing, with a very ſtrong imagination. Therefore *Heſiod* adviſeth all married people not to give themſelves to carnal copulation when they return from burials, but when they come from Feaſts and Plays, leſt that their ſad, heavy, and penſive cogitations, ſhould be ſo transfuſed and engraften in the iſſue; that they ſhould contaminate or infect the pleaſant joyfulneſs of his life with ſad, penſive or paſſionate thoughts. Sometimes it happeneth, although very ſeldom, the child is neither like the Father nor the Mother, but in favour reſembleth his Grandfather, or any other of his Kindred; by reaſon that in the inward parts of the parents, the engrafted power and nature of the Grandfather lies hidden; which when it hath lurked there long, not working any effect, at length breaks forth by means of ſome hidden occaſion: wherein Nature reſembleth the Painter, making the lively pourtraiture of a thing, which as far as the ſubject matter will permit, doth form the iſſue like unto the Parents in every habit; ſo that often-times the diſeaſes of the Parents are transferred or participated unto the children, as it were by a certain hereditary title: for thoſe that are crook-backt, get crook-backt children; thoſe that are lame, lame; thoſe that are leprous, leprous; thoſe that have the ſtone, children having the ſtone; thoſe that have the ptiſick, children having the ptiſick; and thoſe that have the gout, children having the gout: for the ſeed follows the power, nature, temperature, and complexion of him that engendereth it. Therefore of thoſe that are in health and ſound, healthy and ſound; and of thoſe that are weak and diſeaſed, weak and diſeaſed children are begotten, unleſs happily the ſeed of one of the Parents that is ſound doth correct or amend the diſeaſed impreſſion of the other that is diſeaſed, or elſe the temperate and ſound womb as it were by the gentle and pleaſant breath thereof.

Why oftentimes the child reſembleth the Grandfather.

Why ſometimes thoſe that are diſeaſed do get ſound children.

CHAP. III.

What is the cauſe why Females of all brute Beaſts, being great with young, do neither deſire, nor admit the Males, until they have brought forth their Young.

Why the ſenſe of Venereous acts is given to brute beaſts

THe cauſe hereof is, for as much as they are moved by ſenſe onely, they apply themſelves unto the thing that is preſent, very little or nothing at all perceiving things that are paſt and to come. Therefore after they have conceived, they are unmindful of the pleaſure that is paſt, and do abhor copulation; for the ſenſe or feeling of luſt is given unto them by Nature, onely for the preſervation of their kind, and not for voluptuouſneſs, or delectation. But the Males raging, ſwelling, and as it were ſtimulated by the provocations of the heat or fervency of their luſt, do then run unto them, follow and deſire copulation, becauſe a certain ſtrong odor or ſmell cometh into the air from their ſecret or genital parts, which pierceth into their noſtrils, and unto their brain, and ſo inferreth an imagination, deſire, and heat. Contrariwiſe, the ſenſe and feeling of venerous actions ſeemeth to be given by nature to Women, not onely for the propagation of iſſue and for the conſervation of mankind, but alſo to mitigate and aſſwage the miſeries of mans life, as it were by the enticements of that pleaſure: alſo the great ſtore of hot bloud that is about the heart, wherewith men abound, maketh greatly to this purpoſe, which by impulſion of imagination, which ruleth the humours, being driven by the proper paſſages down from the heart and entrails into the genitals, doth ſtir up in them a new luſt.

Why of brute beaſts the Males raging with luſt, follow after the Females.

Wherefore a woman when ſhe is with child, deſireth copulation.

The Males of brute Beaſts, being provoked or moved by the ſtimulation of luſt, rage and are almoſt burſt with a *Tentigo* or extenſion of the genital parts, and ſometimes wax mad; but after that they have ſatisfied their luſt with the female of their kind, they preſently become gentle, and leave off ſuch fierceneſs.

CHAP. IV.

What things are to be obſerved, as neceſſary unto generation in the time of copulation.

How women may be moved to Venery and Conception.

WHen the Husband cometh into the Wifes Chamber, he muſt entertain her with all kind of dalliance, wanton behaviour, and allurements to Venery; but if he perceive her to be ſlow, and more cold, he muſt cheriſh, embrace, and tickle her, and ſhall not abruptly, the nerves being ſuddenly diſtended, break into the field of Nature; but rather ſhall creep in by little and little, intermixing more wanton kiſſes with wanton words and ſpeeches, handling her ſecret parts and dugs, that ſhe may take fire, and be enflamed to venery; for ſo at length the womb ſhall ſtrive and wax fervent with a deſire of caſting forth its own ſeed, and receive the mans ſeed to be mixed together therewith. But if all theſe things will not ſuffice to enflame the woman, for women for the moſt part are more ſlow and ſlack unto the expulſion or yielding forth of their ſeed, it ſhall be neceſſary firſt to foment her ſecret parts with the decoction of hot herbs made with Muſcadine, or boiled in any other good Wine, and to put a little Musk or Civet into the neck or mouth of the womb: and when ſhe ſhall perceive the efflux of her ſeed to approach, by reaſon of the tickling pleaſure, ſhe muſt advertiſe her husband thereof, that at the very inſtant time or moment, he may alſo yield forth his ſeed, that by the concourſe or meeting of the ſeeds, conception may be made, and ſo at length a child formed and born. And that it may have the better ſucceſs, the husband muſt not preſently ſeparate himſelf from his wifes embraces, leſt the air ſtrike into the open womb, and ſo corrupt the ſeeds before they are perfectly mixed together. When the man departs, let the woman lie ſtill in quiet, laying her legs or her thighs acroſs, one upon another, and raiſing them up a little, leſt that by motion or downward ſituation, the ſeed ſhould be ſhed or ſpilt: which is the cauſe why ſhe ought at that time not to talk, eſpecially chiding, nor to cough, nor ſneez, but give her ſelf to reſt and quietneſs, if it be poſſible.

The meeting of the ſeeds moſt neceſſary for generation.

CHAP.

CHAP. V.

By what ſigns it may be known, whether the Woman have conceived, or not.

IF the ſeed in the time of copulation, or preſently after be not ſpilt, if in the meeting of the ſeeds the whole body do ſomewhat ſhake, that is to ſay, the womb drawing it ſelf together for the compreſſion and entertainment thereof, if a little feeling of pain doth run up and down the lower belly, and about the navel, if ſhe be ſleepy, if ſhe loath the embracings of a man, and if her face be pale, it is a token that ſhe hath conceived.

In ſome, after conception ſpots or freckles ariſe in their face, their eyes are depreſſed and ſunk in, the white of their eyes waxeth pale, they wax giddy in the head, by reaſon that the vapours are raiſed up from the menſtrual bloud that is ſtopped, ſadneſs and heavineſs grieve their minds, with loathing and waywardneſs, by reaſon that the ſpirits are covered with the ſmoaky darkneſs of the vapours: pains in teeth and gums, and ſwouning oftentimes cometh, the appetite is depraved or overthrown, with aptneſs to vomit, and longing, whereby it happeneth that they loath meats of goods juice, and long for and deſire illaudable meats, and thoſe that are contrary to nature, as coles, dirt, aſhes, ſtinking ſalt-fiſh, ſuch ſowre, auſtere and tart fruits, pepper, vinegar, and ſuch like acrid things, and other, altogether contrary to nature and uſe, by reaſon of the condition of the ſuppreſſed humour abounding and falling into the orifice of the ſtomach. This appetite ſo depraved or overthrown, endureth in ſome until the time of child-birth; in others it cometh in the third moneth after their conception, when hairs do grow on the child: and laſtly, it leaveth them a little before the fourth moneth, becauſe that the child, being now greater and ſtronger, conſumes a great part of the excremental and ſuperfluous humour. The ſuppreſſed or ſtopped terms in women that are great with child, are divided into three parts; the more pure portion maketh the nutriment for the child, the ſecond aſcendeth by little and little into the dugs, and the impureſt of all remaineth in the womb about the Infant, and maketh the ſecondine or after-birth, wherein the Infant lieth as in a ſoft bed. Thoſe women are great with child, whoſe urin is more ſharp, fervent, and ſomewhat bloudy, the bladder not onely waxing warm by the compreſſion of the womb; fervent, by reaſon of the bloud contained in it, but alſo the thinner portion of the ſame bloud being expreſſed, and ſweating out into the bladder. A ſwelling and hardneſs of the dugs, and veins that are under the dugs in the breaſts and about them, and milk coming out when they are preſſed, with a certain ſtirring motion in the belly, are certain infallible ſigns of greatneſs with child. Neither in this greatneſs of child-bearing, the veins of the dugs onely, but of all the whole body, appear full and ſwelled up, eſpecially the veins of the thighs and legs; ſo that by their manifold folding and knitting together, they do appear varicous, whereof cometh ſluggiſhneſs of the whole body, heavineſs and impotency, or difficulty of going, eſpecially when the time of deliverance is at hand. Laſtly, If you would know whether the Woman have conceived or not, give unto her when ſhe goeth to ſleep, ſome Mead or honied water to drink; and if ſhe have a griping in her guts or belly, ſhe hath conceived; if not, ſhe hath not conceived.

Spots or ſpecks in the faces of thoſe that are with child.

Why many women being great with child refuſe laudable meats, and deſire thoſe that are illaudable and contrary to Nature.

The ſuppreſſed Terms divided into three parts.

Hip. 1. de Morb. mul.

Aph. 41. ſect. 5.

CHAP. VI.

That the womb, ſo ſoon as it hath received the ſeed, is preſently contracted or drawn together.

AFter that the ſeeds of the Male and female have both met, and are mixed together in the capacity of the womb, then the orifice thereof doth draw it ſelf cloſe together, leſt the ſeeds ſhould fall out. There the Females ſeed goeth and turneth into nutriment, and the increaſe of the Males ſeed; becauſe all things are nouriſhed, and do increaſe by thoſe things that are moſt familiar, and like unto them. But the ſimilitude and familiarity of ſeed with ſeed is far greater than with bloud; ſo that when they are perfectly mixed and coagulated together, and ſo wax warm by the ſtraight and narrow encloſure of the womb, a certain thin skin doth grow about it, like unto that that will be over unskimmed Milk.

Why the female ſeed is nutriment for the male ſeed.

Moreover, this concretion or congealing of the ſeed, is like unto an Egg laid before the time that it ſhould: that is to ſay, whoſe membrane or tunicle that it compaſſeth it about, hath not as yet increaſed or grown into a ſhelly hardneſs about it; in folding-wiſe are ſeen many ſmall threds dividing themſelves, over-ſpread with a certain clammy, whitiſh or red ſubſtance, as it were with black bloud. In the midſt under it appeareth the navel, from whence that ſmall skin is produced. But a man may underſtand many things that may appertain unto the conception of mankind by the obſervation of twenty Eggs, ſetting them to be hatched under an Hen, and taking one every day and breaking it, and diligently conſidering it; for in ſo doing, on the twentieth day you ſhall find the Chick perfectly formed with the navel. That little skin that ſo compaſſeth the Infant in the womb, is called the ſecundine or *Chorion*, but commonly the after-birth.

A compendious way to underſtand human conception.

This little skin is perfectly made within ſix days, according to the judgment of *Hippocrates*, as profitable and neceſſary not onely to contain the ſeeds ſo mixed together, but alſo to ſuck nutriment through the orifices of the veſſels ending in the womb. Thoſe orifices the Greeks do call *Cotyledones*, and the Latins *Acetabula*, for they are as it were hollowed eminences, like unto thoſe which may be ſeen in the foot or ſnout of a Cuttle-fiſh many times in a double order, both for the working and holding of their meat. Thoſe eminences called *Acetabula*, do not ſo greatly appear in women as in many brute beaſts. Therefore by theſe the ſecondine cleaveth on every ſide unto the womb, for the conſervation, nutrition, and increaſe of the conceived ſeed.

Lib. de nat. puer.

What the *Cotyledones* are.

CHAP.

CHAP. VII.

Of the generation of the Navel.

AFter the Woman hath conceived, to every one of the aforesaid eminences groweth presently another vessel, that is to say, a Vein to the Vein, and an Artery to the Artery: these soft and yet thin vessels are framed with a little thin membrane, which being spread under, sticketh to them; for to them it is in stead of a membrane, and a ligament, and a tunicle, or a defence; and it is doubled with the others, and made of the Vein and Artery of the Navel. These new small vessels of the Infant, with their orifices, do answer directly one to one, to the *Cotyledones* or eminences of the womb; they are very small and little, as it were the hairy fibres that grow upon roots that are in the earth; and when they have continued so a longer time, they are combined together, that of two they are made one Vessel, until that by continual connexion, all those vessels go and degenerate into two other great vessels, called the Umbilical vessels or the vessels of the navel, because they do make the navel, and do enter into the childs body by the hole of the navel. Here *Galen* doth admire the singular providence of God and Nature; because that in such a multitude of vessels, and in so long a passage or length that they go or are produced, the vein doth never confound it self, nor stick to the artery, nor the artery to the vein; but every vessel joineth it self to the vessel of its own kind. But the Umbilical vein, or Navel vein, entering into the body of the child, doth join it self presently to the hollow part of the liver; but the artery is divided into two, which join themselves to the two Iliack arteries along the sides of the bladder, and are presently covered with the *Peritonæum*; and by the benefit thereof annexed unto the parts which it goes unto. Those small veins and arteries are as it were the roots of the child; but the vein and artery of the Navel are as it were the body of the Tree, to bring down the nutriment to nourish the child. For first we live in the womb the life of Plant, and then next the life of a Sensitive Creature: and as the first tunicle of the child is called *Chorion* or *Allantoides*; so the other is called *Amnios* or *Agnina*, which doth compass the seed or child about on every side. These membranes are most thin, yea for their thinness like unto the Spiders web, woven one upon another; and also connexed in many places by the extremities of certain small and hairy substances, which at length by the adjunction of their like do get strength; whereby you may understand what is the cause why by divers and violent motions of the Mother in going and dancing, or leaping, and also of the Infant in the womb, those membranes are not almost broken. For they are so conjoined by the knots of those hairy substances, that between them nothing, neither the urin, nor the sweat can come, as you may plainly and evidently perceive in the dissection of a womans body that is great with child, not depending on any other mans opinion, be it never so old or inveterate: yet the strength of those membranes is not so great, but that they may be soon broken in the birth, by the kicking of the child.

The Vein never joineth it self with the artery.

Hippocrates calleth all the membranes that compass the infant in the womb, according to the judgment of *Galen* in his Book *De usu Partium*, by the name of the Secondines.

CHAP. VIII.

Of the Umbilical Vessels, or the Vessels belonging to the Navel.

MAny of the ancient Writers have written that there are five Vessels found in the Navel. But yet in many, nay all the bodies I sought in for them, I could never find but three; that is to say, one Vein, which is very large, so that in the passage thereof it will receive the tag of a point, and two Arteries, but not so large, but much narrower,; because the child wanteth or standeth in need of much more bloud for his conformation, and the nutriment or increase of his parts, than of vital spirit.

An old opinion confuted.

These Vessels making the body of the Navel, which, as it is thought, is formed within nine or ten days by their doubling and folding, make knots like unto the knots of a Franciscan Friers girdle, that staying the running bloud in those their knotty windings, they might more perfectly concoct the same: as may be seen in the ejaculatory spermatick vessels, for which use also the length of the Navel is half an ell; so that in many Infants that are somewhat grown, it is found three or four times doubled about their neck or thigh.

To what use the knots of the childs Navel in the womb serve.

As long as the child is in his Mothers womb, he taketh his nutriment onely by the Navel, and not by his Mouth; neither doth he enjoy the use of eyes, ears, nostrils, or fundament, neither needeth he the functions of the heart. For the spirituous bloud goeth unto it by the arteries of the Navel, and into the Iliack arteries; and from the Iliack arteries unto all the other arteries of the whole Body, for by the motion of these onely the Infant doth breath. Therefore it is not to be supposed that the air is carried or drawn in by the lungs unto the heart, in the body of the child, but contrariwise from the heart to the lungs. For neither the heart doth perform the generation or working of bloud, or of the vital spirits. For the Issue or Infant is contented with them as they are made and wrought by his Mother. Which, until it hath obtained a full, perfect, and whole description of his parts and members, cannot be called a Child, but rather an Embryon, or an imperfect substance.

The child in the womb taketh his nutriment by his Navel, not by his Mouth.

How the child breatheth.

CHAP.

CHAP. IX.

Of the ebullition or ſwelling of the ſeed in the womb, and of the concretion of the bubbles or bladders, or the three principal entrails.

IN the ſix firſt days of conception the new veſſels are thought to be made and brought forth of the eminences or *cotyledons* of the mothers veſſels, and diſperſed into all the whole ſeed, as as they were *fibres*, or hairy ſtrings. Thoſe, as they pierce the womb, ſo do they equally and in like manner penetrate the tunicle *Chorion*. And it is carried this way, being a paſſage not onely neceſſary for the nutriment and conformation of the parts, but alſo into the veins diverſly woven and diſperſed into the skin *Chorion*. For thereby it cometh to paſs, that the ſeed it ſelf boileth, and as it were fermenteth or ſwelleth, not only through occaſion of the place but alſo of the bloud and vital ſpirits that flow unto it; and then it riſeth into three bubbles or bladders like unto the bubbles which are occaſioned by the rain falling into a river or channel full of water. Theſe three bubbles or bladders, are certain rude, or new forms, or concretions of the three principal entrails, that is to ſay, of the liver, heart, and brain. All this former time it is called ſeed, and by no other name; but when thoſe bubble ariſe, it is called an embryon, or the rude form of a body until the perfect conformation of all the members: on the fourth day after that the vein of the navel is formed, it ſucketh groſſer bloud, that is, of a more full nutriment out of the *Cotyledons*. And this bloud, becauſe it is more groſs, eaſily congeals and curdles in that place, where it ought to prepare the liver fully and abſolutely made. For then it is of a notable great bigneſs above all the other parts; and therefore it is called *Parenchyma*, becauſe it is but only a certain congealing or concretion of bloud brought together thither, or in that place. From the gibbous part thereof ſpringeth the greater part or trunk of the hollow vein, called commonly *vena cava*, which doth diſperſe his ſmall branches, which are like unto hairs, into all the ſubſtance thereof; and then it is divided into two branches, whereof the one groweth upwards, the other downwards unto all the particular parts of the body.

The three bladders.

When the ſeed is called an embryon.

Why the liver is called *Parenchyma*.

In the mean ſeaſon the arteries of the navel ſuck ſpirituous bloud out of the eminences or *Cotyledons* of the mothers arteries, whereof, that is to ſay, of the more fervent and ſpirituous bloud the heart is formed in the ſecond bladder or bubble, being endued with a more fleſhy, ſound, and thick ſubſtance, as it behoveth that veſſel to be, which is the fountain from whence the heat floweth, and hath a continual motion.

In this the virtue formative hath made two hollow places; one on the right ſide, another on the left. In the right, the root of the hollow vein is infixed or ingraffed, carrying thither neceſſary nutriment for the heart: in the left is formed the ſtamp or root of an artery, which preſently doth divide it ſelf into two branches; the greater whereof goeth upwards to the upper parts, and the wider unto the lower parts, carrying unto all the parts of the body life and vital heat.

CHAP. X.

Of the third Bubble or Bladder, wherein the head and the brain is formed.

THE far greater portion of the ſeed goeth into this third bubble, that is to ſay, yielding matter for the conformation of the brain, and all the head. For a greater quantity of ſeed ought to go unto the conformation of the head and brain; becauſe theſe parts are not ſanguine or bloody, as the heart and liver; but in a manner without bloud, bony, marrow, cartilaginous, nervous, and membranous, whoſe parts, as the veins, arteries, nerves, ligaments, panicles, and skin, are called *ſpermatick* parts; becauſe they obtain their firſt conformation almoſt of ſeed only: although that afterwards they are nouriſhed with blood, as the other fleſhy and muſculous parts are. But yet the bloud, when it cometh unto thoſe parts, degenerateth, and turneth into a thing ſomewhat ſpermatick, by vertue of the aſſimulative faculty of thoſe parts. All the other parts of the head form and faſhion themſelves unto the form of the brain, when it is formed; and thoſe parts which are ſituated and placed about it, for defence eſpecially, are hardened into bones.

Why the greater portion of ſeed goeth into generation of the head and brain.

The head, as the ſeat of the ſenſes, and manſion of the mind and reaſon, is ſituated in the higheſt place; that from thence, as it were from a lofty tower or turret, it might rule and govern all the other members, and their functions and actions that are under it: for there the ſoul or life, which is the rectreſs or governeſs, is ſituated; and from thence it floweth, and is diſperſed into all the whole body. Nature hath framed theſe three principal entrails, as props and ſuſtentations for the weight of all the reſt of the body: for which matter alſo ſhe hath framed the bones.

Why the head is placed on the top of the body.

The firſt bones that appear to be formed, or are ſuppoſed to be conformed, are the bones called *oſſa Ilium*, connexed or united by ſpondyls that are between them: then all the other members are framed and proportioned by their concavities and hollowneſſes, which generally are ſeven, that is to ſay, two of the ears, two of the noſe, one of the mouth, and in the parts beneath the head one of the fundament, and another of the *yard* or conduit of the bladder; and furthermore in women, one of the neck of the womb, without the which they can never be made mothers or bear children.

When all theſe are finiſhed, nature, that ſhe might poliſh her excellent work in all ſorts, hath covered all the body and every member thereof with skin. Into this excellent work or *Microcoſmos* ſo perfect, God, the author of nature and all things, infuſeth or ingrafteth a ſoul or life: which S. *Auguſtine* proveth by this ſentence of *Moſes*: *If any man ſmite a woman with child, ſo* *Exod. 20. qu. 52*

that thereby ſhe be delivered before her natural time, and the child be dead, being firſt formed in the womb let him die the death: but if the child hath not as yet obtained the full proportion and conformation of his body and members, let him recompence it with mony. Therefore it is not to be thought that the life is derived, propagated or taken from *Adam* or our parents; and as it were an hereditary thing diſtributed unto all mankind by their parents; but we muſt believe it to be immediately created of God, even at the very inſtant time when the child is abſolutely perfected in the lineaments of his body, and ſo given unto it by him.

The *Mola* in the womb liveth not as the child.

So therefore the rude lumps of fleſh called *molæ* that engender in womens wombs, and monſters of the like breeding and confuſed bigneſs, although by reaſon of a certain quaking and ſhivering motion, they ſeem to have life, yet they cannot be ſuppoſed to be endued with a life or a reaſonable ſoul: but they have their motion, nutriment and increaſe wholly of the natural and infixed faculty of the womb, and of the generative or procreative ſpirit that is ingraffed naturally in the ſeed.

But even as the infant in the womb obtaineth not perfect conformation before the thirtieth day, ſo likewiſe it doth not move before the ſixtieth day: at which time it is moſt commonly not perceived by women, by reaſon of the ſmalneſs of the motion. But now let us ſpeak briefly of the life or ſoul, wherein conſiſteth the principal original of every function in the body, and likewiſe of generation.

CHAP. XI.

Of the life or ſoul.

The life goeth not into the maſs of ſeed that doth engender the child, before the body of the child and each part thereof hath his perfect proportion and form.

THe ſoul entreth into the body ſo ſoon as it hath obtained a perfect and abſolute diſtinction and conformation of the members in the womb, which in male children, by reaſon of the more ſtrong and forming heat which is ingraffed in them, is about the fourtieth day, and in females obout the fourty fifth day; in ſome ſooner, and in ſome later, by reaſon of the efficacy of the matter working, and pliantneſs or obedience of the matter whereon it worketh. Neither doth the life or ſoul being thus inſpired into the body preſently execute or perform all his functions, becauſe the inſtruments that are placed about it cannot obtain a firm and hard conſiſtence neceſſary for the lively, but eſpecially for the more divine miniſteries of the life or ſoul, but in a long proceſs of age and time.

Why the life or ſoul doth not preſently execute all his offices.

Thoſe inſtruments of the ſoul are vitiated either in the firſt conformation, as when the form or faſhion of the head is ſhaped upwards or pyramidal, as was the head of *Therſites*, that lived in the time of the Trojan war, and of *Triboulet* and *Tonin* that lived in later years; or alſo by ſome caſualty, as by the violent handling of the midwife, who by compreſſion, by reaſon that the ſcull is tender and ſoft, hath cauſed the capacity of the ventricles that be under the brain to be too narrow for them: or by a fall, ſtroak, diſorder in diet, as by drunkenneſs, or a feaver, which inferreth a lethargy, exceſſive ſleepineſs, or phrenſie.

1 *Cor. c.* 12.

Preſently after the ſoul is entred into the body, God endueth it with divers and ſundry gifts: hereof it cometh that ſome are endued with wiſdom by the ſpirit; others with knowledge by the ſame ſpirit; others with the gift of healing by the ſame ſpirit; others with power, dominion and rule; others with propheſie; others with diverſities of tongues; and to others, other endowments, as it hath pleaſed the divine providence and bounty of God, to beſtow upon them, againſt which no man ought to contend or ſpeak. *For it is not meet that the thing formed ſhould ſay unto him that formed it, why haſt thou made me thus? hath not the Potter power to make of the ſame lump of clay one veſſel to honor and another to diſhonour?* It is not my purpoſe, neither belongeth it unto me nor any other humane creature to ſearch out the reaſon of thoſe things, but only to admire them with all humility: But yet I dare affirm this one thing, that a noble and excellent ſoul neglecteth elementary and tranſitory things, and is raviſhed and moved with the contemplation of celeſtial, which it cannot freely enjoy before it be ſeparated from this earthly incloſure or priſon of the body, and be reſtored unto its original.

What the ſoul or life is.

Therefore the ſoul is the inward *Entelechia* or perfection, or the primitive cauſe of all motions and functions both natural and animal, and the true form of man. The Ancients have endeavoured to expreſs the obſcure ſenſe thereof by many deſcriptions. For they have called it a celeſtial ſpirit, and a ſuperior, incorporeal, inviſible, and immortal eſſence, which is to be comprehended of it ſelf alone, that is, of the mind or underſtanding. Others have not doubted but that we have our ſouls inſpired by the univerſal divine mind, which as they are alive, ſo they do beſtow life on the bodies unto whom they are annexed or united. And although this life be diſperſed into all the whole body, and into every portion of the ſame, yet is it void of all corporal weight or mixtion, and it is wholly and alone in every ſeveral part, being ſimple and inviſible, without all compoſition or mixture, yet endued with many virtues and faculties, which it doth utter in divers parts of the body: For it feeleth, imagineth, judgeth, remembreth, underſtandeth, and ruleth all our deſires, pleaſures, and animal motions; it ſeeth, heareth, ſmelleth, taſteth, toucheth; and it hath divers names of theſe ſo many and ſo great functions, which it performeth in divers parts of the body. It is called the ſoul of life; becauſe it maketh the body live, which of it ſelf is dead. It is called the *ſpirit* or *breath*; becauſe it inſpireth our bodies. It is called *reaſon*; becauſe it diſcerneth truth from falſhood, as it were by a certain divine rule. It is termed the mind; becauſe it is mindful of things paſt, in recalling and remembring them: And it is called the *vigor* or *courage*; becauſe it giveth vigor and courage to the ſluggiſh weight, or maſs of the body. And laſtly, it is called the ſenſe and *underſtanding*: becauſe it comprehendeth things that are ſenſible and intelligible. Becauſe it is incorporeal, it cannot occupy a place by corporeal extention; although not-

The life is in all the whole body and in every portion thereof.

The life or ſoul is ſimple and inviſible.

Divers names and the reaſon of divers names that are given to humane forms.

withſtanding

withſtanding it filleth the whole body. It is ſimple, becauſe it is but one in eſſence, nor increaſed, nor diminiſhed: for it is no leſs in a Dwarf than in a Giant; and it is like perfect and great in an infant as in a man, according to its own nature.

But there are three kinds of bodies informed by a ſoul whereby they live: the firſt being the moſt imperfect, is of plants; the ſecond of brute beaſts; and the third of men. The plants live by a vegetative; beaſts by a ſenſitive; and men by an intellective ſoul. And as the ſenſitive ſoul of brute beaſts is endued with all the vertues of the vegetative; ſo the humane intellective comprehendeth the vertues of all the inferior, not ſeparated by any diviſion, but by being indiviſibly united with reaſon and underſtanding, into one humane form and ſoul whereon they depend. But becauſe we have ſaid a little before, that divers functions of the life are reſident, and appear in divers parts of the body, here in this place, omitting all others, we will proſecute thoſe only which are accounted the principal.

Three kinds of living bodies.

The ſuperiour ſoul containeth in it ſelf all the powers of the inferiour.

The principal functions of the humane ſoul, according to the opinion of many, are four in number, proceeding from ſo many faculties, and conſequently from one ſoul; they are theſe: The Common Senſe, Imagination, Reaſoning, and Memory. And they think that the common or interiour ſenſe doth receive the forms and images of ſenſible things, bein carried by the ſpirit through the paſſage of the nerves, as an inſtrument of the external ſenſes, as it were a meſſenger to go between them; and it ſerves not only to receive them, but alſo to know, perceive, and diſcern them. For the eye, wherein the external ſenſe of ſeeing conſiſteth, doth not know white or black. Therefore it cannot diſcern the differenees of colours, as neither the tongue taſtes, nor the noſe ſavours nor the ears ſound, nor laſtly, the hands their touching quality: yea, the eye doth not of it ſelf perceive that it ſeeth, nor the noſe that it ſmelleth, nor the ears that they hear, nor the tongue that it taſteth, nor the hands that they touch. For all theſe things are the offices and functions of the common ſenſe; for this ſenſe knoweth that the eye hath ſeen ſomething, either white, black, red, a man, horſe, ſheep, or ſome ſuch like material thing; yea, even when the ſight is gone and paſt; and ſo likewiſe the noſe to have ſmelled this or that ſavour, the ear to have heard this or that ſound, the tongue to have taſted this or that taſte, and the hand to have touched this or that thing, be they never ſo diverſe. For all the external ſenſes, and all the functions thereof do end, and are referred to the Common ſenſe, as it were the lines of a circle from the circumference into the center, as it is expreſſed in this figure.

What the common ſenſe is.

The function of the common ſenſe is double.

For which cauſe it is called the common or principal ſenſe; for that therein the primitive power of feeling or perceiving is ſituated, for it uſeth the miniſtery or ſervice of the external ſenſes, to know many and diverſe things, whoſe differences it doth diſcern and judge; but ſimple things, that are of themſelves, and without any compoſition and connexion, which may conſtitute any thing true or falſe, or any argumentation, belongeth only to the mind, underſtanding, or reaſon. For this was the counſel of nature, that the external ſenſes ſhould receive the forms of things ſuperficially, lightly, and gently only; like as a glaſs, not to any other end, but that they ſhould preſently ſend them unto the Common ſenſe, as it were unto their center and prince, which he (that is to ſay, the Common ſenſe) delivereth to be collected unto the underſtanding or reaſoning faculty of the ſoul, which *Avicen* and *Averrois* have ſuppoſed to be ſituated in the former part of the brain.

What cauſe the internal ſenſe is called the common ſenſe.

The common ſenſe underſtandeth or knoweth thoſe things that are ſimple only.

Next unto the common ſenſe followeth the phantaſie or imagination, ſo called becauſe of it ariſe the forms and *Ideas* that are conceived in the mind, called of the Greeks *Phantaſmata*. This doth never reſt but in thoſe that ſleep: neither always in them, for oft-times in them it cauſeth dreams, and cauſeth them to ſuppoſe they ſee and perceive ſuch things as were never perceived by the ſenſes, nor which the nature of things, nor the order of the world will permit. The power of this faculty of the mind is ſo great in us, that it often bringeth the whole body in ſubjection unto it.

What imagination is.

For it is recorded in hiſtory, that *Alexander* the Great ſitting at Table, and hearing *Timotheus* the Muſician ſing a Martial ſonnet unto his Cythern, that he preſently leaped from the Table, and called for arms; but when again the Muſician mollified his tune, he returned to the Table and ſate down as before. The power of imagination cauſed by muſical harmony was ſo great, that it ſubjected to it the courage of the worlds conqueror, by whoſe various motion, it would now as it were cauſe him to run headlong to arms, and then pacifie and quiet him, and ſo cauſe him to return to his chair and banquetting again. And there was one whoſoever it was, who ſome few years agon ſeeing the Turk dance on a rope on high with both his feet faſtned in a baſin, turned his eyes from ſo dangerous a ſight or ſpectacle, although came of purpoſe to ſee it, and ſtricken with ſuch fear that his body ſhook and heart quaked, for fear leſt that by ſudden falling down headlong he ſhould break his neck. Many looking down from an high and lofty place, are ſo ſtricken with fear, that ſuddenly they fall down headlong, being ſo overcome and bound with the imagination of the danger, that their own ſtrength is not able to ſuſtain them. Therefore it manifeſtly appeareth that God hath dealt moſt graciouſly and lovingly with us, who unto this power of imagination, hath joined another, that is, the faculty or power of reaſon and underſtanding; which diſcerning falſe dangers and perils from true, doth ſuſtain and hold up a man that he may not be overthrown by them.

What Reaſon is: After this, appeareth and approacheth to perform his function, the faculty of Reaſon, being the Prince of all the principal faculties of the ſoul; which bringeth together, compoſeth, joineth and reduceth all the ſimple, and divided forms or images or things into one heap, that by dividing, collecting, and reaſoning it might diſcern and try truth from fallhood.

The functions of Reaſon. This faculty of Underſtanding or Reaſon is ſubject to no faculty or inſtrument of the body, but is free, and penetrateth into every ſecret, intricate and hidden thing with an incredible celerity: by which a man ſeeth what will follow, perceiveth the originals and cauſes of things, is not ignorant of the proceedings of things; he compareth things that are paſt with thoſe that are preſent and to come, decreeing what to follow, and what to avoid. This bridleth and with-holdeth the furious motions of the mind, bridleth the over-haſty motions of the tongue, and admoniſheth the ſpeaker that before the words paſs out of his mouth, he ought with diligence and diſcretion to ponder and conſider the thing whereof he is about to ſpeak.

What memory is. After Reaſon and Judgment followeth Memory, which keeping and conſerving all forms and images that it receiveth of the ſenſes, and which Reaſon ſhall appoint, and as a faithful keeper and conſerver, receiveth all things, and imprinteth and ſealeth them as well by their own virtue and power, as by the impulſion and adherence of thoſe things in the body of the brain, without any impreſſion of the matter; that when occaſion ſerveth, we may bring them forth there-hence as out of a treaſury or ſtore-houſe. For otherwiſe to what purpoſe were it to read, hear, and note ſo many things, unleſs we were able to keep and retain them in mind by the care and cuſtody of the Memory or Brain? Therefore aſſuredly God hath given us this only remedy and preſervative againſt the oblivion and ignorance of things, which although of it ſelf and of its own nature it be of greater efficacy, yet by dayly and often meditation it is trimmed and made more exquiſite and perfect. And hence it was that the Antients termed wiſdom the daughter of memory and experience. Many have ſuppoſed that the manſion or ſeat of the Memory, is in the hinder part, or in the ventricle of the *Cerebellum*, by reaſon that it is apt to receive the forms of things, becauſe of the engrafted drineſs and hardneſs thereof.

Wiſdom the daughter of memory and experience.

CHAP. XII.

Of the natural excrements in general, and eſpecially of thoſe that the child or infant being in the womb excludeth.

What an excrement is. BEfore I declare what excrements the infant excludeth in the womb, and by what paſſages, I think it good to ſpeak of the excrements which all men do naturally void; All that is called an excrement which nature is accuſtomed to ſeparate and caſt out from the laudable and nouriſhing juice. There are many kinds of thoſe excrements.

The excrement of the firſt concoction. The firſt is of the firſt concoction, which is performed in the ſtomach, which being driven down into the inteſtines or guts, is voided by the fundament.

The excrement of the ſecond concoction is triple. The ſecond cometh from the Liver, and it uſually is three-fold, or of three kinds; one cholerick, whereof a great portion is ſent into the bladder of the gall, that by ſweating out there-hence, it might ſtir up the expulſive faculty of the guts to expel and exclude the excrements. The other is like unto whay, which goeth with the blood into the veins, and is as it were a *vehicle* thereto to bring it unto all the parts of the body, and into every capillar vein for to nouriſh the whole body; and after it hath performed that function, it is partly expelled by ſweat, and partly ſent into the bladder and ſo excluded with the urine. The third is the melancholick excrement which being drawn by the milt, the purer and thinner part thereof goeth into nouriſhment of the milt, and after the remnant is partly purged out downwards by the Hemorrhoidal veins, and partly ſent to the orifice of the ſtomach, to ſtimulate and provoke the appetite.

The excrement of the third concoction is triple. The laſt cometh of the laſt concoction which is diſſolved in the habit of the body, and breathed out, partly by inſenſible tranſpiration, is partly conſumed by ſweating, and partly floweth out by the evident and manifeſt paſſages that are proper to every part: as it happeneth in the brain before all other parts; for it doth unload it ſelf of this kind of excrements by the paſſages of the noſe, mouth, ears, eyes, palat-bone and ſutures of the skull.

Therefore if any of theſe excrements be ſtayed altogether, or any longer than it is meet they ſhould, the default is to be amended by diet and medicine. Furthermore there are other ſorts of excrements not natural, of which we have entreated at large in our book of the Peſtilence.

The uſe of the navel-ſtring. When the infant is in the mothers womb, until he is fully and abſolutely formed in all the lineaments of his body, he ſends forth his urine by the paſſages of the navel or *urachus*. But a little before the time of child-birth, the *urachus* is cloſed, and then the man-child voideth his urine by the conduit of the yard, and the woman-child by the neck of the womb. This urine is gathered together and contained in the coat *Chorion* or *Allantoides*, together with the other excrements, that is to ſay, ſweat and ſuch whayiſh ſuperfluities of the menſtrual matter, for the more eaſie bearing up of the floating or ſwimming child.

The ſigns of ſpeedy and eaſie deliverance. But in the time of child-birth, when the infant by kicking breaketh the membranes, thoſe humors run out, which when the midwives perceive, they take it as a certain ſign that the child is at hand. For if the infant come forth together with thoſe waters, the birth is like to be more eaſie, and with better ſucceſs; for the neck of the womb and all the genitals are ſo by their moiſture relaxed and made ſlippery, that by the endeavour and ſtirring of the infant, the birth will be more eaſie, and with better ſucceſs: contrariwiſe, if the infant be not excluded before all theſe humors be wholly flown out and gone, but remaineth as it were in a dry place, preſently through drineſs the neck of the womb and all the genitals will be contracted and drawn together, ſo that the birth of the child will be very difficult and hard, unleſs the neck of the womb, to amend that default, be anointed with oyl or ſome other relaxing liquor.

Moreover

Moreover, when the child is in the womb, he voideth no excrements by the fundament, unleſs it be when at the time of the birth, the proper membranes and receptacles are burſt by the ſtriving of the infant; for he doth not take his meat at the mouth; wherefore the ſtomach is idle then, and doth not execute the office of turning the meats into *chylus*, nor of any other concoction; wherefore nothing can go down from it into the guts. Neither have I ſeldom ſeen infants born without any hole in their fundament, ſo that I have been conſtrained with a knife to cut in ſunder the membrane or tunicle that grew over and ſtopped it. And how can ſuch excrements be engendred, when the child being in the womb, is nouriſhed with the more laudable portion of the menſtrual bloud; therefore the iſſue or child is wont to yield or avoid two kinds or ſorts of excrements, ſo long as he is in the womb, that is to ſay, ſweat and urine, in both which he ſwims; but they are ſeparated by themſelves, by a certain tunicle called *Allantoides*, as it may be ſeen in kids, dogs, ſheep, and other brute beaſts; for as much as in mankind the tunicle *Chorion* and *Allantoides* or *Farciminalis*, be all one membrane. If the woman be great of a man-child, ſhe is more merry, ſtrong and better coloured, all the time of her child-bearing; but if a woman-child, ſhe is ill coloured, becauſe that women are not ſo hot as men.

Children born without a paſſage in their fundament.

Aph. 24. *ſect.* 5.

The males begin to ſtir within three months and a half, but females after: if a woman conceive a male-child, ſhe hath all her right parts ſtronger to every work: wherefore they do begin to ſet forwards their right foot firſt in going, and when they ariſe they lean on the right arm, the right dug will ſooner ſwell and wax hard: the male-child ſtir more in the right ſide than in the left, and the female-children rather in the left than in the right ſide.

Aph. 47. *ſect.* 5.

CHAP. XIII.

With what travail the Child is brought into the world, and of the cauſe of this labour and travail.

WHen the natural prefixed and preſcribed time of child-birth is come, the child being then grown greater, requires a greater quantity of food: which when he cannot receive in ſufficient meaſure by his navel, with great labour and ſtriving he endeavoreth to get forth: therefore then he is moved with a ſtronger violence, and doth break the membranes wherein he is contained. Then the womb, becauſe it is no able to endure ſuch violent motions, nor ſuſtain or hold up the child any longer, by reaſon that the conceptacles of the membranes are broken aſunder, is relaxed, and then the child purſuing the air which he feeleth to enter in at the mouth of the womb, which then is very wide and gaping, is carried with his head downwards, and ſo cometh into the world with great pain both unto it ſelf, and alſo unto his Mother, by reaſon of the tenderneſs of his body, and alſo by reaſon of the nervous neck of his mothers womb, and ſeparation of the bone called *Os Ilium* from the bone called *Os ſacrum*. For unleſs thoſe bones were drawn in ſunder, how could not only twins that cleave faſt together, but alſo one child alone, come forth forth at ſo narrow a paſſage as the neck of the womb is; Not only reaſon, but alſo experience confirmeth it; for I opened the bodies of women preſently after they have died in travail in child-birth, in whom I have found the bones of *Ilium* to be drrawn the bredth of ones finger from *Os ſacrum*: and moreover, in many unto whom I have been called, being in great extremity of difficult and hard travail, I have not only heard, but alſo felt the bones to crackle and make a noiſe, when I laid my hand upon the coccyx or rump, by the violence of the diſtention. Alſo honeſt matrons have declared unto me that they themſelves, a few days before the birth, have felt and heard the noiſe of thoſe bones ſeparating themſelves one from another with great pain. Alſo a long time after the birth many do feel great pain and ach about the region of the coccyx and *Os ſacrum*, ſo that when nature is not able to repair the diſſolved continuity of the bones of *Ilium*, they are conſtrained to halt all the days of their life after. But the bones of the ſhare called *Oſſa pubis*, I have never ſeen to be ſeparated, as many do alſo affirm. It is reported that in *Italy* the coccyx or rump in all Maidens is broken that when they come to be married they may bear children with leſſer travail in child-birth; but this is a forged tale, for that bone being broken, is naturally and of its own accord repaired, and joined together again with a *Callus*, whereby the birth of the child will be more difficult and hard.

Why the infant is born ſometimes with his head forwards.

In the time of child-birth. the bones of *Ilium* and *Os ſacrum* are drawn and extended one from another.

An Italian fable.

CHAP. XIV.

Of the ſituation of the infant in the womb.

REaſon cannot ſhew the certain ſituation of the infant in the womb, for I have found it altogether uncertain, variable and diverſe both in living and dead women: in the dead by opening their bodies preſently after they were dead; and in the living by helping them by the induſtry of my hand, when they have been in danger of periſhing by travail of child-birth: for by putting my hand into the womb, I have felt the infant coming forth, ſometimes with his feet forward, and ſometime with his hands and feet turned backwards, and ſometimes forwards, as the figure following plainly deſcribeth.

The ſituation of the infant in the womb is diverſe.

I have often found them coming forth with their knees forwards, and ſometimes with one of the feet, and ſometimes with their belly forwards, their hands and feet being lifted upwards, as the former figure ſheweth at large.

Sometimes I have found the Infant coming with his feet downwards ſtriding awide, and ſometimes headlong, ſtretching one of his arms downward out at length and that was an Hermaphrodite, as this figure plainly declareth.

One time I obſerved in the birth of twins that the one came with his head forwards, and the other with his feet, according as here I have thought good to deſcribe them.

In the bodies of women that died in travail of child I have ſometimes found children no bigger than if they had been but four moneths in the womb, ſituated in a round compaſs like a hoop, with their head bowed down to their knees, with both their hands under the knees, and their heels cloſe to their buttocks. And moreover, I proteſt before God that I found a child being yet alive in the body of his mother (whom I opened ſo ſoon as ſhe was dead) lying all along ſtretched out, with his face upwards, and the palms of his hands joined together, as if he was at prayer.

CHAP. XV.

Which is the legitimate and natural, and which the illegitimate or unnatural time of child-birth.

Mankind hath no certain time of bringing forth young.

TO all living creatures, except Man, the time of conception and bringing forth their young is certain and definite; but the iſſue of Man cometh into the world, ſometimes in the ſeventh, ſometimes in the eighth, and ſometimes which is moſt frequent, in the ninth month; ſometimes in the tenth month; yea ſometimes in the beginning of the eleventh month. *Maſſurius* reports that *Lucius Papyrius* the Pretor, the ſecond heir commencing a ſuit, gave the poſſeſſion of the goods away from him, ſeeing the Mother of the Child affirmed that ſhe went thirteen months therewith, being there is no certain definite time of Child-birth. The child that is born in the ſixth month, cannot be long lived, becauſe at that time all his body or members are not perfectly finiſhed, or abſolutely formed. In the ſeventh month it is proved by reaſon and experience that the infant may be long lived. But in the eighth month it is ſeldom or never long lived: the reaſon thereof is, as the Aſtronomers ſuppoſe, becauſe at that time Saturn ruleth, whoſe coldneſs and drineſs is contrary to the original of life: but yet the phyſical reaſon is more true; for the Phyſicians ſay that the child in the womb doth oft-times in the ſeventh month ſtrive to be ſet at liberty from the incloſure of the womb, and therefore it contendeth and laboureth greatly, and ſo with labouring and ſtriving it becometh weak, that all the time of the eighth month it cannot recover his ſtrength again, whereby it may renew his accuſtomed uſe of ſtriving, and that ſome by ſuch labouring and ſtriving hurt themſelves, and ſo die. Yet ſome ſtrong and luſty women are thought to bring forth their children, being lively and ſtrong, on the eighth month, as *Ariſtotle* teſtifieth of the *Egyptians*, the Poets of the inhabitants of the Iſle of *Naxus*, and many of the *Spaniards*. Furthermore I cannot ſufficiently marvel, that the womb, which all the time of child-bearing is ſo cloſed together, that one can ſcarce

Why the child is ſcarce alive in the eighth month.

Lib. 4. de hiſt. anim. cap. 7.

put

put a probe into it, unleſs it be by ſuperfœtation, or when it is open for a ſhort time to purge it ſelf, that preſently before the time of child-birth, it ſhould gape and wax ſo wide, that the infant may paſs through it, and preſently after it cloſe up again as if it had never been opened. But becauſe that the travail of the firſt time of child-birth is wont to be very difficult and grievous, I think it not unmeet that all women, a little before the time of their firſt travail, anoint and relax their privy parts with the unguent here deſcribed. ℞. *ſper. ceti,* ℥ij. *ol. amygd. dul.* ℥iv. *ceræ alb. & medul. cervin.* ℥iij. *axung. anſ. & gallin. an.* ℥j. *tereb. venet.* ℥ij. make thereof an ointment to anoint the thighs, ſhare, privy parts and genitals. Furthermore, it ſhall not be unprofitable, to make a truſs or girdle of moſt thin and gentle dog-skin, which being alſo anointed with the ſame unguent, may ſerve very neceſſarily for the better carrying of the infant in the womb. Alſo baths that are made of the decoction of mollifying herbs, are alſo very profitable to relax the privy parts a little before the time of the birth. That is ſuppoſed to be a natural and eaſie birth, when the infant cometh forth with his head forwards, preſently following the flux of water; and that is more difficult, when the infant cometh with his feet forwards: all the other ways are moſt difficult. Therefore Midwives are to be admoniſhed that as often as they perceive the child to be coming forth none of thoſe ways, but either with his belly or his back forwards, as it were doubled; or elſe with his hands and feet together, or with his head forwards, and one of his hands ſtretched out, that they ſhould turn it, and draw it out by the feet; for the doing whereof, if they be not ſufficient, let them crave the aſſiſtance and help of ſome expert Chirurgion.

The natural and eaſie child-birth.

CHAP. XVI.

Signs of the birth at hand.

THere will be great pain under the navel, and at the groins, and ſpreading therehence toward the *Vertebræ* of the loins, and then eſpecially when they are drawn back from the *Os ſacrum*, the bones *Ilia* and the *Coccyx* are thruſt outward, the genitals ſwell with pain, and a certain Fever-like ſhaking invades the body, the face waxeth red by reaſon of the endeavour of nature, armed unto the expulſion of the infant. And when theſe ſigns appear, let all things be prepared ready to the child-birth. Therefore firſt of all let the woman that is in travail be placed in her bed conveniently, neither with her face upwards, nor ſitting, but with her back upwards and ſomewhat high, that ſhe may breath at more liberty, and have the more power or ſtrength to labour. Therefore ſhe ought to have her legs wide one from another, and crooked, or her heels ſomewhat bowed up towards her buttocks, ſo that ſhe may lean on a ſtaff that muſt be placed overthwart the bed. There are ſome that do travail in a ſtool or a chair made for the ſame purpoſe: others ſtanding on their feet, and leaning on the poſt or pillar of the bed. But you muſt take diligent heed that you do not exhort or perſwade the woman in travail to ſtrive or labour to expel the birth before the fore-named ſigns thereof do manifeſtly ſhew that it is at hand. For by ſuch labour or pains ſhe might be wearied or ſo weakned, that that when ſhe ſhould ſtrive or labour, ſhe ſhall have no power or ſtrength ſo to do. If all theſe things do fall out well in the child-birth, the buſineſs is to be committed to nature, and to the Midwife. And the woman with child muſt only be admoniſhed that when ſhe feeleth very ſtrong pain, that ſhe preſently therewith ſtrive with moſt ſtrong expreſſion, ſhutting her mouth and noſe if ſhe pleaſe, and at the ſame time let the Midwife with her hands force the infant from above downwards. But if the birth be more difficult and painful, by reaſon that the waters wherein the infant lay are flown out long before, and the womb be dry, this ointment following is to be prepared. ℞. *butyri recentis ſine ſale in aqua artemiſiæ loti,* ℥ij. *mucaginis ficuum, ſemin. lini & althææ, cum aqua ſalinæ extractæ, an.* ℥ß. *olei liliorum,* ℥j. make thereof an ointment, wherewith let the Midwife often anoint the ſecret parts. Alſo this powder following may be prepared. ℞. *Cinnamon. cort. caſſiæ fiſtul. dictamni an.* ℥jß. *ſacch. albi ad pondus omnium:* make thereof a moſt ſubtil and fine powder. Let the woman that is in extremity by reaſon of difficult and painful travail in child-birth, take half an ounce thereof at a time, with a decoction of line-ſeed, or in white wine, for it will cauſe more ſpeedy and eaſie deliverance of the child.

How the woman that travaileth in child-birth muſt be placed in her bed.

An unction to ſupply the defect of the waters that are flowed out too long before the birth.

A powder to cauſe ſpeedy deliverance in child-birth.

Moreover let the Midwife anoint her hands with this ointment following, as often as ſhe putteth them into the neck of the womb, and therewith alſo anoint the parts about it. ℞. *olei ex ſeminibus lini,* ℥jß. *olei de caſtoreo,* ℥ß. *gallinæ moſchatæ,* ℥iij. *ladani* ℥j. make thereof a liniment. Moreover, you may provoke ſneeſing, by putting a little pepper or white hellebore in powder into the noſtrils. Line-ſeed beaten, and given in potion, with the water of Mugwort and Savine, is ſuppoſed to cauſe ſpeedy deliverance. Alſo the medicine following is commended for the ſame purpoſe. ℞. *corticis caſſiæ fiſtul. conquaſſatæ* ℥ij. *cicer. rub.* m ß. *buliant cum vino albo & aqua ſufficienti, ſub finem addendo ſabinæ* ℥ij. *in colaturæ pro doſi adde cinam.* ℥ß. *croci gr.* vj. make thereof a potion, which being taken, let ſneeſing be provoked, as it is above-ſaid, and let her ſhut or cloſe her mouth and noſtrils.

Aph. 35. & 43. *ſect.* 5. &

A potion cauſing ſpeedy deliverance.

Many times it happeneth that the infant cometh into the world out of the womb, having his head covered or wrapped about with a portion of the ſecundine or tunicle wherein it is incloſed, eſpecially, when by the much, ſtrong, and happy ſtriving of the mother, he cometh forth together with the water wherein it lieth in the womb, and then the Midwives propheſie or fore-tell that the child ſhall be happy, becauſe he is born as it were with a hood on his head. But I ſuppoſe that it doth betoken health of body both to the infant and alſo to his mother; for it is a token of eaſie deliverance. For when the birth is difficult and painful, the child never bringeth that membrane out with him, but it remaineth behind in the paſſages of the genitals or ſecret parts, becauſe they are narrow. For even ſo the Snake or Adder when ſhe ſhould caſt her skin thereby to renew her age, creepeth through ſome narrow or ſtrait paſſage. Preſently after birth, the woman ſo delivered muſt take two or three ſpoonfuls

What a woman in travail muſt take preſently after her deliverance.

fulls of the oil of ſweet almonds extracted without fire, and tempered with ſugar. Some will rather uſe the yolks of eggs with ſugar, ſome the wine called Hypocras, others culliſes or gelly: but always divers things are to be uſed, according as the Patient or the woman in child-bed ſhall be grieved, and as the Phyſician ſhall give counſel, both to eaſe and aſſwage the furious torments and pain of the throws, to recover her ſtrength and nouriſh her.

The cauſe of the after-throws.

Throws come preſently after the birth of the child, becauſe that then the veins (nature being wholly converted to expulſion) caſt out the reliques of the menſtrual matter that hath been ſuppreſſed for the ſpace of nine months, into the womb with great violence, which becauſe they are groſs, ſlimy and dreggiſh, cannot come forth without great pain both to the veins from whence they come, and alſo unto the womb whereunto they go: alſo then by the converſion of that portion thereof that remaineth into wind, and by the undiſcreet admiſſion of the air in the time of the child-birth, the womb and all the ſecret parts will ſwell, unleſs it be prevented with ſome digeſting, repelling or mollifying oil, or by artificial rowling of the parts about the belly.

CHAP. XVII.

What is to be done preſently after the child is born.

Why the ſecundine or after-birth muſt be taken away preſently after the birth of the child.

PReſently after the child is born, the Midwife muſt draw away the ſecundine or after-birth, as gently as ſhe can: but if ſhe cannot, let her put her hands into the womb, and ſo draw it out, ſeparating it from the other parts; for otherwiſe if it ſhould continue longer, it would be more difficult to be gotten out, becauſe that preſently after the birth the orifice of the womb is drawn together and cloſed, and then all the ſecundine muſt be taken from the child. Therefore the navel-ſtring muſt be tied with a double thred an inch from the belly. Let not the knot be too hard, leſt that part of the navel-ſtring which is without the knot, ſhould fall away ſooner than it ought, neither too ſlack or looſe, leſt that an exceeding and mortal flux of blood ſhould follow after it is cut off, and leſt that through it (that is to ſay, the navel-ſtring) the cold air ſhould enter into the childs body. When the knot is ſo made, the navel-ſtring muſt be cut in ſunder the bredth of two fingers beneath it with a ſharp knife. Upon the ſection you muſt apply a double linnen cloth dipped in oyl of Roſes, or of ſweet Almonds, to mitigate the pain; for ſo within a few days after, that which is beneath the knot will fall away being deſtitute of life and nouriſhment, by reaſon that the vein and artery are tied ſo cloſe, that no life nor nouriſhment can come unto it: commonly all Midwives do let it lie unto the bare belly of the infant, whereof cometh grievous pain and griping, by reaſon of the coldneſs thereof which dieth by little and little as deſtitute of vital heat. But it were far better to rowl it in ſoft cotten or lint, until it be mortified, and ſo fall away.

The binding of the childs navel-ſtring after the birth.

Thoſe midwives do unadviſedly, who ſo ſoon as the infant is born do preſently tie the navel-ſtring and cut it off, not looking firſt for the avoiding of the ſecundine. When all theſe things are done, the infant muſt be wiped, cleanſed and rubbed from all filth and excrement with oil of Roſes or Myrtles. For thereby the pores of the skin will be better ſhut, and the habit of the body the more ſtrengthened.

There be ſome that waſh infants at that time in warm water and red wine, and afterwards anoint them with the fore-named oils. Others waſh them not in wine alone, but boil therein red Roſes and the leaves of Myrtles, adding thereto a little ſalt; and then uſing this lotion for the ſpace of five or ſix days, they not only waſh away the filth, but alſo reſolve and digeſt, if there be any hard or contuſed place in the infants tender body, by reaſon of the hard travail and labour in child-birth.

The defaults that are commonly in children newly born.

Their toes and fingers muſt be handled, drawn aſunder and bowed, and the joints of the arms and legs muſt be extended and bowed for many days and often; that thereby that portion of the excremental humor that remaineth in the joints, by motion may be heated and reſolved. If there be any default in the members either in conformation, conſtruction or ſociety with thoſe that are adjoining to them, it muſt be corrected or amended with ſpeed. Moreover, you muſt look whether any of the natural paſſages be ſtopped, or covered with a membrane, as it often happeneth. For if any ſuch cover or ſtop the orifices of the ears, noſtrils, mouth, yard or womb, it muſt be cut in ſunder by the Chirurgion, and the paſſage muſt be kept open by putting in of tents, peſſaries or doſels, leſt otherwiſe they ſhould join together again after they are cut. If he have one finger more than he ſhould naturally, if his fingers do cleave cloſe together, like unto the feet of a Gooſe or Duck, if the ligamental membrane that is under the tongue be more ſhort and ſtiffer than it ought, that the infant cannot ſuck, nor in time to come, ſpeak, by reaſon thereof; and if there be any other thing contrary to nature, it muſt be all amended by the induſtry of ſome expert Chirurgion.

The defaults of conformation muſt be ſpeedily amended.

Many times in children newly born, there ſticketh on the inner ſide of their mouth and on their tongue, a certain chalky ſubſtance, both in colour and in conſiſtence; this effect proceeding from the diſtemperature of the mouth, the French-men call it the white Cancer. It will not permit the infant to ſuck, and will ſhortly breed and degenerate into ulcers that will creep into the jaws, and even unto the throat, and unleſs it be cleanſed ſpeedily, will be their death. For remedy whereof, it muſt be cleanſed by Deterſives, as with a linnen cloth bound to a little ſtick, and dipped in a medicine of an indifferent conſiſtence made with oil of ſweet almonds, hony and ſugar. For by rubbing this gently on it, the filth may be mollified, and ſo cleanſed or waſhed away.

Remedies for the Cancer in a childs mouth.

Moreover it will be very meet and convenient to give the infant one ſpoonful of oil of almonds, to make his belly looſe and ſlippery, to aſſwage the roughneſs of the weaſon and gullet, and to diſſolve the tough phlegm, which cauſeth a cough, and ſometimes difficulty of breathing. If the eye-lids cleave together, or if they be joined together, or agglutinated to the coats *cornea* or *adnata*; if the watery tumor called *hydrocephalos* affect the head, then muſt they be cured by the proper remedies formerly preſcribed, againſt each diſeaſe.

Many

Many from their birth have ſpots or marks, which the common people of *France* call *Signes*, that is, marks or ſigns. Some of theſe are plain and equal with the skin, others are raiſed up in little tumors, and like unto warts, ſome have hairs upon them, many times they are ſmooth, black or pale; yet for the moſt part red. When they riſe in the face, they ſpread abroad thereon many times with great deformity. Many think the cauſe thereof to be a certain portion of menſtrual matter cleaving to the ſides of the womb, coming of a freſh flux, if happily a man do yet uſe copulation with the woman, or elſe diſtilling out of the veins into the womb, mixed and concorporated with the ſeeds at that time when they are congealed, infecting this or that part of the iſſue being drawn out of the ſeminal body, with their own colour. Women refer the cauſe thereof unto their longing when they are with child; which may imprint the image of the thing they long for or deſire, in the child or iſſue that is not as yet formed (as the force and power of imagination in humane bodies is very great:) but when the child is formed, no imagination is able to leave the impreſſion of any thing in it, no more than it could cauſe horns to grow on the head of King *Chypus* as he ſlept preſently after he was returned from attentively beholding Bulls fighting together. Some of thoſe ſpots be curable, others not; as thoſe that are great, and thoſe that are on the lips, noſtrils, and eye-lids. But thoſe that are like unto warts, becauſe they are partakers of a certain malign quality and melancholick matter, which may be irritated by endeavouring to cure them, are not to be medled with at all, for being troubled and angered, they ſoon turn into a Cancer (which they call *Noli me tangere*) thoſe that are curable are ſmall, and in ſuch parts as they may be dealt withall without danger. Therefore they muſt be pierced through by the roots with a needle and a thred, and ſo being lifted up by the ends of the thred, they muſt be cut away, and the wound that remaineth muſt be cured according to the general method of wounds.

An old fable of King *Chypus*.

Which uncurable.

Which and how they are curable.

There are ſome that ſuppoſe the red ſpots that are raiſed up into little knobs and bunches, may be waſhed away and conſumed by rubbing and anointing them often with menſtrual bloud, or the bloud of the ſecundine or after-birth. Thoſe that are hairy and ſomewhat raiſed up like unto a *Want* or Mouſe, muſt be pierced through the roots in three or four places, and ſtraitly bound, ſo that at length being deſtitute of life and nutriment, they may fall away: after they are faln away, the ulcer that remaineth muſt be cured as other ulcers are. If thereby any ſuperfluous fleſh remain, it muſt be taken away by applying *Ægyptiacum*, or the powder of Mercury, and ſuch like: but if it be doubted that it cometh from the root of the tumor that may haply remain, it muſt be burned away by the root with oyl of vitriol or *aqua fortis*.

There is alſo another kind or ſort of ſpots, of a livid or violet colour, coming eſpecially in the face about the lips, with a ſoft, ſlack, lax, thin, and unpainful tumor, and the veins as if they were varicous round about it. This kind of tumor groweth greater when it ariſeth on children that are wayward and crying, and in men of riper years that are cholerick and angry, and then it will be of a diverſe colour, like unto a lappet and flap of fleſh that hangeth over the Turky-cocks bill. When they have done crying, or ceaſed their anger, the tumor will return to his own natural colour again. But you muſt not attempt to cure it in people that are of theſe conditions.

CHAP. XVIII.

How to pull away the ſecundine or after-birth.

I Suppoſe that they are called ſecundines, becauſe they do give the woman that is with child the ſecond time, as it were a ſecond birth; for if there be ſeveral children in the womb at once, and of different ſexes, they then have every one their ſeveral ſecundines, which thing is very neceſſary to be known by all Midwives. For they do many times remain behind in the womb when the child is born, either by reaſon of the weakneſs of the woman in travail, which by contending and labouring for the birth of the child, hath ſpent all her ſtrength: or elſe by a tumor riſing ſuddenly in the neck of the womb, by reaſon of the long and difficult birth, and the cold air unadviſedly permitted to ſtrike into the orifice of the womb. For ſo the liberties of the ways or paſſages are ſtopped and made more narrow, ſo that nothing can come forth: or elſe becauſe they are doubled and folded in the womb, and the waters gone out from them with the infant, ſo that they remain as it were in a dry place: or elſe becauſe they yet ſtick in the womb by the knots of the veins and arteries, which commonly happeneth in thoſe that are delivered before their time. For even as apples which are not ripe, cannot be pulled from the tree but by violence: but when they are ripe, they will fall off of their own accord: ſo the ſecundine before the natural time of the birth can hardly be pulled away but by violence; but at the prefixed natural time of the birth it may eaſily be drawn away.

Why it is called the ſecundine.

The cauſes of the ſtaying of the ſecundines

Many and grievous accidents follow the ſtaying of the ſecundine; as ſuffocation of the womb, often ſwounding, by reaſon that groſs vapors ariſe from the putrefaction unto the midriff, heart and brain, therefore they muſt be pulled away with ſpeed from the womb, gently handling the navel, if it may be ſo poſſibly done. But if it cannot be done ſo, the woman muſt be placed as ſhe was wont when that the child will not come forth naturally, but muſt be drawn forth by art. Therefore the midwife having her hand anointed with oil, muſt put it gently into the womb, and finding out the navel-ſtring, muſt follow it until it come unto the ſecundine, and if it do as yet cleave to the womb by the Cotyledons, ſhe muſt ſhake and move it gently up and down, that ſo when it is ſhaken and looſed, ſhe may draw it out gently; but if it ſhould be drawn with violence, it were to be feared leſt that the womb ſhould alſo follow: for by violent attraction ſome of the veſſels, and alſo ſome of the nervous ligaments, whereby the womb is faſtned on each ſide may be rent, whereof followeth the corruption of blood ſhed out of the veſſels, and thence cometh inflammation, an abſceſs or a mortal gangrene. Neither is there leſs danger of a convulſion by reaſon of the breaking of the nervous bodies, neither

Accidents that follow the ſtaying of the ſecundines.

The manner of drawing out the ſecundines that remain after the birth.

The cauſe of the falling down of the womb.

neither is there any leſs danger of the falling down of the womb. If that there be any knots or clods of bloud remaining together with the ſecundine, the Midwife muſt draw them out one by one, ſo that not any may be left behind.

The accidents that come of the violent pulling of the womb, together with the ſecundine.

Some women have voided their ſecundine, when it could not be drawn forth by any means, long after the birth of the child, by the neck of their womb, piece-meal, rotten and corrupted, with many grievous and painful accidents. Alſo it ſhall be very requiſite to provoke the endeavour of the expulſive faculty by ſternutatories, aromatick fomentations of the neck of the womb, by mollifying injections: and contrariwiſe, by applying ſuch things to the noſtrils as yield a rank ſavor or ſmell, with a potion made of mug-wort and bay-berries taken in hony and wine mixed together, or with half a dram of the powder of ſavin, or with the hair of a womans head, burnt and beaten to powder, and given to drink; and to conclude, with all things that provoke the terms or courſes.

CHAP. XIX.

What things muſt be given to the infant by the mouth, before he be permitted to ſuck the teat or dug.

To draw flegm from the childs mouth.

IT will be very profitable to rub all the inner ſide of the childs mouth and palat gently with treacle and hony, or the oil of ſweet almonds extracted with fire, and if you can, to cauſe it to ſwallow ſome of thoſe things: for thereby much flegmatick moiſture will be drawn from the mouth, and alſo will be moved or provoked to be vomited up from the ſtomach; for if theſe excremental humors ſhall be mixed with the milk that is ſucked, they would corrupt it, and then the vapors that ariſe from the corrupted milk unto the brain would infer moſt pernicious accidents. And you may know that there are many excremental things in the ſtomach and guts of children by this, becauſe that ſo ſoon as they come into the world, and often before they ſuck milk or take any other thing, they void downwards many excrements diverſly coloured, as yellow, green and black. Therefore many, that they may ſpeedily evacuate the matter that cauſeth the fretting of the guts, do not only miniſter thoſe things fore-named, but alſo ſome laxative ſyrup, as that that is made of damask-Roſes. But before the infant be put to ſuck the mother, it is fitting to preſs ſome milk out of her breſt into its mouth, ſo that ſo the fibres of the ſtomach may by little and little accuſtom themſelves to draw in the milk.

Milk ſoon corrupted in a flegmatick ſtomach.

CHAP. XX.

That mothers ought to nurſe or give ſuck unto their own children.

The mothers milk is moſt familiar for the child.

THat all mothers would nurſe their own children were greatly to be wiſhed; for the Mothers milk is far more familiar nouriſhment for the infant than that of any Nurſe: for it is nothing elſe but the ſame blood made white in the dugs, wherewith before it was nouriſhed in the womb. For the mother ought not to give the child ſuck for the ſpace of a few days after the birth, but firſt to expect the perfect expurgation and avoiding of the excremental humors. And in the mean time let her cauſe her breſts to be ſucked of another, or many other children, or of ſome wholſome or ſober maid, whereby the milk may be drawn by little and little unto her breſts, and alſo by little and little purified.

For a certain ſpace after the birth, the milk will be troubled, and the humors of the body moved: ſo that by long ſtaying in the dugs, it will ſeem to degenerate from its natural goodneſs as the groſneſs of it is ſomewhat congealed, the manifeſt heat in touching, and the yellow colour thereof teſtifieth evidently. Therefore it is neceſſary that others ſhould come in place thereof when it is ſucked out, wherewith the infant may be nouriſhed. But if the mother or the Nurſe chance to take any diſeaſe, as a Feaver, Scouring, or any ſuch like, let her give the child to another to give it ſuck, leſt that the child chance to take the Nurſes diſeaſes. And moreover, mothers ought to nurſe their own children, becauſe for the moſt part they are far more vigilant and careful in bringing up and attending their children than hired and mercenary Nurſes, which do not ſo much regard the infant, as the gain they ſhall have by the keeping of it, for the moſt part. Thoſe that do not nurſe their own children, cannot rightly be termed mothers: for they do not abſolutely perform the duty of a mother unto the child, as *Marcus Aurelius* the Roman Emperor was wont to ſay. For it is a certain unnatural, imperfect and half kind of mothers duty, to bear a child, and preſently to abandon or put it away as if it were forſaken: to nouriſh and feed a thing in their womb (which they neither know nor ſee) with their own bloud, and then not to nouriſh it when they ſee it in the world alive, a creature or reaſonable ſoul, now requiring the help and ſuſtentation of the mother.

The diſeaſe of the Nurſe is participated unto the child.

Gal. lib. 12. *cap.*

CHAP. XXI.

Of the choice of Nurſes.

MAny husbands take ſuch pity on their tender wives, that they provide Nurſes for their children, that unto the pains that they have ſuſtained in bearing them, they may not alſo add the trouble of nurſing them: wherefore ſuch a Nurſe muſt be choſen which hath had two or three children. For the dugs which have been already ſucked and accuſtomed to be filled, have the veins and arteries more large and capable to receive the more milk. In the choice of a Nurſe there is ten things to be conſidered very diligently, as her age, the habit of her body, her behaviour,

the

the condition of her milk, the form not only of her dugs or breasts, but also of her teats or nipples, the time of her child-birth, the sex of her last infant or child, that she be not with child, that she be sound and in perfect health. As concerning her age; she ought not to be under twenty five years, nor above thirty five: the time that is between is the time of strength, more temperate and more wholsome and healthy, and less abounding with excremental humors. And because her body doth not then grow or increase, she must of necessity have the more abundance of blood. After thirty five years in many the menstrual fluxes do cease, and therefore it is to be supposed that they have the less nutriment for children. The best age of a Nurse.

The Nurse also must be of good habit, or square or well set body, her breast broad, her colour lively, not fat, nor lean, but well made, her flesh not soft and tender, but thick, and hard or strong, whereby she may be the more able to endure watching and taking of pains about the child; she must not have a red or freckled face, but brown or somewhat shadowed, or mixed with redness: for truly such women are more hot than those that are red in the face, by reason whereof they must needs concoct and turn their meat the better into blood. For according to the judgment of *Sextus Chæronensis*, as blackish or brown ground is more fertile than the white: even so a brown woman hath more store of milk. You must look well on her head, lest she should have the scurf or running sores; see that her teeth be not foul or rotten, nor her breath stinking, nor no ulcer nor sore about her body, and that she be not born of gouty or leprous Parents. The best habit of body in a Nurse. *Lib. de infantia.*

She ought to be quick and diligent in keeping the child neat and clean, chaste, sober, merry, always laughing and smiling on her Infant, often singing unto it, and speaking distinctly and plainly, for she is the only Mistress to teach the child to speak. Let her be well manner'd, because the manners of the Nurse are participated unto the Infant together with the milk. For the whelps of dogs, if they do suck Wolves or Lionesses, will become more fierce and cruel than otherwise they would. Contrariwise, the Lions whelps will leave their savageness and fierceness, if that they be brought up and nourished with the milk of any Bitch, or other tame beast. If a Goat give a Lamb suck, the same Lambs wool will be more hard than others; contrariwise, if a sheep give a Kid suck, the same Kids hair will be more soft than another Kids hair. She ought to be sober, and the rather for this cause, because many Nurses being overladen with wine and banquetting, often set their children unto their breasts to suck, and then fall asleep, and so suddenly strangle or choak them Of what behavior the Nurse must be.

She must abstain from copulation: for copulation troubleth and moveth the humors and the bloud, and therefore the milk it self, and it diminisheth the quantity of milk, because it provoketh the menstrual flux, and causeth the milk to have a certain strong and virulent quality, such as we may perceive to breath from them that are incensed with the fervent lust and desire of Venery. And moreover, because that thereby they may happen to be with child, whereof ensueth discommodity both to her own child that is within her body, and also to the Nurse-child: to the Nurse-child, because that the milk that it sucketh will be worse and more depraved that otherwise it would be, by reason that the more laudable bloud after the conception remaineth about the womb, for the nutriment and increasing of the infant in the womb; and the more impure blood goeth into the dugs, which breedeth impure or unclean milk: but to the conceived child, because it will cause it to have scarcity of food; for so much as the sucking child sucketh, so much the child conceived in the womb wanteth. Why the Nurse must abstain from copulation.

Also she ought to have a broad breast, and her dugs indifferently big, not slack or hanging, but of a middle consistence, between soft and hard; for such dugs will concoct the blood into milk the better, because that in firm flesh the heat is more strong and compact. You may by touching try whether the flesh be solid and firm, as also by the dispersing of the veins, easily to be seen by reason of their swelling and blewness, through the dugs, as it were into many streams or little rivulets; for in flesh that is loose and slack, they lie hidden. Those dugs that are of a competent bigness, receive or contain no more milk than is sufficient to nourish the infant. In those dugs that are great and hard, the milk is as it were suffocated, stopped or bound in, so that the child in sucking can scarce draw it out, and moreover, if the dugs be hard, the child putting his mouth to the breast, may strike his nose against it, and so hurt it, whereby he may either refuse to suck, or if he doth proceed to suck, by continual sucking, and placing of his nose on the hard breast, it may become flat, and the nostrils turned upwards, to his great deformity, when he shall come to age. If the teats or nipples of the dugs do stand somewhat low or depressed inwards on the tops of the dugs, the child can hardly take them between its lips, therefore his sucking will be very laborious. If the nipples or teats be very big, they will so fill all his mouth, that he cannot well use his tongue in sucking or in swallowing the milk. What dugs a Nurse ought to have.

We may judg of or know the nature and condition of milk, by the quantity, quality, colour, savor and taste; when the quantity of the milk is so little, that it will not suffice to nourish the infant, it cannot be good and laudable; for it argueth some distemperature either of the whole body, or at least of the dugs, especially a hot and dry distemperature. But when it superaboundeth, and is more than the infant can spend, it exhausteth the juice of the Nurses body, and when it cannot all be drawn out by the infant, it cluttereth, and congealeth or corrupteth in the dugs. Yet I would rather wish it to abound, than to be defective, for the superabounding quantity may be pressed out before the child be set to the breast. What is to be observed in the milk.

That milk that is of a mean consistence between thick and thin, is esteemed to be the best. For it betokeneth the strength and vigor of the faculty that engendreth it in the breasts. Therefore if one drop of the milk be laid on the nail of ones thumb, being first made very clean and fair, if the thumb be not moved, and it run off the nail, it signifieth that it is watery milk: but if it stick to the nail, although the end of the thumb be bowed downwards, it sheweth that it is too gross and thick: but if it remain on the nail so long as you hold it upright, and fall from it when The laudable consistence of the milk.

when you hold it a little aſide or downwards by little and little, it ſheweth it is very good milk. And that which is exquiſitely white, is beſt of all. For the milk is no other thing than bloud made white.

Why the milk ought to be very white.

Therefore, if it be of any other colour, it argueth a default in the bloud: ſo that if it be brown, it betokeneth melancholik bloud; if it be yellow, it ſignifieth cholerick bloud; if it be wan and pale, it betokeneth phlegmatick bloud; if it be ſomewhat red, it argueth the weakneſs of the faculty that engendreth the milk. It ought to be ſweet, fragrant and pleaſant in ſmell; for if it ſtrike into the noſtrils with a certain ſharpneſs, as for the moſt part the milk of women that have red hair and little freckles on their faces doth, it prognoſticates a hot and cholerick nature: if with a certain ſowerneſs, it portendeth a cold and melancholick nature. In taſte it ought to be ſweet and as it were ſugered, for the bitter, ſaltiſh, ſharp, and ſtiptick, is naught. And here I cannot but admire the providence of nature, which hath cauſed the bloud wherewith the child ſhould be nouriſhed to be turned into milk: which unleſs it were ſo, who is he that would not turn his face from, and abhor ſo grievous and terrible a ſpectacle of the childs mouth ſo imbrued and beſmeared with bloud? what mother or Nurſe would not be amazed at every moment with the fear of the blood ſo often ſhed out, or ſucked by the infant for his nouriſhment? Moreover, we ſhould want two helps of ſuſtentation, that is to ſay, Butter and Cheeſe.

Why a woman that hath red hair, or freckles on her face cannot be a good Nurſe.

Neither ought the child to be permitted to ſuck within five or ſix days after it is born, both for the reaſon before alledged, and alſo becauſe he hath need of ſo much time to reſt quiet, and eaſe himſelf after the pains he hath ſuſtained in his birth: in the mean ſeaſon the mother muſt have her breaſts drawn by ſome maid that drinketh no wine, or elſe ſhe may ſuck or draw them her ſelf with an artificial inſtrument which I will deſcribe hereafter.

Why that Nurſe that hath born a man child is to be preferred before another

Why ſhe cannot be a good Nurſe whoſe child was born before the time.

That Nurſe that hath born a man child, is to be preferred before another, becauſe her milk is the better concocted, the heat of the male child doubling the mothers heat. And moreover, the women that are great with child of a male child, are better coloured, and in better ſtrength, and better able to do any thing all the time of their greatneſs, which proveth the ſame: and moreover the blood is more laudable, and the milk better. Furthermore it behoveth the Nurſe to be brought on bed, or to travail at her juſt and prefixed or natural time: for when the child is born before his time of ſome inward cauſe, it argueth that there is ſome default lurking and hidden in the body and humors thereof.

CHAP. XXII.

What diet the Nurſe ought to uſe, and in what ſituation ſhe ought to place the infant in the Cradle.

BOth in eating, drinking, ſleeping, watching, exerciſing and reſting, the Nurſes diet muſt be divers, according as the nature of the child both in habit and temperature ſhall be, as for example, if the child be altogether of a more hot bloud, the Nurſe both in feeding and ordering her ſelf ought to follow a cooling diet. In general let her eat meats of good juice, moderate in quantity and quality, let her live in a pure and clear air, let her abſtain from all ſpices, and all ſalted and ſpiced meats, and all ſharp things, wine, eſpecially that which is not allayed or mixed with water, and carnal copulation with a man; let her avoid all perturbations of the mind, but anger eſpecially; let her uſe moderate exerciſe, unleſs it be the excerciſe of her arms and upper parts, rather than the legs and lower parts, whereby the greater attraction of the blood that muſt be turned into milk, may be made towards the dugs. Let her place her child ſo in the Cradle that his head may be higher than all the body, that ſo the excremental humors may be the better ſent from the brain unto the paſſages that are beneath it. Let her ſwathe it ſo as the neck and all the back bone may be ſtraight and equal. As long as the child ſucketh, and is not fed with ſtronger meat, it is better to lay him alway on his back, than any other way, for the back is as it were the keel in a ſhip, the ground-work and foundation of all the whole body, whereon the infant may ſafely and eaſily reſt. But if he lie on the ſide, it were danger leſt that the bones of the ribs being ſoft and tender, not ſtrong enough, and united with ſlack bands, ſhould bow under the weight of the reſt, and ſo wax crooked, whereby the infant might become crook-backed. But when he beginneth to breed teeth, and to be fed with more ſtrong meat, and alſo the bones and connexions of them begin to wax more firm and hard, he muſt be layed one while on this ſide, another while on that, and now and then alſo on his back. And the more he groweth, the more let him be accuſtomed to lie on his ſides; and as he lieth in the Cradle, let him be turned unto that place whereat the light cometh in, leſt that otherwiſe he might become purblind, for the eye of its own nature is bright and lightſome, and therefore always deſireth the light, and abhorreth darkneſs; for all things are moſt delighted with their like, and ſhun their contraries. Therefore unleſs the light comes directly into the childs face, he turneth the himſelf every way being very ſorrowful, and ſtriveth to turn his head and eyes that he may have the light; and that often turning and rowling of his eyes at length groweth into a cuſtom that cannot be left: and ſo it cometh to paſs that the infant doth either become pur-blind, if he ſet his eyes ſtedfaſtly on one thing, or elſe his eyes do become trembling, always turning and unſtable, if he caſt his eyes on many things that are round about him: which is the reaſon that Nurſes, being taught by experience, cauſe over the head of the child lying in the Cradle, an arch or vault of Wickers covered with cloth to be made, thereby to reſtrain, direct, and eſtabliſh the uncertain and wandering motions of the childs eyes.

Anger greatly hurteth the Nurſe.

The exerciſe of the arms is beſt for the Nurſe.

How the child ſhould be placed in the Cradle.

Why an arch of wickers muſt be made over the childs head lying in the cradle.

Why a ſquint-eyed Nurſe cauſeth the child to be ſquint-eyed.

If the Nurſe be ſquint-eyed, ſhe cannot look upon the child but ſide-ways, whereof it cometh to paſs that the child being moiſt, tender, flexible, and prone to any thing with his body, and ſo likewiſe with his eye, by a long and daily cuſtom unto his Nurſes ſight, doth ſoon take the like

cuſtom

cuſtom to look after that ſort alſo, which afterwards he cannot leave or alter. For thoſe evil things which we learn in our youth, do ſtick firmly by us; but the good qualities are eaſily changed into worſe. In the eyes of thoſe that are ſquint-eyed, thoſe two muſcles which do draw the eyes to the greater or leſſer corner, are chiefly or more frequently moved. Therefore either of theſe being confirmed in their turning aſide by long uſe, as the exerciſe of their proper office increaſeth the ſtrength, ſoon overcomes the contrary or withſtanding muſcles, called the *Antagoniſts*, and brings them into their ſubjection, ſo that, will they, nill they, they bring the eye unto this or that corner as they liſt. So children become left-handed, when they permit their right hand to languiſh with idleneſs and ſluggiſhneſs, and ſtrengthen their left hand with continual uſe and motion to do every action therewithall, and ſo bring by the exerciſe thereof more nutriment unto that part. But if men (as ſome affirm) being of ripe years, and in their full growth, by dayly ſociety and company of thoſe that are lame and halt do alſo halt, not minding ſo to do, but it cometh againſt their wills, and when they think nothing thereof, why ſhould not the like happen in children, whoſe ſoft and tender ſubſtance is as flexible and pliant as wax unto every impreſſion? Moreover, children, as they become lame and crook-backt, ſo do they alſo become ſquint-eyed by the hereditary default of their parents.

How children become left-handed.

CHAP. XXIII.

How to make pap for Children.

PAp is a moſt meet food or meat for children; becauſe they require moiſt nouriſhment; and it muſt be anſwerable in thickneſs to the milk, that ſo it may not be difficult to be concocted or digeſted. For pap hath theſe three conditions, ſo that it be made with wheaten flower, and that not crude, but boiled: let it be put into a new earthen pot or pipkin, and ſo ſet into an oven at the time when bread is ſet thereinto to be baked; and let it remain there until the bread be baked and drawn out: for when it is ſo baked, it is leſs clammy and crude. Thoſe that mix the meal crude with the milk, are conſtrained to abide one of theſe diſcommodities or other, either to give the meal groſs and clammy unto the child, if that the pap be only firſt boiled over the fire in a pipkin or skellet, ſo long as ſhall be neceſſary for the milk; hence come obſtructions in the meſaraick veins, and in the ſmall veins of the liver, fretting and worms in the guts, and the ſtone in the reins. Or elſe they give the child the milk, deſpoiled of its butteriſh and whayiſh portion, and the terreſtrial, and cheeſe-like, or curd-like remaining, if the pap be boiled ſo long as is neceſſary for the meal: for the milk requireth not ſo great, neither can it ſuffer ſo long boiling as the meal. Thoſ ethat do uſe crude meal, and have no hurt by it, are greatly bound to nature for ſo great a benefit. But *Galen* willeth children to be nouriſhed only with the Nurſes milk, ſo long as the Nurſe hath enough to nouriſh and feed it. And truly there are many children that are contented with milk only, and will receive no pap until they are three months old. If the child at any time be coſtive, and cannot void the excrements, let him have a cataplaſm made with one dram of Aloes, of white and black Hellebore, of each fifteen grains, being all incorporated in as much of an Ox gall as is ſufficient, and extended or ſpread on Cotton like unto a *pultis*, as broad as the palm of ones hand, and ſo apply it upon the navel warm: Moreover, this cataplaſm hath alſo virtue to kill the worms in the belly. Many times children have fretting of the guts, that maketh them to cry, which cometh of crudity. This muſt be cured by applying unto the belly ſweaty or moiſt wooll, macerated in oil of Camomil.

Three laudable conditions of pap.

How the meal muſt be prepared to make the pap withall.

Why the meal wherewith the pap muſt be made, muſt firſt be boiled or baked.

Lib. 1. de ſanit. tuend.

A cataplaſm to relax the childs belly.

For the fretting of the guts in children.

If when the childs teeth begin to grow, he chance to bite the nipple of the Nurſes breaſt, there will be an ulcer very contumacious and hard to be cured; becauſe that the ſucking of the child, and the rubbing of the cloths do keep it always raw; it muſt be cured with fomenting it with Alum water, and then preſently after the fomentation putting thereupon a cover of lead, made like unto a hat, as they are here deſcribed, with many holes in the top, whereat both the milk, and alſo the ſanious matter that cometh from the ulcers may go out; for lead it ſelf will cure ulcers.

For the ulcers of the nipples or teats.

The figure of leaden Nipples to be put upon the Nipple or Teat of the Nurſe, when it is ulcerated.

Children may be cauſed to ceaſe their crying four manner of ways, that is to ſay, by giving them the teat, by rocking them in a cradle, by ſinging unto them, and by changing the cloaths and ſwathes wherein they are wrapped. They muſt not be rocked too violently in the cradle, leſt that the milk that is ſucked ſhould be corrupted by the too violent motion, by reaſon whereof they muſt not be handled violently any other way, and not altogether prohibited, or not ſuffered to cry. For by crying the breaſt and lungs are dilated, and made bigger and wider; the natural parts the ſtronger, and the brain, noſtrils, the eyes and mouth are purged, by the tears and filth that come from the eyes and noſtrils. But they muſt not be permitted to cry long or fiercely, for fear of breaking the production of the *Peritonæum*, and thereby cauſing the falling down of the guts into the cod, which rupture is called of the Greeks *Enterocele*; or of the caul, which the Greeks call *Epiplocele*.

What moderate crying worketh in the infant.

What immoderate crying cauſeth.

CHAP. XXIV.

Of the weaning of Children.

When children muſt be weaned.

Many are weaned in the eighteenth month, ſome in the twentieth; but all or the moſt part in the ſecond year: for then their teeth appear, by whoſe preſence nature ſeemeth to require ſome harder meat than milk or pap, wherewith children are delighted, and will feed more earneſtly thereon. But there is no certain time of weaning of children. For the teeth of ſome will appear ſooner, and ſome later; for they are prepared of nature for no other purpoſe than to chaw the meat. If children be weaned before their teeth appear, and be fed with meat that is ſomewhat hard and ſolid, according to the judgment of *Avicen*, they are incident to many diſeaſes coming through crudity; becauſe the ſtomach is yet but weak, and wanteth that preparation of the meats which is made in the mouth by chawing; which men of ripe years cannot want without offence: when the child is two years old, and the teeth appear, if the child more vehemently deſire harder meats, and doth feed on them with pleaſure and good ſucceſs, he may be ſafely weaned; for it cannot be ſuppoſed that he hath this appetite of hard meats in vain, by the inſtinct of nature. Yet he may not be weaned without ſuch an appetite, if all other things be correſpondent, that is to ſay, his teeth and age; for thoſe things that are eaten without an appetite, cannot profit. But if the child be weak, ſickly, or feeble, he ought not to be weaned. And when the meet time of weaning cometh, the Nurſe muſt now and then uſe him to the teat, whereby he may leave it by little and little, and then let the teat be anointed or rubbed with bitter things, as with Aloes, water of the infuſion of *Colocynthus*, or Worm-wood, or with Muſtard, or Soot ſteeped in water, or ſuch like. Children that are ſcabby in their heads, and over all their bodies, and which void much phlegm at their mouth and noſtrils, and many excrements downwards, are like to be ſtrong and ſound of body; for ſo they are purged of excremental humors: contrariwiſe, thoſe that are clean and fair of body, gather the matter of many diſeaſes in their bodies, which in proceſs of time will break forth and appear. Certainly, by the ſudden falling of ſuch matters into the back-bone many become crook-backt.

Why children muſt not be weaned before their teeth appear.

How children muſt be weaned.

What children are ſtrong and ſound of body

An often cauſe of ſudden crookedneſs.

CHAP. XXV.

By what ſigns it may be known whether the child in the womb be dead or alive.

A moſt certain ſign of the child dead in the womb.

If neither the Chirurgions hand, nor the mother can perceive the infant to move, if the waters be flowed out, and the ſecundine come forth, you may certainly affirm that the infant is dead in the womb, for this is the moſt infallible ſign of all others: for becauſe the child in the womb doth breath but by the artery of the navel, and the breath is received by the *Cotyledon* of the arteries of the womb, it muſt of neceſſity come to paſs that when the ſecundine is ſeparated from the infant, no air nor breath can come unto it. Wherefore ſo often as the ſecundine is excluded before the child, you may take it for a certain token of the death thereof: when the child is dead, it will be more heavy to the mother than it was before when it was alive, becauſe it is now no more ſuſtained by the ſpirits and faculties wherewith before it was governed and ruled, for ſo we ſee dead men to be heavier than thoſe that are alive, and men that are weak through hunger and famine to be heavier than when they are well refreſhed, and alſo when the mother inclines her body any way, the infant falleth that way alſo even as it were a ſtone. The mother is alſo vexed with ſharp pain from the privities even to the navel, with a perpetual deſire of making water, and going to ſtool, becauſe that nature is wholly buſied in the expulſion or avoidance of that which is dead: for that which is alive will expel the dead ſo far as it can from it ſelf, becauſe the one is altogether different from the other; but likeneſs, if any thing, conjoins and unites things together: the genitals are cold in touching, and the mother complaineth that ſhe feeleth a coldneſs in her womb, by reaſon that the heat of the infant is extinguiſhed, wherewith before her heat was doubled: many filthy excrements come from her, and alſo the mothers breath ſtinketh, ſhe ſwoundeth often, all which for the moſt part happen within three days after the death of the child: for the infants body will ſooner corrupt in the mothers womb than it would in the open air, becauſe that, according to the judgment of *Galen*, all hot and moiſt things, being in like manner incloſed in a hot and moiſt place, eſpecially if by reaſon of the thickneſs or ſtraitneſs of the place they cannot receive the air, will ſpeedily corrupt. Now by the riſing up of ſuch vapors from the dead unto the brain and heart, ſuch accidents may ſoon follow, her face will be clean altered, ſeeming livid and ghaſtly, her dugs fall and hang looſe and lank, and her belly will be more hard and ſwollen than it was before. In all bodies ſo putrifying,

When the child is dead in the womb he is more heavy than he was before being alive.

That which is alive will not ſuffer that which is dead.

Lib. de tumorib.

ing, the natural heat vaniſheth away, and in place thereof ſucceedeth a preternatural, by the working whereof the putrified and diſſolved humors are ſtirred up into vapors, and converted into wind, and thoſe vapors, becauſe they poſſeſs and fill more ſpace and room (for Naturaliſts ſay that of one part of water ten parts of air are made) do ſo puff up the putrified body into a greater bigneſs. You may note the ſame thing in bodies that are gangrenate, for they caſt forth many ſharp vapors, yet nevertheleſs they are ſwollen and puffed up.

Why the belly of a woman will be more big when the child is dead within her than it was before when it was alive.

Now ſo ſoon as the Chirurgion ſhall know that the child is dead by all theſe fore-named ſigns, he ſhall with all diligence endeavor to ſave the mother ſo ſpeedily as he can, and if the Phyſicians cannot prevail with potions, baths, fumigations, ſternutatories, vomits, and liniments appointed to expel the infant, let him prepare himſelf to the work following, but firſt let him conſider the ſtrength of the woman, for if he perceive that ſhe be weak and feeble by the ſmalneſs of her pulſe, by her ſmall, ſeldom and cold breathing, and by the altered and death-like colour in her face, by her cold ſweats, and by the coldneſs of the extreme parts, let him abſtain from the work, and only affirm that ſhe will die ſhortly; contrariwiſe, if her ſtrength be yet good, let him with all confidence and induſtry deliver her on this wiſe from the danger of death.

The ſigns of a woman that is weak.

CHAP. XXVI.

Of the Chirurgical extractions of the child from the womb either dead or alive.

THerefore firſt of all the air of the chamber muſt be made temperate, and reduced unto a certain mediocrity, ſo that it may neither be too hot nor too cold. Then ſhe muſt be aptly placed, that is to ſay, overthwart the bed ſide, with her buttocks ſomewhat high, having a hard ſtuffed pillow or boulſter under them, ſo that ſhe may be in a mean figure of ſituation, neither ſitting altogether upright, nor altogether lying along on her back; for ſo ſhe may reſt quietly, and draw her breath with eaſe, neither ſhall the ligaments of the womb be extended ſo as they would if ſhe lay upright on her back, her heels muſt be drawn up cloſe to her buttocks, and there bound with broad and ſoft linnen rowlers. The rowler muſt firſt come about her neck, and then croſs-wiſe over her ſhoulders, and ſo to the feet, and there it muſt croſs again, and ſo be rowled about the legs, thighs, and then it muſt be brought up to the neck again, and there made faſt, ſo that ſhe may not be able to move her ſelf, even as one ſhould be tied when he is to be cut of the ſtone. But that ſhe may not be wearied, or leſt that her body ſhould yield or ſink down as the Chirurgion draweth the body of the infant from her, and ſo hinder the work, let him cauſe her feet to be ſet againſt the ſide of the bed, and then let ſome of the ſtrong ſtanders by hold her faſt by the legs and ſhoulders. Then that the air may not enter into the womb, and that the work may be done with the more decency, her privy parts and thighs muſt be covered with a warm double linnen cloth. Then muſt the Chirurgion, having his nails cloſely pared, and his rings (if he wear any) drawn off his fingers, and his arms naked, bare, and well anointed with oil, gently draw the flaps of the neck of the womb aſunder, and then let him put his hand gently into the mouth of the womb, having firſt made it gentle and ſlippery with much oil; and when his hand is in, let him find out the form and ſituation of the child, whether it be one or two, or whether it be a Mole or not. And when he findeth that he cometh naturally with his head toward the mouth or orifice of the womb, he muſt lift him up gently, and ſo turn him that his feet may come forwards, and when he hath brought his feet forwards, he muſt draw one of them gently out at the neck of the womb, and then he muſt bind it with ſome broad and ſoft or ſilken band a little above the heel with an indifferent ſlack knot, and when he hath ſo bound it, he muſt put it up again into the womb, then he muſt put his hand in again, and find out the other foot, and draw it alſo out of the womb, and when it is out of the womb, let him draw out the other again whereunto he had before tied the one end of the band, and when he hath them both out, let him join them both cloſe together, and ſo by little and little let him draw all the whole body from the womb. All other women or Midwives may help the endeavour of the Chirurgion, by preſſing the patients belly with their hands downwards as the infant goeth out: and the woman her ſelf by holding her breath, and cloſing her mouth and noſtrils, and by driving her breath downwards with great violence, may very much help the expulſion. I wiſh him to put back the foot into the womb again after he hath tied it, becauſe if that he ſhould permit it to remain in the neck of the womb, it would hinder the entrance of his hand when he putteth it in to draw out the other. But if there be two children in the womb at once, let the Chirurgion take heed leſt that he take not of either of them a leg: for by drawing them ſo, he ſhall profit nothing at all, and yet exceedingly hurt the woman. Therefore that he may not be ſo deceived, when he hath drawn out one foot and tied it, and put it up again, let him with his hand follow the band wherewithall the foot is tied, and ſo go unto the foot, and then to the groin of the child, and then from thence he may ſoon find out the other foot of the ſame child: for if it ſhould happen otherwiſe, he might draw the legs and the thighs out: but it would come no further, neither is it meet that he ſhould come out with his arms along by his ſides, or be drawn out on that ſort, but one of his arms muſt be ſtretched out above his head, and the other down by his ſide; for otherwiſe the orifice of the womb, when it were delivered of ſuch a groſs trunk, as it would be when his body ſhould be drawn out with his arms along by his ſides, would ſo ſhrink and draw it ſelf when the body ſhould come unto the neck, only by the accord of nature requiring union, that it would ſtrangle and kill the infant ſo that it cannot be drawn therehence unleſs it be with a hook put under, or faſtned under his chin, in his mouth, or in the hollowneſs of his eye. But if the infant lieth as if he would come with his hands forwards, or if his hands be forth already, ſo that it may ſeem he may be drawn forth eaſily that way, yet it muſt not be ſo done; for ſo his head would double backwards over his ſhoulders, to the great danger of his

After what ſort the woman in travail muſt be placed when the child being dead in her womb muſt be drawn out.

How ſhe muſt be bound.

How the Chirurgion ought to prepare himſelf and his patient to the drawing out of the child from the womb.

How the infant that is dead in the womb muſt be turned, bound and drawn out.

A caution to avoid ſtrangling of the infant in drawing out the body.

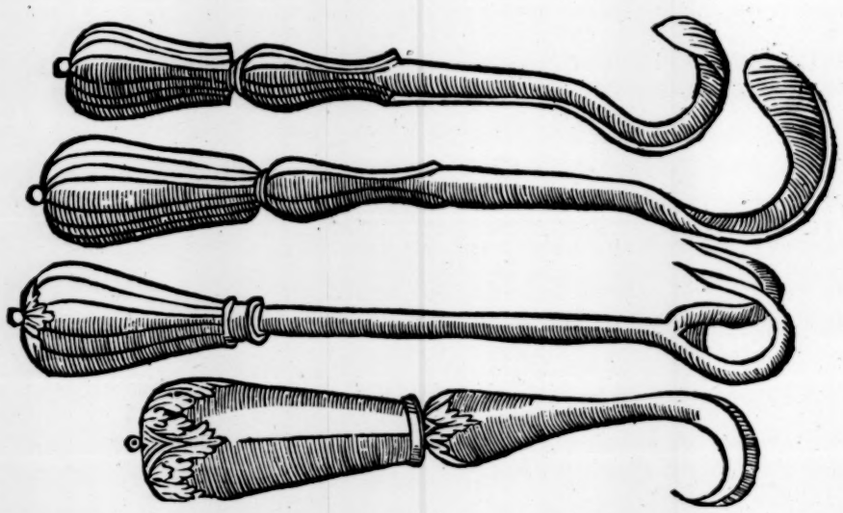
Why the child muſt not be drawn out with his hands forwards.

An hiſtory.

his mother. Once I was called unto the birth of an infant, whom the Midwives had aſſaied to draw out by the arm, ſo that the arm had been ſo long forth that it was gangrenate, whereby the child died; I told them preſently that his arm muſt be put in again, and he muſt be turned otherwiſe. But when it could not be put back by reaſon of the great ſwelling thereof, and alſo of the mothers genitals, I determined to cut it off with an inciſion knife, cutting the muſcles as near as I could to the ſhoulder, yet drawing the fleſh upwards, that when I had taken off the bone with a pair of cutting pincers, it might come down again to cover the ſhivered end of the bone, leſt otherwiſe when it were thruſt in again into the womb, it might hurt the mother. Which being done, I turned him with his feet forwards, and drew him out as is before ſaid. But if the tumor either naturally or by ſome accident, that is to ſay, by putrefaction, which may perchance come, be ſo great that he cannot be turned according to the Surgeons intention, nor be drawn out according as he lieth, the tumor muſt be diminiſhed, and then he muſt be drawn out as is aforeſaid, and that muſt be done at once. As for example, if the dead infant appear at the orifice of the womb, which our Midwives call the Garland, when it gapeth, is open and dilated, but yet his head being more great and puffed up with wind ſo that it cannot come forth, as cauſed to be ſo through that diſeaſe which the Greeks call *Mucrophiſocephalos*, the Surgeon muſt faſten a hook under his chin, or in his mouth, or elſe in the hole of his eye, or elſe, which is better and more expedient, in the hinder part of his head. For when the ſcull is ſo opened, there will be a paſſage whereat the wind may paſs out, and ſo when the tumor falleth and decreaſeth, let him draw the infant out by little and little; but not raſhly, leſt he ſhould break that whereon he hath taken hold: the figure of thoſe hooks is thus.

To diminiſh the wind wherewith the infant being dead in the womb, ſwelleth and is puffed up that he cannot be gotten out of the womb.

The form of Hooks for drawing out the infant that is dead in the womb.



But if the breaſt be troubled with like fault, the hooks muſt be faſtned about the channel-bone: if there be a Dropſie or Tympany in the belly, the hooks muſt be faſtned either in the ſhort ribs, that is to ſay, in the muſcles that are between the ribs, or eſpecially, if the diſeaſe do alſo deſcend into the feet, about the bones that are above the groin; or elſe putting the crooked knife here pictured into the womb with his left hand, let him make inciſion in the childs belly, and ſo get out all his entrails by the inciſion: for when he is ſo bowelled, all the water that cauſed the Dropſie will out. But the Surgeon muſt do none of all theſe things but when the child is dead, and the woman that travelleth in ſuch danger that ſhe cannot handſomely be holpen.

How the head of the infant if it remain in the womb ſeparated from the body, may be drawn out.

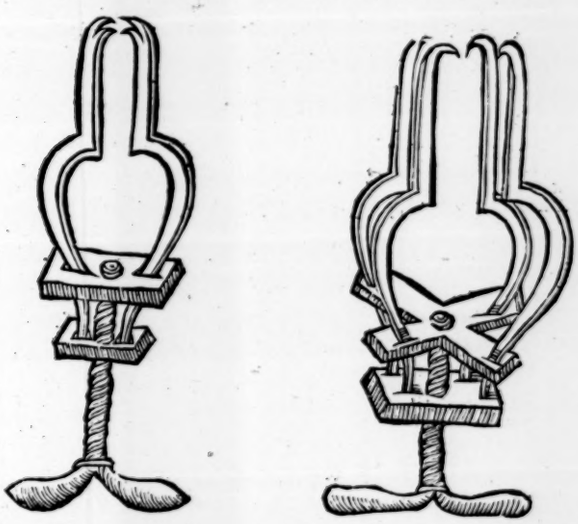
But if by any means it happeneth, that all the infants members be cut away by little and little and that the head onely remaineth behind in the womb, which I have ſometimes againſt my will, and with great ſorrow ſeen; then the left hand, being anointed with oil of Lillies, or freſh Butter, muſt be put into the womb, wherewith the Surgeon muſt find out the mouth, putting his finger into it; then with his right hand he muſt put up the hook (according to the direction of the left hand) gently, and by little and little, and ſo faſten it in the mouth, eye, or under the chin; and when he hath firmly fixed or faſtened it, he muſt therewith draw out the head by little and little, for fear of looſning or breaking the part whereon he hath hold. Inſtead of this Hook, you may uſe the inſtruments that are here deſcribed, which therefore I have taken out of the Surgery of *Francis Dalechamps*; for they are ſo made, that they may eaſily take hold of a ſpherical and round body with the branches, as with fingers.

Why the head being alone in the womb, is more difficult to be got out.

But it is not very eaſie to take hold on the head when it remaineth alone in the womb, by reaſon of the roundneſs thereof, for it will ſlip and ſlide up and down, unleſs the belly be preſſed down, and on both ſides, thereby to hold it unto the inſtrument, that it may with more facility take hold thereon.

Gryphon's

Gryphon's Talons, *that is to ſay, Inſtruments made to draw out the head of a dead infant that is ſeperated in the womb from the reſt of the body.*



CHAP. XXVII.

What muſt be done unto the woman in travail preſently after her deliverance.

THere is nothing ſo great an enemy to a woman in travail, eſpecially to her whoſe child is drawn away by violence, as cold: wherefore with all care and diligence ſhe muſt be kept and defended from cold. For after the birth, her body being void and empty, doth eaſily receive the air that will enter into any thing that's empty, and hence ſhe waxeth cold, her womb is diſtended and puffed up, and the orifice, or the veſſels thereof are ſhut and cloſed, whereof cometh ſuppreſſion of the after-birth, or other after-purgations. And thereof cometh many grievous accidents, as hyſterical ſuffocation, painful fretting of the guts, fevers, and other mortal diſeaſes.

Cold an enemy to women in travail.

What accidents follow the taking of cold in a woman that is delivered of child.

What woman ſoever will avoid that diſcommodity, let her hold her legs or thighs acroſs; for in ſo doing, thoſe parts that were ſeparated will be joined and cloſe together again. Let her belly be alſo bound or rowled with a ligature of an indifferent bredth or length, which may keep the cold air from the womb, and alſo preſs the blood out that is contained in all the ſubſtance thereof. Then give her ſome Capon-broth or Caudle, with Saffron, or with the powder called *Pulvis ducis*, or elſe bread toaſted and dipped in wine wherein ſpice is brewed, for to reſtore her ſtrength and to keep away the fretting of the guts. When the ſecundine is drawn out, and is yet hot from the womb, it muſt be laid warm unto the region of the womb, eſpecially in the winter, but in the Summer the hot skin of a weather newly killed muſt be laid unto the whole belly, and unto the region of the loins. But then the curtains muſt be kept drawn, and all the windows and doors of the chamber muſt be kept ſhut with all diligence, that no cold air may come unto the woman that travaileth, but that ſhe may lie and take her reſt quietly. The Weathers skin muſt be taken away after that it hath lain five or ſix hours, and then all the region of her belly muſt be anointed with the ointment following.

Secundines muſt be laid to the region of the womb whilſt they be warm.

℞. *ſpermatis Ceti*, ℥ij. *olei amygdal. dulcium & hypericon. an.* ℥iß. *ſevi hircini*, ℥j. *olei myrtillor.* ℥j. *ceræ novæ quantum ſufficit*; make thereof an ointment, wherewith let her be anointed twice in the day: let a plaiſter of *Galbanum* be applied to the navel, in the midſt whereof put ſome few grains of Civet or Muſk, ſo that the ſmell of the plaiſter may not ſtrike up into her noſtrils. Then let this medicine following be applied, commonly called *Tela Gualterin.* ℞. *ceræ novæ*, ℥iv. *ſpermatis Ceti*, ℥iß. *terebinth. Venetæ in aqua roſacea lotæ*, ℥ij. *olei amygdal. dulcium & hypericonic. an.* ℥j. *olei maſtich. & myrtini, an.* ℥ß. *axungiæ cervi*, ℥iß. melt them altogether, and when they are melted, take it from the fire, and then dip a linnen cloth therein, as big as may ſerve to fit the region of the belly, whereunto it is to be applied. Theſe remedies will keep the external region of the belly from wrinkling.

Unguents for the woman in travail that the region of the belly may not be wrinkled. The medicine called *Tela Gualterina.*

But of all other, the medicine following excelleth. ℞. *limacum rub.* ℔j. *florum anthos quart.* iv. let them be cut all in ſmall pieces, and put into an earthen pot well nealed with lead, and cloſe ſtopped, then let it be ſet in the dung of horſes for the ſpace of forty days, and then be preſſed or ſtrained, and let the liquor that is ſtrained out be kept in a glaſs well covered, and ſet in the Sun for the ſpace of three or four days, and therewith anoint the belly of the woman that lieth in child-bed. If ſhe be greatly tormented with throws, let the powder following be given unto her. ℞. *aniſi conditi* ℥iij. *nucis moſchat. cornu cervi uſt. an.* ℥jß. *nucleorum dactylor.* ℥iij. *ligni aloes & cinnamomi, an.* ℥ij. make thereof a moſt ſubtil powder, let her take ℥j. thereof at once with white wine warm. Or, ℞. *rad. conſolidæ major.* ℥iß. *nucleorum perſicorum, nucis moſchat. an.* ℈ij. *carab.* ℈ß. *ambræ græcæ gra.* iv. make thereof a powder, let her take one dram thereof at a time with white wine, or if ſhe have a feaver, with the broth of a Capon. Let there be hot bags applied to the genitals, belly and reins; theſe bags muſt be made of millet and oats fried in a frying pan with a little white wine.

A powder for the fretting of the guts.

What muſt be done when the groin is torn in child-birth.

But if through the violence of the extraction the genital parts be torn, as antient writers affirm it hath come to paſs, ſo that the two holes, as the two holes of the privy parts and of the fundament have been torn into one, then that which is rent muſt be ſtitched up, and the wound cured according to art. Which is a moſt unfortunate chance for the woman afterwards, for when ſhe ſhall travail again, ſhe cannot have her genital parts to extend and draw themſelves in again by reaſon of the ſcar. So that then it will be needful that the Chirurgion ſhall again open the place that was cicatrized, for otherwiſe ſhe ſhall never be delivered, although ſhe ſtrive and contend never ſo much. I have done the like cure in two women that dwelt in *Paris*.

CHAP. XXVIII.

What cure muſt be uſed to the Dugs and Teats of thoſe that are brought to bed.

To drive the milk downward.

IF great ſtore and abundance of milk be in the breaſt, and the woman be not willing to nurſe her own child, they muſt be anointed with the unguent following to repel the milk, and cauſe it to be expelled through the womb. ℞. *olei roſ. myrtini an.* ℥iij. *aceti roſat.* ℥j. incorporate them together, and therewith anointing beſprinkle them with the powder of Myrtles, and then apply the plaiſter following. ℞. *pulv. maſtichini, nucis moſchat. an.* ʒij. *nucis cupreſſi* ℥iij. *balauſt. myrtil. an.* ℥iß. *Ireos, florent.* ℥ß. *olei myrtini* ℥iij. *terebinth. Venetæ* ℥ij. *ceræ novæ quantum ſufficit*, make thereof a ſoft plaiſter.

The leaves of brook-lime, creſſes and box boiled togethe in urine and vinegar, are thought a preſent remedy for this purpoſe, that is to ſay, to draw the milk from the breaſt. And others take the clay that falleth down into the bottom of the trough wherein the grindſtone, whereon ſwords are grownd, turneth, and mix it with oil of roſes, and apply it warm unto the dugs, which in ſhort ſpace, as it is thought, will aſſwage the pain, ſtay the inflammation, and drive the milk out of the dugs. The decoction of ground-Ivy, Peruwincle, Sage, red Roſes, and Roch Allum being prepared in oxycrate, and uſed in the form of a fomentation, is thought to perform the like effect: the like virtue have the lees of red wine, applied to the dugs with vinegar, or the diſtilled water of unripe Pine-apples applied to the breaſts with linnen cloths wet therein, or hemlock beaten and applied with the young and tender leaves of a gourd.

By what reaſon, and which way cupping-glaſſes being faſtned on the groin or above the navel, do draw milk out of the breaſt.

This medicine following is approved by uſe: Take the leaves of Sage, Smallage, Rue, and Chervil, and cut or chop them very ſmall, and incorporate them in vinegar and oil of Roſes, and ſo apply it warm to the breaſt, and renew it thrice a day. In the mean time let Cupping-glaſſes be applied to the inner ſide of the thigh and groin, and alſo above the navel; For this is very effectual to draw the milk out of the breaſts into the womb by the veins whereby the womb communicateth with the breaſts. Moreover, they may let children or little whelps ſuck their breaſts, whereby they may draw out the milk that is fixed faſt in their dugs, inſtead whereof we have invented this inſtrument of glaſs, wherewith, when the broader orifice is faſtned or placed on the breaſt or dug, and the pipe turned upwards towards her mouth, ſhe may ſuck her own breaſts her ſelf.

The form of a little glaſs, which being put on the nipple, the woman may ſuck her own breaſts.

Inſtead of this inſtrument, a viol of glaſs being firſt made warm, and the mouth thereof applied to the nipple or teat, by reaſon of the heat and wideneſs thereof will draw the milk forth into the bottom thereof, as it were by a certain ſucking. The after-purgations being firſt evacuated, which is done for the moſt part within twenty days after the birth, if the woman be not in danger of a feaver, nor have any other accident, let her enter into a bath, made of marjerom, mint, ſage, roſemary, mugwort, agrimony, peny-royal, the flowers of camomil, melilote, dill, being boiled in moſt pure and clear running water. All the day following let another ſuch like bath be prepared, whereunto let theſe things following be added. ℞. *farin. fabarum & aven. an.* ℔ iij. *farin. orobi, lupinor. & gland. an.* ℔j. *aluminis roch.* ℥iv. *ſalis com.* ℔ ij. *gallarum, nucum cupreſſi, an.* ℥iij. *roſar. rub.* m. vi. *caryophil. nucum moſchat. an.* ʒiij. boil them all in common water, then ſew them all in a clean linnen cloth, as it were in a bag, and caſt them therein into the bath wherein Iron red hot hath been extinguiſhed, and let the woman that hath lately travailed ſit down therein ſo long as ſhe pleaſeth and when ſhe cometh out, let her be laid warm in bed, and let her take ſome preſerved Orange-pill, or bread toaſted and dipped in Hippocras, or in wine brewed with ſpices, and then let her ſweat, if the ſweat will come forth of its own accord.

Aſtringent fomentations for the privy parts

On the next day let aſtringent fomentations be applied to the genitals on this wiſe prepared. ℞. *gallar. nucum cupreſſi, corticum granat. an.* ℥j. *roſar. rub.* m.j. *thymi, majoran. an.* m. ß. *aluminis rochæ, ſalis com. an.* ʒij. boil them all together in red wine, and make thereof a decoction for a

fomentation,

fomentation, for the forenamed uſe. The diſtilled liquor following is very excellent and effectual to confirm and to draw in the dugs, or any other looſe parts. ℞. *caryophil. nucis moſchat. nucum cupreſſi an.* ℥i ſ. *maſtich.* ℥ij. *alumin. roch.* ℥i ſ. *glandium & corticis querni. an.* ℔ ß. *roſar. rubr.* m. j. *cort. granat.* ℥ij. *terræ ſigillat.* ℥j. *cornu cervi uſti* ℥ ſ. *myrtillor. ſanguinis dracon. an.* ℥j. *boli armeni.* ℥ij. *ireos florent.* ℥j. *ſumach. berber. Hippuris, an.* m. ſ. *conquaſſentur omnia, & macerentur ſpatio duorum dierum, in* ℔. ß. *aquæ roſarum* ℔ij. *prunorum ſylveſtr. meſpilorum, pomorum quernorum, &* ℔ ß. *aquæ fabrorum, aceti denique fortiſſ.* ℥iv. afterward diſtil it over a gentle fire, and keep the diſtilled liquor for your uſe, wherewith let the parts be fomented twice in a day. And after the fomenta- let woollen cloths or ſtupes of linnen cloth be dipped in the liquor, and then preſſed out and laid to the place. When all theſe things are done and paſt, the woman may again keep company with her husband.

A diſtilled liquor for to draw together the dugs that are looſe and flack.

CHAP. XXIX.

What the cauſes of difficult and painful travail in child-birth are.

THe fault dependeth ſometimes on the mother, and ſometimes on the infant or child within the womb. On the mother, if ſhe be more fat, if ſhe be given to gormandize or great eating, if ſhe be too lean or young, as *Savanarola* thinketh her to be, that is great with child at nine years of age, or unexpert, or more old, or weaker than ſhe ſhould be either by nature or by ſome accident: as by diſeaſes that ſhe hath had a little before the time of child-birth, or with a great flux of bloud. But thoſe that fall in travail before the full and prefixed time are very difficult to deliver, becauſe the fruit is yet unripe, and not ready or eaſie to be delivered. If the neck or orifice of the womb be narrow, either from the firſt conformation, or afterwards by ſome chance, as by an ulcer cicatrized: or more hard and callous, by reaſon that it hath been torn before at the birth of ſome other child, and ſo cicatrized again, ſo that if the cicatrized place be not cut even in the moment of the deliverance, both the child and the mother will be in danger of death; alſo the rude handling of the midwife may hinder the free deliverance of the child. Oftentimes women are letted in travail by ſhamefacedneſs, by reaſon of the preſence of ſome man, or hate to ſome woman there preſent.

The cauſes of the difficult child-birth that are in the woman that travaileth.

The paſſions of the mind hinder the birth.

If the ſecundine be pulled away ſooner than it is neceſſary, it may cauſe a great flux of blood to fill the womb, ſo that then it cannot perform his excluſive faculty, no otherwiſe than the bladder when it is diſtended by reaſon of over-abundance of water that is therein, cannot caſt it forth, ſo that there is a ſtoppage of the urine. But the womb is much rather hindred, or the faculty of child-birth is ſtopped or delayed, if together with the ſtopping of the ſecundine, there be either a Mole or ſome other body contrary to nature in the womb. In the ſecundines of two women whom I delivered of two children that were dead in their bodies, I found a great quantity of ſand like unto that which is found about the banks of rivers, ſo that the gravel or ſand that was in each ſecundine was a full pound in weight.

Alſo the infant may be the occaſion of difficult child-birth, as, if too big, if it come overthwart, if it come with its face upwards, and its buttocks forwards, if it come with its feet and hands both forwards at once, if it be dead and ſwoun by reaſon of corruption, if it be monſtrous, if it have two bodies or two heads, if it be manifold or ſeven-fold, as *Albucraſis* affirmeth he hath ſeen, if there be a mole annexed thereto, if it be very weak, if when the waters are flowed out, it doth not move nor ſtir, or offer it ſelf to come forth. Yet notwithſtanding, it happeneth ſometimes that the fault is neither in the mother nor the child, but in the air, which being cold, doth ſo bind, congeal and make ſtiff the genital parts, that they cannot be relaxed: or, being contrariwiſe too hot, it weakneth the woman that is in travail, by reaſon that it waſteth the ſpirits, wherein all the ſtrength conſiſteth: or in the ignorant or unexpert midwife, who cannot artificially rule and govern the endeavors of the woman in travail.

The cauſes of difficult child-birth that are in the infant.

The external cauſes of difficult child-birth.

The birth is wont to be eaſie, if it be in the due and prefixed natural time, if the child offer himſelf luſtily to come forth with his head forwards preſently after the waters are come forth, and the mother in like manner luſty and ſtrong: thoſe which are wont to be troubled with very difficult child-birth, ought a little before the time of the birth, to go into an half-tub filled with the decoction of mollifying roots and ſeeds, to have their genitals, womb and neck thereof to be anointed with much oil, and the inteſtines that are full and loaded muſt be underburthened of the excrements, and then the expulſive faculty provoked with a ſharp clyſter, and the tumors and ſwelling of the birth concurring therewith, the more eaſie excluſion may be made. But I like it rather better, that the woman in travail ſhould be placed in a chair that hath the back thereof leaning backwards, than in her bed, but the chair muſt have a hole in the bottom, whereby the bones that muſt be dilated in the birth, may have more freedom to cloſe themſelves again.

Which is an eaſie birth.

What cauſeth eaſineſs of child-birth.

CHAP. XXX.

The cauſe of Abortion or untimely birth.

ABortion or untimely birth is one thing, and effluxion another. They call abortion the ſudden excluſion of the child already formed and alive, before the perfect maturity thereof. But that is called effluxion, which is the falling down of ſeeds mixed together and coagulated but for the ſpace of a few days, only in the forms of membranes or tunicles, congealed blood and of an unſhapen or deformed piece of fleſh; the Midwives of our country call it a falſe branch or bud. This effluxion is the cauſe of great pain and moſt bitter and cruel torment to the woman: leaving behind

What Abortion is.

What Effluxion is.

Women are in more pain by reaſon of the effluxion than at the true birth.

behind it weakneſs of body far greater than if the child were born at the due time. The cauſes of abortion or untimely birth, whereof the child is called an abortive, are many, as a great ſcouring, a ſtrangury joined with heat and inflammation, ſharp fretting of the guts, a great and continual cough, exceeding vomiting, vehement labour in running, leaping, and dancing, and by a great fall from on high, carrying of a great burthen, riding on a trotting horſe, or in a Coach, by vehement, often and ardent copulation with men, or by a great blow or ſtroke on the belly. For all theſe and ſuch like vehement and inordinate motions diſſolve the ligaments of the womb, and ſo cauſe abortion and untimely birth.

The cauſes of Abortion.

Girding of the belly may cauſe untimely birth.

Alſo whatſoever preſſeth or girdeth in the mothers belly, and therewith alſo the womb that is within it, as are thoſe Ivory or Whale-bone buſks, which women wear on their bodies, thereby to keep down their bellies; by theſe and ſuch like things the child is letted or hindred from growing to his full ſtrength, ſo that by expreſſion, or as it were by compulſion, he is often forced to come forth before the legitimate and lawful time. Thundering, the noiſe of the ſhooting of great Ordnance, the ſound, and vehement noiſe of the ringing of Bells conſtrain women to fall in travail before their time, eſpecially women that are young, whoſe bodies are ſoft, ſlack and tenderer, than thoſe that be of riper years. Long and great faſting, a great flux of blood, eſpecially when the infant is grown ſomewhat great: but if it be but two months old, the danger is not ſo great, becauſe then he needeth not ſo great quantity of nouriſhment; alſo a long diſeaſe of the mother, which conſumeth the blood, cauſeth the child to come forth being deſtitute of ſtore of nouriſhment before the fit time. Moreover, fulneſs, by reaſon of the eating great ſtore of meats, often maketh or cauſeth untimely birth; becauſe it depraveth the ſtrength, and preſſeth down the child; as likewiſe the uſe of meats that are of an evil juice, which they luſt or long for. But baths becauſe they relax the ligaments of the womb, and hot-houſes, for that the fervent and choaking air is received into the body, provoke the infant to ſtrive to go forth to take the cold air, and ſo cauſe abortion.

How baths and hot houſes cauſe untimely birth.

Hip. aph. 53, & 37. *ſect.* 5.

Hip. aph. 45. *ſect.* 5.

What women ſoever, being indifferently well in their bodies, travail in the ſecond or third month without any manifeſt cauſe, thoſe have the Cotyledons of their womb full of filth and matter, and cannot hold up the infant, by reaſon of the weight thereof, but are broken: Moreover ſudden or continual perturbations of the mind, whether they be through anger or fear, may cauſe women to travail before their time; and are accounted to the cauſes of abortions, for that they cauſe great and vehement trouble in the body. Thoſe women that are like to travail before their time, their dugs will wax little; therefore when a woman is great with child, if her dugs ſuddenly wax ſmall and ſlender, it is a ſign that ſhe will travail before her time; the cauſe of ſuch ſhrinking of the dugs is, that the matter of the milk is drawn back into the womb, by reaſon that the infant wanteth nouriſhment to nouriſh and ſuccor it withall. Which ſcarcity the infant not long abiding, ſtriveth to go forth to ſeek that abroad which he cannot have within; for among the cauſes which do make the infant to come out of the womb, thoſe are moſt uſually named with *Hippocrates*, the neceſſity of a more large nutriment and air.

Hip. aph. 38. *ſect.* 5.

Women are in more pain at the untimely birth than at the due time of birth.

The error of the firſt child-birth continues afterwards.

A plaſter ſtaying the infant in the womb.

Therefore if a woman that is with child have one of her dugs ſmall, if ſhe have two children, ſhe is like to travail of one of them before the full and perfect time: ſo that if the right dug be ſmall, it is a man-child, but if it be the left dug, it is a female. Women are in far more pain when they bring forth their children before the time, than if it were at the full and due time; becauſe that whatſoever is contrary to nature, is troubleſome, painful, and alſo oftentimes dangerous. If there be any error committed at the firſt time of child-birth, it is commonly ſeen that it happeneth always after at each time of child-birth. Therefore, to find out the cauſes of that error, you muſt take the counſel of ſome Phyſician, and after his counſel endeavor to amend the ſame. Truly this plaiſter following being applied to the reins doth confirm the womb, and ſtay the infant therein. ℞. *ladani* ℥ij. *galang.* ℥j. *nucis moſchat. nucis cupreſſi, boli armeni, terræ ſigil. ſanguin. dracon. balauſt. an.* ℥ß. *acatiæ, pſidiorum, hypociſtid. an.* ℥j. *maſtich. myrrhæ, an.* ℥ij. *gummi arabic.* ℥j. *terebinthi Venet.* ℥ij. *picis naval.* ℥iß. *ceræ quantum ſufficit, fiat emplaſt. ſecundum artem.* ſpread it for your uſe upon leather. If the part begin to itch, let the plaiſter be taken away and inſtead thereof uſe *unguent. roſat.* or *refrig. Galen.* or this that followeth. ℞. *olei myrtini, maſtich. cydonior. an.* ℥j. *hypo. boli armen. ſang. dracon. acatiæ, an.* ℥j. *ſant. citrini,* ℥ß. *ceræ quant. ſuf.* make thereof an ointment according unto art. There are women that bear the child in their womb ten or eleven whole months, and ſuch children have their conformation of much quantity of ſeed: wherefore they will be more big, great and ſtrong, and therefore they require more time to come to their perfection and maturity; for thoſe fruits that are great will not be ſo ſoon ripe as thoſe that are ſmall. But children that are ſmall and little of body, do often come to their perfection and maturity in ſeven or nine months: if all other things are correſpondent in greatneſs and bigneſs of body, it happeneth for the moſt part that the woman with child is not delivered before the ninth moneth be done, or at the leaſtwiſe in the ſame moneth. But a male child will be commonly born at the beginning or a little before the beginning of the ſame month, by reaſon of his engrafted heat which cauſeth maturity and ripeneſs. Furthermore, the infant is ſooner come to maturity and perfection in a hot woman than in a cold, for it is the property of heat to ripen.

What children are ten or eleven months in the womb.

A male will be born ſooner than a female.

CHAP. XXXI.

How to preſerve the infant in the womb, when the mother is dead.

IF all the ſigns of death appear in the woman that lieth in travail, and cannot be delivered, there muſt then be a Surgeon ready and at hand, which may open her body ſo ſoon as ſhe is dead, whereby the infant may be preſerved in ſafety; neither can it be ſuppoſed ſufficient if the mothers mouth and privy parts be held open; for the infant being incloſed in his mothers

womb,

womb, and compaſſed with the membranes, cannot take his breath but by contractions and dilatations of the artery of the navel. But when the mother is dead, the lungs do not execute their office and function: therefore they cannot gather in the air that compaſſeth the the body by the mouth or *aſpera arteria* into their own ſubſtance, or into the arteries that are diſperſed throughout the body thereof, by reaſon whereof it cannot ſend it unto the heart by the veiny artery which is called *arteria venalis:* for if the heart want air, there cannot be any in the great artery which is called *arteria aorta*, whoſe function it is to draw it from the heart, as alſo by reaſon thereof it is wanting in the arteries of the womb, which are as it were the little conduits of the great artery, whereinto the air that is brought from the heart is derived, and floweth in unto theſe little ones of all the body, and likewiſe of the womb. Wherefore it muſt of neceſſity follow that the air is wanting to the cotyledons of the ſecundines, to the artery of the infants navel, the iliack arteries alſo, and therefore unto his heart, and ſo unto his body: for the air being drawn by the mothers lungs, is accuſtomed to come to the infant by this continuation of paſſages. Therefore becauſe death maketh all the motions of the mothers body to ceaſe, it is far better to open her body ſo ſoon as ſhe is dead, beginning the inciſion at the cartilage, *Xiphoides*, or blade, and making it in a form ſemicircular, cutting the skin, muſcles and *peritonæum*, not touching the guts: then the womb being lifted up, muſt firſt be cut, leſt that otherwiſe the infant might perchance be touched or hurt with the knife.

Why it is not ſufficient to preſerve life in the child to hold open the mouth and privy parts of the mother ſo ſoon as ſhe is dead, and the child alive in her body.

How the belly of the woman that dieth in travel muſt be cut open to ſave the child.

You ſhall oftentimes find the child unmovable, as though he were dead; but not becauſe he is dead indeed, but by reaſon that he, being deſtitute of the acceſs of the ſpirits by the death of the mother, hath contracted a great weakneſs; yet you may know whether he be dead indeed or not, by handling the artery of the navel; for it will beat and pant if he be alive, otherwiſe not; but if there be any life yet remaining in him, ſhortly after he hath taken in the air, and is recreated with the acceſs thereof, he will move all his members, and alſo all his whole body. In ſo great a weakneſs or debility of the ſtrength of the child, by cutting the navel-ſtring, it muſt rather be laid cloſe to the region of the belly thereof, that thereby the heat (if there be any jot remaining) may be ſtirred up again. But I cannot ſufficiently marvel at the inſolency of thoſe that affirm that they have ſeen women whoſe bellies and womb have been more than once cut, and the infant taken out, when it could no otherwiſe be gotten forth, and yet notwithſtanding alive; which thing there is no man can perſwade me can be done without the death of the mother, by reaſon of the neceſſary greatneſs of the wound that muſt be made in the muſcles of the belly, and ſubſtance of the womb; for the womb of a woman that is great with child, by reaſon that it ſwelleth, and is diſtended with much bloud, muſt needs yield a great flux of blood, which of neceſſity muſt be mortal. And to conclude, when that the wound or inciſion of the womb is cicatrized, it will not permit or ſuffer the womb to be dilated or extended, to receive or bear a new birth. For theſe and ſuch like other cauſes, this kind of cure, as deſperate and dangerous, is not (in mine opinion) to be uſed.

How it may be known whether the infant be alive or no.

CHAP. XXXII.

Of Superfetation.

Superfetation is when a woman doth bear two or more children at one time in her womb, and they be encloſed each in his ſeveral ſecundine: but thoſe that are included in the ſame ſecundine, are ſuppoſed to be conceived at one and the ſame time of copulation, by reaſon of the great and copious abundance of ſeed, and theſe have no number of days between their conception and birth, but all at once. For as preſently after meat the ſtomach which is naturally of a good temper, is contracted or drawn together about the meat, to comprehend it on every ſide, though ſmall in quantity, as it were by both hands, ſo that it cannot rowl neither unto this or that ſide; ſo the womb is drawn together unto the conception about the ſeeds, as ſoon as they are brought into the capacity thereof, and is ſo drawn in unto it on every ſide, that it may come together into one body, not permitting any portion thereof to go into any other region or ſide, ſo that by one time of copulation the ſeed that is mixed together, cannot engender more children than one, which are divided by their ſecundines. And moreover, becauſe there are no ſuch cells in the wombs of women, as are ſuppoſed, or rather known to be in the wombs of beaſts, which therefore bring forth many at one conception or birth. But now if any part of the womans womb doth not apply and adjoin it ſelf cloſely to the conception of the ſeed already received, leſt any thing ſhould be given by nature for no purpoſe, it muſt of neceſſity follow that it muſt be filled with air, which will alter and corrupt the ſeeds; therefore the generation of more than one infant at a time, having every one his ſeveral ſecundine, is on this wiſe. If a woman conceive by copulation with a man as this day, and if that for a few days after the conception, the orifice of the womb be not exactly ſhut, but rather gape a little, and if ſhe do then uſe copulation again, ſo that at both theſe times of copulation there may be an effuſion or perfect mixture of the fertile ſeed in the womb, there will follow a new conception or ſuperfetation. For ſuperfetation is no other than a certain ſecond conception, when the woman already with child, again uſeth copulation with a man, and ſo conceiveth again, according to the judgment of *Hippocrates*. But there may be many cauſes alledged why the womb which did join and cloſe doth open and unlooſe it ſelf again. For there be ſome that ſuppoſe the womb to be open at certain times after the conception, that there may be an iſſue out for certain excremental matters that are contained therein, and therefore that the woman that hath ſo conceived already, and ſhall then uſe copulation with a man again, ſhall alſo conceive again.

What ſuperfetation is.

A womans womb is not diſtinguiſhed into divers cells.

The reaſon of ſuperfetation.

Lib. de ſuperfœtationibus.

Why the womb after the conception of the ſeed, doth many times afterwards open.

Others ſay that the womb of it ſelf, and of its own nature is very deſirous of ſeed or copulation, or elſe being heated or inflamed with the pleaſant motion of the man moving her thereto, doth

doth at length unclose it self to receive the mans seed: for likewise it happeneth many times that the orifice of the stomach being shut after eating, is presently unlooſed again, when other delicate meats are offered to be eaten: even so may the womb uncloſe it self again at certain seasons, whereof come manifold issues, whose time of birth and also of conception are different. For as *Pliny* writeth, when there hath been a little space between two conceptions, they are both hastened, as it appeared in *Hercules* and his brother *Iphicles*; and in her which having two children at a birth, brought forth one like unto her husband and another like unto the adulterer. And also in the Procomesian slave or bond-woman, who, by copulation on the same day, brought one forth like unto her master, and another like unto his steward: and in another who brought forth one at the due time of child-birth, and another at five months end. And again, in another, who bringing forth her burden on the seventh month, brought forth two more in the months following. But this is a most manifest argument of superfetation, that as many children as are in the womb (unless they be twins of the same sex) so many secundines are there, as I have often seen my self. And it is very likely that if they were conceived in the same moment of time, that they should all be included in one secundine. But when a woman hath more children than two at one burden, it seemeth to be a monstrous thing, because that nature hath given her but two breasts. Although we shall hereafter rehearse many examples of more numerous births.

Lib. 7. cap. 11.

CHAP. XXXIII.

Of the tumor called Mola, *or a Mole growing in the womb of women.*

The reason of the name.

OF the Greek word *Myle*, which signifieth a Mill-stone, this tumor called *Mola* hath its name: for it is like unto a Mill-stone both in the round or circular figure, and also in hard consistence, for the which self same reason the whirl-bone of the knee is called of the Latins *Mola*, and of the Greeks *Myle*. But the tumor called *Mola*, whereof we here intreat, is nothing else but a certain false conception of deformed flesh, round and hard, conceived in the womb as it were rude and unperfect, not distinguished into the members, coming by corrupt, weak, and diseased seed, of the immoderate flux of the terms, as it is defined by *Hippocrates*. This is included in no secundine, but as it were in its own skin.

What a *Mola* is.

Lib. de steril. *cap. 7. lib. 4. de usu part.*

There are some that think the *Mola* to be engendred of the concourse or mixture of the womans seed and menstrual blood, without the communication of the mans seed. But the opinion of *Galen* is, that never any man saw a woman conceive either a *Mola*, or any other such thing without a copulation of man, as a Hen layeth eggs without a Cock: for the only cause and original of that motion is in the mans seed, and the mans seed doth only minister matter for the generation thereof. Of the same opinion is *Avicen*, who thinketh the *Mola*, to be made by the confluxion of the mans seed that is unfertile, with the womans; when as it, because unfruitful, only puffs up or makes the womans seed to swell as leaven into a greater bigness, but not into any perfect shape or form. Which is also the opinion of *Fernelius*, by the decrees of *Hippocrates* and *Avicen*: for the immoderate fluxes of the courses are conducing to the generation of the *Mola*, which overwhelming the mans seed, being now unfruitful and weak, doth constrain it to desist from its enterprise of conformation already begun, as vanquished or wholly overcome: for the generation of the *Mola* cometh not of a simple heat working upon a clammy and gross humor, as worms are generated; but of both the seeds, by the efficacy of a certain spirit, after a sort prolifical, as may be understood by the membranes wherein the *Mola* is included, by the ligaments whereby many times it is fastned or bound to the true conception or child, engendred or begotten by superfetation; and finally, by the increase, and great and sluggish weight. If all men were not perswaded that the conflux of a mans seed must of necessity concur to the generation of the *Mola*, it would be no small cloak or cover to women to avoid the shame and reproach of their light behaviour.

How the *Mola* is engendred.

CHAP. XXXIV.

How to discern a true conception from a false conception or Mola.

The signs of a *mola* included in the womb.

WHen the *Mola* is included in the womb, the same things appear as in the true and lawful conception. But the more proper signs of the *Mola* are these: there is a certain pricking pain, which at the beginning troubleth the belly as if it were the colick; the belly will swell sooner than it would if it were the true issue, and will be distended with great hardness, and is more difficult and troublesome to carry, because it is contrary to nature, and void of soul or life. Presently after the conception the dugs will swell and puff up, but shortly they fall and become lank and lax; for nature sendeth milk thither in vain, because there is no issue in the womb that may spend the same. The *Mola* will move before the third month, although it be obscurely, but the true conception will not: but this motion of the *Mola* is not of the intellectual soul, but of the faculty of the womb, and of the spirit of the seed dispersed through the substance of the *Mola*; for it is nourished and increaseth after the manner of plants, but not by reason of a soul or spirit sent from above, as the infant doth. Moreover, that motion that the infant hath in its due and appointed time, differeth much from the motion of the *Mola*; for the child is moved to the right side, to the left side, and to every side gently, but the *Mola*, by reason of its heaviness, is fixed, and rowleth in manner of a stone, carried by the weight thereof unto what side soever the woman declineth her self. The woman that hath a *Mola* in her womb, doth daily wax leaner and leaner in all her members, but especially in her legs, although notwithstanding towards night they will swell, so that she will be very slow or heavy in going, the

By what faculty the womb moveth.

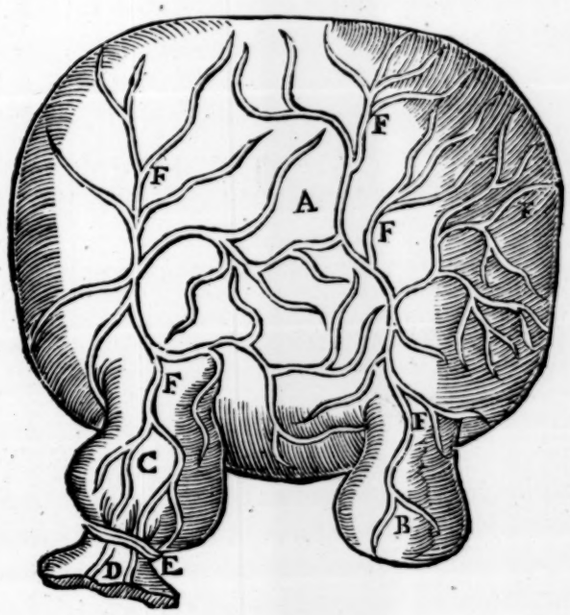
How the motion of the *Mola* differeth from the motion of the infant in the womb.

The *mola* doth turn to each side of the womb, as the situation of the body is.

natural

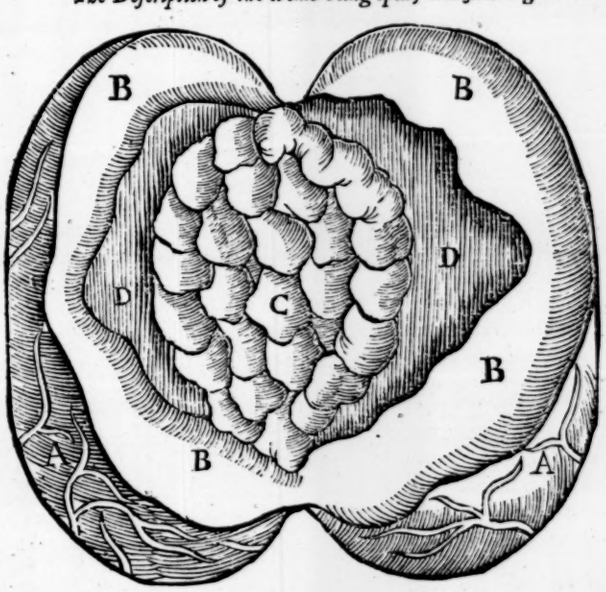
natural heat forſaking the parts remote from the heart by little and little: and moreover, her belly ſwells, by reaſon that the menſtrual matter reſteth about thoſe places, and is not conſumed in the nouriſhment of the *Mola*; ſhe is ſwoln as if ſhe had the dropſie, but that it is harder, and doth not riſe again when it is preſſed with the fingers. The navel doth not ſtand out as it will do when the true iſſue is contained in the womb, neither do the courſes flow as they do ſometimes in the true conception; but ſometimes great fluxes happen, which eaſe the weight of the belly. In many when the *Mola* doth cleave not very faſt, it falleth away within three or four months, being not as yet come unto its juſt bigneſs; and many times it cleaveth unto the ſides of the womb and Cotyledons very firmly, ſo that ſome women carry it in their wombs five or ſix years, and ſome as long as they live.

The external form and deſcription of the forenamed womb.



A *Sheweth the body of the womb.*
B *The teſticle.*
C *The neck of the womb, wherein that little tumor was contained.*
D *Sheweth the end of the neck of the womb that was plucked in ſunder, and alſo the veſſels whereby it drew the nutriment unto it.*
E *Sheweth the band.*
FFF *The veſſels diſperſed through the womb.*

The Deſcription of the womb being open, and ſhewing the Mola *contained therein.*



A A *Shew the external and ſuperficial part of the womb.*
B B B B *Shew the thickneſs of the body, or proper ſubſtance of the womb.*
C *Sheweth the* Mola.
D D *Shew that concavity wherein the* Mola *was contained, or incloſed in the womb.*

The wife of *Guiliam Roger* Pewterer, dwelling in S. *Victors* ſtreet, bore a *Mola* in her womb ſeventeen years, who being of the age of fifty years, died; and I having opened her found the body of her womb to be almoſt looſed, and not tied or bound by its accuſtomed ligatures, but as it were hanging only by the neck, and furthermore cleaving to the Kall adjoining to it, having but only one teſticle, and that on the right ſide, and that ſomewhat broader and looſer than uſual: the horns were not to be ſeen except it were on that ſide, the veſſels were on the neck only, and there very manifeſt and puffed up, it was as big as a mans head. When I had taken it out of her body, I brought it home unto my houſe, that at my leiſure I might find out what was contained in it ſo long; therefore on a certain day, calling together the chief Phyſicians of *Paris*, as *Maſſilæus*, *Alexis*, *Vigor de S. Pont. Feure*, *Brovet*, *Violais*, *Grealmus*, *Ravin*, *Mareſcotius*, *Milotus*, *Hautin*, *Riolan*, *Luſſon*; and Surgeons, as *Brun*, *Cointerel*, *Guillemeau*; all theſe being preſent, I opened the womb, and A Hiſtory.

The deſcription of a *Mola* carried ſeventeen years in the womb.

and I found it in all the body thereof, and in the proper tunicle, ſo ſcirrhous, and ſo hard that I could hardly cut or make a knife to enter it: the body thereof was three fingers thick. In the midſt of the capacity thereof I found a lump of fleſh as big as both my fiſts, like unto a Cows udder, cleaving to the ſides of the womb, but in a certain place, of a very thick, unequal and cloddiſh ſubſtance, with many bodies therein, even as are commonly found in Wens and Griſtles, diſperſed through it as if it were bones. The judgment of all that were preſent was, that this great tumor at the firſt was a *Mola*, which in proceſs of time degenerated into a ſcirrhous body, together with the proper ſubſtance of the womb. Moreover, in the middle of the neck of the womb, we found a tumor as big as a Turkies egg, of ſubſtance hard, cartilaginous and bony, filling all the whole neck, but eſpecially the inward orifice of the womb, which the common people of *France* do call the *Garland*, ſo that by that paſſage nothing could go out, or enter into the womb: all that tumor weighed nine pounds and two ounces, which I, by reaſon of the novelty of the thing, keep in my cloſet, and before I have deſcribed it.

As long as the woman carried this *Mola* in her womb, ſhe felt moſt ſharp pain in her belly; the region of her belly was marvellous hard, diſtended and large, as if it were a woman that had many children at once in her womb; ſo that many Phyſicians when the time of child-birth was paſt, ſuppoſed that ſwelling of the belly to come of the Dropſie, and aſſaied to cure it as they would the Dropſie; but for all the medicines they could uſe, the belly became never the leſſer. Oftentimes the urine was ſtopped for the ſpace of three days, and then the making of urine was very painful unto her, and many times alſo her excrements were ſtopped for the ſpace of a week, by reaſon that the guts were preſſed by the weight of the *Mola*. At certain ſeaſons, as every third month, there came exceeding great fluxes; the matter thereof could not be carried through the capacity of the womb, as we ſaid before, becauſe it was exactly ſhut and ſtopped, but through the veſſels by which Virgins, and alſo certain other women great with child evacuate their menſtrual matter. If the *Mola* be expelled or caſt out in the firſt or ſecond month, as many times it ſo happeneth, it is called of women an unprofitable or falſe conception. Sometimes there are found in one womb two or three moles ſeparated one from another, and ſometimes bound or tied to the ſound and perfect infant: As it happened in the wife of *Valeriola* the Phyſician, which was delivered of a *Mola* which ſhe had carried in her womb twelve months, annexed with a child of four months old, which had deprived the Infant of its room and nutriment. For it is always to be certainly ſuppoſed, that the *Mola*, as a cruel beaſt, by its ſociety, and keeping from its nutriment and place, kills the infant that is joined unto it.

A vain or unprofitable conception.

The *Mola* kills the infant in the womb, when it is faſtned unto it.

I remember once I opened the body of a dead woman, which had a *Mola* in her womb, as big as a Gooſe-egg, which when nature had aſſaied by many vain endeavors to caſt out, remained notwithſtanding, and at length putrified, and therewith infected the whole womb, whereof ſhe died. There be ſome which judging themſelves great with child, do about the ninth or tenth month expel no other thing but ſounding blaſts of wind; whereby the womb ſuddenly falling down, and waxing more ſlender, they are ſaid in a mockery to have been delivered of a fart. To conclude, whatſoever reſembles being with child, if it be not excluded at the due and lawful time of child-birth by its own accord, or by the ſtrength of nature, then muſt it be expelled by art.

CHAP. XXXV.

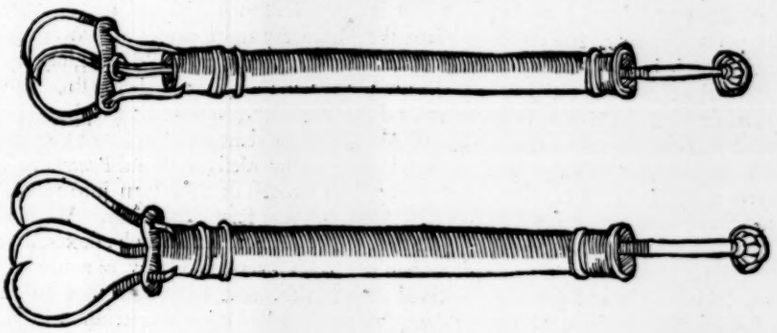
What cure muſt be uſed to the Mola.

ALL things that provoke the flowers and ſecundines, and exclude the Infant, being dead, are to be preſcribed, given inwardly, put up, and applied outwardly, as Trochiſces of *myrrha*, hermodactyls, and ſuch like, firſt having fomentations that are relaxing and mollifying always applied to the places. You muſt uſe theſe medicines, and phlebotomy, diet and baths then and ſo long as it ſhall ſeem neceſſary to the Phyſician that is preſent. But if it happens that the *Mola* is ſeparated or looſed from the womb, and nature cannot expel it when it is ſo looſed, let the Chirurgion place the woman in that ſituation that we ſaid ſhe was put in, when the child was to be drawn from her. Then opening her genital parts, let him take hold on it by putting an inſtrument into it, which by reaſon of the likeneſs thereof is called a Gryphons Talon; for it cannot be taken hold on otherwiſe, by reaſon of the roundneſs thereof; for it hath no place whereon it may be taken hold of: therefore when one taketh hold on it with his hand, it cannot be holden faſt by reaſon of the ſlipperineſs thereof, but will run and ſlip back into the hollowneſs of the womb, like unto a bowl or ball; but it may be more eaſily taken hold on with the Gryphons Talon, if the belly be preſſed on both ſides that it may remain ſtill while the Gryphons Talon takes hold on it; for when it hath taken good hold on it, it may be eaſily drawn out. When the *Mola* is drawn out, the ſame cure muſt be uſed to the woman, as is uſed to a woman after that ſhe is delivered of child.

Thoſe things that provoke the flowers forcibly, do alſo conſume or waſte the *Mola*.

The Chirurgical extraction of the *Mola*.

The Figure of an Inſtrument called a Gryphons Talon, to draw out the Mola *when it is looſe in the womb.*



CHAP. XXXVI.

Of Tumors or ſwellings happening to the Pancreas *or ſweet-breads, and the whole Meſentery.*

THe tumors of other places and parts in the belly ought diligently to be diſtinguiſhed from the *Mola*, and other tumors of the womb. For when the tumors ariſe in the *glandula* called *Pancreas*, and in all the whole *Meſenterium*, many unskilful Surgeons take them for *Molaes* or ſcirrhous tumors of the womb, and ſo go erroneouſly about to cure them, as ſhall appear by theſe Hiſtories following.

An Hiſtory. *Iſabel Rolant* the wife of *John Bony* dwelling in *Paris* in the ſtreet *Moncey* near to St. *Gerviſe* his Church, being threeſcore years of age, departed this life in the year of our Lord 1578. on the two and twentieth day of *October*, and her body being opened in the preſence of Doctor *Milot* the Phyſician; he, when the Meſentery was taken out of the body, cauſed it to be carried home to his houſe, that at his leiſure he might find out the cauſe of this mortal diſeaſe, which was always ſuſpected to be in the Meſentery. Therefore on a time calling *Varadeus*, *Brove*, *Chappel*, *Mareſcotius*, *Arragonius*, *Baillutius*, *Reburtius*, and *Riolan*, all Doctors of Phyſick, and my ſelf and *Pineus* Surgeons, to his houſe to ſee the ſame: Where we found all the Meſentery and the Pancreas in the Meſentery ſwollen and puffed up with a marvellous and almoſt incredible tumor, ſo that it weighed ten pounds and an half, altogether ſcirrhous on the outſide, cleaving on the hinder part onely to the *vertebraes* of the loins; but on the fore-part to the *Peritonæum* being alſo ſcirrhous and wholly cartilaginous. Moreover, there were infinite other abſceſſes in the ſame Meſentery, every one cloſed in his ſeveral ciſt, ſome filled with a honey-like, ſome filled with a tallow-like, ſome with an albugineous, and ſome with a wateriſh liquor or humour, whereof ſome alſo were like unto pap; and to conclude, look how many abſceſſes there were, ſo many kinds or differences of matters there were. It was then eight years ſince that tumour began to grow by little and little without feeling and pain unto ſuch a greatneſs, becauſe that the Meſentery it ſelf was without pain in a manner. For the woman her ſelf could do all the faculties of Nature almoſt as well as if ſhe had been ſound and whole, except that two moneths before ſhe died, ſhe was conſtrained to keep her bed, becauſe ſhe had a continual Fever, which endured ſo long as ſhe lived, and alſo becauſe that the Meſentery, being as it were ſeparated or torn from its roots or ſeat, did rowl up and down in the belly, not without the feeling of grievous pain: for, as we ſaid before, it did ſtick but onely to the *vertebraes* of the loins and *Peritonæum*, and nothing at all to the guts and other parts whereunto it is as it were naturally knit or joined.

Apoſtumes of divers kinds in the *Meſenterium*.

The accidents that come when the *Meſenterium* is ſeparated from the bodies adjoining.

Therefore becauſe the weight and heavineſs thereof depreſſed the bladder, it cauſed a great difficulty in her making of water, and alſo becauſe it reſted on the guts, it made it very painful for her to go to ſtool, ſo that the excrements would not come down except ſhe took a ſharp Clyſter to cauſe them: and as concerning Clyſters, they could not be put up high enough by reaſon of the greatneſs of the tumor which encloſed and ſhut the way; and ſuppoſitories did no good at all. It was alſo very difficult for her to take breath, by reaſon that the midriff or *diaphragma* was compreſſed with the tumor. There were ſome that did ſuſpect it to be a *Mola*, others thought that it came by reaſon of the greatneſs of the tumor. There were ſome that did ſuſpect it to be a *Mola*, others thought that it came by reaſon of the dropſie. Aſſuredly this diſeaſe cauſed the dropſie to enſue; neither was the cauſe thereof obſcure, for the function of the Liver was fruſtrated by reaſon that the concoction or the alteration of the Chylus was intercepted by occaſion of the tumor: and moreover the Liver it ſelf had a proper diſeaſe, for it was hard and ſcirrhous, and had many abſceſſes both within, and without it, and all over it. The milt was ſcarce free from putrefaction, the Guts and Kall were ſomewhat blew and ſpotted, and to be brief, there was nothing ſound in the lower belly.

The dropſie coming of a Tumor of the *Meſenterium*.

There is the like Hiſtory to be read, written by *Philip Ingreſſias*, in his book of Tumors, of a certain Moor that was hanged for theft; for (ſaith he) when his body was publickly diſſected, in the *Meſenterium* were found ſeventy ſcrophulous tumors, and ſo many abſceſſes were contained or encloſed in their ſeveral ciſts or skins, and ſticking to the external tunicle, eſpecially of the greater guts: the matter contained in them was divers; for it was hard, knotty, clammy, glutinous, liquid and wateriſh; but the entrails, eſpecially the Liver and the Milt, were found free from all manner of a tainture, becauſe (as the ſame Author alledgeth) Nature being ſtrong had ſent all the evil juice and the corruption of the entrails into the Meſentery: and verily this

Tom. 1 tra. 3. cap. 1.

Moor, ſo long as he lived, was in good and perfect health. Without doubt the corruption of ſuperfluous humours for the moſt part is ſo great (as is noted by *Fernelius*) that it cannot be received in the receptacles that Nature hath appointed for it; therefore then no ſmall portion thereof falleth into the parts adjoining, and eſpecially into the Meſentery and *Pancreas*, which are as it were the ſink of the whole body. In thoſe bodies which through continual and daily gluttony abound with choler, melancholy and phlegm, if it be not purged in time, Nature being ſtrong and luſty, doth repel and drive it down into the *Pancreas* and the Meſentery, which are as places of no great repute, and that eſpecially out of the Liver and Milt by thoſe veins or branches of the *Vena Porta* which end or go not into the Guts, but are terminated in the Meſentery and *Pancreas*. In theſe places diverſe humours are heaped together, which in proceſs of time turn into a looſe and ſoft tumour, and then if they grow bigger, into a ſtiff, hard and very ſcirrhous tumor. Whereof *Fernelius* affirmeth that in thoſe places he hath found the cauſes of choler, melancholy, fluxes, dyſenteries, cachexiaes, atrophiaes, conſumptions, tedious and uncertain fevers, and laſtly of many hidden diſeaſes, by the taking whereof ſome have received their health, that have been thought paſt cure. Moreover *Ingraſſias* affirmeth out of *Julius Pollux*, that Scrophulaes may be engendred in the Meſentery, which nothing differs from the mind and opinion of *Galen*, who ſaith that Scrophulaes are nothing elſe but indurate and Scirrhous kernels. But the *Meſenterium* with his glanduls being great and many, making the *Pancreas*, doth eſtabliſh, ſtrengthen and confirm the diviſions of the veſſels. Alſo the *ſcirrhus* of the proper ſubſtance of the womb is to be diſtinguiſhed from the *mola*; for in the bodies of ſome women that I have opened, I have found the womb annoied with a ſcirrhous tumor as big as a mans head, in the curing whereof Phyſicians nothing prevailed, becauſe they ſuppoſed it to be a *mola* contained in the capacity of the womb, and not a ſcirrhous tumor in the body thereof.

Lib.6.part.mor. cap.7.

The *Meſenterium* is the ſink of the body.

The Scrophulaes in the *Meſenterium*.

The *Scirrhus* of the womb.

CHAP. XXXVII.

Of the cauſe of barrenneſs in Men.

How the ſeed is unfertil.

THere are many cauſes of barrenneſs in Men, that is to ſay, the too hot, cold, dry or moiſt diſtemper of the ſeed, the more liquid and flexible conſiſtence thereof, ſo that it cannot ſtay in the womb, but will preſently flow out again: for ſuch is the ſeed of old men and ſtriplings, and of ſuch as uſe the act of generation too often and immoderately: for thereby the ſeed becometh crude and wateriſh, becauſe it doth not remain his due and lawful time in the teſticles, wherein it ſhould be perfectly wrought and concocted, but is evacuated by wanton copulation. Furthermore, that the ſeed may be fertile, it muſt of neceſſity be copious in quantity but in quality well concocted, moderately thick, clammy, and puffed with abundance of ſpirits; both theſe conditions are wanting in the ſeed of them that uſe copulation too often: and moreover becauſe the wives of thoſe men never gather a juſt quantity of ſeed laudable both in quality and conſiſtence in their teſticles, whereby it cometh to paſs that they are the leſs provoked or delighted with venereous actions, and perform the act with leſs alacrity, ſo that they yield themſelves leſs prone to conception. Therefore let thoſe that would be Parents of many children uſe a mediocrity in the uſe of Venery.

How the cutting of the veins behind the ears maketh men barren.

The Woman may perceive that the mans ſeed hath ſome diſtemperature in it, if when ſhe hath received it into her womb, ſhe feeleth it ſharp, hot or cold, if the man be more quick or ſlow in the act. Many become barren after they have been cut for the Stone, and likewiſe when they have had a wound behind the ears, whereby certain branches of the jugular veins and arteries have been cut, that are there, ſo that after thoſe veſſels have been cicatrized, there followed an interception of the ſeminal matter downwards, and alſo of the community which ought of neceſſity to be between the brain and the teſticles, ſo that when the conduits or paſſages are ſtopped, the ſtones or teſticles cannot any more receive, neither matter nor lively ſpirits from the brain in ſo great quantity as it was wont, whereof it muſt of neceſſity follow, that the ſeed muſt be leſſer in quantity, and weaker in quality.

Thoſe that have their teſticles cut off, or elſe compreſſed or contuſed by violence, cannot beget children, becauſe that either they want that help the teſticles ſhould miniſter in the act of generation, or elſe becauſe the paſſage of the ſeminal matter is intercepted or ſtopped with a Callus: by reaſon whereof they cannot yield forth ſeed, but a certain clammy humour contained in the glanduls called *Proſtatæ* (yet with ſome feeling of delight).

The defaults of the Yard.

Moreover the defects or imperfections of the yard may cauſe barrenneſs: as, if it be too ſhort, or if it be ſo unreaſonable great that it renteth the privy parts of a woman, and ſo cauſeth a flux of bloud, for then it is ſo painful to the woman, that ſhe cannot void her ſeed, for that cannot be excluded without pleaſure and delight; alſo if the ſhortneſs of the ligament that is under the Yard doth make it to be crooked, and violate the ſtiff ſtraitneſs thereof, ſo that it cannot be put directly or ſtraightly into the womans privy parts. There be ſome that have not the orifice of the conduit of the Yard rightly in the end thereof, but a little higher, ſo that they cannot ejaculate or caſt out their ſeed into the womb.

The ſign of the Palſie in the Yard.

Alſo the particular Palſie of the Yard is numbred amongſt the cauſes of barrenneſs; and you may prove whether the Palſie be in the Yard by dipping the genitals in cold water, for except they do draw themſelves together, or ſhrink up after it, it is a token of the palſie; for members that have the Palſie, by the touching of cold water, do not ſhrink up, but remain in their accuſtomed laxity and looſeneſs: but in this caſe the genitals are indued with ſmall ſenſe, the ſeed cometh out without pleaſure or ſtiffneſs of the Yard, the ſtones in touching are cold, and to conclude, thoſe that have their bodies daily waxing lean through a conſumption, or that are vexed with an evil habit or diſpoſition,

ſition, or with the obſtruction of ſome of the entrails, are barren and unfertil, and likewiſe thoſe in whom ſome noble part neceſſary to life and generation exceedeth the bounds of Nature with ſome great diſtemperature; and laſtly, thoſe who by any means have their genital parts deformed.

Here I omit thoſe that are with-holden from the act of generation by inchantment, magick, witching and inchanted knots, bands and ligatures; for thoſe cauſes belong not to Phyſick, neither may they be taken away by the remedies of our Art. The Doctors of the Canon Laws have made mention of thoſe magick bands which may have power in them, in the particular Title, *De frigidis, maleficiatis, impotentibus & incantatis:* alſo St. *Auguſtin* hath made mention of them, *Tract.7. in Joan.* Magick bands and enchanted knots.

CHAP. XXXVIII.

Of the barrenneſs or unfruitfulneſs of Women.

A Woman may become barren or unfruitful through the obſtruction of the paſſage of the ſeed, or through ſtraitneſs and narrowneſs of the neck of the Womb coming either through the default of the formative faculty, or elſe afterwards by ſome miſchance, as by an Abſceſs, Schirrhus, Warts, Chaps, or by an Ulcer, which being cicatrized, doth make the way more narrow, ſo that the Yard cannot have free paſſage thereinto. Moreover the Membrane called *Hymen*, when it groweth in the midſt or in the bottom of the neck of the womb, hinders the receiving of the mans ſeed. Alſo if the womb be over-ſlippery, or more looſe, or over-wide, it maketh the woman to be barren; ſo doth the ſuppreſſion of the menſtrual fluxes, or the too immoderate flowing of the Courſes or Whites: which cometh by the default of the womb, or ſome entrail, or of the whole body, which conſumeth the menſtrual matter, and carrieth the ſeed away with it. The cauſe why the neck of the womb is narrow. The membrane called *Hymen.*

The cold and moiſt diſtemperature of the womb, extinguiſhes and ſuffocates the Mans ſeed, and maketh it that it will not ſtay or cleave unto the womb, and ſtay till it be concocted: but the more hot and dry doth corrupt for want of nouriſhment, for the ſeeds that are grown either in a mariſh or ſandy ground cannot proſper well: alſo a *Mola* contained in the womb, the falling down of the womb, the leanneſs of the womans body, ill humours bred by eating crude and raw fruits, or great, or over-much, whereof obſtructions and crudities follow, which hinder her fruitfulneſs. Furthermore, by the uſe of ſtupefactive things, the ſeminal matter is congealed and reſtrained, and though it flow and be caſt out, yet it is deprived of the prolifick power, and of the lively heat and ſpirits, the orifices or cotyledones of the Veins and Arteries are ſtopped, and ſo the paſſage for the menſtrual matter into the womb, is ſtopped. When the Kall is ſo far that it girdeth in the womb narrowly, it hindereth the fruitfulneſs of the woman, becauſe it will not permit the mans ſeed to enter into the womb. Moreover the fat and fleſhy habit of the man or woman hinder generation. For it hindereth them that they cannot join their genitals together: and by how much the more bloud goeth into fat, by ſo much the leſs is remaining to be turned into ſeed and menſtrual bloud, which two are the originals and principals of generation. Thoſe women that are ſpeckled in the face, ſomewhat lean, and pale, are more given to Venery than thoſe that are red and fat. Finally, *Hippocrates* ſets down four cauſes onely why women are barren and unfruitful. The firſt is, becauſe they cannot receive the mans ſeed by reaſon of the fault of the neck of the womb; the ſecond, becauſe when it is received into the womb, they cannot conceive it: the third is, becauſe they cannot nouriſh it: the fourth, becauſe they are not able to carry or bear it until the due and lawful time of birth. Theſe things are neceſſary to generation; the Object, Will, Faculty, concourſe of the Seeds, and the remaining or abiding thereof in the womb, until the due and appointed natural time. The cauſe of the flux of Women. *Aph.36.ſect.5. Gal. lib.14. De uſu Par.cap.9. Ariſt.in Prob. Sect. deſtr. Quæſt. 3, & 4.*

CHAP. XXXIX.

The ſigns of a diſtempered Womb.

THat woman is thought to have her womb too hot, whoſe Courſes come forth ſparingly and with pain, and exulcerate by reaſon of their heat, the ſuperfluous matter of the bloud being diſſolved or turned into wind by the power of the heat: whereupon that menſtrual bloud that floweth forth is more groſs and black. For it is the property of heat, by digeſting the thinner ſubſtance, to thicken the reſt, and by aduſtion to make it more black. Furthermore, ſhe that hath her genitals itching with the deſire of copulation, will ſoon exclude the ſeed in copulation, and ſhe ſhall feel it more ſharp as it goeth through the paſſages. That woman hath too cold a womb whoſe Flowers are either ſtopped, or flow ſparingly, and thoſe pale and not well coloured. The ſigns of a hot Womb.

Thoſe that have leſs deſire of copulation, have leſs delight therein, and their ſeed is more liquid and wateriſh, and not ſtaining a linnen cloth by ſticking thereunto, and it is ſparingly and ſlowly caſt forth. That womb is too moiſt that floweth continually with many liquid excrements, which therefore will not hold the ſeed, but preſently after copulation ſuffereth it to fall out; which will eaſily cauſe abortion. The ſigns of too dry a womb appear in the little quantity of the Courſes, in the profuſion of a ſmall quantity of ſeed, by the deſire of copulation, whereby it may be made ſlippery by the moiſture of the ſeed, by the fiſſures in the neck thereof, by the chaps and itching, for all things for want of moiſture will ſoon chap, even like unto the ground, which in the Summer by reaſon of great drought or drineſs, will chap and chink this way and that way, and on the contrary with moiſture it will cloſe and join together again as it were with glew. The ſigns of a cold Womb. The ſigns of a moiſt Womb. The ſigns of a dry Womb.

A woman is thought to have all opportunities unto conception when her Courſes or Flowers do ceaſe, for then the womb is void of excremental filth, and becauſe it is yet open, it will the more eaſily A meet time for conception.

easily receive the mans seed, and when it hath received it, it will better retain it in the wrinkles of the Cotyledones yet gaping as it were in rough and unequal places. Yet a woman will easily conceive a little before the time that the Flowers ought to flow: because that the menstrual matter falling at first like dew into the Womb, is very meet and fit to nourish the seed, and not to drive it out again, or to suffocate it.

Those which use copulation when their Courses fall down abundantly, will very hardly or seldom conceive; and if they do conceive, the Child will be weak and diseased, and especially if the womans bloud that flows out be unsound; but if the bloud be good and laudable, the Child will be subject to all plethorick diseases. There are some Women in whom presently after the flux of the Terms, the orifice of the Womb will be closed, so that they must of necessity use copulation with a man when their menstrual flux floweth, if at least they would conceive at all. A Woman may bear children from the age of fourteen until forty or fifty; which time whosoever doth exceed, will bear until threescore years, because the menstrual fluxes are kept, the prolifical faculty is also preserved: therefore many Women have brought forth children at that age; but after that time no woman can bear, as *Aristotle* writeth.

Arist. l.7. de hist. anim. c. 2. & c.5. *Lib.7.cap.14.* *Lib.6. cap.12.*

Yet *Pliny* saith that *Cornelia* (who was of the house of the *Scipioes*) being in the sixty second year of her age, bare *Volusius Saturnius*, who was Consul; *Valescus de Tarenta* also affirmeth that he saw a Woman that bare a child on the sixty second year of her age, having born before on the sixtieth and sixty first year. Therefore it is to be supposed that by reason of the variety of the air, region, diet and temperament, the menstrual flux and procreative faculty ceaseth in some sooner, in some later; which variety taketh place also in men. For in them, although the seed be genitable for the most part in the second seventh year, yet it is unfruitful until the third seventh year. And whereas most men beget Children until they be threescore years old, which time if they pass, they beget till seventy; yet there are some known that have begot children until the eightieth year. Moreover, *Pliny* writeth that *Masinissa* the King begot a Son when he was fourscore and six years of age, and also *Cato* the Censor after that he was fourscore.

Lib.7. de hist. anim.c.1.&2.6 *Lib.7.cap.14.*

CHAP. XL.

Of the falling down, or perversion, or turning of the Womb.

What is the falling down of the Womb.

THe Womb is said to fall down and be perverted, when it is moved out of its proper and natural place; as when the bands and ligatures thereof being loosed and relaxed, it falleth down unto one side or other, or into its own neck, or else passeth further, so that it comes out at the neck, and a great portion thereof appears without the privy parts. Therefore what things soever resolve, relax, or burst the ligaments or bands whereby the Womb is tied, are supposed to be the causes of this accident. It sometimes happens by vehement labour or travel in Child-birth, when the Womb with violence excluding the issue and the secundines, also follows and falls down, turning the innerside thereof outward. And sometimes the foolish rashness of the Midwife when she draweth away the Womb with the Infant, or with the secundine cleaving fast thereunto, and so drawing it down and turning the innerside outward. Furthermore, a heavy bearing of the Womb, the bearing of the carriage of a great burthen, holding or stretching of the hands or body upwards in the time of greatness with child, a fall, contusion, shaking or jogging by riding either in a Waggon or Coach, or on Horse-back, or leaping or dancing, the falling down of a more large and abundant humour, great griping, a strong and continual cough, a *Tenesmus* or often desire to go to stool, yet not voiding any thing, sneezing, a manifold and great birth, difficult bearing of the Womb, an asthmatical and orthopnoical difficulty of breathing, whatsoever doth weightily press down the *Diaphragma* or Midriff, or the muscles of the *Epigastrium*, the taking of cold air in the time of travel with child, or in the flowing of the menstrual flux, sitting on a cold marble stone, or any other such like cold things are thought oftentimes to be the occasion of these accidents, because they may bring the Womb out of its place.

The causes.

Arist. lib.7. de histor. anim. cap.2.

It falls down in many (saith *Aristotle*) by reason of the desire of copulation that they have, either by reason of the lustiness of their youth, or else because they have abstained a long time from it.

The signs.

You may know that the Womb is fallen down by the pain of those parts wherein it is fallen, that is to say by the entrails, loins, *os sacrum*, and by a tractable tumor at the neck of the Womb, and often with a visible hanging out, of diverse greatness, according to the quantity that is fallen down. It is seen sometimes like unto a piece of red flesh, hanging out at the neck of the Womb, of the bigness and form of a Goose-egg; if the woman stand upright, she feeleth the weight to lie on her privy parts; but if she sit or lie, then she perceiveth it on her back, or go to the stool, the straight gut called *intestinum rectum* will be pressed or loaden as if it were with a burthen; if she lie on her belly, then her urin will be stopped, so that she shall fear to use copulation with a man.

The prognostications.

When the Womb is newly relaxed in a young woman, it may be soon cured; but if it hath been long down in an old woman, it is not to be helped. If the Palsie of the ligaments thereof have occasioned the falling, it scarce admits of cure,; but if it falls down by means of putrefaction, it cannot possibly be cured. If a great quantity thereof hang out between the thighs, it can hardly be cured; but it is corrupted by taking the air, and by the falling down of the urin and filth, and by the motions of the thighs in going it is ulcerated, and so putrefies.

An History.

I remember that once I cured a young Woman who had her Womb hanging out at her privy parts as big as an Egg, and I did so well perform and perfect the Cure thereof, that afterwards she conceived, and bare children many times, and her Womb never fell down.

CHAP.

CHAP. XLI.

The cure of the falling down of the Womb.

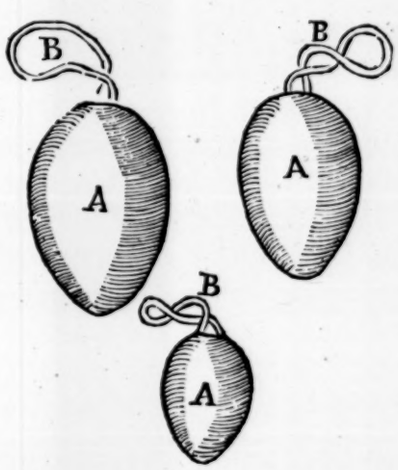
BY this word, falling down of the Womb, we underſtand every motion of the Womb out of its place or ſeat: therefore if the Womb aſcend upwards, we muſt uſe the ſame medicins as in ſtrangulation of the Womb. If it be turned towards either ſide, it muſt be reſtored and drawn back to its right place, by applying and uſing cupping-glaſſes. But if it deſcend and fall down into its own neck, but yet not in great quantity, the woman muſt be placed ſo that her buttocks may be very high, and her legs acroſs; then Cupping-glaſſes muſt be applied to her navel and *Hypogaſtrium*, and when the Womb is brought into its place, injections that bind and dry ſtrongly muſt be injected into the neck of the Womb, ſtinking fumigations muſt be uſed unto the privy parts, and ſweet things uſed to the mouth and noſe. But if the womb hang down in great quantity between the thighs, it muſt be cured by placing the woman after another ſort, and by uſing other kind of Medicins. Firſt of all ſhe muſt be ſo laid on her back, her buttocks and thighs ſo lifted up, and her legs ſo drawn back as when the child or ſecundine are to be taken or drawn from her; then the neck of the Womb, and whatſoever hangeth out thereat, muſt be anointed with Oil of Lillies, freſh Butter, Capons Greaſe, and ſuch like; then it muſt be thruſt gently with the fingers up into its place, the ſick or pained woman in the mean time helping or furthering the endeavour by drawing in of her breath as if ſhe did ſup, drawing up as it were that which is fallen down.

Remedies for the aſcenſion of the Womb.

For the falling down of the Womb, properly ſo called.

After that the Womb is reſtored unto its place, whatſoever is filled with the ointment muſt be wiped with a ſoft and clean cloth, leſt that by the ſlipperineſs thereof the womb ſhould fall down again; the genitals muſt be fomented with an aſtringent decoction, made with Pomgranate Pills, Cypreſs Nuts, Galls, Roch Allum, Horſe-tail, Sumach, Berberies, boiled in the water wherein Smiths quench their Irons; of thoſe materials make a powder, wherewith let thoſe places be ſprinkled: let a Peſſary of a competent bigneſs be put in at the neck of the Womb, but let it be eight or nine fingers in length, according to the proportion of the grieved Patients body. Let them be made either with Lattin, or of Cork covered with Wax, of an oval form, having a thread at one end, whereby they may be drawn back again as need requires.

The forms of oval Peſſaries.



A *Shews the body of the Peſſary.*
B *Sheweth the thread wherewith it muſt be tied to the thigh.*

When all this is done, let the ſick woman keep her ſelf quiet in her bed, with her buttocks lying very high, and her legs acroſs, for the ſpace of eight or ten days: in the mean while the application of Cupping-glaſſes will ſtay the Womb in the right place and ſeat, after it is reſtored thereunto: but if ſhe hath taken any hurt by cold air, let the privy parts be fomented with a diſcuſſing and heating fomentation, on this wiſe: ℞ *Fol. alth. ſalv. lavend. roſmar. artemiſ. flor. chamæm. melilot. an.* m β. *ſem. aniſ. fœnugr. an.* ℥ j. let them be all well boiled in water and wine, and make thereof a decoction for your uſe. Give her alſo Clyſters, that when the Guts are emptied of the excrements, the Womb may the better be received in the void and empty capacity of the belly: for this reaſon the bladder is alſo to be emptied, for otherwiſe it were dangerous leſt that the Womb lying between them, both being full, ſhould be kept down, and cannot be put up into its own proper place by reaſon thereof. Alſo Vomiting is ſuppoſed to be a ſingular remedy to draw up the Womb that is fallen down: furthermore alſo it purgeth out the phlegm wich did moiſten and relax the ligaments of the womb, for as the Womb in time of copulation at the beginning of the conception it moved downwards to meet the ſeed, ſo the Stomach, even of its own accord, is lifted upwards when it is provoked by the injury of any thing that is contrary unto it, to caſt it out with greater violence; but when it is ſo raiſed up, it draws up together therewith the *Peritonæum*, the Womb and alſo the body or parts annexed unto it. If it cannot be reſtored unto its place by theſe preſcribed remedies, and that it be ulcerated and ſo putrefied that it cannot be reſtored unto his place again, we are commanded by the Precepts of Art to cut it away, and then to cure the

A diſcuſſing and heating fomentation.

How vomiting is profitable to the falling down of the Womb.

The cutting away of the Womb when it is putrefied.

the Womb according to Art; but firſt it ſhould be tied, and as much as is neceſſary muſt be cut off, and the reſt ſeared with a Cautery. There are ſome women that have had almoſt all their womb cut off, without any danger of their life, as *Paulus* teſtifieth. *Lib. 6.*

Epiſt. 39. lib. 2. Epiſt. med. *John Langius* Phyſician to the Count Palatine writeth, that *Carpus* the Chirurgeon took out the womb of a Woman of *Bononia*, he being preſent, and yet the woman lived and was very well after it.

Trac. de mirand. morb. cauſ. *Antonius Benevenius* Phyſician of *Florence* writeth, that he, called by *Ugolius* the Phyſician to the cure of a woman whoſe womb was corrupted and fell away from her by pieces, and yet ſhe lived ten years after it.

An Hiſtory. There was a certain woman, being ſound of body, of good repute, and above the age of thirty years, in whom, ſhortly after ſhe had been married the ſecond time, which was in *Anno* 1571. having no child by her firſt husband, the lawful ſigns of a right conception did appear: yet in proceſs of time there aroſe about the lower part of her privities the ſenſe or feeling of a weight or heavineſs, being ſo troubleſom unto her by reaſon that it was painful, and alſo for that it ſtopped her urin, that ſhe was conſtrained to diſcloſe her miſchance to *Chriſtopher Mombey* a Surgeon, her neighbour dwelling in the Suburbs of S. *Germans*; who having ſeen the tumor or ſwelling in her groin, aſſwaged the pain with mollifying and anodyne Fomentations and Cataplaſms; but preſently after he had done this, he found on the inner ſide of her lip of the orifice of the neck of the womb, an Impoſtume rotten and running, as if it had been out of an abſceſs newly broken, with ſanious matter, ſomewhat red, yellow, and pale, running a long time. Yet for all this the feeling of the heavineſs or weight was nothing diminiſhed, but did rather increaſe daily, ſo that from the Year of our Lord 1573. ſhe could not turn her ſelf being in her bed on this or that ſide, unleſs ſhe laid her hand on her belly to bear and eaſe her ſelf of the weight; and alſo ſhe ſaid when ſhe turned her ſelf, ſhe ſeemed to feel a thing like a Bowl or Rowl in her belly unto the ſide whereunto ſhe turned her ſelf, neither could ſhe go to ſtool, or avoid her excrements ſtanding or ſitting, unleſs ſhe lift up that weight with her hands towards her ſtomach or midriff: when ſhe was about to go, ſhe could ſcarce ſet forwards her feet, as if there had ſomething hanged between her thighs, that did hinder her going. At certain ſeaſons that rotten apoſtume would open or uncloſe of it ſelf, and flow and run with its wonted ſanious matter, but then ſhe was grievouſly vexed with pain of the head, and all her members, ſwouning, loathing, vomiting, and almoſt choaking, ſo that by the perſuaſion of a fooliſh woman ſhe was induced and contented to take *Antimonium*, the working and the ſtrength thereof was ſo great and violent, that after many vomits, with many frettings of the guts, and watery dejections of ſtools, ſhe thought her fundament fell down, but being certified by a woman that was a familiar friend of hers, unto whom ſhe ſhewed her ſelf, that there was nothing fallen down at or from her fundament, but it was from her womb, ſhe called in the Year of our Lord, 1575. Surgeons, as my ſelf, *James Guillemeau*, and *Antony Vieux*, that we might help her in extremity.

Antimonium taken in a potion doth cauſe the womb to fall down.

The ſigns of the ſubſtance of the Womb drawn out. When we had diligently and with good conſideration weighed the whole eſtate of her diſeaſe, we agreed with one conſent, that that which was fallen down ſhould be cut away, becauſe that by the black colour, ſtinking, and other ſuch ſigns, it gave a teſtimony of a putrefied and corrupted thing. Therefore for two days we drew out the body by little and little, and piece-meal, which ſeemed unto the Phyſicians that we had called, as *Alexius*, *Gaudinus*, *Feureus*, and *Violaneus*, and alſo to our ſelves, to be the body of the Womb; which thing we proved to be ſo, becauſe one of the teſticles came out whole, and alſo a thick membrane or skin being the relick of the *Mola*, which being ſuppurated, and the abſceſs broken, came out by little and little in matter; after that all this body was ſo drawn away, the ſick woman began to wax better and better, yet notwithſtanding for the ſpace of nine days before it was taken away, ſhe voided nothing by ſiege, and her urin alſo was ſtopped for the ſpace of four days.

After this all things became as they were before, and ſhe lived in good health three Moneths after, and then died of a Pleuriſie that came on her very ſuddenly; and I having opened her body, obſerving and marking every thing very diligently, could not find the womb at all, but in ſtead thereof there was a certain hard and callous body, which Nature, who is never idle, had framed in ſtead thereof, or to fill the hollowneſs of the belly.

CHAP. XLII.

Of the Tunicle or Membrane called Hymen.

Whether there be a membrane called *Hymen*. IN ſome Virgins or Maidens in the orifice of the neck of the womb, there is found a certain Tunicle or Membrane, called of ancient Writers *Hymen*, which prohibiteth the copulation of a man, and cauſeth a woman to be barren; this Tunicle is ſuppoſed by many, and they not of the common ſort onely, but alſo learned Phyſicians, to be as it were, the encloſure of the Virginity or Maidenhead. But I could never find it in any, ſeeking of all ages from three to twelve, of all that I had under my hands in the Hoſpital of *Paris*.

An Hiſtory. Yet once I ſaw in a Virgin of ſeventeen years, whom her mother had contracted to a man, and ſhe knew nevertheleſs there was ſomething in her privy parts that hindred her from bearing of children, who deſired me to ſee her, and I found a very thin nervous membrane a little beneath the *Nymphæa*, near unto the orifice of the neck of the womb, in the midſt there was a very little hole whereout the Terms might flow; I ſeeing the thickneſs thereof, cut it in ſunder with my Sciſſars, and told her Mother what ſhe ſhould do afterwards: and truly ſhe married ſhortly after and bore children. *Realdus Columbus* is of my opinion, and ſaith that this is ſeen very ſeldom; for theſe are his words, Under the *Nymphæa* in many, but not in all Virgins, there is another membrane which when it is preſent (which is but ſeldom) it ſtoppeth, ſo that the Yard cannot be put into the orifice of *Lib. 11. cap. 16.*

of the Womb, for it is very thick; above towards the bladder it hath an hole by which the Courſes flow out. And he alſo addeth, that he obſerved it in two young Virgins, and in one elder Maid.

Avicen writes, that in Virgins in the neck of the Womb there are Tunicles compoſed of Veins and Ligaments very little, riſing from each part of the neck thereof, which at the firſt time of copulation are wont to be broken, and the bloud run out. *Almanſor* writeth, that in Virgins the paſſage of the neck of the Womb is very wrinkled, or narrow and ſtrait, and thoſe wrinkles to be woven or ſtaid together with many little veins and arteries, which are broken at the firſt time of copulation. *Lib. 3 ſent. 21. Tract. 1. cap. 1.*

The triſles of Midwives about the membrane called *Hymen.*

Theſe are the judgments of Phyſicians of this membrane: Midwives will certainly affirm that they know a Virgin from one that is defloured, by the breach or ſoundneſs of that membrane. But by their report, too credulous Judges are ſoon brought to commit an errour. For that Midwives can ſpeak nothing certainly of this membrane, may be proved by this, becauſe that one ſaith that the ſituation thereof is in the very entrance of the privy parts, others ſay it is in the midſt of the neck of the Womb, and others ſay it is within at the inner orifice thereof, and ſome are of an opinion, that they ſay or ſuppoſe that it cannot be ſeen or perceived before the firſt birth. But truly of a thing ſo rare, and which is contrary to Nature, there cannot be any thing ſpoken for certainty. Therefore the bloud that cometh out at the firſt time of copulation, comes not always by the breaking of that membrane, but by the breaking and violating or renting of the little veins which are woven and beſpread all over the ſuperficial and inward parts of the Womb and neck thereof, deſcending into the wrinkles, which in thoſe that have not yet uſed the act of generation, are cloſed as if they were glewed together, although that thoſe Maids that are at their due time of marriage, feel no pain nor no flux of bloud, eſpecially if the mans Yard be anſwerable to the neck of the womb. Whereby it appears evidently how greatly the inhabitants of *Fez*, the Metropolitan City of *Mauritania* are deceived; for *Leo* the *African* writeth, that it is the cuſtom amongſt them, that ſo ſoon as the married man and his ſpouſe are returned home to their houſe from the Church where they have been married, they preſently ſhut themſelves into a Chamber, and make faſt the door, while the marriage dinner is preparing: in the mean while ſome old or grave Matron ſtandeth waiting before the Chamber to receive a bloudy linnen cloth the new married husband is to deliver her there; which when ſhe hath received, ſhe brings it into the midſt of all the company of gueſts, as a freſh ſpoil and teſtimony of the married wifes Virginity, and then for joy thereof they all fall to banquetting ſolemnly. But if through evil fortune it happeneth that in this time of copulation the ſpouſe bleedeth not in the privy parts, ſhe is reſtored again unto her Parents, which is a very great reproach unto them, and all the Gueſts depart home ſad, heavy, and without dinner.

What Virgins at the firſt time of copulation do not bleed at their privy parts. *Lib. 3.*

Moreover there are ſome, that having learned the moſt filthy and infamous Arts of Baudery, proſtitute common Harlots, make gain thereof, making men that are naughtily given to believe that they are pure Virgins, making them to think that the act of generation is very painful and grievous unto them, as if they had never uſed it before, although they are very expert therein indeed; for they do cauſe the neck of the Womb to be ſo wrinkled and ſhrunk together, ſo that the ſides thereof ſhall even almoſt cloſe or meet together; then they put thereinto the bladders of Fiſhes, or gall of Beaſts filled full of bloud, and ſo deceive the ignorant and young Letcher by the defraud and deceit of their evil Arts, and in time of copulation they mix ſighs with groans, and woman-like cryings, and Crocodiles tears, that they may ſeem to be Virgins, and never to have dealt with man before.

The filthy deceit of Bauds and Harlots.

CHAP. XLIII.

A memorable Hiſtory of the Membrane called Hymen.

John Wierus writeth that there was a Maid at *Camburge*, who in the midſt of the neck of the womb had a thick and ſtrong membrane growing overthwart, ſo that when the monethly Terms come out, it would not permit them, ſo that thereby the menſtrual matter was ſtopped and flowed back again, which cauſed a great tumor and diſtention in the belly, with great torment, as if ſhe had been in travel with child: the Midwives being called, and having ſeen and conſidered all that had been done, and did appear, did all with one voice affirm, that ſhe ſuſtained the pains of child-birth, although that the Maid her ſelf denied that ſhe ever dealt with man. Therefore then this foreſaid Author was called, who when the Midwives were void of counſel, might help this wretched Maid, having already had her urin ſtopt now three whole weeks, and perplexed with great watchings, loſs of appetite, and loathing: and when he had ſeen the grieved place, and marked the orifice of the neck of the womb, he ſaw it ſtopped with a thick membrane; he knew alſo that that ſudden breaking out of bloud into the Womb and the veſſels thereof, and the paſſage for thoſe matters that was ſtopped, was the cauſe of her grievous and tormenting pain. And therefore he called a Chirurgeon preſently, and willed him to divide the membrane that was in the midſt, that did ſtop the flux of bloud; which being done, there came forth as much black, congealed and putrefied bloud as weighed ſome eight pounds. In three days after ſhe was well and void of all diſeaſe and pain. I have thought it good to ſet down this example here, becauſe it is worthy to be noted, and profitable to be imitated, as the like occaſion ſhall happen. *Lib. de Proſt. damn. cap. 38.*

CHAP. XLIV.

Of the ſtrangulation of the Womb.

What is the ſtrangulation of the Womb.

THe ſtrangulation of the Womb, or that which cometh from the Womb, is an interception or ſtopping of the liberty in breathing or taking wind, becauſe that the Womb, ſwollen or puffed up by reaſon of the acceſs of groſs vapours and humours that are contained therein, and alſo ſnatched as it were by a convulſive motion, by reaſon that the veſſels and ligaments diſtended with fulneſs, are ſo carried upwards againſt the midriff and parts of the breſt, that it maketh the breath to be ſhort, and often as if a thing lay upon the breſt and preſſed it.

Why the womb ſwelleth.

The accidents that come of the ſtrangling of the womb.

Moreover the Womb ſwelleth, becauſe there is contained or incloſed in it a certain ſubſtance, cauſed by the defluxion either of the Seed or Flowers, or of the Womb or Whites, or of ſome other humour, tumor, abſceſs, rotten apoſtume, or ſome ill juice, putrefying or getting, or ingendring an ill quality, and reſolved into groſs vapours. Theſe, as they affect ſundry or divers places, infer divers or ſundry accidents, as rumbling and noiſe in the belly; if it be in the guts, deſire to vomit, after (with ſeldom vomiting) cometh wearineſs and loathing of meat, if it trouble the Stomach. Choaking with ſtrangulation, if it aſſail the breſt and throat; ſwooning, if it vex the heart; madneſs, or elſe that which is contrary thereto, ſound ſleep or drowſineſs, if it grieve the brain: all which oftentimes prove as malign as the biting of a mad dog, or equal the ſtingings or bitings of venomous beaſts.

Why the ſtrangulation that cometh of the corruption of the ſeed, is more dangerous than that that comes of the corruption of the bloud.

It hath been obſerved that more grievous ſymptoms have proceeded from the corruption of the Seed than of the menſtrual bloud. For by how much every thing is more perfect and noble, while it is contained within the bounds of the integrity of its own nature, by ſo much it is the more grievous and perilous, when by corruption it hath once tranſgreſſed the laws thereof. But this kind of accident doth very ſeldom grieve thoſe women which have their menſtrual flux well and orderly, and do uſe copulation familiarly; but very often thoſe women that have not their menſtrual flux as they ſhould, and do want and are deſtitute of husbands, eſpecially if they be great eaters, and lead a ſolitary life. When the veſſels and ligaments of the Womb are ſwollen and diſtended as we ſaid before, ſo much as is added to their latitude or breadth, ſo much is wanting in their length: and therefore it happeneth that the Womb, being removed out of its ſeat, doth one while fall to the right ſide towards the liver, ſometimes to the left towards the milt, ſometimes upwards unto the midriff and ſtomach, ſometimes downwards, and ſo forwards unto the bladder, whereof cometh an Iſchury and Strangury; or backwards, whereof cometh oppreſſion of the ſtraight Gut, and ſuppreſſion of the excrements, and the *Teneſmus*.

The cauſe of the divers turnings of the womb into divers parts of the body.

The womb is not ſo greatly moved by an accident, but by it ſelf.

But although we acknowledge the womb to decline to thoſe parts which we named, yet it is not by accident onely, as when it is drawn by the proper and common ligaments and bands, when they are contracted or made ſhorter, being diſtended with fulneſs, but alſo of it ſelf, as when it is forced or provoked through the grief of ſomething contrary to Nature that is contained therein: it wandreth ſometimes unto one ſide, and ſometimes unto another part with a plain and evident natural motion, like unto the ſtomach which embraceth any thing that is gentle and mild, but avoideth any thing that is offenſive and hurtful; yet we deny that ſo great accidents may be ſtirred up by the falling of it alone unto this or that ſide, for then it might happen that women that are great with child, whoſe wombs are ſo diſtended by reaſon that the child is great, that it doth preſs the midriff, might be troubled with a ſtrangulation like unto this; but much rather by a venomous humour breathing out a malign and groſs vapour, not only by the veins and arteries, but alſo by the pores that are inviſible, which pollutes the faculties of the parts which it toucheth with its venomous malignity and infection, and intercepts the functions thereof. Neither doth the variety of the parts receiving onely, but alſo of the matter received, cauſe variety of accidents.

Whereof come ſuch divers accidents of ſtrangulation of the womb.

The cauſe of ſleepineſs in the ſtrangulation of the womb.

For ſome accidents come by ſuppreſſion of the terms, others come by corruption of the Seed; but if the matter be cold, it bringeth a drowſineſs, being lifted up unto the brain, whereby the woman ſinketh down as if ſhe were aſtoniſhed, and lieth without motion and ſenſe or feeling, and the beating of the arteries, and the breathing are ſo ſmall, that ſometimes it is thought they are not at all, but that the woman is altogether dead. If it be more groſs, it inferreth a convulſion; if it participate of the nature of a groſs melancholick humour, it bringeth ſuch heavineſs, fear and ſorrowfulneſs, that the party that is vexed therewith ſhall think that ſhe ſhall die preſently, and cannot be brought out of her mind by any means or reaſon; if of a cholerick humour, it cauſeth the madneſs called *Furor Uterinus*, and ſuch a prating that they ſpeak all things that are to be concealed; and a giddineſs of the head, by reaſon that the animal ſpirit is ſuddenly ſhaken by the admixtion of a putrefied vapour and hot ſpirit: but nothing is more admirable, than that this diſeaſe taketh the Patient ſometimes with laughing, and ſometimes with weeping; for ſome at the firſt will weep and then laugh in the ſame diſeaſe and ſtate thereof.

The cauſe of drowſie madneſs.

An Hiſtory.

But it exceedeth all admiration which *Hollerius* writeth, uſually happened to two of the daughters of the Provoſt of *Roven*. For they were held with long laughter for an hour or two before the fit, which neither for fear, admonition, nor for any other means they could hold; and their Parents chid them, and asked them wherefore they did ſo, they anſwered that they were not able to ſtay their laughter. The aſcenſion of the Womb is diligently to be diſtinguiſhed from the ſtrangulation thereof; for the accidents of the aſcenſion and of the ſtrangulation are not one, but the woman is onely oppreſſed with a certain pain of the heart, difficulty of breathing or ſwouning, but yet without fear, without raving or idle talking, or any other greater accident.

The aſcenſion of the womb is to be diſtinguiſhed from the ſtrangulation.

Therefore oftentimes contrary cauſes infer the aſcenſion: that is, overmuch drineſs of the Womb, labouring through the defect of moiſture, whereby it is forced after too violent and immoderate

eva-

evacuations of the Flowers, and in Child-bed, and ſuch like, and laborious and painful travel in Child-bed, through which occaſion it waxeth hot, contrary to Nature, and withereth and turneth it ſelf with a certain violence unto the parts adjoining, that is to ſay, unto the Liver, Stomach and Midriff: if happily it may draw ſome moiſture there-hence unto it. I omit that the Womb may be brought unto its place upwards by often ſmelling to aromatick things, yet in the mean while it inſers not the ſtrangulation that we deſcribed before.

CHAP. XLV.

The ſigns of imminent ſtrangulation of the Womb.

BEfore that theſe fore-named accidents come, the Woman thinks that a certain painful thing ariſeth from her Womb unto the orifice of the ſtomach and heart, and ſhe thinketh her ſelf to be oppreſſed and choaked, ſhe complaineth her ſelf to be in great pain, and that a certain lump or heavy thing climbs up from the lower parts unto her throat, and ſtoppeth her wind, her heart burneth and panteth. And in many the Womb and Veſſels of the Womb ſo ſwell, that they cannot ſtand upright on their legs, but are conſtrained to lie down flat on their bellies, that they may be the leſs grieved with the pain, and to preſs that down ſtrongly with their hands that ſeemeth to ariſe upwards, although that not the Womb it ſelf, but the vapour aſcendeth from the Womb as we ſaid before: but when the fit is at hand, their faces are pale on a ſudden, their underſtanding is darkened, they become ſlow and weak in the legs, with unableneſs to ſtand. Hereof cometh ſound ſleep, fooliſh talking, interception of the ſenſes and breath, as if they were dead, loſs of ſpeech, the contraction of their legs, and the like.

The Womb it ſelf doth not ſo well make the aſcenſion as the vapour thereof.

CHAP. XLVI.

How to know whether the Woman be dead in the ſtrangulation of the Womb, or not.

IHave thought it meet (becauſe many Women, not onely in ancient Times, but in our own and our Fathers memory have been ſo taken with this kind of ſymptom, that they have been ſuppoſed and laid out for dead, although truly they were alive:) to ſet down the ſigns in ſuch a caſe which do argue life and death. Therefore firſt of all it may be proved whether ſhe be alive or dead, by laying or holding a clear and ſmooth Looking-glaſs before her mouth and noſtrils. For if ſhe breath, although it be never ſo obſcurely, the thin vapour that cometh out, will ſtain or make the Glaſs dusky. Alſo a fine downiſh feather taken from under the wing of any Bird, or elſe a fine flock being held before the mouth, will by the trembling or ſhaking motion thereof, ſhew that there is ſome breath, and therefore life remaining in the body. But you may prove moſt certainly whether there be any ſpark of life remaining in the body, by blowing ſome ſneezing powders of Pellitory of *Spain*, and Hellebore in the noſtrils. But though there no breath appear, yet muſt you not judge the woman for dead, for the ſmall vital heat, by which being drawn into the heart, ſhe yet liveth, is contented with tranſpiration onely, and requires not much attraction, which is performed by the contraction and dilatation of the Breſt and Lungs unto the preſervation of it ſelf. For ſo Flies, Gnats, Piſmires, and ſuch like, becauſe they are of a cold temperature, live unmoveably incloſed in the caves of the earth, no token of breathing appearing in them, becauſe there is a little heat left in them, which may be conſerved by the office of the arteries and heart, that is to ſay, by perſpiration, without the motion of the breſt, becauſe the greateſt uſe of reſpiration is, that the inward heat may be preſerved by refrigeration and ventilation. Thoſe that do not mark this, fall into that error which almoſt coſt the life of him who in our time firſt gave life to Anatomical adminiſtration, that was almoſt decaied and neglected.

Women living taken for dead.

How Women that have the ſuffocation of the Womb, live onely by tranſpiration without breathing.

How Flies, Gnats, and Piſmires do live all the Winter without breathing.

For he being called in *Spain* to open the body of a Noble-woman which was ſuppoſed dead through ſtrangulation of the Womb, behold at the ſecond impreſſion of the Inciſion-knife, ſhe began ſuddenly to come to her ſelf, and by the moving of her members and body, which was ſuppoſed to be altogether dead, and with crying, to ſhew manifeſt ſigns that there was ſome life remaining in her. Which thing ſtruck ſuch an admiration and horrour into the hearts of all her friends that were preſent, that they accounted the Phyſician, being before of a good fame and report, as infamous, odious, and deteſtable, ſo that it wanted but little but that they would have ſcratched out his eyes preſently: wherefore he thought there was no better way for him, if he would live ſafe, then to forſake the Countrey. But neither could he ſo alſo avoid the horrible prick and inward wound of his Conſcience (from whoſe judgment no offender can be abſolved) for his inconſiderate dealing, but within few days after being conſumed with ſorrow, he died, to the great loſs of the Commonwealth, and the Art of Phyſick.

An Hiſtory.

CHAP. XLVII.

How to know whether the ſtrangulation of the Womb comes of the ſuppreſſion of the Flowers, or the corruption of the Seed.

THere are two chief cauſes eſpecially, as moſt frequently happening, of the ſtrangulation of the Womb: but when it proceedeth from the corruption of the Seeds all the accidents are more grievous and violent: difficulty of breathing goes before, and ſhortly after comes depriVation thereof; the whole habit of the body ſeemeth more cold than a ſtone: the Woman is a Widow, or elſe hath great ſtore or abundance of Seed, and hath been uſed to the company of a man, by the

The ſigns of ſuffocation of the Womb coming of corrupt ſeed.

the abſence whereof ſhe was before wont to be pained with heavineſs of the head, to loath her meat, and to be troubled with ſadneſs or fear, but chiefly with melancholy. Moreover, when ſhe hath ſatisfied, and every way fulfilled her luſt, and then preſently on a ſudden begins to contain her ſelf; it is very likely that ſhe is ſuffocated by the ſuppreſſion of the Flowers, which formerly had them well and ſufficiently, which formerly had been fed with hot, moiſt and many meats, therefore engendring much bloud, which ſitteth much, which is grieved with ſome weight and ſwelling in the region of the belly, with pain in the ſtomach, and a deſire to vomit, and with ſuch other accidents as come by the ſuppreſſion of the Flowers. Thoſe who are freed from the fit of the ſuffocation of the womb, either by Nature or by Art, in a ſhort time their colour cometh into their faces by little and little, and the whole body beginneth to wax ſtrong, and the teeth, that were ſet and cloſed faſt together, begin (the jaws being looſed) to open and uncloſe again; and laſtly, ſome moiſture floweth from the ſecret parts with a certain tickling pleaſure; but in ſome women, as in thoſe eſpecially in whom the neck of the womb is tickled with the Midwifes finger, in ſtead of that moiſture comes thick and groſs ſeed, which moiſture or ſeed when it is fallen, the womb being before as it were raging, is reſtored unto its own proper nature and place, and by little and little all ſymptoms vaniſh away. Men by the ſuppreſſion of their ſeed have not the like ſymptoms as women have, becauſe Mans ſeed is not ſo cold and moiſt, but far more perfect and better digeſted, and therefore more meet to reſiſt putrefaction, and whileſt it is brought or drawn together by little and little, it is diſſipated by great and violent exerciſe.

The ſigns when it comes of the ſuppreſſion of the Flowers.

The ſigns of one recovering of or from the ſuffocation of the Womb.

Why the ſuppreſſion of the ſeed is not perilous or deadly to men.

CHAP. XLVIII.

Of the Cure of the Strangulation of the Womb.

The pulling of the hairs of the lower parts are profitable both for this malady and for the cauſe of the ſame.

SEeing that the ſtrangulation of the womb is a ſudden and ſharp diſeaſe, it therefore requireth a preſent and ſpeedy remedy; for if it be neglected, it many times cauſeth preſent death. Therefore when this malady cometh, the ſick woman muſt preſently be placed on her back, having her breſt and ſtomach looſe, and all her cloaths and garments ſlack and looſe about her, whereby ſhe may take breath the more eaſily; and ſhe muſt be called on by her own name with a loud voice in her ears, and pulled hard by the hairs of the temples and neck, but yet eſpecially by the hairs of the ſecret parts, that by provoking or cauſing pain in the lower parts, the Patient may not onely be brought to her ſelf again, but alſo that the ſharp and malign vapour aſcending upwards, may be drawn downwards: the legs and arms muſt be bound and tied with painful ligatures, all the body muſt be rubbed over with rough linnen cloths beſprinkled with Salt and Vinegar, until it be very ſore and red; and let this peſſary following be put into the womb. ℞ *Succi mercur. artemiſ. an.* ℥ ij. *in quibus diſſolve pul. bened.* ʒ iij. *pul. radic. enulæ camp. galang. minor. an.* ʒ j. make thereof a peſſary. Then let the ſoals of her feet be anointed with Oil of Bays, or with ſome ſuch like Oil; let a great cupping-glaſs with a great flame be applied to the belly below the navel, to the inner part of the thigh, and to the groin, whereby both the matter that climbs upwards, and alſo the womb it ſelf running the ſame way, may be brought downwards or drawn back. There may be made a fumigation of Spices to be received up into the womb, which that it may the eaſier be done, the womb may be held open by putting in the Inſtrument here following deſcribed, into the neck thereof. Let it be made of gold, ſilver, or lattin, into the form of a peſſary; at the one end thereof, that is to ſay, that end which goeth up into the neck of the womb, let there be made many holes on each ſide, but at the lower end let it be made with a Spring, that it may open and ſhut as you will have it. Alſo it muſt have two Laces or Bands by which it muſt be made faſt into a Swathe or Girdle tied about the Patients belly.

A Peſſary.

The matter of ſweet fumigations.

By what power ſweet Fumigations do reſtore the womb unto its own nature and place.

The matter and ingredients of ſweet and aromatick fumigations, are Cinamon, Calam. Aromat. Lig. Aloes, Ladanum, Benzoin, Thyme, Pepper, Cloves, Lavander, Calamint, Mugwort, Penni-royal, *Alepta moſchat.* Nutmegs, Musk, Amber, Squinant, and ſuch like, which for their ſweet ſmell and ſympathy, allure or intice the womb downwards, by their heat conſume and digeſt the thick vapours and putrefied ill juice. Contrariwiſe, let the noſtrils be perfumed with fetid and rank ſmells, and let theſe be made with *Gum. galbanum, ſagapenum, ammoniacum, aſſa fœtida, bitumen*, oil of Jeat, ſnuff of a Tallow-candle when it is blown out, with the fume of Birds Feathers, eſpecially of Partridges or Woodcocks, of Mans hair, or Goats hair, of old Leather, of Horſe-hoofs, and ſuch like things burned, whoſe noiſom or offenſive ſavour the womb avoiding, doth return unto its own place or ſeat again.

Stinking ſmels to be applied to the noſtrils.

Avicens ſecret for ſuffocation of the Womb.

Moreover it ſhall be very neceſſary to procure vomit by thruſting a Gooſe-feather down into the throat, or elſe the hairs of the Patients own head. Shortly after ſhe muſt uſe a potion of fifteen grains of black Pepper bruiſed and diſſolved in *hydromel*, or water and honey mixed together, or in ſome ſtrong Wine, which remedy *Avicen* holdeth for a ſecret.

Caſtoreum drunken.

Expreſſions into the womb

Alſo in ſtead thereof three hours before meat ʒ ß of Treacle diſſolved in ℥ j. of the water of Wormwood may be given her: alſo it is thought that one drop of the oil of Jeat dropped on the tongue, is a very profitable remedy. There be ſome that allow a potion of half a dram of *Caſtoreum* diſſolved in white Wine, or in the Broth of a Capon; alſo it is profitable not onely to give her Treacle to drink, but alſo to inject it into the womb, being firſt diſſolved in *Aqua vitæ*, and in the mean time to drop two drops of oil of Sage, or ſome ſuch Chymical Oil, into the ears. If ſhe be drowſie or ſleepy, ſhe muſt be awaked or kept waking with ſneezing powders of white Hellebore and Pellitory.

It is alſo requiſite to inject Clyſters both into the fundament and ſecret parts, which muſt be made of the decoction of things that diſcuſs wind, as of Calamint, Mugwort, Lavander, Penni-royal, Camomil, Melilot, and ſuch like; and let peſſaries or ſuppoſitories be made of Ladanum, Ginger, *Gallia moſchat.* Treacle, Mithridate, Civet, and Musk, of the oil of Cloves, Anniſeeds, Sage, Roſemary, and ſuch like,

The matter of Peſſaries.

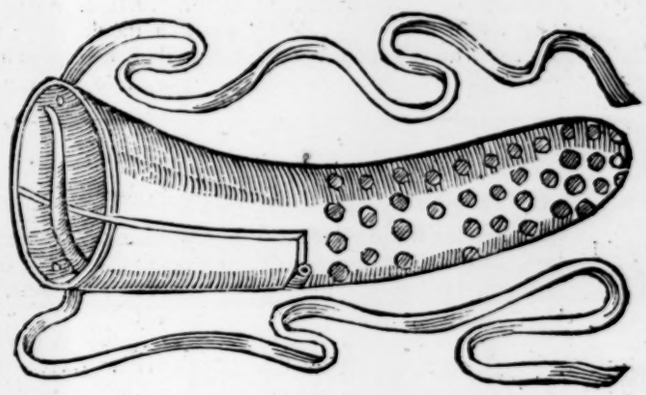
like, chymically drawn; this following is a convenient deſcriptiou of a Clyſter. ℞ *Radic. emulæ, camp. Iræos, ebuli, ariſtoloch.* an. ʒ j. *fol. abſynth. artemiſiæ, matricar. puleg. origani,* an. m.j. *baccarum lauri, juniperi & ſambuc.* an. p.j. *ſem. amnios, cymini, rutæ,* an. ʒ ij. *florum ſtœchados, roriſmar. ſalviæ, centaur. minor.* an. p.ij. *fiat decoctio, cape colaturæ,* ℔ j. *in qua diſſolve mellis anthoſati, ſacc. rubr. & bened.* an. ʒ j. *diacharth.* ʒ ij. *olei aneth. nard.* an. ʒ j. ß. make thereof a Clyſter, and apply this plaſter following to the belly. ℞ *Maſp. empl. oxycrocei, & melilot.* an. ʒ iij. *olei nard.* as much as ſhall ſuffice to make it conveniently ſoft: make thereof a plaſter, and ſpread it on a leather, and apply it to the region of the belly when the fit is ended: if ſhe be married, let her forthwith uſe copulation, and be ſtrongly encountred by her husband, for there is no remedy more preſent than this.

A Clyſter ſcattering groſs vapours.

A quick, certain, and a pleaſant remedy for the ſuffocation of the Womb.

The deſcription of a Veſſel made with a Funnel or Pipe for to fumigate the Womb.

The form of a Peſſary to be put in the neck of the Womb, to hold it open.



Let the Midwife anoint her fingers with *oleum nardinum*, or *moſchetalinum*, or of Cloves, or elſe of Spike mixed with Musk, Ambergreece, Civet, and other ſweet Powders, and with theſe let her rub and tickle the top of the neck of the womb which toucheth the inner orifice, but her ſecret parts muſt firſt be warmed by the applying of warm linnen cloths, for ſo at length the venomous matter contained in the womb, ſhall be diſſolved and flow out, and the malign, ſharp, and flatulent vapours, whereby the womb is driven as it were into a fury or rage, ſhall be reſolved and diſſipated, and ſo when the conjunct matter of the diſeaſe is ſcattered and waſted, the womb, and alſo the Woman ſhall be reſtored unto themſelves again. Some hold it for a ſecret to rub the Navel with the juice of Garlick boiled and mixed with Aloes.

Tickling of the neck of the Womb.

CHAP. XLIX.

Of Womens Monethly Flux or Courſes.

USually they call the flux of bloud that iſſueth from the ſecret parts of Women, Monethly Flowers or Courſes, becauſe it happeneth to them every Moneth ſo long as they are in health. There be ſome which call them Terms, becauſe they return at their uſual time. Many of the French men call it *Sepmains*, becauſe in ſuch as ſit much, and are given to plentiful feeding, it endureth almoſt for the ſpace of ſeven days. Some call them purgations, becauſe that by this flux all a Womans body is purged of ſuperfluous humours. There be ſome alſo that call thoſe Fluxes the Flowers, becauſe that as in Plants the flower buddeth out before the fruits; ſo in Women-kind the Flux goeth before the iſſue, or the conception thereof.

The reaſon of the names of the monethly flux of women

For the Courſes flow not before a Woman be able to conceive, for how ſhould the ſeed being caſt into the Womb have his nouriſhment and increaſe, and how ſhould the child have his nouriſhment when it is formed of the ſeed, if this neceſſary humour were wanting in the womb? yet it may be

ſome

What women do conceive, this flux not appearing at all.

ſome Women may conceive without the flux of the Courſes: but that is in ſuch as have ſo much of the humour gathered together, as is wont to remain in thoſe which are purged, although it be not ſo great a quantity that it may flow out, as it is recorded by *Ariſtotle*. But as it is in ſome very great, and in ſome very little, ſo it is in ſome ſeldom, and in ſome very often.

What women have this menſtrual flux often, abundantly, and for a longer ſpace than others.

There are ſome that are purged twice, and ſome thrice in a moneth, but it is altogether in thoſe who have a great Liver, large Veins, and are filled and fed with many and greatly nouriſhing meats, which ſit idlely at home all day, which having ſlept all night, do notwithſtanding lie in bed ſleeping a great part of the day alſo, which live in a hot, moiſt, rainy and ſoutherly air, which uſe warm baths of ſweet waters and gentle frictions, which uſe and are greatly delighted with carnal copulation: in theſe and ſuch like Women, the Courſes flow more frequently and abundantly.

What women have this flux more ſeldom, leſs, and a far more ſhort time than others.

But contrariwiſe, thoſe that have ſmall and obſcure veins, and thoſe that have their bodies more furniſhed and big either with fleſh or with fat, are more ſeldom purged, and alſo more ſparingly, becauſe that the ſuperfluous quantity of bloud uſeth to go into the habit of the body. Alſo tender, delicate and fair Women are leſs purged than thoſe that are brown, and endued with a more compact fleſh, becauſe that by the rarity of their bodies, they ſuffer a greater waſting or diſſipation of their ſubſtance by tranſpiration. Moreover, they are not ſo greatly purged with this kind of purgation, which have ſome other ſolemn or accuſtomed evacuation in any other place of their body, as by the noſe or Hæmorrhoids.

Why young women are purged in the new of the Moon.

And as concerning their Age, old women are purged when the Moon is old, and young women when the Moon is new, as it is thought. I think the cauſe thereof is, for that the Moon ruleth moiſt bodies; for by the variable motion thereof the Sea floweth and ebbeth; and Bones, Marrow, and Plants abound with their genital humour.

Therefore young people which have much bloud, and more fluxible, and their bodies more fluxible, are ſoon moved unto a flux, although it be even in the firſt quarter of the Moons riſing or increaſing: but the humours of old women, becauſe they wax ſtiff as it were with cold, and are not ſo abundant, and have more denſe bodies and ſtraighter veſſels, are not ſo apt to a flux, nor do they ſo eaſily flow, except it be in the full of the Moon, or elſe in the decreaſe; that is to ſay, becauſe the bloud that is gathered in the full of the Moon falls from the body even of its own weight, for that by reaſon of the decreaſing or wane of the Moon, this time of the Moneth is more cold and moiſt.

Why old women are purged in the wane of the Moon.

CHAP. L.

The Cauſes of the Monethly Flux or Courſes.

The material cauſe of the Monethly flux.

BEcauſe a woman is more cold, and therefore hath the digeſtive faculty more weak, it cometh to paſs, that ſhe requireth and deſireth more meat or food than ſhe can digeſt or concoct. And becauſe that ſuperfluous humour that remaineth is not digeſted by exerciſe, nor by the efficacy of ſtrong and lively heat, therefore by the providence or benefit of Nature, it floweth out by the veins of the womb, by the power of the expulſive faculty, as its own certain and prefixed ſeaſon or time. But then eſpecially it beginneth to flow, and a certain rude portion of bloud to be expelled, being hurtful and malign otherwiſe in no quality, when Nature hath laid her principal foundations of the increaſe of the body, ſo that in greatneſs of the body ſhe hath come as it were in a manner to the higheſt top, that is to ſay, from the thirteenth to the fiftieth year of her age.

When the Monethly flux begins to flow.

The final cauſe.

Moreover, the child cannot be formed in the womb, nor have his nutriment or increaſe without this flux: therefore this is another final cauſe of the monethly flux. Many are perſuaded that women do far more abound with bloud than men, conſidering how great an abundance of bloud they caſt forth of their ſecret parts every moneth, from the thirteenth to the fiftieth year of their age: how much women great with child, of whom alſo many are menſtrual, yield unto the nutriment and increaſe of the child in their wombs, and how much Phyſicians take from women that are with child by opening of a vein, which otherwiſe would be delivered before their natural and prefixed time; how great a quantity thereof they avoid in the birth of their children, and for ten or twelve days after, and how great a quantity of milk they ſpend for the nouriſhment of the child when they give ſuck, which milk is none other thing than bloud made white by the power of the kernels that are in the dugs, which doth ſuffice to nouriſh the child, be he great or little; yet notwithſtanding many Nurſes in the mean while are menſtrual: and as that may be true, ſo certainly this may be true, that one dram (that I may ſo ſpeak) of a mans bloud is of more efficacy to nouriſh and increaſe, than two pounds of woman's bloud, becauſe it is far more perfect, more concocted, wrought, and better repleniſhed with abundance of ſpirits: whereby it cometh to paſs that a man endued with a more ſtrong heat, doth more eaſily convert what meat ſoever he eateth unto the nouriſhment and ſubſtance of his body; and if that any ſuperfluity remains he doth eaſily digeſt and ſcatter it by inſenſible tranſpiration. But a woman being more cold than a man, becauſe ſhe taketh more than ſhe can concoct, doth gather together more humors, which becauſe ſhe cannot diſperſe, by reaſon of the unperfectneſs and weakneſs of her heat, it is neceſſary that ſhe ſhould ſuffer, and have her monthly purgation, eſpecially when ſhe groweth unto ſome bigneſs: but there is no ſuch need in a man.

A woman exceeds a man in quantity of bloud.

A man exceedeth a woman in the quality of his bloud.

A man is more hot than a woman, and therefore not menſtrual.

CHAP.

CHAP. LI.

The causes of the suppression of the Courses or Menstrual Flux.

THE Courses are suppressed or stopped by many causes, as by sharp, vehement, and long diseases, by fear, sorrow, hunger, immoderate labours, watchings, fluxes of the belly, great bleeding, hæmorrhoids, fluxes of bloud at the mouth, and evacuations in any other part of the body whatsoever, often opening of a Vein, great sweats, ulcers flowing much and long, scabbiness of the whole skin, immoderate grosness and clamminess of the bloud, and by eating of raw fruits, and drinking of cold water, by sluggishness and thickness of the vessels, and also the obstruction of them by the defaults and diseases of the womb, by distemperature, an abscess, an ulcer, by the obstruction of the inner orifice thereof, by the growing of a callus, caruncle, cicatrize of a wound or ulcer, or membrane growing there, by injecting of astringent things into the neck of the womb, which place many women endeavour foolishly to make narrow: I speak nothing of age, greatness with child, and nursing of children, because these causes are not besides nature, neither do they require the help of the Physician.

The foolish endeavour of making the orifice of the womb narrow is rewarded with the discommodity of stopping of the Flowers.

Many Women, when their Flowers or Terms be stopped, degenerate after a manner into a certain manly nature, whence they are called *Viragines*, that is to say, stout, or manly Women; therefore their voice is more loud and big, like unto a mans, and they become bearded.

What women are called *Viragines*.

In the City *Abdera* (saith *Hippocrates*) *Phaethusa* the wife of *Pytheas* at the first did bear children and was fruitful, but when her husband was exiled, her Flowers were stopped for a long time: but when these things happened, her body became manlike and rough, and had a beard, and her voice was great and shrill. The very same thing happened to *Namysia* the wife of *Gorgippus* in *Thasus*. Those Virgins that from the beginning have not their Monethly flux, and yet nevertheless enjoy their perfect health, they must necessarily be hot and dry, or rather of a manly heat and driness, that they may so disperse and dissipate by transpiration, as men do, the excrements that are gathered; but verily all such are barren.

Lib. 6. Epidem. sect. 7.

The women that are called *Viragines* are barren.

CHAP. LII.

What accidents follow the suppression or stopping of the Monethly Flux or Flowers.

WHen the Flowers or monethly Flux are stopped, Diseases affect the Womb, and from thence pass into all the whole body. For thereof cometh Suffocation of the Womb, Head-ach, Swouning, beating of the Heart, and swelling of the breasts and secret parts, inflammation of the Womb, an Abscess, Ulcer, Cancer, a Fever, Nauseousness, Vomitings, difficult and slow concoction, the Dropsie, Strangury, the full Womb pressing upon the orifice of the bladder, black and bloudy Urin, by reason that portion of the bloud sweateth out into the bladder. In many Women the stopped matter of the Monethly Flux is excluded by Vomiting, Urin, and the Hæmorrhoids, in some it groweth into *Varices*. In my Wife when she was a Maid, the Menstrual matter was excluded and purged by the Nostrils. The Wife of *Peter Feure* of *Castleaudun*, was purged of her Menstrual matter by the Dugs every moneth, and in such abundance, that scarce three or four cloaths were able to dry it and suck it up.

Why the strangury, or bloudiness of the Urin followeth the suppression of the Flowers. Histories of such as were purged of their Menstrual flux by the Nose and Dugs.

In those that have not the Flux monethly to evacuate this plenitude by some part or place of the body, there often follows difficulty of breathing, Melancholy, Madness, the Gout, an ill disposition of the whole body, dissolution of the strength of the whole body, want of appetite, a Consumption, the Falling-sickness, an Apoplexy.

Those whose bloud is laudable, yet not so abundant, do receive no other discommodity by the suppression of the Flowers, unless it be that the Womb burns or itcheth with the desire of copulation, by reason that the Womb is distended with hot and itching bloud, especially if they lead a sedentary life. Those Women that have been accustomed to bear children, are not so grieved and evil at ease when their Flowers are stopped by any chance contrary to Nature, as those Women which did never conceive, because they have been used to be filled; and the vessels by reason of their customary repletion and distention are more large and capacious: when the Courses flow, the appetite is partly dejected, for that Nature being then wholly applied to expulsion, cannot throughly concoct or digest; the Face waxeth pale and without its lively colour, because that the heat with the spirits, go from without inwards, so to help and aid the expulsive faculty.

To what women the suppression of the Moneths is most grievous.

CHAP. LIII.

Of provoking the Flowers or Courses.

THE suppression of the Flowers is a plethorick Disease, and therefore must be cured by evacuation, which must be done by opening the Vein called *Saphena*, which is at the ankle, but first let the basilick Vein of the arm be opened, especially if the body be plethorick, lest that there should a greater attraction be made into the Womb, and by such attraction or flowing in, there should come a greater obstruction. When the Veins of the Womb are distended with so great a swelling that they may be seen, it will be very profitable to apply Horse-leeches to the neck thereof: Pessaries for Women may be used, but fumigations of aromatick things are more meet for Maids, because they are bashful and shame-faced. Unguents, Liniments, Emplasters, Cataplasms that serve for that matter, are to be prescribed and applied to the secret parts; Ligatures and Fri-

Why the Vein called *Basilica* in the arm must be opened before the Vein *Saphena* in the foot.

Horse leeches to be applied to the neck of the Womb.

What women do conceive, this flux not appearing at all.

ſome Women may conceive without the flux of the Courſes: but that is in ſuch as have ſo much of the humour gathered together, as is wont to remain in thoſe which are purged, although it be not ſo great a quantity that it may flow out, as it is recorded by *Ariſtotle*. But as it is in ſome very great, and in ſome very little, ſo it is in ſome ſeldom, and in ſome very often.

What women have this menſtrual flux often, abundantly, and for a longer ſpace than others.

There are ſome that are purged twice, and ſome thrice in a moneth, but it is altogether in thoſe who have a great Liver, large Veins, and are filled and fed with many and greatly nouriſhing meats, which ſit idlely at home all day, which having ſlept all night, do notwithſtanding lie in bed ſleeping a great part of the day alſo, which live in a hot, moiſt, rainy and ſoutherly air, which uſe warm baths of ſweet waters and gentle frictions, which uſe and are greatly delighted with carnal copulation: in theſe and ſuch like Women, the Courſes flow more frequently and abundantly.

What women have this flux more ſeldom, leſs, and a far more ſhort time than others.

But contrariwiſe, thoſe that have ſmall and obſcure veins, and thoſe that have their bodies more furniſhed and big either with fleſh or with fat, are more ſeldom purged, and alſo more ſparingly, becauſe that the ſuperfluous quantity of bloud uſeth to go into the habit of the body. Alſo tender, delicate and fair Women are leſs purged than thoſe that are brown, and endued with a more compact fleſh, becauſe that by the rarity of their bodies, they ſuffer a greater waſting or diſſipation of their ſubſtance by tranſpiration. Moreover, they are not ſo greatly purged with this kind of purgation, which have ſome other ſolemn or accuſtomed evacuation in any other place of their body, as by the noſe or Hæmorrhoids.

Why young women are purged in the new of the Moon.

And as concerning their Age, old women are purged when the Moon is old, and young women when the Moon is new, as it is thought. I think the cauſe thereof is, for that the Moon ruleth moiſt bodies; for by the variable motion thereof the Sea floweth and ebbeth; and Bones, Marrow, and Plants abound with their genital humour.

Why old women are purged in the wane of the Moon.

Therefore young people which have much bloud, and more fluxible, and their bodies more fluxible, are ſoon moved unto a flux, although it be even in the firſt quarter of the Moons riſing or increaſing: but the humours of old women, becauſe they wax ſtiff as it were with cold, and are not ſo abundant, and have more denſe bodies and ſtraighter veſſels, are not ſo apt to a flux, nor do they ſo eaſily flow, except it be in the full of the Moon, or elſe in the decreaſe; that is to ſay, becauſe the bloud that is gathered in the full of the Moon falls from the body even of its own weight, for that by reaſon of the decreaſing or wane of the Moon, this time of the Moneth is more cold and moiſt.

CHAP. L.

The Cauſes of the Monethly Flux or Courſes.

The material cauſe of the Monethly flux.

BEcauſe a woman is more cold, and therefore hath the digeſtive faculty more weak, it cometh to paſs, that ſhe requireth and deſireth more meat or food than ſhe can digeſt or concoct. And becauſe that ſuperfluous humour that remaineth is not digeſted by exerciſe, nor by the efficacy of ſtrong and lively heat, therefore by the providence or benefit of Nature, it floweth out by the veins of the womb, by the power of the expultive faculty, as its own certain and prefixed ſeaſon or time.

When the Monethly flux begins to flow.

But then eſpecially it beginneth to flow, and a certain rude portion of bloud to be expelled, being hurtful and malign otherwiſe in no quality, when Nature hath laid her principal foundations of the increaſe of the body, ſo that in greatneſs of the body ſhe hath come as it were in a manner to the higheſt top, that is to ſay, from the thirteenth to the fiftieth year of her age.

The final cauſe.

Moreover, the child cannot be formed in the womb, nor have his nutriment or increaſe without this flux: therefore this is another final cauſe of the monethly flux.

A woman exceeds a man in quantity of bloud.

Many are perſuaded that women do far more abound with bloud than men, conſidering how great an abundance of bloud they caſt forth of their ſecret parts every moneth, from the thirteenth to the fiftieth year of their age: how much women great with child, of whom alſo many are menſtrual, yield unto the nutriment and increaſe of the child in their wombs, and how much Phyſicians take from women that are with child by opening of a vein, which otherwiſe would be delivered before their natural and prefixed time; how great a quantity thereof they avoid in the birth of their children, and for ten or twelve days after, and how great a quantity of milk they ſpend for the nouriſhment of the child when they give ſuck, which milk is none other thing than bloud made white by the power of the kernels that are in the dugs, which doth ſuffice to nouriſh the child, be he great or little; yet notwithſtanding many Nurſes in the mean while are menſtrual: and as that may be true, ſo certainly this may be true, that one dram (that I may ſo ſpeak) of a mans bloud is of more efficacy to nouriſh and increaſe, than two pounds of womans bloud, becauſe it is far more perfect, more concocted, wrought, and better repleniſhed with abundance of ſpirits: whereby it cometh to paſs that a man endued with a more ſtrong heat, doth more eaſily convert what meat ſoever he eateth unto the nouriſhment and ſubſtance of his body; and if that any ſuperfluity remains he doth eaſily digeſt and ſcatter it by inſenſible tranſpiration. But a woman being more cold than a man, becauſe ſhe taketh more than ſhe can concoct, doth gather together more humors, which becauſe ſhe cannot diſperſe, by reaſon of the unperfectneſs and weakneſs of her heat, it is neceſſary that ſhe ſhould ſuffer, and have her monthly purgation, eſpecially when ſhe groweth unto ſome bigneſs: but there is no ſuch need in a man.

A man exceedeth a woman in the quality of his bloud. A man is more hot than a woman, and therefore not menſtrual.

CHAP.

CHAP. LI.

The cauſes of the ſuppreſſion of the Courſes or Menſtrual Flux.

THe Courſes are ſuppreſſed or ſtopped by many cauſes, as by ſharp, vehement, and long diſeaſes, by fear, ſorrow, hunger, immoderate labours, watchings, fluxes of the belly, great bleeding, hæmorrhoids, fluxes of bloud at the mouth, and evacuations in any other part of the body whatſoever, often opening of a Vein, great ſweats, ulcers flowing much and long, ſcabbineſs of the whole skin, immoderate groſsneſs and clammineſs of the bloud, and by eating of raw fruits, and drinking of cold water, by ſluggiſhneſs and thickneſs of the veſſels, and alſo the obſtruction of them by the defaults and diſeaſes of the womb, by diſtemperature, an abſceſs, an ulcer, by the obſtruction of the inner orifice thereof, by the growing of a callus, caruncle, cicatrize of a wound or ulcer, or membrane growing there, by injecting of aſtringent things into the neck of the womb, which place many women endeavour fooliſhly to make narrow: I ſpeak nothing of age, greatneſs with child, and nurſing of children, becauſe theſe cauſes are not beſides nature, neither do they require the help of the Phyſician.

The fooliſh endeavour of making the orifice of the womb narrow is rewarded with the diſcommodity of ſtopping of the Flowers.

Many Women, when their Flowers or Terms be ſtopped, degenerate after a manner into a certain manly nature, whence they are called *Viragines*, that is to ſay, ſtout, or manly Women; therefore their voice is more loud and big, like unto a mans, and they become bearded.

What women are called *Viragines*.

In the City *Abdera* (ſaith *Hippocrates*) *Phaethuſa* the wife of *Pytheas* at the firſt did bear children and was fruitful, but when her husband was exiled, her Flowers were ſtopped for a long time: but when theſe things happened, her body became manlike and rough, and had a beard, and her voice was great and ſhrill. The very ſame thing happened to *Namyſia* the wife of *Gorgippus* in *Thaſus*. Thoſe Virgins that from the beginning have not their Monethly flux, and yet nevertheleſs enjoy their perfect health, they muſt neceſſarily be hot and dry, or rather of a manly heat and drineſs, that they may ſo diſperſe and diſſipate by tranſpiration, as men do, the excrements that are gathered; but verily all ſuch are barren.

Lib. 6. Epidem. ſect. 7.

The women that are called *Viragines* are barren.

CHAP. LII.

What accidents follow the ſuppreſſion or ſtopping of the Monethly Flux or Flowers.

WHen the Flowers or monethly Flux are ſtopped, Diſeaſes affect the Womb, and from thence paſs into all the whole body. For thereof cometh Suffocation of the Womb, Head-ach, Swouning, beating of the Heart, and ſwelling of the breſts and ſecret parts, inflammation of the Womb, an Abſceſs, Ulcer, Cancer, a Fever, Nauſeouſneſs, Vomitings, difficult and ſlow concoction, the Dropſie, Strangury, the full Womb preſſing upon the orifice of the bladder, black and bloudy Urin, by reaſon that portion of the bloud ſweateth out into the bladder. In many Women the ſtopped matter of the Monethly Flux is excluded by Vomiting, Urin, and the Hæmorrhoids, in ſome it groweth into *Varices*. In my Wife when ſhe was a Maid, the Menſtrual matter was excluded and purged by the Noſtrils. The Wife of *Peter Feure* of *Caſteaudun*, was purged of her Menſtrual matter by the Dugs every moneth, and in ſuch abundance, that ſcarce three or four cloaths were able to dry it and ſuck it up.

Why the ſtrangury, or bloudineſs of the Urin followeth the ſuppreſſion of the Flowers.

Hiſtories of ſuch as were purged of their Menſtrual flux by the Noſe and Dugs.

In thoſe that have not the Flux monethly to evacuate this plenitude by ſome part or place of the body, there often follows difficulty of breathing, Melancholy, Madneſs, the Gout, an ill diſpoſition of the whole body, diſſolution of the ſtrength of the whole body, want of appetite, a Conſumption, the Falling-ſickneſs, an Apoplexy.

Thoſe whoſe bloud is laudable, yet not ſo abundant, do receive no other diſcommodity by the ſuppreſſion of the Flowers, unleſs it be that the Womb burns or itcheth with the deſire of copulation, by reaſon that the Womb is diſtended with hot and itching bloud, eſpecially if they lead a ſedentary life. Thoſe Women that have been accuſtomed to bear children, are not ſo grieved and evil at eaſe when their Flowers are ſtopped by any chance contrary to Nature, as thoſe Women which did never conceive, becauſe they have been uſed to be filled; and the veſſels by reaſon of their cuſtomary repletion and diſtention are more large and capacious: when the Courſes flow, the appetite is partly dejected, for that Nature being then wholly applied to expulſion, cannot throughly concoct or digeſt; the Face waxeth pale and without its lively colour, becauſe that the heat with the ſpirits, go from without inwards, ſo to help and aid the expulſive faculty.

To what women the ſuppreſſion of the Moneths is moſt grievous.

CHAP. LIII.

Of provoking the Flowers or Courſes.

THe ſuppreſſion of the Flowers is a plethorick Diſeaſe, and therefore muſt be cured by evacuation, which muſt be done by opening the Vein called *Saphena*, which is at the ankle, but firſt let the baſilick Vein of the arm be opened, eſpecially if the body be plethorick, leſt that there ſhould a greater attraction be made into the Womb, and by ſuch attraction or flowing in, there ſhould come a greater obſtruction. When the Veins of the Womb are diſtended with ſo great a ſwelling that they may be ſeen, it will be very profitable to apply Horſe-leeches to the neck thereof: Peſſaries for Women may be uſed, but fumigations of aromatick things are more meet for Maids, becauſe they are baſhful and ſhame-faced. Unguents, Liniments, Emplaſters, Cataplaſms that ſerve for that matter, are to be preſcribed and applied to the ſecret parts; Ligatures and Fri-

Why the Vein called *Baſilica* in the arm muſt be opened before the Vein *Saphena* in the foot.

Horſe leeches to be applied to the neck of the Womb.

ctions of the thighs and legs are not to be omitted, fomentations and ſternutatories are to be uſed, and Cupping-glaſſes are to be applied to the groins; walking, dancing, riding, often and wanton copulation with her husband, and ſuch like exerciſes, provoke the Flowers. Of Plants, the Flowers of St. *Johns* Wort, the Roots of Fennel, and Aſparagus, Bruſcus or Butchers-broom, or Parſly, Brooklime, Baſil, Balm, Betony, Garlick, Onions, Criſta Marina, Coſtmary, the Rind or Bark of Caſſia Fiſtula, Calamint, Origanum, Penniroyal, Mugwort, Thyme, Hyſſop, Sage, Marjoram, Roſemary, Hore-hound, Rue, Savin, Spurge, Saffron, Agarick, the Flowers of Elder, Bay-berries, the Berries of Ivy, Scammony, Cantharides, *Pyrethrum* or Pellitory of Spain, *Euphorbium*. The aromatick things are *Amomum*, Cinnamon, Squinanth, Nutmegs, *Calamus Aromaticus*, *Cyperus*, Ginger, Cloves, Galingal, Pepper, Cubibes, Amber, Musk, Spikenard, and ſuch like; of all which let Fomentations, Fumigations, Baths, Broths, Boles, Potions, Pills, Syrups, Apozems, and Opiats, be made as the Phyſician ſhall think good.

Plants that provoke the Flowers.

Sweet things.

The Apozeme that followeth is proved to be very effectual: ℞ *Fol. & flor. dictam. an.* p.ij. *pimpinel.* m. ſs. *omnium capillar. an.* p. j. *artemiſ. thymi, marjor. origan. an.* m. ß. *rad. rub. major. petroſelin. fœnicul. an.* ʒ j. ß. *rad. pæon. biſtort. an.* ʒ ſs. *cicerum rub. ſem. pæon. fœnicul. an.* ʒ ß. make thereof a decoction in a ſufficient quantity of Water, adding thereto Cinnamon ʒ iij. in one pint of the decoction diſſolve (after it is ſtrained) of the Syrup of Mugwort and of Hyſſop, *an.* ʒ. ij. *diarrhod. abbat.* ʒ j. let it be ſtrained through a bag, with ʒ ij. of the Kernels of Dates, and let her take ʒ iv. in the morning.

An apozeme to provoke the Flowers.

Let Peſſaries be made with *Galbanum*, *Ammoniacum*, and ſuch like mollifying things, beaten into a maſs in a mortar with a hot peſtle, and made into the form of a Peſſary, and then let them be mixed with Oil of Jaſmine, *Euphorbium*, an Ox-gall, the Juice of Mugwort, and other ſuch like, wherein there is power to provoke the Flowers, as with Scammony in Powder: let them be as big as ones thumb, ſix fingers long, and rowled in Lawn, or ſome ſuch like thin linnen cloth; of the ſame things Nodulaes may be made. Alſo Peſſaries may be prepared with Honey boiled, adding thereto convenient powders, as of Scammony, Pellitory, and ſuch like. Neither ought theſe to ſtay long in the neck of the Womb leſt they ſhould exulcerate, and they muſt be pulled back by a thred that muſt be put through them, and then the orifice of the Womb muſt be fomented with white Wine of the decoction of Penniroyal or Mother-wort.

But it is to be noted, that if the ſuppreſſion of the Flowers happeneth through the default of the ſtopped orifice of the Womb, or by inflammation, theſe maladies muſt firſt be cured before we come unto thoſe things that of their proper ſtrength and virtue provoke the Flowers: as for example, if ſuch things be made and given when the Womb is inflamed, the bloud being drawn into the grieved place, and the humours ſharpened, and the body of the Womb heated, the inflammation will be increaſed. So if there be any ſuperfluous fleſh, if there be any Callus of a wound or ulcer, or if there be any membrane ſhutting the orifice of the Womb, and ſo ſtopping the flux of the Flowers they muſt firſt be conſumed and taken away before any of thoſe things be adminiſtred. But the opportunity of taking and applying of things, muſt be taken from the time wherein the ſick Woman was wont to be purged before the ſtopping, or if ſhe never had the Flowers, in the decreaſe of the Moon; for ſo we ſhall have Cuſtom, Nature, and the external efficient cauſe to help Art. When theſe Medicins are uſed, the Women are not to be put into Baths or Hot-houſes, as many do, except the malady proceed from the denſity of the Veſſels, and the groſsneſs and clammineſs of the bloud. For Sweats hinder the menſtrual Flux, by diverting and turning the matter another way.

What cauſes of the ſtopping of the Flowers muſt be cured before the diſeaſe it ſelf.

The fitteſt time to provoke the Flowers.

Why Hot-houſes do hurt thoſe in whom the Flowers are to be provoked.

CHAP. LIV.

The ſigns of the approaching of the Menſtrual Flux.

When the Monethly flux firſt approacheth, the Dugs itch and become more ſwollen and hard than they are wont; the woman is more delirous of copulation, by reaſon of the ebullition of the provoked bloud, and the acrimony of the bloud that remaineth; her voice becometh bigger, her ſecret parts itch, burn, ſwell, and wax red. If they ſtay long, ſhe hath pain in her loins and head, nauſeouſneſs and vomiting troubleth the ſtomach: notwithſtanding, if thoſe matters which flow together in the womb, either of their own nature, or by corruption, be cold, they loath the act of generation, by reaſon that the Womb waxeth feeble through ſluggiſhneſs and watery humours filling the ſame, and it floweth by the ſecret parts very ſoftly. Thoſe Maids that are marriageable, although they have the menſtrual flux very well, yet they are troubled with Head-ach, nauſeouſneſs, and often vomiting, want of appetite, longing, an ill habit of body, difficulty of breathing, trembling of the heart, ſwouning, melancholy, fearful dreams, watching with ſadneſs and heavineſs, becauſe that the genital parts burning and itching, they imagine the act of generation, whereby it cometh to paſs that the ſeminal matter, either remaining in the teſticles in great abundance, or elſe poured into the hollowneſs of the Womb by the tickling of the genitals, is corrupted, and acquireth a venomous quality, and cauſeth ſuch like accidents as happen in the ſuffocation of the Womb.

What women do love, and what women do loath the act of generation when the moneths are ſtopped.

With what accidents thoſe that are marriageable and are not married, are troubled.

The cauſe of ſo many accidents.

Maids that live in the Country are not ſo troubled with thoſe Diſeaſes, becauſe there is no ſuch lying in wait for their Maiden-heads, and alſo they live ſparingly and hardly, and ſpend their time in continual labour. You may ſee many Maids ſo full of juice that it runneth in great abundance, as if they were not menſtrual, into their Dugs, and is there converted into milk, which they have in as great quantity as Nurſes, as we read it recorded by *Hippocrates*. If a Woman which is neither great with child, nor hath born children, hath milk, ſhe wants the menſtrual fluxes; whereby you may underſtand that that concluſion is not good which affirmeth that a Woman which hath milk in her breſts, either to be delivered of child, or to be great with child; for *Cardanus* writeth that he knew

Aph. 36. ſect. 5.

Lib. 2. de ſubt.

one

one *Antony Buzus* at *Genua*, who being thirty years of age, had ſo much milk in his breaſts as was ſufficient to nurſe a child; for the breeding and efficient cauſe of milk proceeds not onely from the engrafted faculty of the glandulous ſubſtance, but much rather from the action of the mans ſeed, for proof whereof you may ſee many men that have very much milk in their breaſts, and many women that almoſt have no milk, unleſs they receive mans ſeed. Alſo Women that are ſtrong and luſty like unto men, which the Latines call *Viragines*, that is to ſay, whoſe ſeed cometh unto a manly nature, when the Flowers are ſtopped, concoct the blood, and therefore when it wanteth paſſage forth, by the likeneſs of the ſubſtance it is drawn into the dugs, and becometh perfect milk: thoſe that have the Flowers plentifully and continually for the ſpace of four or five days, are better purged and with more happy ſucceſs than thoſe that have them for a longer time.

The efficient cauſe of the milk is to be noted.

CHAP. LV.

What accidents follow immoderate fluxes of the Flowers or Courſes.

IF the menſtrual Flux floweth immoderately, there alſo follow many accidents; for the concoction is fruſtrated, the appetite overthrown, then follows coldneſs throughout all the body, exolution of all the faculties, an ill habit of all the body, Leanneſs, the Droplie, an Hectick Fever, Convulſion, Swouning, and often ſudden death: if any have them too exceeding immoderately, the bloud is ſharp and burning, and alſo ſtinking, the ſick woman is alſo troubled with a continual Fever, and her tongue will be dry, ulcers ariſe in the gums and all the whole mouth. In women the Flowers do flow by the veins and arteries which riſe out of the ſpermatick veſſels, and end in the bottom and ſides of the womb; but in virgins and in women great with child, whoſe children are ſound and healthful, by the branches of the Hypogaſtrick vein and artery, which are ſpred and diſperſed over the neck of the womb. The cauſe of this immoderate flux is in the quantity or quality of the bloud; in both the fault is unreaſonable copulation, eſpecially with a man that hath a Yard of a monſtrous greatneſs, and the diſſolution of the retentive faculty of the veſſels: oftentimes alſo the Flowers flow immoderately by reaſon of a painful and a difficult birth of the child, or the after-birth, being pulled by violence from the cotyledons of the womb, or by reaſon that the veins and arteries of the neck of the womb are torn by the coming forth of the Infant with great travel, and many times by the uſe of ſharp Medicins, and exulcerating Peſſaries. Oft-times alſo Nature avoids all the juice of the whole body critically by the womb after a great diſeaſe, which flux is not raſhly or ſuddenly to be ſtopped. That menſtrual bloud that floweth from the womb, is more groſs, black, and clotty, but that which cometh from the neck of the womb is more clear, liquid and red.

By what pores the Flowers do flow in a Woman and in a Maid.

The cauſes of an unreaſonable flux of bloud.

The critical flux of the Flowers.

The ſigns of bloud flowing from the womb or neck of the womb.

CHAP. LVI.

Of ſtopping the immoderate flowing of the Flowers or Courſes.

YOu muſt make choice of ſuch meats and drinks as have power to incraſſate the bloud; for as the Flowers are provoked with meats that are hot and of ſubtil parts, ſo they are ſtopped by ſuch meats as are cooling, thickning, aſtringent, and ſtiptick, as are Barly-waters, ſodden Rice, the extreme parts of Beaſts, as of Oxen, Calves, Sheep, either fried or ſodden with Sorrel, Purſlain, Plantain, Shepherds-purſe, Sumach, the buds of Brambles, Berberies, and ſuch like. It is ſuppoſed that a Harts-horn burned, waſhed, and taken in aſtringent water, will ſtop all immoderate Fluxes; likewiſe *Sanguis draconis*, *terra ſigillata*, *bolus armenus*, *lapis hæmatites*, Coral beaten into moſt ſubtil powder, and drunk in ſteeled water; alſo Pap made with milk wherein ſteel hath oftentimes been quenched, and the flower of Wheat, Barley, Beans, or Rice, is very effectual for the ſame. Quinces, Cervices, Medlars, Cornelian-berries, or Cherries, may likewiſe be eaten at the ſecond Courſe. Julips are to be uſed of ſteeled waters, with ſyrup of dry Roſes, Pomegranats, Sorrel, Myrtles, Quinces, or old Conſerves of red Roſes, but Wine is to be avoided: but if the ſtrength be ſo extenuated, that they require it, you muſt chuſe groſs and aſtringent Wine tempered with ſteeled water; exerciſes are to be ſhunned, eſpecially Venerous Exerciſes, Anger is to be avoided, a cold air is to be choſen, which (if it be not ſo naturally) muſt be made ſo by ſprinkling cold things on the ground, eſecially if the Summer or heat be then in his full ſtrength; ſound ſleeping ſtays all evacuations except ſweating. The opening of a Vein in the arm, Cupping-glaſſes faſtened on the breaſts, bands, and painful frictions of the upper parts are greatly commended in this malady.

The inſtitution or order of life.

But if you perceive that the cauſe of this accident lieth in a cholerick ill juice mixed with the bloud, the body muſt be purged with Medicins that purge choler and water, as Rhubarb, Myrobalans, Tamarinds, Sebeſtens, and the purging Syrup of Roſes.

Purging.

CHAP. LVII.

Of local Medicins to be uſed againſt the immoderate flowing of the Courſes.

ALſo Unguents are made to ſtay the immoderate flux of the Terms, and likewiſe injections and peſſaries. This or ſuch like may be the form of an Unguent. ℞ *Ol. Maſtich. & myrt. an.* ʒ ij. *nucum cupr. olibani, myrtil. an.* ʒ ij. *ſucci roſar. rubr.* ʒ j. *pulv. maſtichin.* ʒ ij. *boli armen. terræ ſigillat. an.* ʒ ß. *ceræ quantum ſufficit, fiat unguentum.* An injection may be thus made. ℞ *Aq. plantag. roſar. rubr. burſæ paſtor. centinodii, an.* ℔ ß. *corticis querni, nucum cupreſſi, gallar. non maturar. an.* ʒ ij. *berberis,*

An unguent.

An aſtringent injection.

berberis, ſumach. balauſt. alumin. roch. an. ℥. j. make thereof a decoction, and inject it in a ſyringe blunt-pointed into the Womb, leſt if it ſhould be ſharp, it might hurt the ſides of the neck of the womb, alſo Snails beaten with their ſhells, and applied to the navel, are very profitable. Quinces roſted under the Coals, and incorporated with the powder of Myrtles and Bole-Armenick, and put into the neck of the womb, are marvellous effectual for this matter. The form of a peſſary may be thus:

Aſtringent Peſſaries.

℞ *Gallar. immaturar. combuſt. & in aceto extinctar.* ℥ ij. *ammo.* ʒ ß. *ſang. drac. pulv. rad. ſymphyt. ſumach. maſtich. ſucci acaciæ, cornu ceruſt. colophon. myrrhæ, ſcoriæ ferri, an.* ℥ j. *caphur.* ℈ ij. mix them, and incorporate them all together with the juice of Knot-graſs, Syn-green, Night-ſhade, Henbane, Water-lillies, Plantain, of each as much as is ſufficient, and make thereof a Peſſary.

Cooling things, as Oxycrate, *Unguentum roſatum*, and ſuch like, are with great profit uſed to the region of the loins, thighs, and genital parts: but if this immoderate flux do come by eroſion, ſo that the matter thereof continually exulcerateth the neck of the womb, let the place be anointed with the milk of a ſhe-Aſs, with Barley-water, or binding and aſtringent mucilages, as of Pſillium, Quinces, Gum Tragacanth, Arabick, and ſuch like.

CHAP. LVIII.

Of Womens Fluxes, or the Whites.

The reaſon of the name. The differences.

BEſides the fore-named Flux, which by the Law of Nature happeneth to Women monethly, there is alſo another called a *Womans Flux*, becauſe it is onely proper and peculiar to them: this ſometimes wearieth the Woman with a long and continual diſtillation from the womb, or through the womb, coming from the whole body without pain, no otherwiſe than when the whole ſuperfluous filth of the body is purged by the reins or urin; ſometimes it returneth at uncertain ſeaſons, and ſometimes with pain and exulcerating the places of the womb: it differeth from the menſtrual Flux, becauſe that this for the ſpace of a few days, as it ſhall ſeem convenient to Nature, caſteth forth laudable bloud; but this *Womans Flux* yieldeth impure juice, ſometimes ſanious, ſometimes ſerous and livid, otherwhiles white and thick, like unto Barly-cream, proceeding from flegmatick bloud: this laſt kind thereof is moſt frequent. Therefore we ſee women that are flegmatick, and of a ſoft and looſe habit of body, to be often troubled with this diſeaſe; and therefore they will ſay among themſelves that they have the Whites. And as the matter is diverſe, ſo it will ſtain their ſmocks with a different colour. Truly if it be perfectly red and ſanguin, it is to be thought it cometh by eroſion, or the exſolution of the ſubſtance of the veſſels of the womb, or of the neck thereof: therefore it cometh very ſeldom of bloud, and not at all except the woman be either great with child, or ceaſe to be menſtrual for ſome other cauſe; for then in ſtead of the monethly flux there floweth a certain whayith excrement, which ſtaineth her cloaths with the colour of water wherein fleſh is waſhed.

What women are apt to this flux.

Womens flux cometh very ſeldom of bloud.

Alſo it very ſeldom proceeds of a melancholick humour, and then for the moſt part it cauſeth a Cancer in the womb. But oftentimes the purulent and bloudy matter of an ulcer lying hidden in the womb, deceiveth the unskilful Chirurgeon or Phyſician: but it is not ſo hard to know theſe diſeaſes one from the other; for the matter that floweth from an ulcer, becauſe (as it is ſaid) it is purulent, it is alſo leſſer, groſſer, ſtinking, and more white. But thoſe that have ulcers in thoſe places, eſpecially in the neck of the womb, cannot have copulation with a man without pain.

By what ſigns an ulcer in the womb may be known from the white Flowers.

CHAP. LIX.

Of the cauſes of the Whites.

SOmetimes the cauſe of the Whites conſiſteth in the proper weakneſs of the womb, or elſe in the uncleanneſs thereof; and ſometimes by the default of the principal parts. For if the brain or the ſtomach be cooled, or the liver ſtopped or ſcirrhous, many crudities are engendred, which if they run, or fall down into the womb that is weak by Nature, they cauſe the flux of the Womb or Whites: but if this Flux be moderate, and not ſharp, it keepeth the body from malign diſeaſes; otherwiſe it uſeth to infer a Conſumption, Leanneſs, Paleneſs, and an œdematous ſwelling of the legs, the falling down of the womb, the dejection of the appetite and all the faculties, and continual ſadneſs and ſorrowfulneſs; from which it is very hard to perſuade the ſick woman, becauſe that her mind and heart will be almoſt broken, by reaſon of the ſhame that ſhe taketh, becauſe ſuch filth floweth continually; it hindereth conception, becauſe it either corrupteth, or driveth out the ſeed when it is conceived. Oftentimes if it ſtoppeth for a few Moneths, the matter that ſtayeth there cauſeth an abſceſs about the womb in the body or neck thereof; and by the breaking of the abſceſs there followeth rotten and cancerous ulcers, ſometimes in the womb, ſometimes in the groin, and often in the hips.

How a Womans flux is wholeſom. How it cauſeth diſeaſes. How it letteth the conception.

Why it is hard to be cured.

This diſeaſe is hard to be cured, not onely by reaſon of it ſelf, as becauſe all the whole filth and ſuperfluous excrements of a womans body floweth down into the womb, as it were into a ſink; becauſe it is naturally weak, hath an inferiour ſituation, many veſſels ending therein; and laſt of all, becauſe the Courſes are wont to come through it; as alſo by reaſon of the ſick woman, who oftentimes had rather die than to have that place ſeen, the diſeaſe known, or permit local Medicins to be applied thereto: for ſo ſaith *Montanus*, that on a time he was called to a Noble-woman of *Italy*, who was troubled with this diſeaſe, unto whom he gave counſel to have cleanſing decoctions injected into her womb; which when ſhe heard, ſhe fell into a ſwound, and deſired her husband never thereafter to uſe his counſel in any thing.

An Hiſtory.

CHAP.

CHAP. LX.

The Cure of the Whites.

IF the matter that floweth out in this diſeaſe be of a red colour, it differeth from the natural Monethly flux in this onely, becauſe it keeps no order or certain time in its returning. Therefore Phlebotomy and other remedies which we have ſpoken of, as requiſite for the menſtrual flux, when it floweth immoderately, is here neceſſary to be uſed. But if it be white, or doth teſtifie or argue the ill juice of this or that humour by any other colour, a Purgation muſt be preſcribed of ſuch things as are proper to the humour that offends: for it is not good to ſtop ſuch a flux ſuddenly, for it is neceſſary that ſo the body ſhould be purged of ſuch filth or abundance of humours; for they that do haſten to ſtop it, cauſe the dropſie by reaſon that this ſink of humours is turned back into the liver; or elſe a Cancer in the Womb, becauſe it is ſtaid there; or a Fever, or other diſeaſes, according to the condition of the part that receiveth it. Therefore we muſt not come to local deterſives, deſiccatives, reſtrictives, unleſs we have firſt uſed univerſal remedies according to Art. Alum-baths, baths of Brimſtone, and of bitumen, or iron, are convenient for the Whites that come of a phlegmatick humour; in ſtead whereof baths may be made of the decoction of herbs that are hot, dry, and indued with an aromatick power, with Alum and Pebles, or Flint-ſtones red hot thrown into the ſame. Let this be the form of a cleanſing decoction and injection. ℞ *Fol. abſynth. agrim. centinod. burſ. paſt. an.* m. ß. boil them together, and make thereof a decoction, in which diſſolve *mellis roſar.* ℥ ij. *aloes, myrrhæ, ſalis nitri, an.* ʒ j. make thereof an injection the woman being ſo placed on a pillow under her buttocks that the neck of the Womb being more high, may be wide open: when the injection is received, let the Woman ſet her legs acroſs, and draw them up to her buttocks, and ſo ſhe may keep that which is injected. They that endeavour to dry and bind more ſtrongly, add the juice of *acatia*, green galls, the rinds of Pomegranats, Roch-alum, Romane Vitriol, and they boil them in Smiths water and Red wind; peſſaries may be made of the like faculty.

If the flux of a Woman be red, wherein it differeth from the menſtrual flux.

A Womans flux is not ſuddenly to be ſtopped.

What baths are profitable.

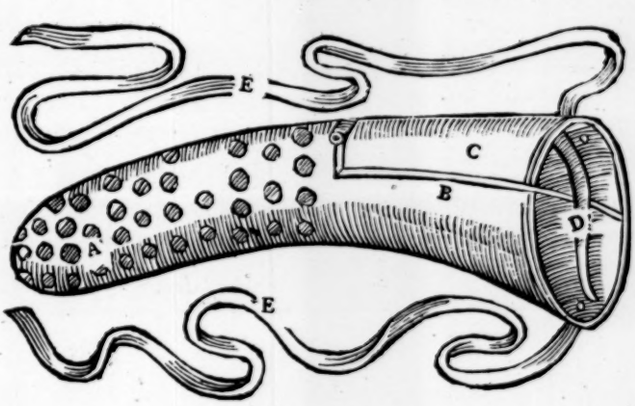
An aſtringent injection.

If the matter that cometh forth be of an ill colour or ſmell, it is like that there is a rotten ulcer; therefore we ought to inject thoſe things that have power to correct the putrefaction: among which *Ægyptiacum*, diſſolved in Lie, or Red wine, excelleth. There are women which when they are troubled with a virulent Gonorrhæa, or an involuntary flux of the ſeed, cloaking the fault with an honeſt name, do untruly ſay that they have the Whites, becauſe that in both theſe diſeaſes a great abundance of filth is avoided. But the Chirurgeon may eaſily perceive that malady by the rottenneſs of the matter that floweth out, and he ſhall perſuade himſelf that it will not be cured without ſalivation or fluxing at the mouth, and ſweats. In the mean while let him put in an inſtrument made like unto a peſſary, and cauſe the ſick woman to hold it there: this inſtrument muſt have many holes in the upper end, through which the purulent matter may paſs, which by ſtaying or ſtopping might get a ſharpneſs; as alſo that ſo the Womb may breath the more freely, and may be kept more temperate and cool by receiving the air, by the benefit of a ſpring whereby this Inſtrument, being made like unto a peſſary, is opened and ſhut.

The ſigns of a putrefied ulcer in the Womb.

The virulent Gonorrhæa is like unto the flux of Women.

The form of an Inſtrument made like unto a Peſſary, whereby the Womb may be ventilated.



A *Sheweth the end of the Inſtrument, which muſt have many holes therein.*
B *Sheweth the body of the Inſtrument.*
C *Sheweth the Plate whereby the mouth of the Inſtrument is opened and ſhut, as wide and as cloſe as you will, for to receive the air more freely.*
D *Sheweth the Spring.*
EE *Shew the Laces and Bands to tie about the Patients body, that ſo the Inſtrument may be ſtaid and kept faſt in his place.*

CHAP. LXI.

Of the Hæmorrhoids *and Warts of the neck of the Womb.*

LIke as in the Fundament, ſo in the neck of the Womb there are Hæmorrhoids, and as it were varicous Veins, oftentimes flowing with much bloud, or with a red and ſtinking whayiſh humour. Some of theſe, by reaſon of their redneſs and great inequality as it were of knobs, are like unripe Mulberries, and are called vulgarly *Venæ morales*, that is to ſay, the Veins or Hæmorrhoids like unto Mulberries: others are like unto Grapes, and therefore are named *Uvales*: other ſome are like unto Warts, and therefore are called *Venæ verucales*: ſome appear and ſhew themſelves with a great tumor, others are little, and in the bottom of the neck of the Womb; others are in

The differences of the Hæmorrhoids of the neck of the Womb.

What an *Acrochordon* is.

the ſide or edge thereof. *Acrochordon* is a kind of Wart with a callous bunch or knot, having a thin or ſlender root, and a greater head, like unto the knot of a Rope, hanging by a ſmall thred; it is called of the *Arabians*, *Verruca botoralis*.

What a *Thymus* is.

There is alſo another kind of Wart, which becauſe of its great roughneſs and inequality, is called *Thymus*, as reſembling the flower of Thyme. All ſuch diſeaſes are exaſperated and made more grievous by any exerciſe, eſpecially by venerous acts: many times they have a certain malignity, and an hidden virulency joined with them, by occaſion whereof they are aggravated even by touching onely, becauſe they have their matter of a raging humour; therefore to theſe we may not rightly uſe a true, but onely the palliative cure, as they term it: the *Latins* call them onely *Ficus*, but the *French* men name them with an adjunct, Saint *Fiacrius* Figs.

S. *Fiacrius* figs.

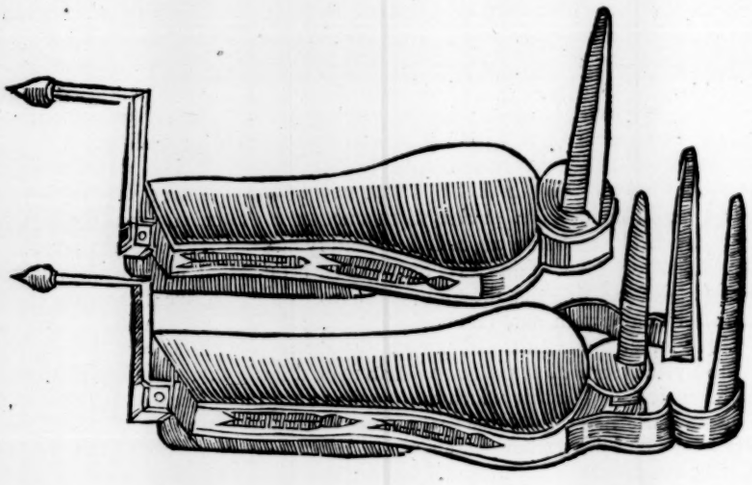
CHAP. LXII.

Of the Cure of the Warts that are in the neck of the Womb.

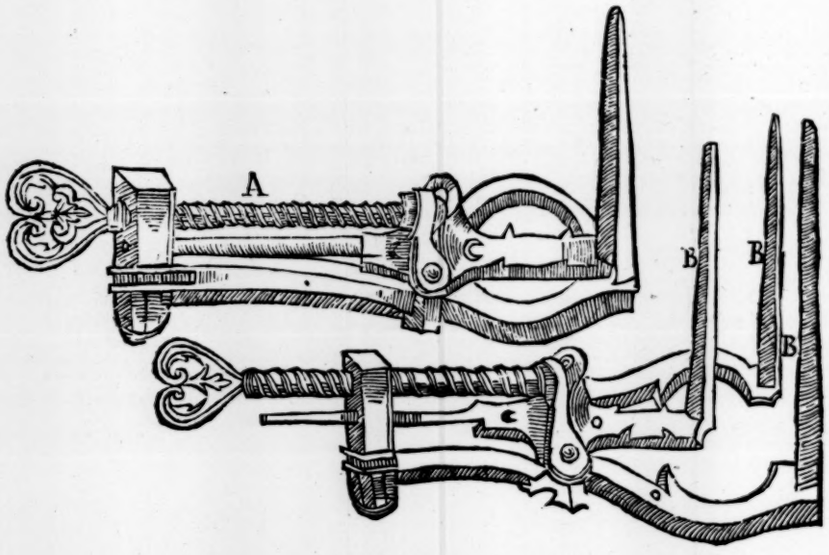
What Warts of the Womb muſt be bound and ſo cut off.

THe Warts that grow in the neck of the Womb, if they be not malignant, are to be tied with a thred, and ſo cut off. Thoſe that lie hid more deep in the Womb, may be ſeen and cured by opening the *Matrix* with a dilater made for the purpoſe.

Divers Speculum Matricis, *or Dilaters for the inſpection of the* Matrix.



Another form of a Dilater, or Speculum Matricis, *whereof the declaration followeth.*



A *Sheweth the Screw which ſhutteth and openeth the Dilater of the* Matrix.
B *Sheweth the Arms or Branches of the Inſtrument, which ought to be eight or nine fingers long.*

But theſe Dilaters of the Matrix ought to be of a bigneſs correſpondent to the Patients body; let them be put into the Matrix, when the woman is placed as we have ſaid, when the child is to be drawn out of her body. That inſtrument is moſt meet to tie the Warts, which we have deſcribed in the relaxation

laxation of the Palat or *Uvula*: let them be tied harder and harder every day until they fall away. Therefore for the curing of Warts there are three chief ſcopes, as Bands, Sections, Cauteries; and leſt they grow up again, let Oil of Vitriol be dropped on the place, or *Aqua fortis*, or ſome of the lee whereof potential Cauteries are made. This Water following is moſt effectual to conſume and waſte Warts. ℞ *Aq. plantag.* ℥ vj. *virid. æris* ʒ ij. *alum. roch.* ʒ iij. *ſal. com.* ℥ ß. *vit. rom. & ſublim. an.* ʒ ß. beat them all together, and boil them; let one or two drops of this water be dropped on the grieved place, not touching any place elſe; but if there be an ulcer, it muſt be cured as I have ſhewed before. A certain man ſtudious of Phyſick, of late affirmed to me, that Ox-dung tempered with the leaves or powder of Savin, would waſte the Warts of the womb, if it were applied thereto warm; which, whether it be true or not, let Experience, the Miſtreſs of things, be judge. Verily, *Cantharides* put into unguents will do it, and (as it is likely) more effectually; for they will conſume the calouſneſs which groweth between the Toes or Fingers. I have proved by experience, that the Warts that grow on the hands, may be cured by applying of Purſlain beaten or ſtamped in its own juice. The Leaves and Flowers of Marigolds, do certainly perform the ſelf-ſame thing.

Three ſcopes of the cure of Warts in the Womb.

An effectual water to conſume Warts.

Unguents to conſume warts.

CHAP. LXIII.

Of Chaps, and thoſe wrinkled and hard Excreſcences, which the Greeks call Condylomata.

CHaps or Fiſſures, are cleft and very long little Ulcers with pain very ſharp and burning, by reaſon of the biting of an acrid, ſalt and dry humour, making ſo great a contraction, and often-times narrowneſs in the fundament and the neck of the womb, that ſcarcely the top of ones finger may be put into the orifice thereof, like unto pieces of Leather or Parchment, which are wrinkled and parched by holding of them to the fire. They riſe ſometimes in the mouth, ſo that the Patient can neither ſpeak, eat, nor open his mouth, ſo that the Surgeon is conſtrained to cut it. In the cure thereof, all ſharp things are to be avoided, and thoſe which mollifie are to be uſed, and the grieved place or part is to be moiſtned with Fomentations, Liniments, Cataplaſms, Emplaſters; and if the malady be in the Womb, a dilater of the matrix or peſſary muſt be put thereinto very often, ſo to widen that which is over hard, and too much drawn together or narrow, and then the cleft little ulcers muſt be cicatrized. *Condylomata* are certain wrinkled and hard bunches, and as it were excreſcences of the fleſh, riſing eſpecially in the wrinkled edge of the fundament and neck of the womb. Cooling and relaxing medicins ought to be uſed againſt this diſeaſe, ſuch as are Oil of Eggs and Oil of Lin-ſeed, take of each of them two ounces, beat them together a long time in a leaden Mortar, and therewith anoint the grieved part; but if there be an inflammation, put thereto a little Camphir.

What Chaps are.

The Cure.

What *Condylomata* are.

The Cure.

CHAP. XLIV.

Of the itching of the Womb.

IN Women, eſpecially ſuch as are old, there oftentimes cometh an itching in the neck of the Womb, which doth ſo trouble them with pain, and a deſire to ſcratch, that it taketh away their ſleep. Not long ſince a woman asked my counſel, that was ſo troubled with this kind of malady, that ſhe was conſtrained to extinguiſh or ſtay the itching burning of her ſecret parts by ſprinkling cinders of fire, and rubbing them hard on the place. I counſelled her to take *Ægyptiacum* diſſolved in Sea-water or lee, and inject it in her ſecret parts with a Syringe, and to wet ſtupes of flax in the ſame Medicin, and put them up into the Womb, and ſo ſhe was cured. Many times this itch cometh in the fundament or teſticles of aged men, by reaſon of the gathering together or conflux of ſalt phlegm, which when it falleth into the eyes, it cauſeth the Patient to have much ado to refrain ſcratching: when this matter hath diſperſed into the whole habit of the body, it cauſeth a burning or itching ſcab, which muſt be cured by a cooling and moiſtning diet, by phlebotomy and purging of the ſalt humour, by baths and horns applied, with ſcarification and anointing the whole body with the Unction following. ℞ *Axung. porcin. recent.* ℔ j. ß. *ſap. nig. vel gallici, ſalis nitri, aſſat. tartar. ſtaphyſag. an.* ʒ ß. *ſulph. viv.* ℥ j. *argent. viv.* ʒ ij. *acet. roſ. quart.* j. incorporate them all together, and make thereof a liniment according to Art, and uſe it as is ſaid before: *Unguentum enulatum cum Mercurio* is thought to have great force, not without deſert, to aſſwage the itch, and dry ſcab. Some uſe this that followeth: ℞ *Alum. ſpum. nitr. ſulph. viv. an.* ʒ vj. *ſtaphyſ.* ℥ j. let them all be diſſolved in Vinegar of Roſes, adding thereto *Butyr. recent. q. ſ.* make thereof a liniment for the fore-named uſe.

CHAP. LXV.

Of the relaxation of the great Gut, or Inteſtine, which happeneth to Women.

MAny Women that have had great travail and ſtrains in Child-birth, have the great inteſtine (called of the Latins, *Craſſum inteſtinum*) or Gut, relaxed and ſlipped down; which kind of affect happeneth much to children, by reaſon of a phlegmatick humour moiſtening the ſphincter-muſcle of the fundament, and the two others called *Levatores*. For the cure thereof, firſt of all the Gut called *rectum inteſtinum*, or the ſtrait Gut, is to be fomented with a decoction of heating and reſolving herbs, as of Sage, Roſemary, Lavender, Tyme, and ſuch like; and then of aſtringent things, as of Roſes, Myrtils, the rinds of Pomegranats, Cypreſs-nuts, Galls, with a little Allum; then it muſt be ſprinkled with the Powder of things that are aſtringent without biting: and laſt

The Cauſe.

The Cure.

An effectual remedy.

laſt of all, it is to be reſtored, and gently put into its place. That is ſuppoſed to be an effectual and ſingular remedy for this purpoſe, which is made of twelve red Snails put into a Pot with ʒ ß of Alum, and as much of Salt, and ſhaken up and down a long time, for ſo at length when they are dead there will remain an humour, which muſt be put upon Cotton, and applied to the Gut that is fallen down.

The differences and ſigns.

By the ſame cauſe (that is to ſay, of painful child-birth in ſome women) there ariſeth a great ſwelling in the Navel; for when the *Peritonæum* is relaxed or broken, ſometimes the Kall, and ſometimes the Guts ſlip out: many times flatulences come thither, the cauſe, as I now ſhewed, is over great ſtraining or ſtretching of the belly, by a great burthen carried in the Womb, and great travel in child-birth: if the fallen-down Guts make that tumor, pain joined together with that tumor doth vex the Patient; and if it be preſſed, you may hear the noiſe of the guts going back again: if it be the Kall, then the tumor is ſoft, and almoſt without pain, neither can you hear any noiſe by compreſſion: if it be wind, the tumor is looſe and ſoft, yet it is ſuch as will yield to the preſſing of the finger with ſome ſound, and will ſoon return again: if the tumor be great, it cannot be cured, unleſs the *Peritonæum* be cut, as

An Hiſtory.

it is ſaid in the cure of Ruptures. In the Church-Porches of *Paris*, I have ſeen Beggar-women, who by the falling down of the Guts, have had ſuch tumors as big as a bowl, who notwithſtanding could go, and do all other things as if they had been ſound and in perfect health: I think it was becauſe the *fæces* or excrements, by reaſon of the greatneſs of the tumor, and the bigneſs or wideneſs of the inteſtines, had a free paſſage in and out.

CHAP. LXVI.

Of the relaxation of the Navel in Children.

OFtentimes in Children newly born, the Navel ſwelleth as big as an Egg, becauſe it hath not been well cut or bound, or becauſe the whayiſh humours are flowed thither, or becauſe that part hath extended it ſelf too much by crying, by reaſon of the pains of the fretting of the Childs guts, many times the Child bringeth that tumor joined with an abſceſs with him from his

An abſceſs not to be opened.

Mothers Womb: but let not the Chirurgeon aſſay to open that abſceſs, for if it be opened, the guts come out through the inciſion, as I have ſeen in many, and eſpecially in a Child of my Lord *Martigues*; for when *Peter* of the Rock, the Chirurgeon, opened an abſceſs that was in it, the bowels ran out at the inciſion, and the Infant died; and it wanted but little that the Gentlemen of my Lords

An Hiſtory.

retinue that were there, had ſtrangled the Chirurgeon. Therefore when *John Gromontius* the Carver deſired me, and requeſted me of late that I would do the like in his Son; I refuſed to do it, becauſe it was in danger of its life by it already; and in three days after the abſceſs broke, and the bowels guſhed out, and the child died.

CHAP. LXVII.

Of the pain that Children have in breeding of Teeth.

The time of breeding of the Teeth.

CHildren are greatly vexed with their Teeth, which cauſe great pain when they begin to break as it were out of their ſhell or ſheath, and begin to come forth, the gums being broken, which for the moſt part happeneth about the ſeventh moneth of the Childs age.

The cauſe of the pain in breeding Teeth.

This pain cometh with itching and ſcratching of the gums, an inflammation, flux of the belly, whereof many times cometh a Fever, falling of the Hair, a Convulſion, at length death. The cauſe of the pain is the ſolution of the continuity of the Gums by the coming forth of the Teeth.

The ſigns.

The ſigns of that pain is an unaccuſtomed burning, or heat of the Childs mouth, which may be perceived by the Nurſe that giveth it ſuck, a ſwelling of the Gums and Cheeks, and the Childs being more wayward and crying than was wont, and it will put its fingers to its mouth, and it will rub them on its

The Cure.

Gums as though it were about to ſcratch, and it ſlavereth much. That the Phyſician may remedy this, he muſt cure the Nurſe as if ſhe had the Fever, and ſhe muſt not ſuffer the Child to ſuck ſo often, but make him cool and moiſt, when he thirſteth, by giving him at certain times *Syrupus Alexandrinus*, *ſyrup. de Limonibus*, or the ſyrup of Pomgranats with boiled Water; yet the Child muſt not hold thoſe things that are actually cold long in his mouth, for ſuch by binding the Gums, do in ſome ſort ſtay the Teeth that are newly coming forth; but things that lenifie and mollifie are rather to be uſed, that is to ſay, ſuch things as do by little and little relax the looſe fleſh of the Gums, and alſo aſſwage the pain. Therefore the Nurſe ſhall oftentimes rub the Childs Gums with her fingers anointed or beſmeared with Oil of ſweet Almonds, freſh Butter, Honey, Sugar, mucilage of the ſeeds of *Pſilium*, or of the ſeeds of Marſh-mallows extracted in the water of Pellitory of the Wall. Some think that the brain of a Hare, or of a ſucking Pig roaſted or ſodden, through a ſecret property, are effectual for the ſame: and on the out-ſide ſhall be applied a Cataplaſm of Barly-meal, Milk, Oil of Roſes, and the Yolks of Eggs. Alſo a ſtick of Liquorice ſhaven and bruiſed and anointed with Honey, or any of the fore-named Syrups, and often rubbed in the mouth or on the gums, is likewiſe profitable: ſo

What power ſcratching of the gums hath to aſſwage the pain of them.

is alſo any Toy for the Child to play withall, wherein a Wolves tooth is ſet, for this by ſcratching doth aſſwage the painful itching, and rarifie the Gums, and in ſome weareth them that the Teeth appear the ſooner. But many times it happeneth that all theſe and ſuch like medicins profit nothing at all, by reaſon of the contumacy of the gums, by hardneſs or the weakneſs of the Childs nature; therefore in ſuch a caſe, before the fore-named mortal accidents come, I would perſuade the Chirurgeon to open the gums in ſuch places as the Teeth bunch out with a little ſwelling, with a Knife or Lancet, ſo breaking and opening a way for them, notwithſtanding that a little flux of bloud will follow by the tention of the gums: of which kind of remedy I have with proſperous and happy ſucceſs made trial in ſome of mine own Children in the preſence of *Feureus*, *Altinus*, and *Cortinus*,

Doctors

Doctors of Physick, and *Guillemeau* the Kings Chirurgeon, which is much better and more safe than to do as some Nurses do, who, taught onely by the instinct of Nature, with their nails and scratching, break and tear, or rent the Childrens gums. The Duke of *Nevers* had a son of eight moneths old, which died of late, and when we, with the Physicians that were present, diligently sought for the cause of his death, we could impute it unto nothing else than to the contumacious hardness of the gums, which was greater than was convenient for a child of that age; for therefore the Teeth could not break forth, nor make a passage for themselves to come forth: of which our judgment this was the trial, that when we cut his gums with a knife, we found all his Teeth appearing as it were in an array, ready to come forth, which if it had been done when he lived, doubtless he might have been preserved. An History.

The End of the Four and Twentieth Book.

BOOK XXV.

Of MONSTERS *and* PRODIGIES.

THE PREFACE.

WE call Monsters, what things soever are brought forth contrary to the common decree and order of Nature. So we term that Infant monstrous which is born with one arm alone, or with two heads. But we define Prodigies, those things which happen contrary to the whole course of Nature, that is, altogether differing and dissenting from Nature: as if a man should be delivered of a Snake or a Dog. Of the first sort are thought all those, in which any of those things which ought, and are accustomed to be, according to Nature, is wanting, or doth abound, is changed, worn, covered, or deformed, hurt, or not put in its right place: for sometimes some are born with more fingers than they should, other some but with one finger: some with those parts divided which should be joined, others with those parts joined which should be divided: some are born with the privities of both sexes, male and female. And Aristotle *saw a Goat with a horn upon her knee. No living Creature was ever born which wanted the Heart, but some have been seen wanting the Spleen, others with two Spleens, and some wanting one of the Reins. And none have been known to have wanted the whole Liver, although some have been found that had it not perfect and whole: and there have been those which wanted the Gall, when by Nature they should have had it; and besides it hath been seen that the Liver, contrary to its natural site, hath lien on the left side, and the Spleen on the right. Some Women also have had their Privities closed, and not perforated, the membranous obstacle, which they call the* Hymen, *hindering. And men are sometimes born with their Fundaments, Ears, Noses, and all the rest of the passages shut, and accounted monstrous, Nature erring from its intended scope. But to conclude, those Monsters are thought to portend some ill, which are much differing from their Nature.*

What a Monster is. What a Prodigy is. *Lib. 4. gen. anim. cap. 4.*

CHAP. I.

Of the causes of Monsters; and first of those Monsters which appear for the glory of God, and the punishment of Mans wickedness.

THere are reckoned up many causes of Monsters, the first whereof is the glory of God, that his immense power may be manifest to those which are ignorant of it, by the sending of those things which happen contrary to Nature: for thus our Saviour Christ answered the Disciples (asking whether *He* or his *Parents* had offended, who being *born blind*, received his sight from him) that neither *He* nor his *Parents* had committed any fault so great, but this so happened onely that the *glory* and majesty of God should be divulged by that miracle, and such great works.

Another cause is, that God may either punish mens wickedness, or shew signs of punishment at hand, because Parents sometimes lie and join themselves together without law and measure, or luxuriously and beastly, or at such times as they ought to forbear by the command of God and the Church, such monstrous, horrid and unnatural births do happen.

The

The Figure of a Colt with a Mans Face.

At *Verona*, *An. Dom.* 1254. a Mare foaled a Colt with the perfect face of a Man, but all the reſt of the body like an Horſe: a little after that the Wars between the *Florentines* and *Piſans* began, by which all *Italy* was in a combuſtion.

The Figure of a winged Monſter.

About the time that Pope *Julius* the ſecond raiſed up all *Italy*, and the greateſt part of Chriſtendom againſt *Lewis* the Twelfth, the King of *France*, in the Year of our Lord 1512. (in which Year, upon Eaſter day, near *Ravenna* was fought that mortal battle, in which the Popes Forces were overthrown) a Monſter was born in *Ravenna*, having a Horn upon the Crown of his head, and beſides, two wings, and one foot alone, moſt like to the feet of Birds of prey, and in the knee thereof an eye, the Privities of male and female, the reſt of the body like a man, as you may ſee by this Figure.

The third cauſe is, an abundance of ſeed and overflowing matter. The fourth, the ſame in too little quantity, and deficient. The fifth, the force and efficacy of imagination. The ſixth, the ſtraightneſs of the Womb. The ſeventh, the diſorderly ſite of the party with child, and the poſition of the parts of the body. The eighth, a fall, ſtrain, or ſtroak, eſpecially upon the belly of a woman with child. The nineth, hereditary diſeaſes, or affects by any other accident. The tenth, the confuſion and mingling together of the ſeed. The eleventh, the craft and wickedneſs of the Devil. There are ſome others which are accounted for Monſters, becauſe their original or eſſence full of admiration, or do aſſume a certain prodigious form by the craft of ſome begging Companions; therefore we will ſpeak briefly of them in their place, in this our Treatiſe of Monſters.

CHAP. II.

Of Monſters cauſed by too great abundance of Seed.

SEeing we have already handled the two former and truly final cauſes of Monſters, we muſt now come to thoſe which are material, corporeal, and efficient cauſes, taking our beginning from that we call the too great abundance of the matter of ſeed. It is the opinion of thoſe Philoſophers which have written of Monſters, that if at any time a Creature bearing one at once, as Man, ſhall caſt forth more ſeed in copulation than is neceſſary to the generation of one body, it cannot be that onely one ſhould be begot of all that: therefore from thence either two or more muſt ariſe: whereby it cometh to paſs, that theſe are rather judged wonders, becauſe they happen ſeldom, and contrary to common cuſtom. Superfluous parts happen by the ſame cauſe that Twins and many at one birth, contrary to Natures courſe, do chance, that is, by a larger effuſion of ſeed than is required for the framing of that part, that ſo it exceeds either in number or elſe in greatneſs. So *Auſtin* tells that in his time in the Eaſt, an Infant was born, having all the parts from the belly upwards double, but from thence downward ſingle and ſimple: for it had two heads, four eyes, two breaſts, four hands, in all the reſt like to another child, and it lived a little while. *Cælius Rhodiginus* ſaith he ſaw two Monſters in *Italy*, the one male, the other female, handſomely and neatly made through all their bodies, except their heads, which were double; the male died within a few days after it was born, but the female (whoſe ſhape is here delineated) lived five and twenty years, which is contrary to the common cuſtom of Monſters; for they for the moſt part are very ſhort-lived, becauſe they both live and are born, as it were, againſt Natures conſent; to which may

be

be added, they do not love themſelves, by reaſon they are made a ſcorn to others, and that by that means lead a hated life.

But it is moſt remarkable which *Lycoſthenes* telleth of a * Woman-monſter; for, excepting her two heads, ſhe was framed in the reſt of her body to an exact perfection: her two heads had the like deſire to eat and drink, to ſleep, to ſpeak, and to do every thing; ſhe begged from door to door, every one giving to her freely. Yet at length ſhew was baniſhed *Bavaria*, leſt that by the frequent looking upon her, the imagination of Women with child, ſtrongly moved, ſhould make the like impreſſion in the Infants they bare in their Wombs.

*The Effigies of a * Maid with two heads.*

The Effigies of two • Girls whoſe Backs grew together.

In the Year of our Lord 1475. at *Verona* in *Italy*, two • Girls were born with their backs ſticking together from the lower part of the ſhoulders unto the very buttocks. The novelty and ſtrangeneſs of the thing moved their Parents, being but poor, to carry them through all the chief Towns in *Italy* to get money of all ſuch as came to ſee them.

The Figure of a Man with another growing out of him.

In the Year 1530. there was a man to be ſeen at *Paris*, out of whoſe belly another, perfect in all his members except head, hanged forth as if he had been grafted there. The man was forty years old, and he carried the other implanted or growing out of him, in his arms, with ſuch admiration to the beholders, that many ran very earneſtly to ſee him.

The

The

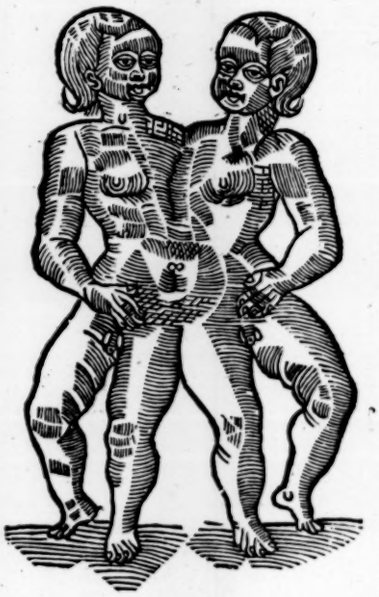
The Effigies of a horned or hooded Monſter.

At *Quiers*, a ſmall Village ſome ten miles from *Turin* in *Savoy*, in the Year 1578. upon the ſeventeenth day of *January*, about eight of the Clock at night, an honeſt Matron brought forth a Child having five horns, like to Rams horns, ſet oppoſite to one another upon his head: he had alſo a long piece of fleſh, like in ſome ſort to a French-hood which Women uſe to wear, hanging down from his forehead by the nape of his neck almoſt the length of his back: two other pieces of fleſh, like the collar of a ſhirt, were wrapped about his neck: the fingers ends of both his hands ſomewhat reſembled a Hawks Talons, and his knees ſeemed to be in his hams: the right leg and the right foot were of a very red colour; the reſt of the body was of a tawny colour: it is ſaid he gave ſo terrible a ſcritch when he was brought forth, that the Midwives, and the reſt of the Women that were at her labour, were ſo frighted that they preſently left the houſe and ran away. When the Duke of *Savoy* heard of this Monſter, he commanded it ſhould be brought to him, which performed, one would hardly think what various cenſures the Courtiers gave of it.

The Monſter you ſee here delineated, was found in the middle and innermoſt part of an * Egg, with the face of a Man, but hairs yielding a horrid repreſentation of Snakes; the chin had three other Snakes ſtretched forth like a beard. It was firſt ſeen at *Autun*, at the houſe of one *Bancheron* a Lawyer: a Maid breaking many Eggs to butter, the white of this Egg given a Cat, preſently killed her. Laſtly, this Monſter coming to the hands of the Baron *Seneey*, was brought to King *Charles* the nineth being then at *Metz*.

** The ſhape of a Monſter found in an Egg.*

The Effigies of a monſtrous ♭ Child, having two heads, two arms, and four legs.



In the Year 1546. a Woman at *Paris* in her ſixth Moneth of her account, brought forth a ♭ Child having two heads, two arms, and four legs. I diſſecting the body of it, found but one heart, by which one may know it was but one Infant. For you may know this from *Ariſtotle*, whether the monſtrous birth be one or more joined together, by the principal part: for if the body have but one heart, it is but one; if two, it is double by the joining together in the conception.

In

In the Year 1569. a certain Woman of *Tours* was delivered of * Twins joined together with one head, and naturally embracing each other. *Renatus Ciretus* the famous Chirurgeon of thoſe parts, ſent me their *Sceleton.*

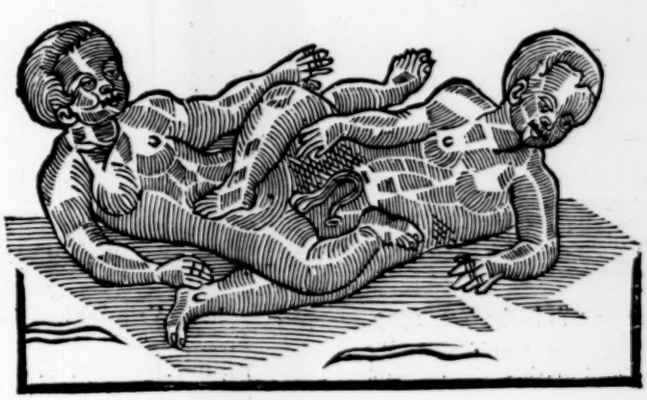
*The Portraiture of * Twins joined together with one Head.*

The Effigies of two ᶜ Girls being Twins, joined together by their Fore-heads.

Munſter writes that in the Village *Briſtan*, not far from *Worms*, in the Year 1495. he ſaw two • Girls perfect and entire in every part of their bodies, but they had their Fore-heads ſo joined together that they could not be parted or ſevered by any art: they lived together ten years, then the one dying, it was needful to ſeparate the living from the dead: but ſhe did not long out-live her ſiſter, by reaſon of the malignity of the wound made in parting them aſunder.

In the Year of our Lord 1570. the twentieth of *July*, at *Paris* in the ſtreet *Gratilliers*, at the ſign of the Bell, theſe two Infants were born, differing in ſex, with that ſhape of body that you ſee here expreſſed in the Figure. They were baptized in the Church of S. *Nicolas* of the Fields, and named *Ludovicus* and *Ludovica*, their Father was a Maſon, his name was *Peter Germane*, his ſirname *Petit Dieu* (*i.*) Little-God, his Mothers name was *Mathea Petronilla.*

The ſhape of the Infants lately born at Paris.



In the Year 1572. in *Pont de See* near *Angers*, a little Town, were born upon the tenth day of *July*, two Girls, perfect in their limbs, but that they had but four fingers apiece on their left hands: they clave together in their fore-parts, from their breſt to their navel, which was but one, as their heart alſo but one; their liver was divided into four lobes; they lived half an hour, and were baptized.

The Figure of two Girls joined together in their breaſts and belly.

The Figure of a Child with two heads, and the body as big as one of four moneths old.

Var. lect. lib. 24. cap. 8. *Cælius Rhodiginus* tells, that in a Town of his Countrey called *Sarzano*, *Italy* being troubled with Civil Wars, there was born a Monſter of unuſual bigneſs; for he had two heads, having all his limbs anſwerable in greatneſs and tallneſs to a Child of four Moneths old: between his two heads, which were both alike, at the ſetting on of the ſhoulder, it had a third hand put forth, which did not exceed the ears in length, for it was not all ſeen: it was born the 5. of the Ides of *March*, 1514.

The Figure of one with four legs and as many arms.

The Figure of a man out of whoſe belly another head ſhewed it ſelf.

Jovianus Pontanus tells in the Year 1529. the nineth day of *January*, there was a man-child born in *Germany*, having four arms, and as many legs.

In the Year that *Francis* the firſt, King of *France*, entered into League with the *Swiſſes*, there was born a monſter in *Germany*, out of the midſt of whoſe belly there ſtood a great head; it came to mans age, and his lower, and as it were inſerted head, was nouriſhed as much as the true and upper head.

In

The ſhape of two monſtrous Twins, being but of one onely Sex.

In the Year 1572. the laſt day of *February*, in the Pariſh of *Vinhan*, in the way as you go from *Carnuta* to *Paris*, in a ſmall Village called *Bordes*, one called *Cyprina Giranda* the Wife of *James Merchant* a Husbandman, brought forth this Monſter whoſe ſhape you ſee here delineated, which lived until the Sunday following, being but of one onely Sex, which was the Female.

The ſhape of a Monſtrous Pig.

In the Year 1572. on Eaſter Monday at *Metz* in *Lorain*, in the Inn whoſe Sign is the *Holy Ghoſt*, a Sow pigged a Pig which had eight Legs, four Ears, and the Head of a Dog; the hinder part from the belly downward was parted in two as in Twins, but the fore-parts grew into one; it had two Tongues in the mouth, with four Teeth in the upper Jaw, and as many in the lower. The Sex was not to be diſtinguiſhed, whether it were a Bore or Sow Pig, for there was one ſlit under the Tail, and the hinder parts were all rent and open. The ſhape of this Monſter, as it is here ſet down, was ſent me by *Borgeſius* the famous Phyſician of *Metz*.

CHAP. III.

Of Women bringing many Children at one birth.

WOman is a Creature bringing uſually but one at a birth: but there have been ſome who have brought forth two, ſome three, ſome four, ſome five, ſix, or more at one birth. *Empedocles* thought that the abundance of ſeed was the cauſe of ſuch numerous births: the *Stoicks* affirm the divers Cells or Partitions of the Womb to be the cauſe; for the ſeed being variouſly parted into theſe Partitions, and the conception divided, there are more children brought forth; no otherwiſe than in Rivers, the Water beating againſt the Rocks, is turned into divers circles or rounds. But *Ariſtotle* ſaith there is no reaſon to think ſo; for in Women that parting of the Womb into Cells, as in Dogs and Sows, taketh no place; for Womens wombs have but one cavity, parted into two receſſes, the right and left, nothing coming between, except by chance diſtinguiſhed by a certain line; for often Twins lie in the ſame ſide of the Womb. *Ariſtotles* opinion is, that a Woman cannot bring forth more than five children at one birth. The Maid of *Auguſtus Cæſar* brought forth five at a birth, and a ſhort while after ſhe and her children died. In the year 1554. at *Bearn* in *Switzerland*, the Wife of Dr. *John Gelenger* brought forth five children at one birth, three Boys and two Girls. *Albucraſis* affirms a Woman to have been the Mother of ſeven children at one birth; and another, who by ſome external injury did abort, brought forth fifteen perfectly ſhaped in all their parts. *Pliny* reports that it was extant in the writings of Phyſicians, that twelve children were born at one birth; and that there was another in *Peloponneſus* which four ſeveral times was delivered of five children at one birth, and that the greater part of thoſe children lived. It is reported by *Dalechampius* that *Bonaventura* the ſlave of one *Savil*, a Gentleman of *Sena*, at one time brought forth ſeven children, of which four were baptized. In our time, between *Sarte* and *Main*, in the Pariſh of *Seaux*, not far from *Chambellay*, there is a Family and Noble Houſe called *Maldemeure*, the Wife of the Lord of *Maldemeure*, the firſt year ſhe was married brought forth Twins, the ſecond year ſhe had three children, the third year four, the fourth year five, the fifth year ſix, and of that birth ſhe died: of thoſe ſix one is yet alive, and is Lord of *Maldemeure*. In the Valley of *Beaufort*, in the County of *Anjou*, a young Woman the daughter of *Mace Channiere*, when at one perfect birth ſhe had brought forth one child, the tenth day following ſhe fell in labour of another, but could not be delivered until it was pulled from her by force, and was the death of the Mother.

4. *De gen. anim. cap.* 4.

Lib. 7. *cap.* 11. *cap.* 3.

The Picture of Dorothy *great with child with many children.*

The nineth Book of the Poliſh Hiſtory.

Martin Comerus the Author of the *Poliſh* Hiſtory, writeth that one *Margaret*, a woman ſprung from a noble and ancient Family near *Cracovia*, and wife to Count *Virboſlaus*, brought forth at one birth thirty five live children, upon the twentieth day of *January* in the Year 1296. *Franciſcus Picus Mirandula* writeth, that one *Dorothy* an *Italian* had twenty children at two births; at the firſt nine and at the ſecond eleven, and that ſhe was ſo big, that ſhe was forced to bear up her belly, which lay upon her knees, with a broad and large ſcarff tied about her neck, as you may ſee by this Figure.

And they are to be reprehended here again, who affirm the cauſe of numerous births to conſiſt in the variety of the Cells of the Womb; for they feign a Womans Womb to have ſeven Cells or Partitions, three on the right ſide for Males, three on the left ſide for Females, and one in the midſt for Hermaphrodites or Scrats: and this untruth hath gone ſo far, that there have been ſome that affirmed every of the ſeven Cells to have been divided into ten Partitions, into which the ſeed diſperſed, doth bring forth a divers and numerous increaſe, according to the variety of Cells furniſhed with the matter of ſeed; which, though it may ſeem to have been the opinion of *Hippocrates* in his Book *De Natura Pueri*, notwithſtanding it is repugnant to reaſon, and to thoſe things which are manifeſtly apparent to the eyes and ſenſes.

Lib.4. de Gen. anim. cap.4.

The opinion of *Ariſtotle* is more probable, who ſaith Twins and more at one birth, are begot and brought forth by the ſame cauſe that the ſixth finger groweth on the hand, that is, by the abundant plenty of the ſeed, which is greater and more copious than can be all taken up in the natural framing of one body; for if it all be forced into one, it maketh one with the parts increaſed more then is fit, either in greatneſs or number; but if it be, as it were, cloven into divers parts, it cauſeth more than one at one birth.

CHAP. IV.

Of Hermaphrodites, or Scrats.

AND here alſo we muſt ſpeak of Hermaphrodites, becauſe they draw the cauſe of their generation and conformation from the abundance of ſeed, and are called ſo, becauſe they are of both Sexes, the Woman yielding as much ſeed as the Man. For hereupon it commeth to paſs that the forming faculty (which always endeavours to produce ſomething like it ſelf) doth labour both the matters almoſt with equal force, and is the cauſe that one body is of both ſexes.

Yet ſome make four differences of Hermaphrodites; the firſt of which is the male Hermaphrodite, who is a perfect and abſolute male, and hath only a ſlit in the *Perinæum* not perforated, and from which neither Urin nor Seed doth flow. The ſecond is the female, which beſides her natural Privity, hath a fleſhy and skinny ſimilitude of a mans Yard, but unapt for erection and ejaculation of ſeed, and wanteth the Cod and Stones; the third difference is of thoſe, which albeit they bear the expreſs figures of members belonging to both ſexes, commonly ſet the one againſt the other, yet are found unapt for generation, the one of them onely ſerving for making of water: the fourth difference is of thoſe who are able in both ſexes, and throughly perform the part of both man and woman, becauſe they have the genitals of both ſexes complete and perfect, and alſo the right breſt like a man, and the left like a woman: the Laws command thoſe to chuſe the ſex which they will uſe, and in which they will remain and live, judging them to death if they be found to have departed from the ſex they made choice of; for ſome are thought to have abuſed both and promiſcuouſly to have had their pleaſure with men and women. There are ſigns by which the Phyſicians may diſcern whether the Hermaphrodites are able in the male or female ſex, or whethe

whether they are impotent in both: theſe ſigns are moſt apparent in the Privities and Face; for if the matrix be exact in all its dimenſions, and ſo perforated that it may admit a mans Yard, if the Courſes flow that way, if the hair of the head be long, ſlender and ſoft, and to conclude, if to this tender habit of the body a timid and weak condition of the mind be added, the Female ſex is predominant, and they are plainly to be judged Women. But if they have the *Perinæum* and fundament full of hairs, (the which in Women are commonly without any) if they have a yard of a convenient largeneſs, if it ſtand well and readily, and yield ſeed, the Male ſex hath the preheminence, and they are to be judged men. But if the conformation of both the genitals, be alike in figure, quantity, and efficacy, it is thought to be equally able in both ſexes: although by the opinion of *Ariſtotle*, thoſe who have double genitals, the one of the male, the other of the female, the one of them is always perfect, the other imperfect. *Lib. 4. de genit. anim. cap. 5.*

The Figure of Hermaphrodite Twins cleaving together with their backs.

Anno Dom. 1486. in the Palatinate, at the Village *Robach*, near *Heidelberg*, there were Twins, both Hermaphrodites, born with their backs ſticking together.

The Effigies of an Hermaphrodite having four hands and feet.

The ſame day the *Venetians* and *Genoeſes* entered into league, there was a Monſter born in *Italy* having four arms and feet, and but one head; it lived a little after it was baptized. *James Ruef* a *Helvetian* Chirurgeon ſaith he ſaw the like, but which beſides had the Privities of both ſexes, whoſe figure I have therefore ſet forth, *Page* 590.

CHAP. V.

Of the changing of Sex.

Amatus Luſitanus reports that in the Village *Eſquina*, there was a maid named *Maria Pateca*, who at the appointed age for her Courſes to flow, had in ſtead of them a mans Yard, lying before that time hid and covered, ſo that of a Woman ſhe became a Man, and therefore laying aſide her Womans habit, was cloathed in mans, and changing her name, was called *Emanuel*; who when he had got much wealth by many and great negotiations and commerce in *India*, returned into his Country, and married a wife: but *Luſitanus* ſaith he did not certainly know whether he had any children, but that he was certain he remained always beardleſs.

Anthony Loqueneux, the Kings Keeper or Receiver of his Rents of St. *Quintain*, at *Vermandois*, lately affirmed to me that he ſaw a man at *Reims*, at the Inn having the ſign of the *Swan*, in the Year 1560. who was taken for a Woman until the fourteenth year of his age; for then it happened as he played ſomewhat wantonly with a Maid which lay in the ſame bed with him, his members (hitherto lying hid) ſtarted forth and unfolded themſelves: which when his Parents knew (by help of the Eccleſiaſtick power) they changed his name from *Joan* to *John*, and put him in mans apparel.

Some years agone, being in the Train of King *Charles* the Nineth, in the French Glaſs-houſe, I was ſhewed a man called *Germane Granierus*, but by ſome *Germane Maria* (becauſe in former times when he was a Woman he was called *Marie*) he was of an indifferent ſtature, and well ſet body, with a thick and red beard; he was taken for a Girl until the fifteenth Year of his Age, becauſe there was no ſign of being a man ſeen in his body, and for that amongſt Women, he in like attire did thoſe things which appertain to Women: in the fifteenth year of his age, whileſt he ſomewhat earneſtly purſued Hogs given into his charge to be kept, who running into the Corn, he leaped violently over a ditch, whereby it came to paſs that the ſtays and foldings being broken, his hidden members ſuddenly broke forth, but not without pain; going home, he weeping complained to

his Mother that his guts came forth: with which his Mother amazed, calling Phyſicians and Surgeons to counſel, heard he was turned into a man; therefore the whole buſineſs being brought to the Cardinal the Biſhop of *Lenuncure*, an aſſembly being called, he received the name and habit of a man.

Pliny reports that the ſon of *Caſſinus* of a Girl became a Boy, living with his Parents; but by the command of the Sooth-ſayers he was carried into a Deſart Iſle, becauſe they thought ſuch Monſters did always ſhew or portend ſome monſtrous thing. Certainly women have ſo many and like parts lying in their womb, as men have hanging forth; onely a ſtrong and lively heat ſeems to be wanting, which may drive forth that which lies hid within: therefore in proceſs of time the heat being increaſed and flouriſhing, and the humidity (which is predominant in child-hood) overcome, it is not impoſſible that the virile members, which hitherto ſluggiſh by defect of heat, lay hid, may be put forth; eſpecially if to that ſtrength of the growing heat ſome vehement concuſſion or jactation of the body be joined. Therefore I think it manifeſt by theſe experiments and reaſons, that it is not fabulons that ſome women have been changed into men: but you ſhall find in no hiſtory, men that have degenerated into women; for Nature always intends and goes from the imperfect to the more perfect, but not baſely from the more perfect to the imperfect.

CHAP. VI.

Of Monſters cauſed by the defect of Seed.

IF, on the contrary, the ſeed be any thing deficient in quantity, for the conformation of the Infant or Infants, ſome one or more members will be wanting, or more ſhort and decrepit. Hereupon it happens that Nature intending Twins, a Child is born with two heads, and but one arm, or altogether lame in the reſt of his limbs.

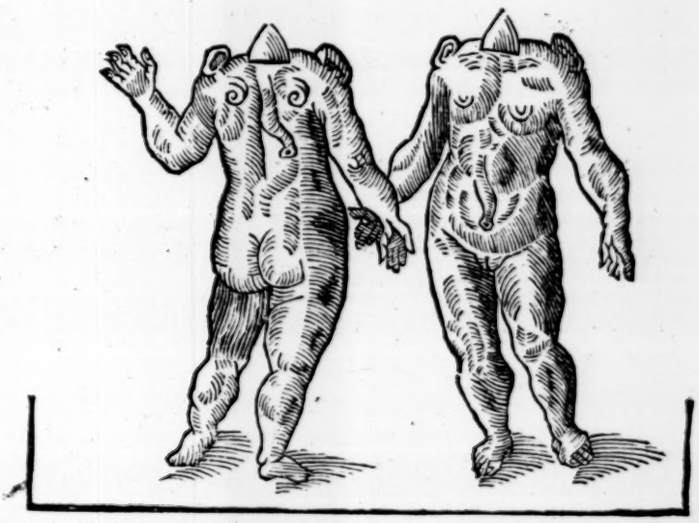
The Effigies of a monſtrous child, by reaſon of the defect of the matter of Seed.

Anno Dom. 1573. I ſaw at St. *Andrews* Church in *Paris*, a Boy nine years old, born in the Village *Parpavilla*, ſix miles from *Guiſe*; his Fathers name was *Peter Renard*, and his Mother, *Marquete:* he had but two fingers on his right hand, his arm was well proportioned from the top of his ſhoulder almoſt to his wriſt, but from thence to his two fingers ends it was very deformed; he wanted his legs and thighs, although from the right buttock a certain unperfect Figure, having onely four Toes, ſeemed to put it ſelf forth; from the midſt of the left buttock two Toes ſprung out, the one of which was not much unlike a mans Yard, as you may ſee by the Figure.

In the Year 1562. in the Calends of *November*, at *Villa Franca* in *Gaſcony*, this Monſter, a headleſs woman, whoſe Figure hereafter follows, was born, which figure Dr. *John Altinus* the Phyſician gave to me, when I went about this Book of Monſters, he having received it from *Fontanus* the Phyſician of *Angoleſtre*, who ſeriouſly affirmed he ſaw it.

The

The Figure of a monſtrous woman without a head, before and behind.



The Effigies of a man without arms, doing all that is uſually done with hands.

The Effigies of a Monſter with two heads, two legs, and but one arm.

A few years agone there was a man of forty years old to be ſeen at *Paris*, who although he wanted his arms, notwithſtanding did indifferently perform all thoſe things which are uſually done with the hands; for with the top of his ſhoulder, head and neck, he would ſtrike an Ax or Hatchet with as ſure and ſtrong a blow into a poſt, as any other man could do with his hand: and he would laſh a Coachmans whip, that he would make it give a great crack, by the ſtrong refraction of the air; but he eat, drank, plaid at Cards, and ſuch like, with his feet. But at laſt he was taken for a Thief and Murderer, was hanged and faſtned to a wheel.

Alſo not long ago there was a Woman at *Paris* without arms, which neverthelеſs did cut, ſew, and do many other things, as if ſhe had her hands.

We read in *Hippocrates*, that *Attaginis* his wife brought forth a child all of fleſh without any bone, and notwithſtanding it had all the parts well formed.

CHAP.

CHAP. VII.

Of Monſters which take their cauſe and ſhape by imagination.

The force of imagination upon the body and humours.

THe Ancients having diligently ſought into all the ſecrets of Nature, have marked and obſerved other cauſes of the generation of Monſters: for, underſtanding the force of imagination to be ſo powerful in us, as for the moſt part, it may alter the body of them that imagine, they ſoon perſuaded themſelves that the faculty which formeth the Infant may be led and governed by the firm and ſtrong cogitation of the Parents begetting them (often deluded by nocturnal and deceitful apparitions) or by the mother conceiving them; and ſo that which is ſtrongly conceived in the mind, imprints the force into the Infant conceived in the womb: which thing many think to be confirmed by *Moſes*, becauſe he tells that *Jacob* increaſed and bettered the part of the ſheep granted to him by *Laban* his Wifes father, by putting rods, having the bark in part pulled off, finely ſtreaked with white and green, in the places where they uſed to drink, eſpecially at the time they engendered, that the repreſentation apprehended in the conception, ſhould be preſently impreſſed in the young; for the force of imagination hath ſo much power over the Infant, that it ſets upon it the notes or characters of the thing conceived.

Gen. cap. 30.

We have read in *Heliodorus*, that *Perſia* Queen of *Æthiopia*, by her Husband *Hidaſtes*, being alſo an Ethiope, had a daughter of a white complexion, becauſe in the embraces of her husband, by which ſhe proved with child, ſhe earneſtly fixed her eye and mind upon the picture of then fair *Andromeda* ſtanding oppoſite unto her. *Damaſcene* reports, that he ſaw a Maid hairy like a Bear, which had that deformity by no other cauſe or occaſion than that her Mother earneſtly beheld in the very inſtant of receiving and conceiving the ſeed, the image of St. *John* covered with a Camels skin, hanging upon the poſts of the bed.

They ſay *Hippocrates* by this explication of the cauſes, freed a certain Noble-woman from ſuſpicion of adultery, who being white her ſelf, and her husband alſo white, brought forth a child as black as an Ethiopian, becauſe in copulation ſhe ſtrongly and continually had in her mind the picture of the Ethiope.

The Effigies of a Maid all hairy, and an Infant that was black by the imagination of their Parents.

There are ſome who think the Infant once formed in the Womb, which is done at the utmoſt within two and forty days after the conception, is in no danger of the Mothers imagination, neither of the ſeed of the Father which is caſt into the Womb, becauſe when it hath got a perfect figure, it cannot be altered with any external form of things; which whether it be true or no, is not here to be inquired of: truly I think it beſt to keep the woman all the time ſhe goeth with child, from the ſight of ſuch ſhapes and figures.

In *Stequer* a Village of *Saxony*, they ſay, a Monſter was born with four feet, eyes, mouth, and noſe like a Calf, with a round and red excreſcence of fleſh on the fore-head, and alſo a piece of fleſh like a hood hung from his neck upon his back, and it was deformed with its thighs torn and cut.

The

The effigies of a horrid Monſter, having feet, hands and other parts like a Calf.

The effigies of an Infant with a face like a Frog.

Anno Dom. 1517. in the Pariſh of *Kings-wood* in the Foreſt of *Biera*, in the way to *Fontainbleau*, there was a Monſter born with the face of a Frog, being ſeen by *John Bellanger*, Chirurgeon to the Kings Engineers, before the Juſtices of the Town of *Harmoy*, principally *John Bribon* the Kings Procurator in that place. The Fathers name was *Amadæus the Little*, his Mothers *Magdalene Sarbucala*, who troubled with a Fever, by a Womans perſuaſion, held a quick Frog in her hand until it died; ſhe came thus to bed with her husband and conceived: *Bellanger*, a man of an acute wit, thought this was the cauſe of the monſtrous deformity of the child.

CHAP. VIII.

Of Monſters cauſed by the ſtraitneſs of the Womb.

That the ſtraitneſs or littleneſs of the womb may be the occaſion of Monſters.

WE are conſtrained to confeſs by the event of things, that Monſters are bred and cauſed by the ſtraitneſs of the Womb; for ſo Apples growing upon the Trees, if before they come to juſt ripeneſs they be put into ſtrait Veſſels, their growth is hindred. So ſome Whelps which Women take delight in, are hindred from any further growth by the littleneſs of the place in which they are kept. Who knows not that the Plants growing in the Earth, are hindred from a longer progreſs and propagation of their roots, by the oppoſition of a Flint, or any other ſolid body, and therefore in ſuch places are crooked, ſlender and weak, but on the other part, where they have free nouriſhment, to be ſtrait and ſtrong? for ſeeing that by the opinion of Naturaliſts, the place is the form of the thing placed, it is neceſſary that thoſe things that are ſhut up in ſtraiter ſpaces, prohibited of free motion, ſhould be leſſened, depraved, and lamed.

Empedocles and *Diphilus* acknowledged three cauſes of monſtrous births: The too great or ſmall matter of the ſeed, the corruption of the ſeed, and depravation of growth by the ſtraitneſs or figure of the womb, which they thought the chiefeſt of all, becauſe they thought the cauſe was ſuch in natural births, as in forming of Metals and fuſible things, of which Statues being made, do leſs expreſs the things they be made for, if the molds or forms into which the matter is poured, be rough, ſcabrous, too ſtrait, or otherwiſe faulty.

CHAP. IX.

Of Monſters cauſed by the ill placing of the Mother, in ſitting, lying down, or any other ſite of the body in the time of her being with child.

WE often too negligently and careleſly corrupt the benefits and corporal endowments of Nature in the comlineſs and dignity of conformation: it is a thing to be lamented and pitied in all, but eſpecially in women with child, becauſe that fault doth not onely hurt the Mother, but deforms and perverts the Infant which is contained in her womb: for we moving any manner of way, muſt neceſſarily move whatſoever is within us. Therefore they which ſit idlely at home all the time of their being with Child, as croſs-legged, thoſe which

which holding their heads down, do ſew or work with the needle, or do any other labour, which preſs the belly too hard with cloaths, breeches, and ſwathes, do produce children wry-necked, ſtooping, crooked, and disfigured in their feet, hands, and the reſt of their joints, as you may ſee in the following Figure.

The Effigies of a child, who from the firſt conception, by the ſite of the Mother, had his hands and feet ſtanding crooked.

CHAP. X.

Of Monſters cauſed by a ſtroke, fall, or the like occaſion.

THere is no doubt but if any injury happen to a Woman with child, by reaſon of a ſtroke, fall from on high, or the like occaſion, the hurt alſo may extend to the child. Therefore by theſe occaſions the tender bones may be broken, wreſted, ſtrained, or depraved after ſome other monſtrous manner: and more, by the like violence of ſuch things, a Vein is often opened or broken, or a flux of bloud, or great Vomiting is cauſed by the vehement concuſſion of the whole body, by which means the child wants nouriſhment, and therefore will be ſmall and little, and altogether monſtrous.

CHAP. XI.

Of Monſters which have their original by reaſon of hereditary diſeaſes.

BY the injury of hereditary diſeaſes Infants grow monſtrous, that is, monſtrouſly deformed: for Crook-backed produce Crook-backed, and often-times ſo crooked, that between the bunch behind and before, the head lies hid, as a Tortoiſe in her ſhell: ſo Lame produce Lame, Flat-noſed their like, Dwarffs bring forth Dwarffs, Lean bring forth Lean, and Fat produce Fat.

CHAP.

CHAP. XII.

Of Monſters by the confuſion of Seed of divers kinds.

THat which followeth is a horrid thing to be ſpoken; but the chaſte mind of the Reader will give me pardon, and conceive that, which not onely the Stoicks, but all Philoſophers, who are buſied about the ſearch of the cauſes of things muſt hold, That there is nothing obſcene or filthy to be ſpoken. Thoſe things that are accounted obſcene may be ſpoken without blame, but they cannot be acted or perpetrated without great wickedneſs, fury and madneſs; therefore that ill which in obſcurity conſiſts not in word, but wholly in the act. Therefore in times paſt there have been ſome, who nothing fearing the Deity, neither the Law, nor themſelves, that is, their ſoul, have ſo abjected and proſtrated themſelves, that they have thought themſelves nothing different from Beaſts: wherefore Atheiſts, Sodomites, Out-laws, forgetful of their own excellency and divinity, and transformed by filthy luſt, have not doubted to have filthy and abominable copulation with Beaſts. This ſo great, ſo horrid a crime, for whoſe expiation all the fires in the World are not ſufficient, though they too maliciouſly crafty, have concealed, and the conſcious Beaſts could not utter, yet the generated miſ-ſhapen iſſue hath abundantly ſpoken and declared, by the unſpeakable power of God, the revenger and puniſher of ſuch impious and horrible actions. For of this various and promiſcuous confuſion of ſeeds of a different kind, Monſters have been generated and born, who have been partly Men and partly Beaſts.

The like deformity of iſſue is produced, if Beaſts of a different ſpecies do copulate together, Nature always affecting to generate ſomething which may be like it ſelf: for Wheat grows not but by ſowing of Wheat, nor an Apricock but by the ſetting or grafting of an Apricock, for Nature is a moſt diligent preſerver of the ſpecies of things.

The Effigies of a Monſter half Man and half Dog.

Anno Dom. 1493. there was generated of a Woman and a Dog an iſſue, which from the navel upwards perfectly reſembled the ſhape of the Mother, but therehence downwards the Sire, that is, the Dog. This Monſter was ſent to the Pope that then reigned, as *Volaterane* writeth: alſo *Cardane* mentions it; wherefore I have given you the Figure thereof. *Cardan. lib. 14. de var. rerum cap. 94.*

The Figure of a Monſter in Face reſembling a Man, but a Goat in his other Members.

Cælius Rhodiginus writes that at *Sibaris*, a Herdſman called *Chrathis* fell in love with a Goat, and accompanied with her, and of this deteſtable and brutiſh copulation an Infant was born, which in legs reſembling the Dam, but the face was like the Fathers.

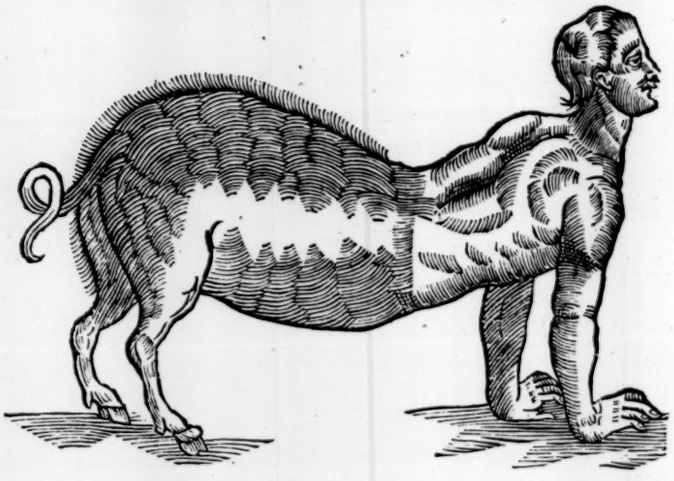
The

The Figure of a Pig, with a Head, Face, Hands, and Feet of a Man.

Anno Dom. 1110. in a certain Town of *Liege* (as ſaith *Lycoſthenes*) a Sow farrowed a Pig with the Head, Face, Hands and Feet of a Man, but in the reſt of the body reſembling a Swine.

Anno Dom. 1564. at *Bruxels* at the houſe of one *Joeſt Dičizpeert*, in the Street *Warmoesbroečs*, a Sow farrowed ſix Pigs, the firſt whereof was a Monſter repreſenting a Man in the Head, Face, Fore-feet and Shoulders, but in the reſt of the body another Pig, for it had the genitals of a Sow-pig, and it ſucked like other Pigs: but the ſecond day after it was farrowed, it was killed of the People together with the Sow, by reaſon of the monſtrouſneſs of the thing. Here followeth the Figure thereof.

The Effigies of a Monſter half Man and half Swine.



Anno Dom. 1571. at *Antwerp*, the wife of one *Michael* a Printer, dwelling with one *John Molline* a Graver or Carver, at the Sign of the Golden Foot in the *Camiſtrate*, on S. *Thomas* his day, at ten of the Clock in the Morning, brought forth a Monſter wholly like a Dog, but that it had a ſhorter neck, and the head of a Bird, but without any Feathers on it. This Monſter was not alive, for that the Mother was delivered before her time; but ſhe giving a great ſcritch in the inſtant of her deliverance the Chimney of the houſe fell down, yet hurt no body, no not ſo much as any one of four little children that ſate by the fire-ſide.

The Figure of a Monſter like a Dog, but with a Head like a Bird.

The

The Figure of a three-headed Lamb.

Lewis Gellius writeth that he hath read in an approved Author, that an Ewe once brought forth a Lion, a Beast of an unlike and adverse nature to her.

*An.Dom.*1577. in the Town of *Blandy* three miles from *Melon*, there was lambed a Lamb having three heads, the middlemost of which was bigger than the rest; when one bleated they all bleated. *John Bellanger* the Chirurgeon of *Melo* affirmed that he saw this Monster, and got it drawn, and sent the figure thereof to me with that humane Monster that had the head of Frog, which we have formerly described.

There are some Monsters in whose generation by this there may seem to be some divine cause, for that their beginnings cannot be derived or drawn from the general cause of Monsters; that is, Nature, or the errours thereof, by reason of some of the fore-mentioned particular causes: such are these Monsters that are wholly against all Nature, like that which we formerly mentioned of a Lion yeaned by an Ewe.

Yet Astrologers (lest there should seem to be any thing which they are ignorant of) refer the causes of these to certain constellations and aspects of the Planets and Stars, according to *Aristotles* saying in his Problems; in confirmation whereof they tell us this tale. It happened in the time of *Albertus Magnus*, that in a certain Village, a Cow brought forth a Calf which was half a man: the Townsmen apprehended the Herdsman, and condemned him as guilty of such a crime, to be presently burnt together with the Cow; but by good luck *Albertus* was there, to whom they gave credit, by reason of his much and certain experience in Astrology, that it was not occasioned by any humane wickedness, but by the efficacy of a certain position of the Stars that this Monster was born.

CHAP. XIII.

Of Monsters occasioned by the craft and subtilty of the Devil.

IN treating of such Monsters as are occasioned by the craft of the Devil, we crave pardon of the courteous Reader, if peradventure going further from our purpose, we may seem to speak more freely and largely of the Existence, Nature, and Kinds of Devils. Therefore first it is manifest that there are Conjurers, Charmers, and Witches, which whatsoever they do, perform it by an agreement and compact with the Devil, to whom they have addicted themselves: for none can be admitted into that Society of Witches, who hath not forsaken God the Creator, and his Saviour, and hath not transferred the Worship due to Him above, upon the Devil, to whom he hath obliged himself. And assuredly, whosoever addicts himself to these Magical vanities and Witchcrafts, doth it either because he doubts of Gods Power, Promises, steady and great Good Will towards us: or else for that he is madded with an earnest desire of knowing things to come; or else because disdaining poverty, he affects and desires from a poor estate to become rich on the sudden. It is the constant opinion of all, both Ancient and Modern, as well Philosophers as Divines, that there are some such men; which when they have once addicted themselves to impious and devillish Arts, can by the wondrous craft of the Devil, do many strange things, and change, and corrupt bodies, and the health and life of them, and the condition of all mundane things. Also experience forceth us to confess the same; for punishments are ordained by the Laws against the Professors and Practisers of such Arts; but there are no Laws against those things which neither ever have been, nor ever came into the knowledge of men: for such things are rightly judged and accounted for impossibilities, which have never been seen or heard of.

There are Sorcerers, and how they come so to be.

What induceth them thereto.

Before the birth of Christ there have been many such People; for you may find in *Exodus* and *Leviticus* Laws made against such persons by *Moses*, by whom God gave the Law to his People. The Lord gave the sentence of death to *Ochasias* by his Prophet, for that he turned unto these kind of people. We are taught by the Scriptures that there are good and evil spirits, and that the former are termed Angels, but the latter Devils; for the Law is also said to be given by the Ministry of Angels: and it is said that our bodies should rise again at the sound of a Trumpet, and at the voice of an Arch-Angel. Christ said that God would send his Angels to receive the Elect into the Heavens.

Exod.cap.22. Levit.cap.19.

Hebr.1.14. Gal 3.19. 1 Thess.4.16.

The History of *Job* testifieth that the Devil sent fire from Heaven, and killed his Sheep and Cattel, and raised winds that shook the four corners of the house, and overwhelmed his children in the ruines thereof. The History of *Achab* mentioneth a certain lying spirit in the mouth of the false Prophets. Satan entring into *Judas* moved him to betray Christ. Devils who in a great num-

Job 13. Mat.16 34.

ber possessed the body of a man, were called and obtained of Christ that they might enter into Swine, whom they carried headlong into the Sea.

In the beginning God created a great number of Angels, that those divine and incorporeal spirits might inhabit Heaven, and as Messengers, signifie Gods pleasure to men, and as Ministers or Servants, perform his commands, who might be as Over-seers, and Protectors of humane affairs. Yet of this great number there were some who were blinded by pride, and thereby also cast down from the presence, and heavenly habitation of God the Creator. These harmful and crafty spirits delude mens minds by divers jugling tricks, and are always contriving something to our harm, and would in a short space destroy mankind, but that God restrains their fury; for they can onely do so much as is permitted them: Expelled Heaven, some of them inhabit the Air, others the bowels of the Earth; there to remain till God shall come to judge the World: and as you see the Clouds in the Air somewhiles to resemble Centaurs, otherwhiles Serpents, Rocks, Towers, Men, Birds, Fishes, and other shapes: so these spirits turn themselves into all the shapes and wondrous forms of things; as oft-times into wild Beasts, into Serpents, Toads, Owls, Lapwings, Crows or Ravens, Goats, Asses, Dogs, Cats, Wolves, Bulls, and the like. Moreover, they oft-times assume and enter humane bodies, as well dead as alive, whom they torment and punish, yea also they transform themselves into Angels of Light.

The Power of evil spirits over mankind.

The differences of Devils.

The delusions of Devils.

They feign themselves to be shut up and forced by Magical Rings, but that is onely their deceit and craft; they wish, fear, love, hate, and oft-times as by the appointment and decree of God, they punish Malefactors: for we read that God sent evil Angels into *Egypt*, there to destroy. They howl in the night, they murmur and rattle as if they were bound in chains, they move Benches, Tables, Counters, Props, Cupbords, Children in the Cradles, play at Tables and Chess, turn over Books, tell Money, walk up and down Rooms and are heard to laugh, to open Windows and Doors, cast sounding Vessels, as Brass and the like, upon the ground, break Stone-pots and Glasses, and make other the like noises. Yet none of all these things appear to us when we arise in the morning, neither find we any thing out of its place or broken. They are called by several names, as Devils, Evil spirits, *Incubi*, *Succubi*, Hobgoblins, Fairies, Robin-good-fellows, Evil angels, Sathan, Lucifer, the Father of Lies, Prince of Darkness, and of the World, Legion, and other names agreeable to their Offices and Natures.

Their Titles and Names.

CHAP. XIV.

Of the subterrene Devils, and such as haunt Mines.

What the Devils in Mines do.

Lewis Lavater writes, that by the certain report of such as work in Mines, that in some Mines there are seen spirits, who in the shape and habit of Men, work there, and running up and down seem to do much work, when notwithstanding they do nothing indeed. But in the mean time they hurt none of the by-standers, unless they be provoked thereto by words or laughter: for then they will throw some heavy or hard thing upon him that hurt them, or injure them some other way.

The same Author affirms that there is a silver Mine in *Rhetia*, out of which *Peter Briot*, the Governour of the place, did in his time get much Silver. In this Mine there was a Devil, who chiefly on Friday, when as the Miners put the Mineral they had digged into Tubs, kept a great quarter, and made himself exceeding busie, and poured the Mineral as he listed, out of one Tub into another. It happened one day that he was more busie than he used to be, so that one of the Miners reviled him, and bad him be gone on a vengeance to the punishment appointed for him. The Devil offended with this imprecation and scoff, so wrested the Miner, taking him by the head, twining his neck about, he set his face behind him, yet was not the Workman killed therewith, but lived, and was known by divers for many years after.

CHAP. XV.

By what means the Devils may deceive us.

Devils are Spirits.

Our minds involved in the earthy habitation of our bodies, may be deluded by the Devils divers ways: for they excel in purity and subtilty of essence, and in the much use of things: besides, they challenge a great preheminence, as the Princes of this World, over all sublunary bodies. Wherefore it is no marvel if they, the Teachers and Parents of Lies, should cast clouds and mists before our Eyes from the beginning, and turn themselves into a thousand shapes of things and bodies, that by these juglings and tricks they may shadow and darken mens minds.

CHAP. XVI.

Of Succubi *and* Incubi.

The reason of the name.

*Lib.*15. *de civ. Dei, cap.* 22, *&* 23.

Powerful by these fore-mentioned Arts and Deceits, they have sundry times accompanied with men in copulation, whereupon such as have had to do with men, were called *Succubi*; those which made use of Women, *Incubi*. Verily St. *Augustine* seemeth not to be altogether against it, but that they, taking upon them the shape of man, may fill the genitals, as by the help of Nature, to the end that by this means they may draw aside the unwary, by the flames of Lust, from Vertue and Chastity.

An History.

John Ruse, in his Book of the Conception and Generation of Man, writes that in his time, a certain

certain Woman of monstrous lust, and wondrous imprudency, had to do by night with a Devil that turned himself into a man, and that her belly swelled up presently after the act, and when as she thought she was with child, she fell into so grievous a disease, that she voided all her entrails by stool, Medicins nothing at all prevailing.

An History. The like History is told of a servant of a certain Butcher, who thinking too attentively on Venerous matters, a Devil appeared to him in the shape of a Woman, with whom (supposing it to be a Woman) when as he had to do, his genitals so burned after the act, that becoming inflamed he died with a great deal of torment.

An opinion confuted. Neither doth *Peter Paludanus*, and *Martin Arelatensis* think it absurd to affirm that Devils may beget children, if they shall ejaculate into the Womans womb seed taken from some man either dead or alive. Yet this opinion is most absurd and full of falsity, mans seed consisting of a seminal or sanguinous matter, and much spirit: if it run otherwise into the womb than from the testicles, and stay never so little a while, it loseth its strength and efficacy, the heat and spirits vanishing away; for even the too great length of a mans yard is reckoned amongst the causes of barrenness, by reason that the seed is cooled by the length of the way. If any in copulation, after the ejaculation of the seed, presently draw themselves from the Womans embraces, they are thought not to generate, by reason of the air entering into the yet open womb, which is thought to corrupt the seed. By which it appears how false that History in *Averrois* is, of a certain Woman that said she conceived with child by a mans seed shed in a Bath, and so drawn into her womb, she entering the Bath presently after his departure forth. It is much less credible that Devils can copulate with Women, for they are of an absolute spirituous Nature; but bloud and flesh are necessary for the generation of man. What natural reason can allow that the incorporeal Devils can love corporeal Women? And how can we think that they can generate, who want the instruments of generation? How can they who neither eat nor drink be said to swell with seed? Now where the propagation of the species is not necessary to be supplied by the succession of individuals, Nature hath given no desire to Venery, neither hath it imparted the use of generation; but the Devils once created were made immortal by Gods appointment: If the faculty of generation should be granted to Devils, long since all places had been full of them. Wherefore if at any time Women with child by the familiarity of the Devil, seem to travel, we must think it happens by those Arts we mentioned in the former Chapter, to wit, they use to stuff up the bodies of living Women with cold clouts, bones, pieces of iron, thorns, twisted hairs, pieces of wood, Serpents, and a world of such trumpery, wholly dissenting from a Womans nature: who afterwards, the time, as it were, of their delivery drawing nigh, through the womb of her that was falsly judged with child, before the blinded, and, as it were bound up eyes of the by-standing women, they give vent to their impostures. The following History, recorded in the Writings of many most credible Authors, may give credit thereto.

Averrois his History convict of falsehood.

The illusions of the Devil.

An History. There was at *Constance* a fair Damosel called *Margaret*, who served a wealthy Citizen: she gave it out every where that she was with child by lying with a Devil on a certain night. Wherefore the Magistrates thought it fit she should be kept in Prison, that it might be apparent both to them and others, what the end of this exploit would be. The time of deliverance approaching, she felt pains like those which Women indure in travail; at length, after many throws, by the Midwives help, in stead of a child, she brought forth iron nails, pieces of wood, of glass, bones, stones, hairs, tow, and the like things, as much different from each others as from the nature of her that brought them forth, and which were formerly thrust in by the Devil to delude the too credulous minds of men.

Our sins are the cause that the Devils abuse us. The Church acknowledgeth that Devils by the permission and appointment of God punishing our wickedness, may abuse a certain shape, so to use copulation with mankind. But that an humane birth may thence arise, it not onely affirms to be false, but detests as impious, as which believes that there was never any man begot without the seed of man, our Saviour Christ excepted. Now what confusion and perturbation of Creatures should possess this world (as *Cassianus* saith) if Devils could conceive by copulation with men? or if Women should prove with child by accompanying them, how many Monsters would the Devils have brought forth from the beginning of the world? how many Prodigies by casting their seed into the wombs of wild and brute Beasts? for by the opinion of Philosophers, as often as Faculty and Will concur, the effect must necessarily follow: now the Devils never have wanted will to disturb mankind, and the order of this World; for the Devil as they say, is our common enemy from the beginning; and as God is the author of order, and beauty, so the Devil, by Pride, contrary to God, is the causer of confusion and wickedness.

Wherefore if power should accrew equal to his evil mind and nature, and his infinite desire of mischief and envy; who can doubt but a great confusion of all things and species, and also great deformity would invade the decent and comely order of this Universe, Monsters arising on every side: But seeing that Devils are incorporeal, what reason can induce us to believe that they can be delighted with venerous actions: and what will can there be whereas there is no delight, nor any decay of the species to be feared? seeing that by Gods appointment they are immortal, so to remain for ever in punishment; so what need they succession of individuals by generation? wherefore if they neither will nor can, it is a madness to think that they do commix with Man.

CHAP. XVII.

Of Magick and supernatural Diseases and Remedies.

THat I may refresh the mind of the Reader, invited to these Histories of Monsters raised up by the Art of the Devil, Witches, and Conjurers, his Servants, I have thought good to add the following History of certain Diseases, and remedies supernatural, and wholly magical out of *Fernelius*. There are Diseases, which as they are sent amongst men by God being offended, so they cannot expect cure otherwise than from God, from whence they are thought supernaturally to have their essence and cure. Thus the Air oft-times, yet chiefly in the time of King *David*, being defiled with the Pestilence, killed sixty odd thousand persons.

Lib. 2. de abdit. caus. cap. 16.

Thus *Hezechias* was struck with a grievous disease: *Job* was defiled with filthy Ulcers by *Satan* at Gods command. And as the Devil, the cruel enemy of mankind, commonly useth by Gods permission to afflict those: so wicked persons by the wondrous subtilty of the Devil, offer violence and do harm to many. Some invoke I know not what Spirits, and adjure them with Herbs, Exorcisms, Imprecations, Incantations, Charms: and others hang about their necks, or otherwise carry certain Writings, Characters, Rings, Images, and other such impious stuff. Some use Songs, Sounds, or Numbers: sometimes Potions, Perfumes, and Smells; sometimes Gestures and Jugling. There be some that make the portraiture of the absent Party in Wax, and boast that they can cause or bring a disease into whatsoever part thereof they prick, by the force of their Words and Stars, into the like part of the party absent; and they have no few other tricks to bring other diseases.

Witches hurt by the Devils assistance.

We know for certain that Magicians, Witches, and Conjurers, have by charms so bound some that they could not have to do with their Wives; and have made others so impotent, as if they had been gelt or made Eunuchs. Neither do wicked men onely send diseases into mans body, but also Devils themselves. These truly are soon distracted with a certain Fury, but in this one thing they differ from simple Madness, for that they speak things of great difficulty, tell things past and hid, disclose the secrets of such as are present, and revile them many ways, and are terrified, tremble and grow angry by the power of divine words.

An History.

One not very long agon, being by reason of heat exceeding drie in the night-time, rising out of his sleep. and not finding drink, took an apple that he found by chance, and eating it he thought his jaws were shut and held fast as by ones hands, and that he was almost strangled: and also now possessed of a Devil entering into him, he seemed in the dark to be devoured of a huge exceeding black Dog, which he, afterwards restored to his former health, orderly related to me. There were divers who by his pulse, heat and the roughness of his tongue, thought him to be in a Fever, and by his watching, and the perturbation of his mind, thought him onely to rave.

An History.

Another young Noble man, some few years since, was troubled at set times with a shaking of the body, and as it were a Convulsion, wherewith one while he would move onely his left arm, another while the right arm; and also sometimes but one finger onely, somewhiles but one leg, sometimes the other, and at other times the whole trunk of his body, with such force and agility, that lying in his bed, he could scarce be held by four men; his head lay without any shaking, his tongue and speech was free, his understanding sound, and all his senses perfect even in the height of his fit. He was taken at the least ten times a day, well in spaces between, but wearied with labour: it might have been judged a true Epilepsie, if the understanding and senses had failed.

The most judicious Physicians who were called to him, judged it a Convulsion, cousin-german to the Falling-sickness, proceeding from a malign and venomous vapour impact in the spine of the Back, whence a vapour dispersed it self over all the Nerves, which pass from the spine every way into the Limbs, but not into the Brain. To remove this, which they judged the cause, frequent Clysters are ordained, and strong Purges of all sorts, Cupping-glasses are applied to the beginnings of the Nerves, Fomentations, Unctions, Emplasters, first to discuss, then to strengthen and wear away the malign quality: These things doing little good, he was sweated with Baths, Stoves, and a Decoction of *Guaiacum*, which did no more good than the former, for that we were all far from the knowledge of the true cause of his Disease: for in the third moneth, a certain Devil was found to be the Author of all this ill, bewraying himself by voice, and unaccustomed words and sentences, as well Latin as Greek (though the Patient were ignorant of the Greek Tongue:) he laid open many Secrets of the By-standers, and chiefly of the Physicians, deriding them for that he had abused them to the Patients great harm, because they had brought his body so low by needless Purgations.

The Devil shews himself by speaking of Greek.

When his Father came to visit him, he would cry out long before he came at him, or saw him, *Drive away this Visitant, and keep him from coming in here: or else pluck his Chain from about his neck:* for on this (as it is the custom of the French Order of Knights) there hangs the image of St. *Michael*. If holy and divine things were read before him, he shook and trembled more violently. When his Fit was over, he remembred all that was done, and affirmed he did it against his will, and that he was sorry for it. The Devil, forced by Ceremonies and Exorcisms, denied that he was damned for any crime, and said that he was a spirit: being asked who he was, and by what means and power he did these things, he said that he had many habitations into which he could betake himself, and in the time of his rest, he could torment others: that he was cast into this body by a certain person whom he would not name, and that he entered by his feet up to his neck, and that he would go forth again the same way, when as his appointed time was come. He spoke of sundry other things, as others which are possessed use to do.

Devils wax angry, and are terrified by divine things.

Now I speak not these things as new or strange, but that it may appear that Devils sometimes entering into the body, do some whiles torment it by diverse and uncouth ways; other whiles they

they do not enter in, but either agitate the good humours of the body, or draw the ill into the principal parts, or with them obſtruct the veins or other paſſages, or change the ſtructure of the inſtruments, from which cauſes innumerable diſeaſes proceed: of theſe, Devils are the authors, and wretched and forlorn perſons the Miniſters: and the reaſon of theſe things is beyond the ſearch of Nature.

Pliny tells that the Emperour *Nero* in his time found magical arts moſt vain and falſe: but what need we alledge profane Writers, when as thoſe things that are recorded in Scripture of the Pythoniſs, of the Woman ſpeaking in her belly, of King *Nebuchodonozor*, of the Magicians of *Pharaoh*, and other ſuch things not a few, prove that there both is, and hath been Magick. *Pliny* tells of *Demarchus*, that he taſting of the entrails of a ſacrificed child, turned himſelf into a Wolf. We read in *Homer* that *Circe* in the long wandring of *Ulyſſes*, changed his Companions into Beaſts, with an inchanted Cup or Potion: and in *Virgil*, that the growing Corn may be ſpoiled or carried away by inchantments: which things, unleſs they were approved and witneſſed by many mens credits, the wiſdom of Magiſtrates and Lawyers, would not have made ſo many Laws againſt Magicians, neither would there have been a mulct impoſed upon their heads by the Law of the Twelve Tables, who had inchanted other mens Corn. But as in magical Arts the Devil doth not exhibit things themſelves, as thoſe which he cannot make, but onely certain ſhews or appearances of things: ſo in theſe which are any ways accommodated to the uſe of Phyſick, the Cure is neither certain nor ſafe, but deceitful, captious, and dangerous.

It is but a deceitful cure that is performed by the Devil.

I have ſeen the Jaundice over the whole body, cured in one night, by a written ſcroul hanged about the neck: alſo I have ſeen Agues chaſed away by words and ſuch ceremonies, but in a ſhort while after they returned again and became much worſe. Now there are ſome vain things, and verily the fanſies of old Women, which becauſe they have long poſſeſſed the minds of men, weakened with too much ſuperſtition, we term them ſuperſtitious. Theſe are ſuch as we cannot truly ſay of them, wherefore and whence they have the faculties aſcribed to them: for they neither ariſe from the temperament, neither from the other manifeſt qualities, neither from the whole ſubſtance, neither from a divine or magical power, from which two laſt mentioned, all Medicins beyond Nature, and which are conſequently to be uſed to Diſeaſes, whoſe eſſences are ſupernatural, muſt proceed. Such like old Wives Medicins and ſuperſtitious remedies, are written Figures and Characters, Rings, where neither the aſſiſtance of God or Spirits is implored. Let me ask you, Is it not a ſuperſtitious Medicin to heal the Falling-ſickneſs, to carry in writing the name of the three Kings, *Gaſpar*, *Melchior*, and *Balthaſar*, who came to worſhip Chriſt? To help the Tooth-ach, if one whileſt Maſs is ſaying, touch his teeth, ſaying theſe words, *Os non comminuitis ex eo?* To ſtay Vomiting with certain Ceremonies and words, which they abſent pronounce, thinking it ſufficient if that they but onely know the Patients name?

Old Wives ſuperſtitious Medicins againſt divers Diſeaſes.

I ſaw a certain fellow that with murmuring a few words, and touching the part, would ſtanch bloud out of what part ſoever it flowed: there be ſome who to that purpoſe ſay this, *De latere ejus exivit ſanguis & aqua.* How many Prayers or Charms are carried about to cure Agues? ſome taking hold of the Patients hand, ſay, *Æque facilis tibi Febris hæc ſit, atque Mariæ virgini Chriſti partus.* Another waſheth his hands with the Patient before the Fit, ſaying to himſelf that ſolemn Pſalm, *Exaltabo te Deus, meus Rex*, &c. If one tell an Aſs in his Ear that he is ſtung by a Scorpion, they ſay that the danger is immediately over.

As there are many ſuperſtitious words, ſo there are many ſuperſtitious writings alſo. To help ſore Eyes, a Paper wherein the the two Greek Letters Τ and Α are written, muſt be tied in a thred, and hanged about the neck. And for the Tooth-ach this ridiculous ſaying, *Strigiles facileſque dentatæ, dentium dolorem perſanate.* Alſo oft-times there is no ſmall ſuperſtition in things that are outwardly applied. Such is that of *Apollonius* in *Pliny*, to ſcarifie the Gums in the Tooth-ach, with the tooth of one that died a violent death: to make Pills of the ſkull of one hanged, againſt the bitings of a mad Dog: to cure the Falling-ſickneſs by eating the fleſh of a wild Beaſt killed with the ſame iron wherewith a man was killed: that he ſhall be freed from a Quartan Ague who ſhall drink the Wine whereinto the Sword that hath cut off a mans head, ſhall be put; and he, the parings of whoſe nails ſhall be tied in a linnen cloth to the neck of a quick Eel, and the Eel let go into the Water again. The pain of the Milt to be aſſwaged, if a Beaſts Milt be laid upon it, and the Phyſician ſay that he cures or makes a Medicin for the Milt. Any one to be freed from the Cough, who ſhall ſpit in the mouth of a Toad, letting her go away alive. The Halter wherein one hath been hanged put about the Temples, to help the Head-ach. This word *Abracadabra*, written on a Paper, after the manner deſcribed by *Serenus*, and hanged about the neck, to help Agues or Fevers, eſpecially Semi-tertians. What truth can be in that which ſundry affirm, that a leaf of *Lathyris*, which is a kind of Spurge, if it be plucked upwards, will cauſe vomit, but broken downwards will move to Stool? You may alſo find many other ſuperſtitious fictions concerning herbs, ſuch as *Galen* reports that *Andreas* and *Pamphilus* writ, as incantations, transformations, and herbs dedicated to Conjurers and Devils. *Lib. 6. de Simp.*

I had thought never in this place to have mentioned theſe and the like, but that there may be everywhere found ſuch wicked perſons, who leaving the Arts and Means which are appointed by God to preſerve the health of Mans body, fly to the ſuperſtitious and ridiculous remedies of Sorcerers, or rather of Devils, which notwithſtanding the Devil ſometimes makes to perform their wiſhed for effects, that ſo he may ſtill keep them enſnared and addicted to his ſervice. Neither is it to be approved which many ſay, that it is good to be healed by any Art or Means, for that healing is a good work. This ſaying is unworthy of a Chriſtian, and ſavours rather of him that truſts more to the Devil than in God. Thoſe Empericks are not of the Society of Sorcerers and Magicians, who heal ſimple wounds with dry lint, or lint dipt in water: this Cure is neither magical nor miraculous, as many ſuppoſe, but wholly natural, proceeding from the healing Fountains of Nature; Wounds and Fractures which the Surgeon may heal by onely taking away the impedi-

ments, that is pain, defluxions, inflammation, an abſceſs and gangrene, which retard and hinder the cure of ſuch diſeaſes. The following examples will ſufficiently make evident the Devils maliciouſneſs, always wickedly and craftily plotting againſt our ſafety and life.

Lib.epiſt.38.ep. A certain Woman of *Florence* (as *Langius* writes) having a malign ulcer, and being troubled with intolerable pain at the ſtomach, ſo that the Phyſicians could give her no eaſe: behold on a ſudden ſhe vomited up long and crooked nails and braſs needles wrapped up with wax and hairs, and at length a great gobbet of fleſh, ſo big that a Giants jaws could ſcarce ſwallow it.

But that which happened in the year of our redemption 1539. in a certain Town called *Fugenſtal*, in the Biſhioprick of *Eyſtet*, exceeds all credit, unleſs there were Eye-witneſſes of approved integrity yet living. In this Town one *Ulrich Nuſeſſer*, an Husbandman, was tormented with grievous pain in the one ſide of his belly; he ſuddenly got hold of a iron Key with his hand under the skin, which was not hurt, the which the Barber-Surgeon of the place cut out with a Razor; yet for all this the pain ceaſed not, but he grew every day worſe than other: wherefore expecting no other remedy but death, he got a Knife and cut his throat. His dead body was opened, and in his ſtomach were found a round and loggiſh piece of wood, four ſteel knives, part ſharp, and part toothed like a Saw, and two ſharp pieces of iron, each whereof exceedeth the length of a ſpan; there was alſo as it were a ball of hair. All theſe things were put in by the craft and deceit of the Devil. Thus far *Langius*.

CHAP. XVIII.

Of the Cozenages and crafty Tricks of Beggars.

HAving treated of Monſters, it follows that we ſpeak of thoſe things which either of themſelves, by reaſon of their nature full of admiration, have ſome kind of monſtrouſneſs in them, or elſe from ſome other ways, as by the craft and cozenage of men. And becauſe to the laſt mentioned crafts of the Devil, the ſubtle devices of begging Companions are ſomewhat alike, therefore I will handle them in the next place, that the Surgeon being admoniſhed of them, may be more cautious and cunning in diſcerning them when he meets with them.

An hiſtory of a counterfeit arm.

Anno Dom. 1525. when I was at *Anjou*, there ſtood a crafty Beggar begging at the Church door, who tying and hiding his own arm behind his back, ſhewed in ſtead thereof, one cut from the body of one that was hanged, and this he propped up and bound to his breſt, and ſo laid it open to view, as if it had been all enflamed, ſo to move ſuch as paſſed by, unto greater commiſeration of him. The cozenage lay hid, every one giving him money, until at length his counterfeit arm not being ſurely faſtned, fell upon the ground, many ſeeing and obſerving it; he being apprehended and laid in priſon, by the appointment of the Magiſtrate was whipped through the Town, with his falſe arm hanging before him, and ſo baniſhed.

Another of a cancrous breſt.

I had a brother called *John Parey*, a Surgeon, who dwelt in *Vitre* in *Britain*; he once obſerved a young woman begging, who ſhewed her breaſt, as if it had a cancrous ulcer thereon, looking fearfully by reaſon of much ſordid filth, wherewith it ſeemed to defile the cloth that lay under it. But when as he had more diligently beheld the womans face, and the freſh colour thereof, as alſo of the places about the ulcer, and the good habit of the whole body agreeable to that colour (for ſhe was ſomewhat fat, and of a very good habit of body) he was eaſily hereby induced to ſuſpect ſome roguery and deceit. He acquainted the Magiſtrate with this his ſuſpicion, and got leave that he might carry her home to his houſe, ſo to ſearch her more narrowly. Where opening her breaſt, he found under her arm-pit, a Sponge moiſtned with a commixture of beaſts bloud and milk, and carried through an Elder-pipe to the hidden holes of her counterfeit *Cancer*. Therefore he foments her breaſt with warm water, and with the moiſture thereof looſeth the skins of black, green, and yellow Frogs laid upon it, and ſtuck together with Glew made of Bole-armenick, the White of an Egg, and Flour; and theſe being thus fetched off, he found her breaſt perfectly ſound.

The Beggar being caſt for this into priſon, confeſſed that ſhe was taught this trick by a Beggar that lay with her, who himſelf alſo, by putting about his leg an Oxes Milt, and perforating it in ſundry places, that ſo the fore-mentioned liquor might drop out, counterfeited an Ulcer of a monſtrous bigneſs and malignity, covering the edges of the Milt on every ſide with a filthy cloth. This Beggar was diligently enquired after, but could not be found; and ſo ſhe was whipped and baniſhed.

Of one feigning himſelf leprous.

* Cliquets are things made ſomewhat reſembling a ſmall Wool-card, but have two or three little pieces of boards ſo faſtned together with leather, that they will make a great noiſe with them, and theſe are uſed by the French Beggars.

Within leſs than a year after, there came into the ſame City a notable crafty Companion, who preſently taking up the Church-doors, laid open his Wares; to wit, a Kercher with ſome ſmalll pieces of money lying thereon, a wooden Barrel, and *Cliquets, where-with he would ever now and then make a great noiſe: his face was ſpread over with great thick puſtles, being of a blackiſh red colour, and made with Glue like thoſe that have the Leproſie: this his ghaſtly look made him to be pitied by all men, which was the cauſe that every one gave him money. Then my brother came ſomewhat nearer him, and asked him how long he had been troubled with this ſo cruel Diſeaſe; he anſwered with an obſcure and hoarſe voice, that he was born a Leper from his Mothers Womb, and that his Parents both died of this wicked Diſeaſe, ſo that their members fell away by piece-meal. Now he had a woollen ſwathe about his chaps, wherewith (having his left hand under his Cloak) he ſo ſtraitned his chaps, that much black bloud roſe into his face, and made him ſo hoarſe that he could ſcarce ſpeak; yet he could not contain himſelf, but that in ſpeaking he ever now and then ſlackned the ſwathe with his hand, the freelier to draw his breath; which when my brother had obſerved, ſuſpecting ſome cozenage, he obtained leave of the Magiſtrate to ſearch and examine the man, whether he were truly leprous, or no. Firſt therefore he took away his Swathe or Rowler that was about his neck, then waſhed his face with warm water, ſo that the counterfeit glued puſtles were diſſolved, and his face (free from all tainture) ſhewed it ſelf of a good and natu-

ral

ral colour and shape. Then he laid bare his whole body, and diligently viewed each part, and found no sign of a Leprosie, one or other. Which when the Magistrate once heard, he made him to be put in prison, and to be thrice whipped through the Streets of the City, with his Barrel hanging before him, and his Cliquets behind him, adding thereto the punishment of perpetual banishment. It happened that as he was whipped the third Market-day, the People cried out to the Hangman in jest, that he should not fear to lash him soundly, for being leprous he could not feel it; the Executioner incited by this cry of the People, did so belabour him, that the Wretch died of his Whipping within a short while after, having a just reward for his wickedness. For these Impostors, besides that they live like drones, feigning this or that Disease, and so being idle, enjoy the fruits of others labours: they also divers times conspiring together, take away the lives and goods of honest and substantial Citizens and other people: for there are some of them that in an evening, as men that have no habitation, desire lodging for a night, and it being granted them, they, when as the Master of the house and his Family are asleep, open the doors to their Comrades, men as wicked as themselves, and kill and carry away all they can.

A multitude of Beggars hurtful to the City.

Certainly we may justly affirm, that this crafty way of begging is the Mother and School of all dishonesty: for how many acts of bawdry and poisoning every where corrupt the Wells and publick Fountains? How many places have been burnt under the shew of begging? Where can you get more fit Spies? Where more fit Undertakers and Workers of all manner of Villany, than out of the crew of these Beggars?

How to discover such as counterfeit the Jaundice.

Some of them there are, who besmear their faces with soot laid in water, so to seem to have the Jaundice. But you may at the first sight find out the deceit, by the native whiteness of the outer coat of the eye, called *Adnata*, which in such as truly have the Jaundice, useth to be died and overcast with a yellowish colour; also you may be more certain thereof, if you wet a cloth in Water or Spittle, and so rub the face; for the adventitious yellowness will quickly vanish, and the true native colour shew it self.

Some there be, who not content to have mangled, and filthily exulcerated their limbs with caustick herbs, and other cauteries; or to have made their bodies more swollen, or else lean, with medicated drinks; or to have deformed themselves some other way, but from good and honest Citizens, who have charitably relieved them, they have stollen their children, have broken or dislocated their arms and legs, have cut out their tongues, have depressed the chest or whole breast; that with these as their own children, begging up and down the Countrey, they may get the more relief, pitifully complaining that they came by this mischance by Thunder or Lightning, or some other strange accident.

Lastly, They part the Kingdom amongst themselves as into Provinces, and communicate by Letters one to another, what news or new quaint devices there are to conceal or advance their Roguery: to which purpose they have invented a new Language onely known to themselves, so to discourse together, and not to be understood by others. [We here vulgarly term it *Canting*.]

Of one counterfeiting the falling of the Fundament.

Dr. *Flecelle*, a Physician of *Paris*, intreated me to bear him company to his Country-house at *Champigny*, four miles from *Paris*. Where as soon as we arrived, and were walking in the Court, there came presently to us a good lusty well flesht manly woman, begging alms for St. *Fiacre* sake, and taking up her Coat and her Smock, she shewed a great gut hanging down some half a foot, which seemed as if it had hanged out of her fundament, whereout there dropped filth like unto *pus*, which had all stained her Legs and Smock, most beastly and filthy to look upon. *Flecelle* asked how long she had been troubled with this Disease; she answered that it was four years since she first had it. Hence he easily gathered that she played the counterfeit: for it was not likely that such abundance of purulent matter came forth of the body of so well flesht and coloured a Woman; for she would rather have been very lean and in a consumption. Wherefore provoked with just anger, by reason of the wickedness of the deceit, he run upon her and threw her down upon the ground, and trod her under his feet, and hit her divers blows upon the belly, so that he made the gut which hung at her, to come away, and by threatning her with more grievous punishment, made her confess the cozenage, and that it was not her gut, but of an Ox, which being filled with bloud and milk, and tied at both ends, she put the one of them into her fundament, and let the filth flow forth at very little holes.

Of one feigning the falling down of the Womb.

Not very long ago, a Woman equally as shameless, offered her self to the Overseers of the Poor of *Paris*, intreating that she might be entered for one of their Pensioners, for that her Womb was fallen down by a dangerous and difficult birth, wherefore she was unable to work for her living. Then they commanded that she should be tried and examined, according to the custom, by the Surgeons which are therefore appointed: who seeing how the whole business was carried, made report she was a Counterfeit, for she had thrust an Oxes bladder, half blown and besmeared with beastly bloud by the neck, whereto she had fastned a little Sponge, into the neck of her Womb, for the Sponge being filled and swollen up by the accustomed moisture of the Womb, so held up the Oxes bladder that hanged thereat, that she might safely go without any fear of the falling of it out, neither could it be pulled forth but with good force. For this her device she was put into Prison, and being first whipped, was after banished. This cozenage is not much unlike theirs, who by fitly applying a Sheeps paunch to their groin, counterfeit themselves to be burstен.

Of a Beggar that feigned her self to have a Snake in her belly.

Anno Dom. 1561. there came to *Paris* a lusty, stout, and very fat *Norman* Woman, being about some thirty years old, who begging from door to door, did cast to meet with rich Women, and very familiarly and pitifully would relate unto them her misfortune, saying, she had a Snake in her Belly, which crept in at her mouth as she slept in a Hemp-land: she would let one feel her stir, by putting their hand to her Belly, adding also that she was troubled day and night with its unceasant gnawing of her guts. The novelty of this sad chance, moved all to pity and admiration; wherefore as much as they could, they assisted her with means and counsel. Amongst the rest, there was

a Wo-

a Woman of great devotion and charity, who ſending for Doctor *Hollerius Chevall* and me, asked us if this Snake could by any means be gotten forth. *Hollerius* gave her a ſtrong purgation, hoping that by ſtirring up the expulſive faculty, the Serpent might be caſt forth together with the noxious humours. But this hope had no ſuch ſucceſs. Wherefore when as we met again, we thought it fit to put a *Speculum matricis* into the neck of her womb, ſo to ſee if we could diſcern either head or tail: but I making large dilatation of her Womb, could ſee no ſuch thing; onely we obſerved a certain voluntary motion, whereof ſhe her ſelf was the author, by contracting and dilating the muſcles of the lower belly. Which when as we had obſerved, perceiving the deceit and impoſture, we thought good ſo to terrifie her, and make her confeſs the deceit, to tell her that ſhe muſt take another, but that a more ſtrong purgation; that what we could not do by the former, as more gentle, we might attain to by the latter, as far ſtronger. She diſſembling all fear, and conſcious of her craft and diſſimulation, after we were gone in the evening, packing up her ſtuff, and a great deal more then her own, ſhe ſecretly ſtole away, not bidding her Hoſteſs farewel: and thus at length the fraud was apparent, to the loſs of the honeſt Gentlewoman. I ſaw this baggage ſix days after, ſitting luſtily upon a Pack-horſe, at the Gate *Montmartre*, and laughing heartily with ſuch as brought Sea-fiſh to Town: and ſhe was returning (as it was moſt likely) into her Countrey, ſeeing her couzenage was diſcovered here.

The craft of ſuch as feign themſelves to have the Falling-ſickneſs. Of ſuch as feign themſelves leprous.

Such as feign themſelves dumb, draw back and double their tongues in their mouths. Such as falling down counterfeit the Falling-ſickneſs, bind ſtraitly both their wriſts with plates of iron, tumble and rowl themſelves in the mire, ſprinkle and defile their heads and faces with Beaſts bloud, and ſhake their limbs and whole body. Laſtly, by putting Soap into their mouths, they foam at the mouth like thoſe that have the Falling-ſickneſs. Otherſome with Flour make a kind of Glue, wherewith they beſmear their whole bodies, as if they had that Leproſie or Scab that is vulgarly termed *Malum ſancti Manis*. Neither muſt we think this Art of Counterfeiting and cheating Begging to be new, and of late invention; for long ago it flouriſhed in *Aſia*, even in the time of *Hippocrates*, as may appear in his Book *De Aere, Locis, & Aquis*. But by how much this diſeaſe hath taken more deep root, and grown more inveterate by proceſs of time, by ſo much it muſt more diligently and carefully be looked to and prevented, by cruelly puniſhing ſuch Counterfeits: for that by this feigned begging, as the Nouriſher of Sloth, and Shop of all diſhoneſty, that which is taken from the good is beſtowed upon the ill, and one wicked and counterfeit Beggar hurts all other wretched people.

CHAP. XIX.

Of ſtrange or monſtrous accidents in Diſeaſes.

Monſters happen alſo in diſeaſes.

WHat monſtrouſneſs ſoever was in the laſt mentioned parties, it was made up by the craft of Beggars for filthy gain. But if there be any monſtrouſneſs in the following narrations, it is of Nature, but working as it were miraculouſly, by ſome ſecret and occult means; for thus there are oftentimes Monſters in Diſeaſes. Before the Town of St. *John de Angeley*, a Souldier called *Francis*, of the Company of Captain *Muret*, was wounded with a Harquebuz-ſhot on the belly, between his navel and ſides; the bullet was not taken out, becauſe the Surgeons who ſearched him diligently, could not find it: wherefore he was troubled with grievous and tormenting pains, until the nineth day after he received the wound, the bullet came forth at his fundament: wherefore within three weeks after he was perfectly whole. He was healed by *Simon Crinay*, the Surgeon of the *French* Companies.

A bullet ſhot into the belly came forth at the Fundament.

A bullet ſticking in the throat and the Patient recovering.

James Pope, Lord of St. *Albans* in *Dauphine*, was wounded at the Skirmiſh at *Chaſenay*, having three Harquebuz bullets entering into his body, one whereof pierced under his throat, where it buncheth out as with a knot, near to the pipe of his lungs, even to the beginning of the *Vertebræ* of the neck, in which place the Leaden bullet ſtuck, and as yet doth remain. Hereupon he was afflicted with many and fearful ſymptoms, as a Fever, and a great ſwelling of his whole neck, ſo that for ten whole days he could ſwallow nothing but broths and liquid things. Yet he recovered, and remaineth well at this preſent, by the cure of *James Dalam* the Surgeon.

Lib. 3. anatom. cap. 9.

A crooked iron ſhot into the back, came forth at the Fundament.

Alexander Benedictus makes mention of a certain Country man, who, ſhot into the back with a dart, drawing out the ſhaft, the head was left behind, being in length about the bredth of two fingers, but hooked and ſharp on the ſides. When as the Surgeon had carefully and diligently ſought for it, and could by no means find it, he healed up the wound, but two moneths after this crooked head came forth at his fundament.

A ſwallowed needle voided by urin.

The ſame Author telleth that at *Venice* a Virgin ſwallowed a needle, which ſome two years after ſhe voided by urin, covered over with a ſtony matter, gathered about viſcous humours.

A needle running in at the buttock, came forth at the groin.

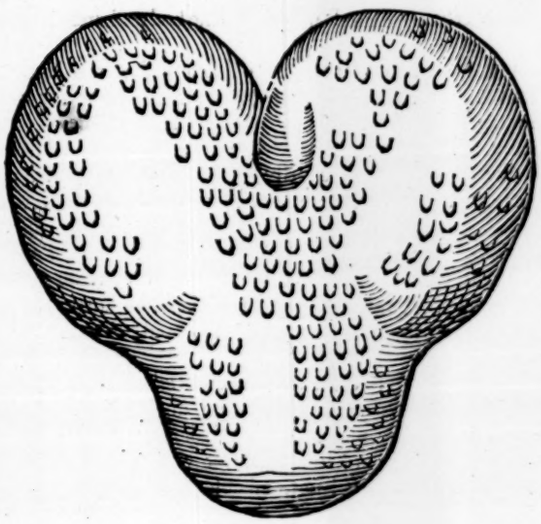
Catherine Perlan, the wife of *William Guerrier*, a Draper of *Paris*, dwelling in the *Jewry*, as ſhe rode on Horſe-back into the Country, a needle out of her Pin-cuſhion, got under her by accident, ran ſo deep into her right buttock, that it could not by any Art or force be plucked forth. Four moneths after ſhe ſent for me to come to her, and ſhe told me that as often as ſhe had to do with her husband, ſhe ſuffered extreme pricking pain in her right groin; putting my hand thereto, as I felt it, my fingers met with ſomething ſharp and hard, wherefore I uſed the matter ſo, that I drew forth the needle all ruſty: this may be accounted as a miracle, that Steel, naturally heavy, ſhould riſe upwards from the buttock to the groin, and pierce the muſcles of the thigh, without cauſing an abſceſs.

A needle in the midſt of a Stone taken forth of the bladder.

Anno Dom. 1566. the two ſons of *Laurence Collo* (men excellent in cutting for the Stone) took forth a Stone of the bigneſs of a Wall-nut, in the midſt whereof was a needle, juſt like thoſe that Shoe-makers uſe: the Patients name was *Peter Cocquin*, dwelling in the Street *Galand*, at the place called

called *Maubert* at *Paris*, and I think he is yet living. This Stone was ſhewed to King *Charles* the Ninth, for the monſtrouſneſs of the thing, I being then preſent, which being given me by the Surgeon, I preſerve amongſt my other rarities.

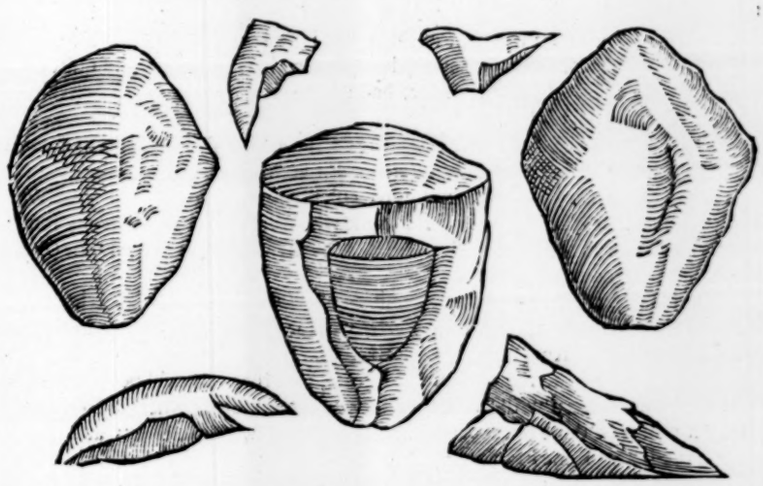
The Figure of a Stone taken forth of the Bladder of a Confectioner.



Anno Dom. 1570. the Dutcheſs of *Ferrara* at *Paris*, ſent for *John Collo* to take a Stone out of a Confectioner. This Stone, though it weighed nine ounces, and was as thick as ones fiſt, yet was it happily taken out, the Patient recovering, *Francis Rouſſet* and *Joſeph Javelle*, the Dutcheſs Phyſicians, being preſent. Yet not long after this Confectioner died by the ſtoppage of his water, by reaſon of two other little ſtones, which about to deſcend from the Kidnies to the Bladder, ſtaid in the midway of the Ureters. The figure of the extracted ſtone was this.

Anno Dom. 1569. *Laurenee Collo* the younger, took three ſtones out of the Bladder of one dwelling at *Marly*, called commonly *Tire-vit*, becauſe being troubled with the Stone from the tenth year of his age, he continually ſcratched his Yard, each of the Stones were as big as an Hens Egg; of colour white, they altogether weighed twelve ounces. When they were preſented to King *Charles*, then lying at St. *Maure des Fauſſez*, he made one of them to be broken with a Hammer, and in the midſt thereof there was found another of a Cheſnut colour, but otherwiſe much like a Peach-ſtone. Theſe three Stones, beſtowed on me by the Brethren, I have here repreſented to the life.

The Effigies of the three fore-mentioned Stones, whereof one is broken.



I have in the diſſecting of dead Bodies, obſerved divers Stones of various forms and figures, as of Pigs, Whelps, and the like. *Dalechampius* telleth that he ſaw a man, which by an Abſceſs of his Loins, which turned to a Fiſtula, voided many Stones out of his Kidnies, and yet notwithſtanding could endure to ride on Horſe-back, or in a Coach. *John Magnus*, the Kings moſt learned and skilful Phyſician, having in cure a Woman, troubled with cruel torment and pains of the Belly and Fundament, ſent for me, that by putting a *Speculum* into the Fundament, he might ſee if he could perceive any diſcernable cauſe of ſo great and pertinacious pain: and when as he could ſee nothing which might further him in the finding out of the cauſe of her pain (following Reaſon as a Guide) by giving her often Clyſters and Purgations, he brought it ſo to paſs, that ſhe at length voided a Stone at her Fundament of the bigneſs of a Tennis-ball: which once avoided all her pain ceaſed.

A Stone by the force of Purging Medicins voided by the Fundament.

Hippocrates tells us that the Servant of *Dyſeris* in *Lariſſa*, when ſhe was young, in uſing Venery was much pained, and yet ſometimes without pain, yet ſhe never conceived. But when ſhe was ſixty years old, ſhe was pained in the afternoon as if ſhe had been in labour. When as ſhe one day before noon had eaten many Leeks, afterward ſhe was taken with a moſt violent pain far exceeding all her former, and ſhe felt a certain rough thing riſing up in the orifice of her womb: but ſhe falling into

5 *Epid.*

A Stone coming out of the neck of the Womb.

into a ſwound, another woman putting in her hand, got out a ſharp ſtone of the bigneſs of a whirl, and then ſhe forthwith became well, and remained ſo.

*Lib.*1. *cap. de palp. cond.* In a certain Woman, who, as *Hollerius* tells, for the ſpace of four Moneths was troubled with an incredible pain in making water, two ſtones were found in her heart, with many abſceſſes, her Kidnies and Bladder being whole.

Anno Dom. 1558. I opened in *John Bourlier* a Tailor, dwelling in the ſtreet of St. *Honore*, a watry abſceſs in his knee, wherein I found a ſtone, white, hard, and ſmooth, of the thickneſs of an Almond; which being taken out, he recovered. Certainly there is no part of the body wherein ſtones may not breed and grow.

No part of the body wherein ſtones may not be found

Anthony Benevenius a Florentine Phyſician writes, that a certain Woman ſwallowed a braſs Needle without any pain, and continued a year after without feeling or complaining of it: but at the end thereof ſhe was moleſted with great pains in her belly; for helping of which ſhe asked the advice of all the Phyſicians ſhe could, making in the interim no mention of the ſwallowed Needle. Wherefore ſhe had no benefit by all the Medicins ſhe took; and ſhe continued in pain for the ſpace of two years, until at length the Needle came forth at a little hole by her Navel, and ſhe recovered her health.

A Needle ſwallowed, came forth at the Navel ſome two years after.

A Scholar named *Chambelant*, a Native of *Bourges*, a Student in *Paris*, in the Colledge of *Preſſe*, ſwallowed a ſtalk of Graſs, which came afterwards whole out between two of his ribs, with the great danger of the Scholars life. For it could not come there unleſs by paſſing or breaking through the lungs, the encompaſſing membrane, and the intercoſtal muſcles; yet he recovered, *Fernelius* and *Haquet* having him in cure.

A ſprig of Graſs ſwallowed came forth whole again between the ribs.

Carolle Chirurgeon to Monſieur the Marſhal of *Anville*, told me that *Francis Guillinet* the Chirurgeon of *Sommiers*, a ſmall Village ſome eight miles from *Mompelier*, had in cure, and healed a certain Shepherd, who was forced by Thieves to ſwallow a Knife of the length of half a foot, with a Horn handle of the thickneſs of ones thumb: he kept it the ſpace of half a year, yet with great pain, and he fell much away, but yet was not in a Conſumption, until at length an abſceſs riſing in his groin, with great ſtore of very ſtinking quitture, the Knife was there taken forth in the preſence of the Juſtices, and left with *Joubert* the Phyſician of *Mompelier*.

A Knife ſwallowed, came forth at an abſceſs in the groin.

Monſieur the Duke of *Rohan* had a Fool called *Guido*, who ſwallowed the point of a Sword of the length of three fingers, and he voided it at his Fundament on the twelfth day following, yet with much ado: there are yet living Gentlemen of *Britany*, who were eye-witneſſes thereof.

The point of a Sword ſwallowed, came forth at the fundament.

There have been ſundry Women with child, who have ſo caſt forth piece-meal children that have died in their Wombs, as that the bones have broke themſelves a paſſage forth at the Navel, but the fleſh, diſſolved as it were into quitture, flowed out by the neck of the womb and the fundament, the Mothers remaining alive, as *Dalechampius* obſerves out of *Albucraſis*.

Wonderful excretions of Infants out of the Womb

It is not very ſtrange that there have been Women, who troubled with a fit of the Mother, have lain three whole days without motion, without breathing, or pulſe that were any way apparent, and ſo have been carried out for dead.

Women troubled with the Mother laid out for dead.

A certain young man, as *Fernelius* tells, by ſomewhat too vehement Exerciſe, was taken with ſuch a Cough, that it left him not for a moment of time, until he therewith had caſt forth a whole impoſtume of the bigneſs of a Pigeons Egg, wherein, being opened, there was found quitture exquiſitely white and equal. He ſpit bloud two days after, had a great Fever, and was much diſtempered, yet notwithſtanding he recovered his health.

An Impoſtume ſpit out, of the bigneſs of a Pigeons Egg.

Anno Dom. 1578. *Stephana Chartier* dwelling at St. *Maure des Fauſſez*, a Widow of forty years old, being ſick of a Tertian Fever, in the beginning of her Fit vomited up a great quantity of choler, and together therewith three hairy Worms, in figure, colour, and magnitude like the Worms called Bear-worms, yet ſomewhat blacker; they lived eight whole days after without any food: the Chirurgeon of this Town brought them to Dr. *Milot*, who ſhewed them to *Feure*, *Le Groſs*, *Mareſcot*, and *Courtin*, Phyſicians, and to me alſo.

Worms caſt up in the Fit of an Ague.

This following Hiſtory, taken out of the Chronicles of *Menſtrele*, exceeds all admiration. A certain Frank-Archer of *Meudon*, four miles from *Paris*, was for Robbery condemned to be hanged: in the mean time it was told the King by the Phyſicians, that many in *Paris* at that time were troubled with the Stone, and amongſt the reſt the Lord of *Boſcage*, and that it would be for the good of many, if they might view and diſcern with their eyes the parts themſelves wherein ſo cruel a diſeaſe did breed, and that it might be done much better in a living than in a dead body; and that they might make trial upon the body of the Frank-Archer, who had formerly been troubled with theſe pains. The King granted their requeſt; wherefore opening his body, they viewed the breathing parts, and ſatisfied themſelves as much as they deſired, and having diligently and exactly reſtored each part to its proper place, the body, by the Kings command was ſewed up again, and dreſſed and cured with great care. It came ſo to paſs, that this Frank-Archer recovered in a few days, and getting his pardon, got good ſtore of money beſides.

This narration exceeds not only all admiration, but alſo belief.

Alexander Benedictus tells, that he ſaw a Woman called *Victoria*, who having loſt all her teeth, and being bald, yet had others come up in their places, when as ſhe was fourſcore years old.

Stephen Teſſier a Chirurgeon of *Orleance*, told me that not long ago he cured one *Charles Verignol* a Serjeant of *Orleance*, of a wound received in his ham, whereby the two tendons bending the ham, were quite cut aſunder. He took this order in the cure; he cauſed the Patient to bend his leg, then he ſewed together the ends of the cut tendons, then placed the member in that ſite, and handled with that Art, that at length he healed the wound, the Patient not halting at all. Truly this is a memorable thing, and carefully and heedfully to be imitated by the young Chirurgeon.

*Pract. lib.*64. *cap.*1.

How many have I ſeen, who wounded and thruſt through the body with Swords, Arrows, Pikes, Bullets, have had portion of the brain cut off by a wound of the head, an arm or leg taken away by a Cannon-bullet, yet have recovered; and how many on the contrary, have died of light and ſmall wounds, not worth the ſpeaking of?

A

A certain man was ſhot near to his groin with an Arrow, whom we have ſeen, ſaith *Hippocrates*, and he recovered beyond all mens expectation. The arrows head was not taken forth, for it was very deep in, neither did the wound bleed very much, neither did he halt: but we found the head and took it forth ſix years after he was hurt. Now *Hippocrates* gives no reaſon of its ſo long ſtay, but that he ſaith it might be ſuſpected it lay hid between the Nerves, and that no Vein or Artery was cut thereby. *5. Epidem.*

CHAP. XX.

Of the wonderful original, or breeding of ſome Creatures.

WE have read in *Boiſtey*, that a certain Workman of *Avignion*, when as he lived in that City, opened a leaden Coffin, wherein a dead body lay, that was ſo cloſely ſoldered that the air could not get in; and as he opened it, he was bitten by a Serpent that lay therein, with ſo venomous and deadly a bite, that it had near to have coſt him his life. Yet the original cauſe of this Creature is not ſo prodigious as he ſuppoſeth, for it is an uſual thing for a Serpent to breed of any putrified carkaſs, but chiefly of mans. *Boiſt. in Hiſtor. Prodig.* It is a common thing for a Serpent to breed of the dead corps of a man.

Baptiſta Leo writes, that in the time of Pope *Martin* the fifth, there was a live Serpent found encloſed in a vaſt but ſolid Marble, no chink appearing in ſuch denſe ſolidity, whereby this living Creature might breath. A live Serpent in a ſolid Marble.

Whileſt in my Vineyard, that is at *Meudon*, I cauſed certain huge ſtones to be broken to pieces, a Toad was found in the midſt of one of them. When as I much admired thereat, becauſe there was no ſpace wherein this Creature ſhould be generated, increaſe, or live, the Stone-cutter wiſhed me not to marvel thereat, for it was a common thing, and that he ſaw it almoſt every day. Certainly it may come to paſs, that from the more moiſt portion of ſtones, contained in places moiſt and under ground, and the celeſtial heat mixing and diffuſing it ſelf over the whole maſs of the World, the matter may be animated for the generation of theſe creatures. The cauſe of ſuch wonderful generations.

CHAP. XXI.

Of the wondrous nature of ſome marine things, and other living creatures.

THe laſt mentioned creatures were wonderful in their original, or rather in their growth: but theſe which follow, though they be not wonderful of themſelves, as thoſe that conſiſt of their own proper nature, and that working well and after an ordinary manner; yet they are wondrous to us, or rather monſtrous, for that they are not very familiar to us. For the rarity and vaſtneſs of bodies, is in ſome ſort monſtrous. Of this ſort there are many, eſpecially in the Sea, whoſe ſecret corners and receptacles are not pervious to men: as *Tritons*, which from the middle upwards are reported to have the ſhape of men: and the *Sirens*, *Nereides*, or Meremaids, who (according to *Pliny*) have the faces of women, and ſcaly bodies; yea, whereas they have the ſhape of man; neither yet can the fore-mentioned confuſion and conjunction of ſeeds take any place here, for as we lately ſaid, they conſiſt of their own proper nature. *Lib. 9.*

When *Mena* was Preſident of *Egypt*, and walked on the banks of *Nilus*, he ſaw a Sea-monſter in the ſhape of a man coming forth of the Waters; his ſhape was juſt like to a man even to the middle, with his countenance compoſed to gravity, his hair yellow, yet intermixed with ſome grey, his ſtomach bony, his arms orderly made and jointed, his other parts ended in a Fiſh. Three days after in the morning, there was ſeen another Sea-monſter, but with ſhape or contenance of a woman, as appeared by her face, her long hair, and ſwollen breaſts: both theſe Monſters continued ſo long above water, that any one might view them very well.

The Effigies of the Triton *and* Siren *of* Nilus.

In our times (ſaith *Rondeletius*) in *Norway* was a monſter taken in a tempeſtuous Sea, the which as many as ſaw it, preſently termed a Monk, by reaſon of the ſhape which you may here ſee ſet forth.

The

The Figure of a Fiſh reſembling a Monk.

The Figure of a Fiſh in the habit or ſhape of a Biſhop.

Anno Dom. 1531. there was ſeen a Sea-monſter in the habit of a Biſhop, covered over with ſcales: *Rondoletius* and *Geſner* have deſcribed it.

Geſner profeſſeth that he received from *Jerome Cardane* this Monſter, having the head of a Bear, the feet and hands of an Ape.

The Effigies of a Sea-monſter headed like a Bear.

The Effigies of a Lion-like ſcaly Sea-monſter.

Not long before the death of Pope *Paul* the Third, in the midſt of the Tyrrhene Sea, a Monſter was taken, and preſented to the Succeſſor of this *Paul:* it was in ſhape and bigneſs like to a Lion, but all ſcaly; and the voice was like a mans voice. It was brought to *Rome* to the great admiration of all men, but it lived not long there being deſtitute of its own natural place and nouriſhment, as it is reported by *Philip Foreſt.*

Lib.5. Chron.

An. Dom. 1523. the third day of *November*, there was ſeen at *Rome* this Sea-monſter, of the bigneſs of a child of five years old, like to a man even to the Navel, except the Ears; in the other parts it reſembled a Fiſh.

The

The Effigies of a Sea-monſter with a mans Face.

Geſner makes mention of this Sea-Monſter, and ſaith that he had the Figure thereof from a Painter, who took it from the very Fiſh, which he ſaw at *Antwerp*. The head looks very ghaſtly, having two horns, prick-ears, and arms not much unlike a man, but in the other parts it was like a Fiſh. It was taken in the *Illyrian* Sea, as it came aſhore out of the water to catch a little child: for being hurt by ſtones caſt by Fiſhermen that ſaw it, it returned a while after to the ſhore from whence it fled, and there died.

The Effigies of a Sea-Devil.

Geſner tells us that a Sea-Monſter, with the head, mane, and breaſt of a Horſe, and the reſt of his body like a Fiſh, was ſeen and taken in the Ocean Sea, brought to *Rome*, and preſented to the Pope.

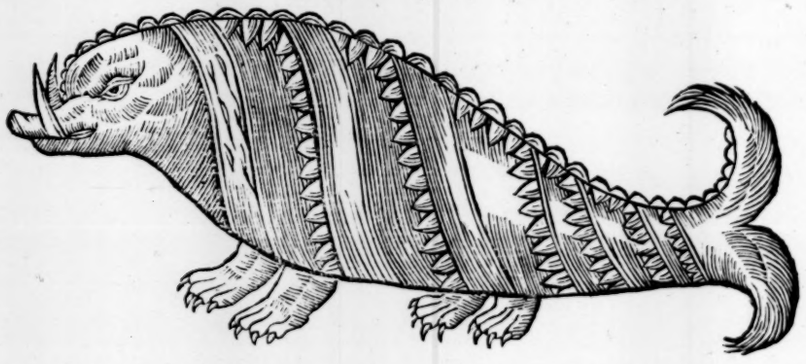
Olaus Magnus tells that a Sea-Monſter taken at *Bergen*, with the head and ſhape of a Calf, was given him by a certain Engliſh Gentleman. The like of which was preſented lately to King *Charles* the Nineth, and was long kept living in the Waters at *Fountain-bleau*, and it went oft-times aſhore. This is much different from the common Sea-Calf or Seal.

*The Effigies of a monſtrous * Sea-Calf.*

* This here figured is the Sea-Morſe, taken commonly by our men in their *Greenland* Voyages: and I judge the Sea-boar and Elephant to be the ſame, but that the Painter hath ſhewed his skill too much in the one: and the other is an old Morſe, as this here figured is a young one.

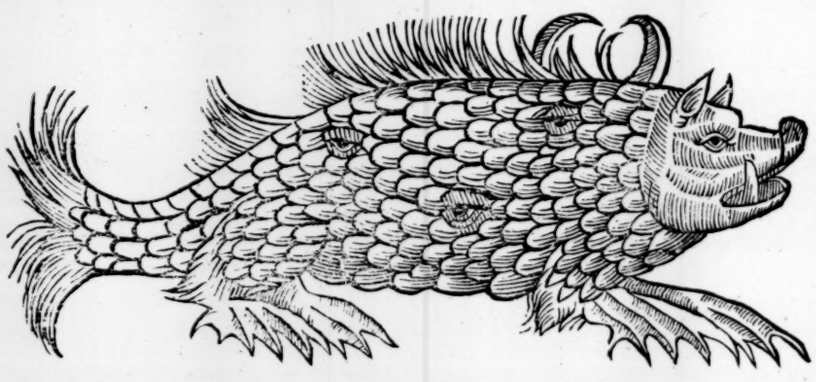
This great Monſter was ſeen in the Ocean Sea, with the head of a Boar, but longer tuſks, ſharp and cutting, with ſcales ſet in a wonderful order, as you may ſee by the following Figure.

The Effigies of a Sea-bore.



Olaus Magnus writes that this Monſter was taken at *Thyle*, an Iſland of the North, *Anno Dom.* 1538. it was of a bigneſs almoſt incredible, as that which was ſeventy two foot long, and fourteen high, and ſeven foot between the eyes: now the liver was ſo large that therewith they filled five Hogſheads; the head reſembled a Swine, having as it were a half Moon on the back, and three eyes in the midſt of his ſides; his whole body was ſcaly.

The Effigies of a monſtrous Sea-Swine.



The *Sea-Elephant*, as *Hector Boetius* writes in his deſcription of *Scotland*, it is a Creature that lives both in the Water and aſhore, having two teeth like to Elephants, with which as oft as he deſires to ſleep, he hangs himſelf upon a Rock, and then he ſleeps ſo ſoundly, that Mariners ſeeing him at Sea, have time to come aſhore and bind him, by caſting ſtrong ropes about him. But when as he is not awakened by this means, they throw ſtones at him, and make a great noiſe; with which awakened he endeavours to leap back into the Sea with his accuſtomed violence, but finding himſelf faſt, he grows ſo gentle, that they may deal with him as they pleaſe. Wherefore they then kill him, take out his fat and divide or cut his skin into thongs, which becauſe they are ſtrong and do not rot, are much eſteemed of.

The Effigies of a Sea-Elephant.

The Brabians of Mount *Mazoven*, which runs alongſt the Red Sea, chiefly feed on a Fiſh called *Orobone*, which is very terrible and much feared by other Fiſh, being nine or ten foot long, and of the breadth agreeable thereto, and it is covered with ſcales like a Crocodile.

A Crocodile is a vaſt Creature, coming ſometimes to be fifteen foot long, and ſeeing it is a Creature that doth not bring forth young, but eggs, it uſeth at the moſt to lay ſome ſixty eggs, no bigger than Gooſe eggs, riſing to ſuch bigneſs from ſo ſmall beginnings (for the hatched young one is proportionable to the egg) ſhe is very long lived.

It

It hath ſo ſmall and uſeleſs a tongue, that it may ſeem to have none at all. Wherefore ſeeing it lives both on Land and Water; as it lives on Land it is to be taken for a tongue, but as it lives part of the life in the Water, it hath no uſe of a tongue, and therefore it is not to be reputed one. For Fiſhes either wholly want tongues, or elſe have them ſo impedite and bound, that they ſerve for little uſe. The Crocodile onely of all other things moves the upper jaw, the lower remaining unmovable: for her feet, they are neither good to take nor hold any thing; ſhe hath eyes not unlike thoſe of Swine, long teeth ſtanding forth of the mouth, moſt ſharp claws, a ſcaly skin, ſo hard that no weapon can pierce it. Of the Land Crocodile (reſembling this both Land and Water one) is made the Medicin *Crocodilea*, moſt ſingular for ſore-eyes, being anointed with the juice of Leeks, it is good againſt ſuffuſions or dimneſs of the ſight; it takes away freckles, puſiles, and ſpots; the Gall anointed on the eyes helps Cataracts, but the bloud clears the ſight.

The Crocodile onely moves the upper jaw.

Expende diligenter Plinii locum, lib. 28. c. 8.

Thevet ſaith they live in the Fountains of the River *Nilus*, or rather in a lake flowing from the ſame Fountains, and that he ſaw ſome that were ſix paces long, and a yard croſs the back, ſo that their very looks were formidable. They catch them thus: When as the Water of *Nilus* falls, the Egyptians let down a line, having thereto faſtned an iron hook of ſome three pound weight, made very large and ſtrong; upon this hook they put a piece of the fleſh of a Camel or ſome other Beaſt; which when as he ſees, he preſently falls upon it, and devours it hook and all, wherewith when he finds himſelf to be cruelly pulled and pinched, it would delight you to ſee how he frets and leaps aloft; then they draw him thus hooked, by little and little to the ſhore, and faſten the rope ſurely to the next tree, leſt he ſhould fall upon them that are about him; then with Prongs and ſuch things they ſo belabour his belly, whereas his skin is ſoft and thin, that at length they kill him, and uncaſing him, they make ready his fleſh and eat it for delicious food. *John Lereus* in his Hiſtory of *Braſil*, writes that the Salvages of that Countrey willingly feed upon Crocodiles, and that he ſaw ſome who brought into their houſes young ones, wherewith their Children gathering about it, would play without receiving any harm thereby.

Coſmograph. tom. 1. l. 2. c. 8.

How they take Crocodiles.

Cap. 10.

True (ſaith *Pliny*) is that common opinion, Whatſoever is brought forth in any part of Nature, that alſo is in the Sea, and many other things over and above, that are in no other place. You may perceive that there are not onely the reſemblances of living Creatures, but alſo of other things; if you look upon the Sword, Saw, Cucumer, like in ſmell and colour to that of the Earth, that you may leſs wonder at the Sea-feather and Grape, whoſe Figures I have here given you out of *Rondoletius*.

Lib 9. cap. 2.

The Sea-feather is like thoſe feathers of Birds which are worn in hats for ornament, after they are trimmed and dreſt for that purpoſe. The Fiſhermen call them Sea-pricks, for that one end of them reſembleth the end of a mans yard when the prepuce is drawn off it. As long as it is alive it ſwells and becomes ſometimes bigger and ſometimes leſſer; but dead, it becomes very flaccid and lank: it ſhines bright on the night like a Star.

You may by this gather, that this which we here expreſs, is the Grape whereof *Pliny* makes mention, becauſe in the ſurface and upper part thereof it much reſembles a fair bunch of Grapes; it is ſomewhat longiſh like a miſhapen Club, and hangs upon a long ſtalk; the inner parts are nothing but confuſion, ſometimes diſtinguiſhed with little glandules, like that we have here figured alone by it ſelf.

The Figure of the Sea-feather and Grape.

In the Sea near the Iſland *Hiſpaniola* in the Weſt-Indies, there may be ſeen many monſtrous Fiſhes, amongſt which *Thevet* in his Coſmography thought this moſt rare and obſervable, which in the vulgar Language of the Natives is termed *Aloes*. For it is juſt like a Gooſe, with a long and ſtrait neck, with the head ending ſharp, or in a Cone, not much unlike a Sugar-pear, it is no bigger than a Gooſe, it wanteth ſcales, it hath four fins under the belly for ſwimming; when it is above water you would ſay that it were a Gooſe.

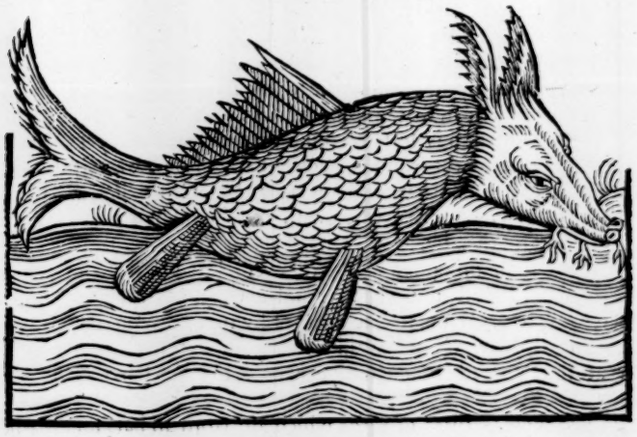
The Sarmatian, or Eaſtern German Ocean contains Fiſhes unknown to hot Countries, and very monſtrous. Such is that which reſembling a Snail, equals a Barbel in magnitude of body, and a Stag in the largeneſs and branches of her horns: the ends of her horns are rounded as it were into little Balls, ſhining like unto Pearls, the neck is thick, the eyes ſhining like unto little candles, with a roundiſh noſe ſet with hairs like to a Cats, the mouth wide, whereunder hangs a piece of fleſh very ugly to behold. It goes on four legs, with ſo many broad and crooked feet, the which with a long tail, and variegated like a Tiger, ſerves her for Fins to ſwim withal. This Creature is ſo timerous, that though it be an *Amphibium*, that is, which lives both in the Water and aſhore, yet uſually it keeps it ſelf in the Sea, neither doth it come aſhore to feed, unleſs in a very clear ſeaſon. The fleſh thereof is very good and grateful meat, and the bloud medicinable for ſuch as

The bloud of great Tortoiſes good for the Leproſie. *Tom. lib.* 20.

have their livers ill affected, or their lungs ulcerated, as the bloud of great Tortoiſes is good for the Leproſie. *Thevet* in his Coſmography affirmeth that he ſaw this in *Denmark*.

In a deep Lake of Freſh water, upon which ſtands the great City or Town of *Themiſtitian*, in the Kingdom of *Mexico*, which is built upon Piles, like as *Venice* is, there is found a Fiſh of the bigneſs of a Calf, called by the Southern Salvages *Andura*, but by thoſe of the place, and the Spaniards the Conquerors of that place, *Hoga*. It is headed and eared almoſt like a Swine; from the chaps hang five long bearded *appendices*, of the length of ſome half a foot, like the beard of a Barbel. It hath fleſh very grateful and good to eat. It bringeth forth live young like as the Whale. As it ſwims in Waters it ſeems green, yellow, red, and of many colours, like a Chameleon: it is moſt frequently converſant about the Shore-ſides of the Lake, and there it feeds upon the leaves of the Tree called called *Hoga*, whence alſo the Fiſh hath its name. It is fearfully toothed, and a fierce Fiſh, killing and devouring ſuch as it meeteth withal, though they be bigger than her ſelf: which is the reaſon why the Fiſhermen chiefly deſire to kill her, as *Thevet* affirmeth in his Coſmography.

The monſtrous Fiſh Hoga.

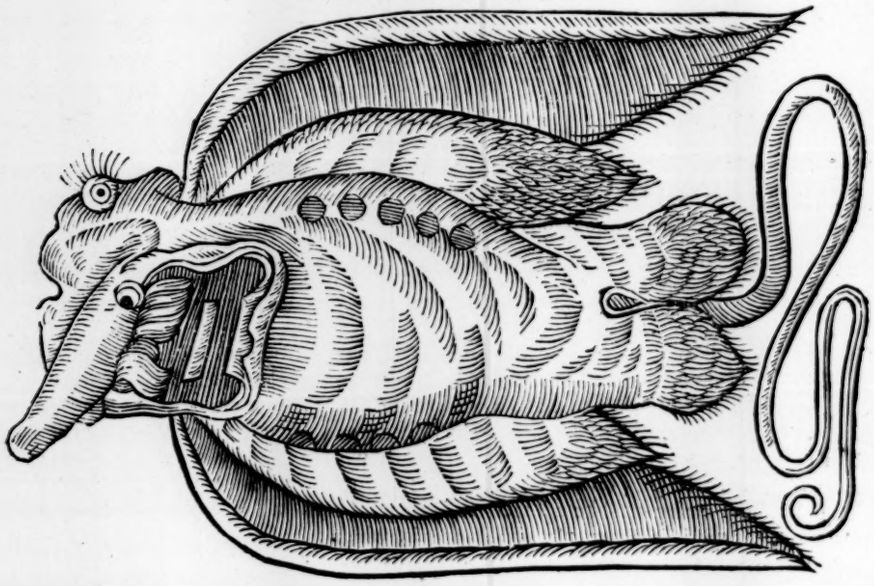


Andrew Thevet in his Coſmography writes, that as he ſailed to *America*, he ſaw infinite ſtore of flying Fiſhes, called by the Salvages *Bulampech*, who riſing out of the Water, flie ſome fifty paces, eſcaping by that means from other greater fiſh that think to devour them.

This kind of flyiug Fiſh exceeds not the bigneſs of a Mackrel, is round-headed, with a bleuiſh back, two wings which equal the length of almoſt all their body. They oft-times flie in ſuch a multitude, that they fall foul upon the ſails of Ships, whileſt they hinder one anothers flight, and by this means they fall upon the Decks, and become a prey to the Sailers: which ſame thing we have read confirmed by *John Lereus* in his Hiſtory of *Breſil*.

In the *Venetian* Gulf, between *Venice* and *Ravenna*, two miles above *Quioza*, *Anno Dom.* 1550. there was taken a flying Fiſh, very horrible and monſtrous, being four foot long, it had a very great head, with two eyes ſtanding in a line, and not one againſt another, with two ears, and a double mouth, a ſnout very fleſhy and green, two wings, five holes in her throat, like thoſe of a Lamprey, a tail an ell long, at the ſetting on whereof there were two little wings. This Monſter was brought alive to *Quioza*, and preſented to the chief of the City, as a thing whereof the like had not been formerly ſeen.

The Figure of a monſtrous flying Fiſh.



There

There are ſo many and different ſorts of ſhells to be found in the Sea, that it may be truly ſaid, that Nature, the hand-maid of the Almighty, diſports it ſelf in the framing of them. In ſo great diverſity I have chiefly made choice of three to treat of here, as thoſe that are worthy of the greateſt admiration. In theſe lie hid certain little Fiſhes, as Snails in their ſhells, which *Ariſtotle* calls *Cancelli*, and he affirmeth them to be the common companions of the *cruſted and ſhell-fiſhes, as thoſe which in their *ſpecies* or kind are like to Lobſters, and uſe to be bred without ſhells; but as they creep into ſhells, and there inhabit, they are like to ſhell-fiſhes. It is one of theſe that is termed the *Hermit*. He hath two ſomewhat long and ſlender horns, under which are his eyes, always ſtanding out of his head, as thoſe which he cannot pluck or draw in, as Crabs can. His fore-feet have claws upon them, wherewith he defends himſelf, and carries meat to his mouth, having two other on each ſide, and a third being a leſſer, the which he uſeth in going. The female lays eggs, which hang forth at her back part as if they were put upon a thred, being joined together by certain little membranes. Laſtly, in the opinion of *Ælian*, the *Cancellus*, or ſmall Cray-fiſh is born naked and without a ſhell, but within a while after, ſhe of many which ſhe finds empty, makes choice of a fit one, and when as grown bigger, ſhe cannot be contained or dwell any longer therein, or elſe being ſtimulated with a natural deſire of copulation, ſhe removes into a more capacious and convenient one. Theſe little Cray-fiſhes oft-times fight together for their habitation, and the ſtronger carries away the empty ſhell, or elſe makes the weaker to quit poſſeſſion. Now the ſhell is either of a *Nerita* or *Turbo*, and oft-times of a ſmall purple; and entering into poſſeſſion, ſhe carries it about, there feeds and grows, and then ſeeks a more capacious one, as *Ariſtotle* ſaith in the formerly-cited place.

4. *De hiſt. anim. cap.* 4.

*By cruſted is meant Crabs, Lobſters, Shrimps, and ſuch like.

The deſcription of the Hermit Cray-fiſh.

Lib. 7. *cap.* 31.

They change their habitation for two cauſes.

The Effigies of the empty Shells whereinto the Cancelli *uſe to creep to dwell.*

Some think that this *Bernard* the Hermit is that kind of *Cancellus* which is by *Pliny* termed *Pinnoter*; but in truth the *Pinnoter* is not a kind of *Cancellus*, or Cray-fiſh, but of a little Crab. Now in *Ariſtotle* there is much difference between *Cancellus* and *Cancer parvus*, though *Pliny* may ſeem to confound them; for he is bred naked, having his cruſt onely, but without a ſhell: wherefore ſeeing that by Nature he wants it, he diligently ſearches for it, and dwells in it, when as he hath found it: But the *Pinnoter* is not bred by it ſelf alone, but in *Pinnæ* and ſome others, and he changeth not his habitation, becauſe (as *Ariſtotle* thinks) being of the kind of Dwarf-Crabs, it never grows big, neither dwells it in empty ſhells. Now the *Pinna*, or *Pin*, is a kind of ſhell-fiſh, it breeds in muddy places, and is always open, neither is it at any time without a Companion, which they therefore call the *Pinnoter*, or *Pinnophylax*, (*i. e.*) the Pin-keeper, as *Pliny* ſaith. Verily that theſe things are thus, you may plainly perceive by theſe words of *Athenæus*. *Chryſippus Solenſis* 5. *De Honeſt. & Volupt.* ſaith, the *Pinna* and *Pinnoter* aſſiſt and further each other, neither can they live aſunder. The *Pinna* may be referred to the kind of Oiſters, but the *Pinnoter* is a Dwarf-Crab: the *Pinna* opens her ſhell for the little fiſhes to enter thereinto; the *Pinnoter* ſtands by, obſerving if any come in; which if they do, he gives the *Pin* notice thereof by biting, who preſently thereupon ſhuts her ſhell, and ſo they feed together upon that they catch by this means. Thus *Athenæus*. She is alſo for this her craft mentioned by *Plutarch* in his Writings. The *Pinnoter* is ſometimes called by *Pliny*, *Cancer dapis affectator*.

What the *Pinnoter*, or Dwarf-Crab is.

What the *Pinna* is.

Lib. 9. *cap.* 42.

Lib. 3. *Deipno.*

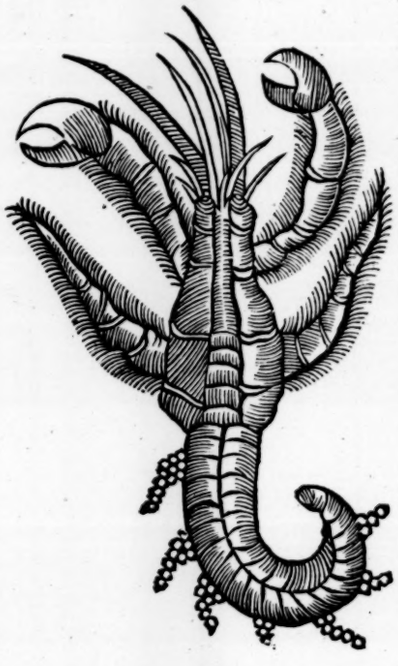
The familiarity and craft of the *Pinna* and *Pinnoter*.

But that which by theſe Authors is attributed to the Dwarf-Crab, the ſame by *Cicero* is aſcribed to the little Shrimp: Now the *Pinna* (ſaith he) opening her two large ſhells, enters into confederacy with the little Shrimp for getting of food; wherefore when little Fiſhes ſwim into her gaping ſhell, then the *Pinna*, admoniſhed by the Shrimps biting her, ſhuts her ſhell; thus two unlike Creatures get their living together. But *Plutarch* ſeems to make the *Pinna* to be the Pearl-Oiſter in that Work of his, whereas he enquireth whether the craft of Water or Land-beaſts be the greater.

Lib. 2. *de nat. deorum.*

The Figure of him out of his Cell.

The Effigies of Bernard *the Hermit houſed in his Shell.*



Plin. lib. 9. c. 29.

But amongſt the moſt miraculous Fiſhes may fitly be placed the *Nautilos*, or Sailer; of ſome called *Pompylos* (it is thought to be a kind of *Polypus*) it comes with the face upwards to the top of the Sea, raiſing it ſelf by little and little, that caſting forth all the water by a pipe, as if it had a Pump, it eaſily floats; then putting back the two firſt tendrils or arms, it extends between them a membrane of wondrous fineneſs or thinneſs, which gathering air like as a Sail, and ſhe rowing with the reſt of her arms, guides her ſelf with her tail in the midſt, as a Rudder. Thus ſhe ſails along in imitation of Pinnaces, and if any thing affright her, ſhe preſently takes in Water, and ſinks her ſelf.

How the Whale may be reckoned amongſt Monſters.

The better to ſtore this Treatiſe of Monſters, abuſing the name with the Poets, we will reckon up the Whale amongſt the Sea-monſters, by reaſon of his monſtrous and wondrous magnitude. Now the Whale is the greateſt by much, of all the Fiſhes of the Sea; for moſt commonly this Beaſt is thirty ſix cubits long, eight high, the ſlit of his mouth is eighteen foot long, teeth they have none, but in ſtead thereof in each Jaw, horny black Excreſcences or Fins [which we vulgarly term Whale-bones] which by little and little end in ſmall hairs like to a Swines briſtles, which coming and ſtanding out of his mouth, are in ſtead of Guides, leſt whileſt he ſwims with a blind and rapid violence, he might run againſt a Rock. His eyes are diſtant one from the other the ſpace of four Ells, which outwardly appear ſmall, but inwardly they are bigger than a mans head; wherefore they are deceived that ſay that they are no bigger than an Oxes eyes: his noſe is ſhort, but in the middle of his fore-head he hath a pipe whereat he draws in the air, and caſts forth a whole ſhower or River of water, that therewithal he will even ſink the Veſſels or Boats of Mariners; when he hath filled himſelf beyond meaſure, he cries out or roars with ſo great or ſtrong a voice, that he may be heard two miles off. He hath two very large fins upon his ſides wherewith he ſwims, and under which in the time of danger he hides his young; he hath none upon his back. His tail in ſite is like to the tails of Dolphins, neither is it much unlike in ſhape, which when he moves, he ſo toſſeth the Sea, that he drowns and overturns the Boats that he toucheth. You may by diſſecting them find that a Whale brings forth live young, and gives them ſuck; for the male hath Teſticles and a Yard, but the female a Womb and Dugs. They are taken in divers places about Winter, but chiefly about the Coaſt of *Aquitain*, at a ſmall Town which is vulgarly called *Biarris*, ſome ſix miles diſtant from *Bayon:* whereunto I being ſent by King *Charls* the Nineth when he was at *Bayon*, to cure the Prince of *Roche Sur-Yon*, I was an eye-witneſs how they are caught; and alſo I confirmed that which I had formerly read to that purpoſe, in that excellent and moſt

A Whale brings forth young, and ſuckles them.

true

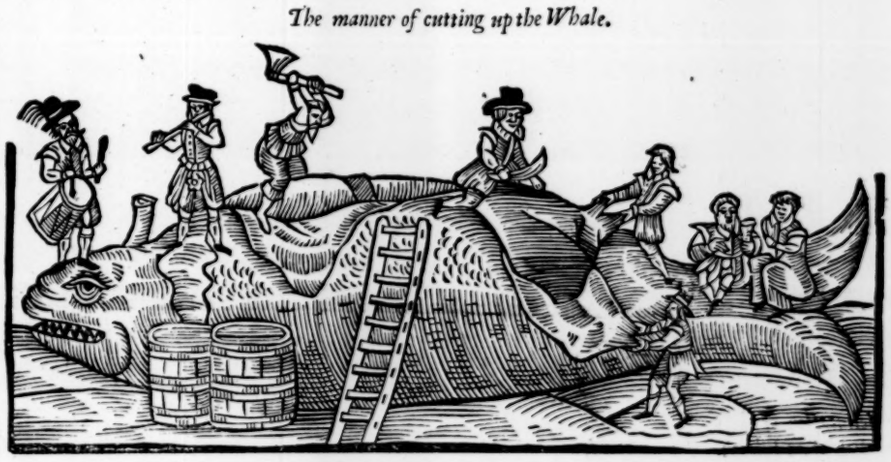
true Hiſtory of Fiſhes ſet forth by *Rondoletius*. Now at that Town there is a little hill, in the top whereof there is a Tower of very great antiquity, from which as from a watch-Tower they keep watch whether or no any Whales ſwim that way. Wherefore the Watch-men from the Tower, either ſeeing, or by the horrible noiſe hearing a Whale to paſs that way, they give warning thereof to the inhabitants by the beating of Drums, and ringing a Bell: which ſign once given they all run forthwith, as to extingniſh the City if it were on fire, being furniſhed with weapons and all things fitting for that purpoſe. For the people of that country are very diligent and expert in catching the Whale. Wherefore in each of the boats furniſhed with all things either to aſſail or flie, there are put ten luſtie rowers, and divers others furniſhed with harping irons to ſtrike the Whale, which being caſt and faſtned in her, they looſe out huge long ropes, faſtned to them, until ſuch time as he be dead, then together with the ropes, and aſſiſted by the waves of the Sea, they draw the Whale (wearied with running and labouring, and fainting by reaſon of the magnitude and multitude of his wounds, being in the time of their conflict diligently chaſed and driven toward the ſhore) on land, and merrily part the prey, each whereof hath his ſhare, according to the number of the irons thrown, the magnitude of the wound, and the neceſſity and excellency of the wounded part for life: each of their harping-irons are known by their peculiar marks. In the heat of the skirmiſh many ſtand up and down in boats, onely for this purpoſe, to take up ſuch as chance to fall into the Sea, leſt they ſhould be drowned. The Males are caught with more difficulty, the Females more eaſily, eſpecially if their young ones be with them; for whileſt they linger to help and ſuccour them, they loſe the occaſion of eſcaping. The fleſh is of no eſteem, the tongue onely is commendable; for being very large, and of a very lax ſubſtance, it is powdered, and by moſt Gentlemen accounted for a dainty. The lard is diſperſed over many Countries, to be boiled and eaten with fiſh in the time of Lent, that Gormandizers may have ſomething to ſerve them in ſtead of fleſh which is then forbidden. There is great ſtore of Fat in them in the parts under the skin and belly, which melted, concretes not again, by reaſon of the ſubtilty; they keep it to burn in Lamps, and to uſe about their Ships. The houſes of the Fiſh-eaters are built with their bones; alſo Orchards in the Coaſt of *Aquitane*, are fenced with theſe bones. The Fins that ſtand forth of their mouths, which are commonly called Whale-bones, being dried and poliſhed, ſerve to make Busks for Women, Whip-ſtaves, and little Staves, as alſo to ſtiffen garments. Many make ſeats or ſtools of the *Vertebræ*, or ſpondils of the back-bone.

How they are caught.

Why the Females are more eaſily caught then the Males.

Whale-bone.

The manner of cutting up the Whale.



In the River *Scalde*, ten miles from *Antwerp*, *Anno Dom.* 1477. the ſecond day of *July*, there was a Whale taken, of a blackiſh blue colour, ſhe had a ſpout-hole in the top of her head, out of which ſhe caſt great ſtore of water: ſhe was fifty eight foot long, and ſixteen foot high, her tail was fourteen foot broad; from the eye to the end of her noſe, was ſome ſixteen foot. Her lower jaw was ſix foot on each ſide, ſhe had twenty five teeth, which ſhe could hide in her upper jaw, there being holes for them, it being wholly toothleſs; for which one thing this Whale may be judged monſtrous, for that Nature hath denied them teeth, and for that in Creatures that are not horned, it is ſo ordained by Nature, that when they have teeth in their lower jaw, they ſhould have others alſo in the upper to anſwer them, ſo to chaw their meat. The longeſt of theſe teeth exceeded not ſix inches.

There is (as *Pliny* reports) a very ſmall Fiſh accuſtomed to live upon Rocks, it is called *Echeneis*, never exceeding the length of a foot; it is thought that ſhips go more ſlowly if this ſtick to them: wherefore the Latins have alſo given it a name of *Remora*, for that a ſhip being under ſail with a good wind, may by the *Echeneis* ſeizing on her, as if ſhe would devour her, be ſtaid againſt the Sailers wills, and ſtand ſtill as if ſhe were in a ſafe harbor. Wherefore ſhe is ſaid in the *Actiun* fight to have ſtaid the ſhip of *Marcus Antonius*, haſtening to go about and incourage his Souldiers, ſo that he was forced to enter into another ſhip, and thereupon *Cæſars* Navy came upon them too haſtily, and before they were provided.

Lib. 9. cap. 25. & lib. 32. cap. 1. The wondrous power of the *Remora*.

She alſo ſtaid the Ship of the Emperour *Caius* coming from *Aſiura* to *Antes*, his Ship of all the Navy making no way; neither did they longer wonder at this ſtay, the cauſe being preſently known, ſome forthwith leaping into the Sea to find the cauſe thereof, there found her about the Ship, even ſticking to the Rudder, and they ſhewed her to *Caius*, being wrath that this ſo ſmall a thing ſhould ſtop him, and countermand the endeavour of forty Rowers.

Therefore this little Fiſh tames and infringes the violence and madneſs of the world, and that with

with no labour, not without holding, or any other way, but onely by ſticking thereto. Certainly, however it comes to paſs, who from this example of holding of Ships, can doubt of any power or effect of Nature, in Medicins which grow naturally? Yea, and without this example, the *Torpedo* out of the Sea alſo may be ſufficient; who afar off and at a diſtance, if it be touched with a Spear or Rod, will benumb even the ſtrongeſt arms, and retard the feet, how ever nimble to run away.

The wondrous force of the *Torpedo*.

CHAP. XXII.

Of the admirable Nature of Birds, and of ſome Beaſts.

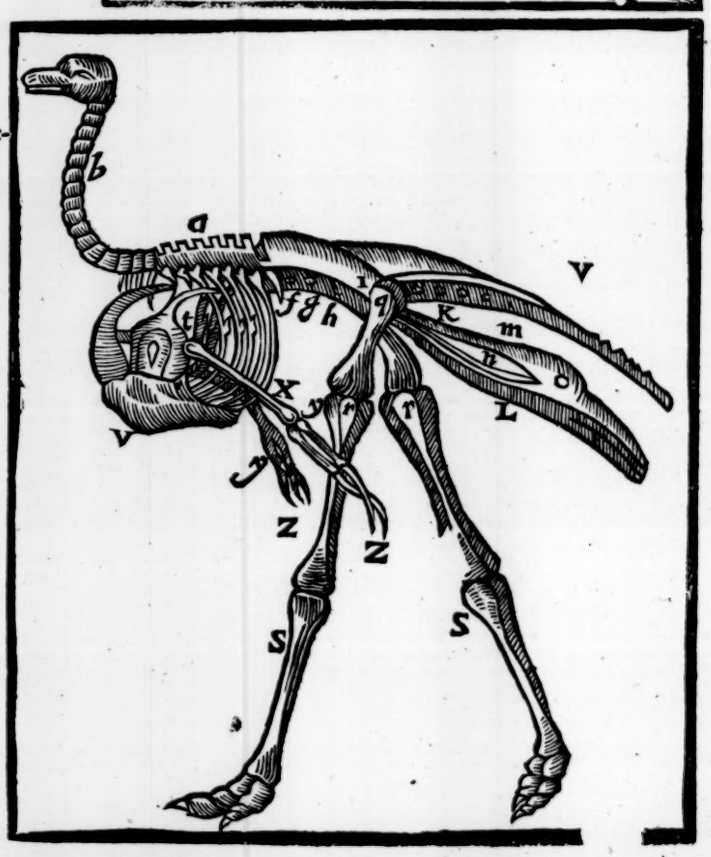
THat there be divers things not onely in the Sea, but alſo in the Air and Earth, which by the wonderful condition of their own Nature may equal that of Monſters, the onely *Eſtrich* may ſerve for a witneſs. It is the biggeſt of Birds, though indeed it partly reſembles a Bird, and partly a Beaſt, (and it is familiar to *Africa* and *Æthiopia*) as which, contrary to the nature of Beaſts, hath feathers, and againſt the cuſtom of Birds, cannot flie aloft; for it hath not feathers fit to flie, but like unto hairs, yet will it outrun a horſe. The natural force of the ſtomach in concocting, is miraculous; as to which nothing is untamable: ſhe lays eggs of a wondrous largeneſs, ſo that they may be framed into cups: their feathers are moſt beautiful, as you may perceive by this following Figure.

The Eſtrich is between a Bird and a Beaſt.

The wondrous force of her ſtomach.

The Figure of an Eſtrich.

Any one may eaſily gather of what a prodigious magnitude an *Eſtrich* is, by the greatneſs of its bones. Three of theſe Birds were kept at the Kings charge, by the Mareſchal *De Rets*: one whereof dying, it was beſtowed upon me, whereof I have with great diligence made a *Sceleton*.



The delineation of the Sceleton *of an Eſtrich.*

A *Shews the head, which was somewhat thicker than the head of a Crane, of the length of ones hand, plain from the crown even to the beak; the beak being divided to the middle region of the eye, being roundish at the end thereof.*

B *The neck a yard long, consisting of seventeen* Vertebræ, *each whereof on each side is furnished with a transverse process looking downwards, of some fingers length, excepting the two which are next the head, which want these, and are joined together by* Ginglymos.

C *The back is of a foots length, consisting of seven* Vertebræ.

D *The holy-bone of two foot long, in whose top there is a transverse process, under which there lies a great hole.*

E *Three more, but less.*

F G H *After which there follows the cavity or socket, whereinto the head of the thigh bone is received and hid. This externally and on the side produceth a perforated bone, noted with the letter* I. *perforated I say at the beginning, for it is presently united at the letter* K. *then it is forked and divided into two other bones, whereof one is bigger than the other. The less is noted with the letter* L. *then they are both united at the letter* M. *each of them is half a foot and four inches long. But from that part whereas they first begun to be divided, to that whereas they are united, there is a hole some four fingers broad, but the length of ones hand, or more, and it is noted with the letter* N. *The residue of the bone is like to a pruning Knife three inches broad, but six in length: the end whereunder is the letter* O. *it is joined by coalition.*

P *The rump consisting of nine* Vertebræ, *like to a mans. The thigh bones are two, whereof that which is noted with the letter* Q. *is of the length of a foot, and of thickness equal to a horses thigh. The other next under (which peradventure you may call the leg-bone) noted with* R. *is a foot and half long: it hath joined thereto the* Fibula, *or lesser focil of the length, but which grows smaller as it comes lower.*

S *Is the leg, to which the foot adheres, being one foot and a half long, divided at the end into two claws, the one bigger, the other less, whereof each one consists of three bones.*

T *Eight ribs, which are inserted into the* Sternon, *the three middlemost of these have a bony production like to a hook.*

V *Is the* Sternon, *consisting of one bone of some foots length, representing a buckler; to this there is joined another bone, which stretched over the three first ribs, is in stead of clavicles or collar-bones.*

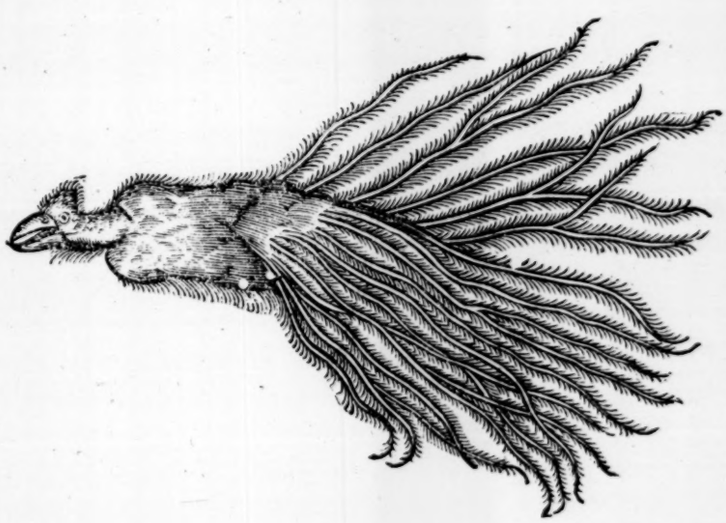
X *The first bone of the wing, which is one foot and half long.*

Y *Two bones under this, equivalent to the ell and wand, under which there are six other bones composing the point of the wing, noted with* Z.

This whole *Sceleton* is seven foot long, and so many foot or more high from the feet to the beak: there are many other observable things in his composure, but I have thought fit to omit them for brevity sake.

The description of the Bird of Paradise.

Jerome Cardane in his Books *De Subtilitate*, writes that in the Island of the *Moluccas* you may sometimes find lying upon the ground, or take up in the waters, a dead Bird called a *Manucodiata*, that is in Hebrew, the Bird of God, it is never seen alive. It lives aloft in the air, it is like a Swallow in body and beak, yet distinguished with diverse coloured feathers: for those on the top of the head are of a golden colour, those of the neck like to a Mallard, but the tail and wings like Peacocks;



*it wants feet: wherefore if it become weary with flying, or desire sleep, it hangs up the body by twining the Feathers about some bough of a tree. It passeth through the air, wherein it must remain as long as it lives, with great celerity, and lives by the air and dew onely. The Cock hath a cavity depress't in the back, wherein the Hen lays and sits upon her egs. I saw one at *Paris* which was presented to King *Charles* the Nineth.

* Whosoever desires to know more of the truth of this bird, let him read *Clusius* in the *Auctarium ad lib.* 5. *cap.* 1. *Exoticorum.*

We have read in *Thevets* Cosmography, that he saw a Bird in *America*, which in that Countrey Speech is called *Touca*, in this very monstrous and deformed, for that the beak in length and thickness, exceeds the bigness of the rest of the body; it feeds on pepper, as the Black-birds and Felfars with us do upon Ivy-berries, which are not less hot than Pepper. *Tom.* 2. *l.* 21. *c.* 22.

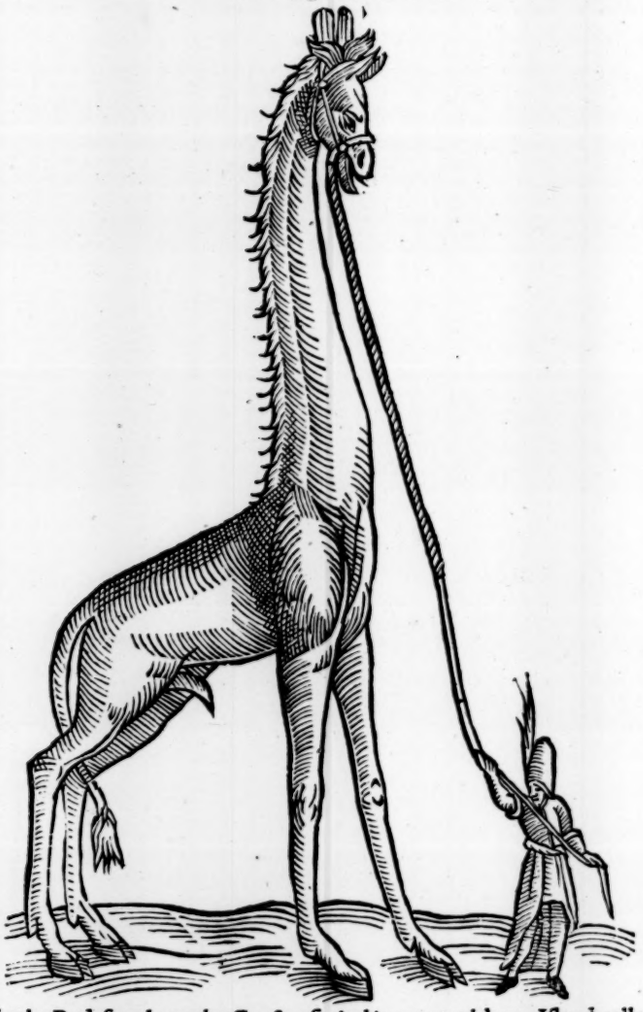
A certain Gentleman of *Provence* brought a Bird of this kind from that Country, to present it to King *Charles* the Nineth, but dying in the way he could not present it alive. Wherefore the King wished the Mareschal *De Rets* to give her to me, that I might take forth her bowels and embalm her, that she might be kept amongst the Kings rarities. I did what I could, yet not long after she rotted: she resembled a Crow in body and feathers, but had a yellowish beak, clear, smooth, and

and toothed like a Saw, and of ſuch length and thickneſs as we formerly mentioned. I keep it yet as a monſtrous thing.

Tom.1.cap.11. lib.4. *Thevet* writes, that in the Iſland *Zocotera* there is frequently found a certain wild Beaſt called *Hulphalis*, of the bigneſs of an Ethiopian Monkey. It is a very monſtrous Creature, but in nothing more than that it is thought to live upon the air onely; the skin as if it were died in grain, is of a ſcarlet colour, yet it is in ſome places ſpotted and variegated: it hath a round head like to a bowl, with feet round, broad, and wanting hurtful nails. The Moors kill it and uſe to eat the fleſh of it, being firſt bruiſed, that ſo it may be the more tender.

Thevet. tom.1. lib.11. cap.13. In the Realm of *Camota*, of *Ahob*, of *Benga*, and other Mountains of *Cangipa*, *Plimatiq*, and *Catagan*, which are in the inner *India*, beyond the River of *Ganges*, ſome five degrees beyond the Tropick of *Cancer*, is found a Beaſt, which the Weſtern Germans call *Giraff*. This Beaſt in head, ears, and cloven feet, is not much unlike our Doe; it hath a very ſlender neck, but is ſome ſix foot long, and there are few Beaſts that exceeds him in the length of their legs: his tail is round, but reacheth no farther then his hams, his skin is exceeding beautiful, yet ſomewhat rough, having hair thereon ſomewhat longer than a Cow, it is ſpotted and variegated in ſome places with ſpots of a middle colour between white and cheſnut, ſo as Leopards are: for which cauſe by ſome Greek Hiſtorians it is called *Cameleopardalis*: it is ſo wild before it be taken, that with the good-will it will not ſo much as be ſeen. Therefore it inhabits and lives onely in deſert and ſecret places, unknown to the reſt of the Beaſts of that Region; ſhe preſently flies away at the ſight of a man, yet he is taken at length, for that he is not very ſpeedy in running away; once taken he is as eaſily and ſpeedily tamed as any wild Beaſt whatſoever. He hath above his crown two ſtrait horns covered with hairs and of a foot length. When as he holds up his head and neck, he is as high as a Lance. He feeds upon Herbs, and Leaves, and Boughs, or Trees; yea, he is alſo delighted with bread.

The Effigies of a Giraffa.



Such as ſail in the Red-ſea along the Coaſt of *Arabia*, meet with an Iſland called by the Arabians *Cademota*: in that part thereof where the River *Plata* runs, is found a wild Beaſt called by the barbarous Inhabitants *Paraſſoupi*, being of the bigneſs of a Mule, headed not unlike one, yet rough and haired like to a Bear, but not of ſo dark a colour, but inclining to yellow, with cloven feet like a Hart: ſhe hath two long horns on her head, but not branched, ſomewhat reſembling thoſe ſo much magnified horns of Unicorns. For the Natives of the place, bitten by the venomous tooth of either Beaſt or Fiſh, are preſently helped and recovered by drinking the water wherein ſuch horns have been infuſed for ſix or ſeven days ſpace, as *Thevet* in his Coſmography reports.

In

In one of the Iſlands of the *Moluccaes* there is found a Beaſt living both on Land and Water like as a *Crocodile*; it is called *Campureh*, it is of the bigneſs of an Hart, it hath one horn in the fore-head moveable after the faſhion of the noſe of a Turky-cock: it is ſome three foot and a half long, and never thicker than a mans arm; his neck is covered over with an aſh colour; he hath two feet like to a Gooſes feet, wherewith he ſwims both in freſh and ſalt-waters. His fore-feet are like to a Stags, he lives upon fiſh. Many have perſwaded themſelves that this beaſt is a kind of Unicorn, and that therefore his horn ſhould be good againſt poiſons. The King of the Iſland loves to be called by the name of this Beaſt; and ſo alſo other Kings take to themſelves the names of the wild Beaſts, Fiſhes, or Fruits, that are moſt precious and obſervable in their dominions, as *Thevet* reports.

The Figure of an Elephant.

Man-

The Indian Elephants are biggeſt than the African.

Mauritania and *Æthiopia* and that part of *Africk* that is beyond the Deſarts and Syrtes, bring forth Elephants; but thoſe of *India* are far larger. Now although in the largeneſs of their body they exceed all four-footed Beaſts, yet may they be more ſpeedily and eaſily tamed than other Beaſts. For they may be taught to do many things above the common nature of Beaſts. Their skin is ſomewhat like to a Buffles, with little hair upon it, but that which is, is aſh-coloured, his head large, his neck ſhort, his ears two handfuls broad, his noſe or trunk very long, and hanging down almoſt to the ground, hollow like as a Trumpet, the which he uſeth in ſtead of an hand, his mouth is not far from his breſt, not much unlike a Swines, from the upper part whereof two large teeth thruſt forth themſelves, his legs are thick and ſtrong, not conſiſting of one bone as many formerly have falſly believed (for they kneel to admit their Rider, or to be laden, and then riſe up again of themſelves) his feet are round like a Quoit ſome two or three hands bredth, and divided into five cleſts. He hath a tail like a Buffle, but not very rough, ſome three hands bredth long; wherefore they would be much troubled with Flies and Waſps, but that Nature hath recompenced the ſhortneſs of their tails by another way; for when they find themſelves moleſted, they contract their skin ſo ſtrongly, that they ſuffocate and kill theſe little Creatures taken in the wrinkles thereof; they overtake a man running by going onely, for his legs are proportionable to the reſt of his body.

How they keep Flies from them.

They feed upon the leaves and fruits of Trees, neither is any tree ſo ſtrong and well rooted, which they cannot throw down and break. They grow to be ſixteen handfuls high; wherefore ſuch as ride upon an Elephant are much troubled as if they went to Sea. They are of ſo unbridled a nature, that they cannot endure any head-ſtall or reins; therefore you muſt ſuffer them to take the courſe and way they pleaſe. Yet do they obey their Countrey-men without any great trouble, for they ſeem after ſome ſort to underſtand their Speech, wherefore they are eaſily governed by their known voices and words. They throw down a man that angers them, firſt taking him up with their trunk and lifting him aloft, and then letting him fall, they tread him under foot, and leave him not before he be dead. *Ariſtotle* writes that Elephants generate not before they be twenty years old: they know not adultery, neither touch they any female but one, from which they alſo diligently abſtain when they know ſhe hath once conceived. It cannot be known how long they go with young; the reaſon is for that their copulation is not ſeen, for they never do it but in ſecret. Their females bring forth reſting upon their hind legs, and with pain like Women; they lick their young, and theſe preſently ſee and go, and ſuck with their mouths, and not with their trunks. You may ſee Elephants teeth of a monſtrous and ſtupendious bigneſs, at *Venice*, *Rome*, *Naples*, and *Paris*; they term it Ivory, and it is uſed for Cabinets, Harps, Combs, and other ſuch like uſes.

Liv. 9. de Hiſt. anim. cap. 28.

It is not known how long an Elephant goes with young.

Tom. 2. lib. 23. cap. 2.

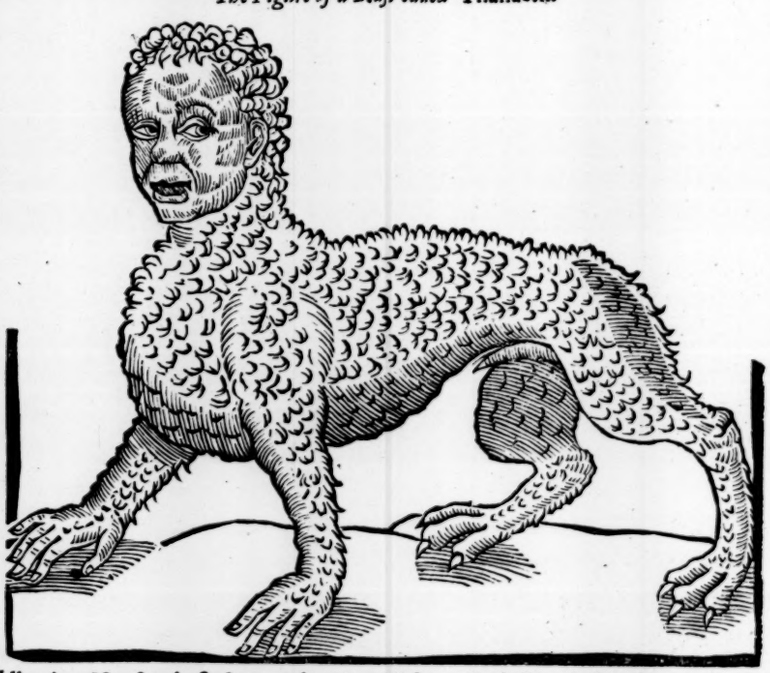
We have read in *Thevet*, that in *Florida* there are great Bulls, called in that Countrey Tongue *Beautrol*, they have horns of a foot long, a bunch on their backs like a Camel, their hair long and yellow, the tail of a Lion; there is ſcarce any Creature more fierce or wild, for it can never be tamed, unleſs it be taken from the dam. The Salvages uſe their hides againſt the cold, and their horns as an antidote againſt poiſon.

Their horns good againſt poiſon.

Tom. 1. lib. 2. cap. 10.

The ſame Author affirms, that whileſt he ſailed in the Red Sea, he ſaw a Monſter in the hands of a certain Indian Merchant, which in the bigneſs and ſhape of his limbs was not unlike a Tiger, yet had the face of a Man, but a very flat noſe: beſides his fore-feet were like a mans hands, but the hind like the feet of a Tigre; he had no tail, he was of a dun colour: to conclude, in head, ears, neck, and face it reſembled a man, but in the blackiſh and curled hair, a Moor: for the other parts they were like a Tiger; they called it *Thanacth*.

The Figure of a Beaſt called Thanacth.



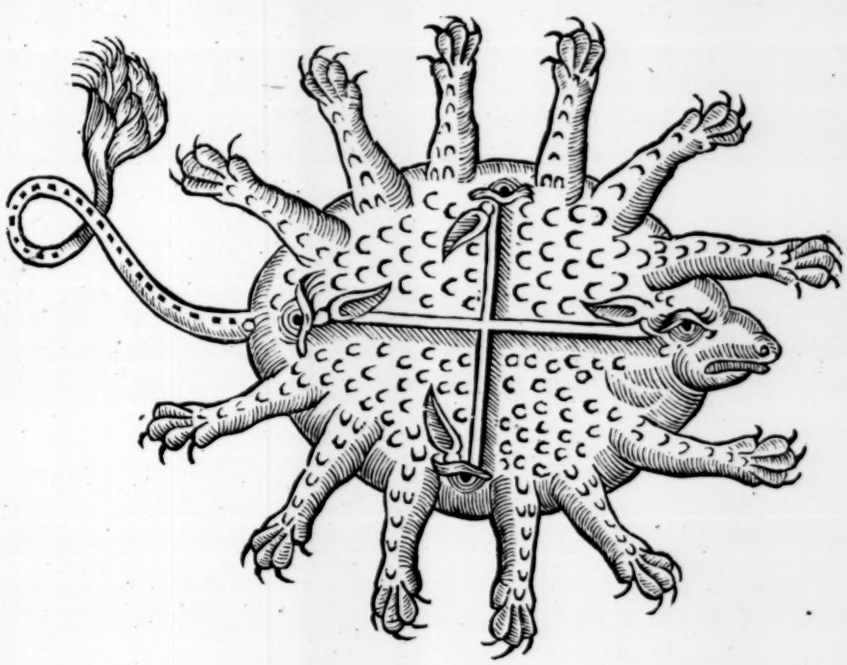
This following Monſter is ſo ſtrange that it will ſcarce be believed, but by thoſe that have ſeen it: it is bred in *America*, and by the Salvages called *Haiit*, of the bigneſs of a Monkey, with a great belly, almoſt touching the ground and the head and face of a child: being taken it mourns and

and ſighs like to a man that is troubled and perplext; it is of an aſh-colour, hath the feet divided into three claws, four fingers long, and ſharper than thoſe of a Lion: it climbs Trees and lives there more frequently than upon the ground, the tail is no longer than the bredth of three fingers. It is ſtrange and almoſt monſtrous that theſe kind of Creatures have never been ſeen to feed upon or eat any thing: for the Salvages have kept them long in their houſes to make trial thereof, wherefore they think them to live by the Air.

The Figure of the Beaſt called Haiit.

I have taken this following Monſter out of *Leo*'s Affrican Hiſtory; it is very deformed, being round after the manner of a Tortoiſe two yellow lines croſſing each other at right angles, divide his back; at every end of which he hath one eye, and alſo one ear, ſo that ſuch a creature may ſee on every ſide with his four eyes, as alſo hear by his ſo many ears: yet hath he but one mouth, and one belly to contain his meat, but his round body is encompaſſed with many feet, by whoſe help he can go any way he pleaſe without turning of his body, his tail is ſomething long and very hairy at the end. The inhabitants affirm, that his bloud is more effectual in healing of wounds than any balſam.

Blood as good as Balſom.

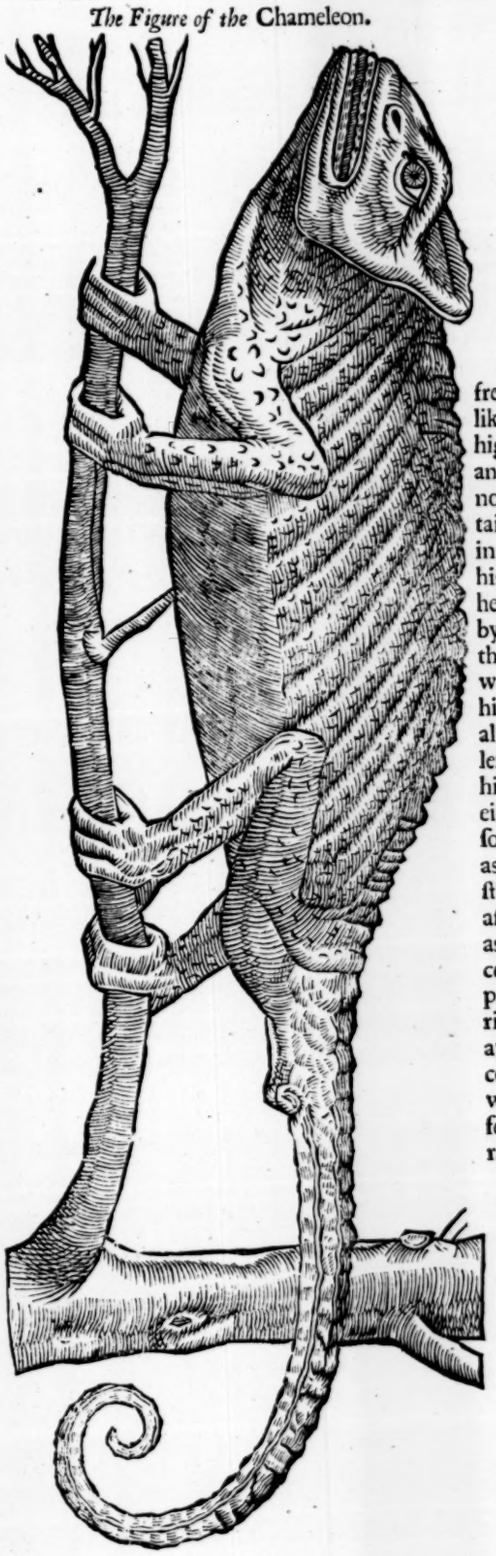


It is ſtrange that the *Rhinoceros* ſhould be a born Enemy to the Elephant; wherefore he whets his horn, which grows upon his noſe, upon the Rocks, and ſo prepares himſelf for fight, wherein he chiefly aſſails the belly, as that which he knows to be the ſofteſt: he is as long as an Elephant, but his legs are much ſhorter, he is of the colour of Box, yet ſomewhat ſpotted. *Pompey* was the firſt that ſhewed one at *Rome*. *Plin. l. 8. c. 24.*

The Figure of the Rhinoceros.

The

The Figure of the Chameleon.



Africa produceth the *Cameleon*, yet is it more frequent in *India*: he is in ſhape and greatneſs like a Lizard, but that his legs are ſtrait and higher, his ſides are joined to the belly as in Fiſh, and his back ſtands up after the ſame manner, his noſe ſtands out not much unlike a Swines, his tail is long, and endeth ſharp, and he folds it up in a round, like a Serpent, his nails are crooked, his pace ſlow, like as the Tortois, his body rough, he never ſhuts his eyes, neither doth he look about by the moving of the apple, but by the turning of the whole eye. The nature of his colour is very wonderful, for he changeth it now and then in his eye and tail, and whole body beſide; and he always aſſimilates that which he is next to, unleſs it be red or white. His skin is very thin, and his body clear; therefore the one of theſe two, either the colour of the neighbouring things in ſo great ſubtilty of his clear skin, eaſily ſhines as in a glaſs; or elſe various humours diverſly ſtirred up in him, according to the variety of his affections, repreſent divers colours in his skin, as a Turky-cock doth in thoſe fleſhy excreſcences under his throat, and under his head: he is pale when he is dead. *Mathiolus* writes that the right eye taken from a living Chameleon takes away the white ſpots which are about the thorny coat of the eye; his body being beaten, and mixed with Goats milk, and rubbed upon any part, fetcheth off hairs; his gall diſcuſſeth the Cataracts of the eye.

Plin. lib. 8. c. 33.

Ariſt. lib. 2. hiſt. anim. cap. 12.

The ſtrange nature of the colour of the Chameleon.

CHAP. XIII.

Of Celeſtial Monſters.

PEradventure it hath not been ſtrange that Monſters have been generated upon the Earth, and in the Sea: but for monſters to appear in Heaven, and in the upper Region of the Air, exceeds all admiration. Yet have we often read it written by the Ancients, that the Face of Heaven hath been deformed, by bearded, tailed, and haired Comets; by Meteors repreſenting burning Torches and Lamps, Pillars, Darts, Shields, Troops of Clouds hoſtilely aſſailing each other; Dragons, two Moons, Suns, and the like Monſters and Prodigies.

Antiquity hath not ſeen any thing more prodigious than that Comet which appeared with bloudy hair in *Uverſtein*, upon the ninth day of *October*, 1528. for it was ſo horrible and fearful a ſpectacle, that divers died with fear, and many fell into grievous diſeaſes going from the Eaſt to the South; it endured no longer than one hour and a quarter: in the top whereof was ſeen a bending arm holding a great Sword in a threatning hand; at the end thereof appeared three Stars, but that over which the point of the Sword directly hanged, was more bright and clear than the reſt: on each ſide of this Comet were ſeen many Spears, Swords, and other kinds of Weapons died with bloud, which were intermixed with mens heads, having long and terrible hair and beards, as you may ſee in this Figure.

The Figure of a fearful Comet.

Alſo there have been ſeen great and thick bars of Iron to have fallen from Heaven, which have preſently been turned into Swords and Rapiers. At *Sugoliah* in the Borders of *Hungaria*, a Stone fell from Heaven with a great noiſe, the ſeventh day of *September*, *Anno Dom.* 1514. it weighed two hundred and fifty pound: the Citizens hanged it up with a great iron chain put through it, in the midſt of the Church of their City, and uſed to ſhew it as a miracle to Travellers of better note, that paſs that way. * *Pliny* reports that claſhing of armour, and the ſound of a Trumpet were heard from Heaven often, before and after the *Cimbrian* War. The ſame Author writes that in the third Conſulſhip of *Marius* the *Amarines* and *Tudortines* ſaw the Heavenly Armies coming from Eaſt and Weſt, and ſo joining, thoſe being vanquiſhed which came from the Eaſt. Which ſame thing was ſeen in *Luſalia*, at a Town called *Jubæa*, two hours after midnight, *Anno Dom.* 1535. But in *Anno Dom.* 1550. upon the 19 day of *July*, in *Saxony* not far from *Wittenburg*, there appeared in the air a great Stag, incompaſſed with two armed Hoſts, making a great noiſe in their conflict, and at the ſame inſtant it rained bloud in great abundance; the Sun ſeemed to be cloven in two pieces, and the one of them to fall upon the Earth. A little before the taking of *Conſtantinople* from the Chriſtians, there appeared a great army in the Air appointed to fight, attended on with a great company of Dogs and other wild Beaſts. *Julius Obſequius* reports that in *Anno Dom.* 458. it rained fleſh in *Italy*, in great and leſſer pieces, part of which were devoured by the Birds before they fell upon the Earth: that which fell upon the Earth kept long unputrified, and unchanged in colour and ſmell. *Anno Dom.* 989. *Otho* the third being Emperour, it rained Corn in *Italy*. *Anno Dom.* 180. it rained Milk and Oil in great abundance, and Fruit-bearing Trees brought forth Corn. *Lycoſthenes* tells that in the time of *Charles* the Fifth, whileſt *Maidenburg* was beſieged, three Suns firſt appeared about ſeven of the clock in the Morning, and then were ſeen for a whole day, whereof the middlemoſt was the brighteſt, the two others were reddiſh, and of a bloudy colour; but in the night time there appeared three Moons. The ſame appeared in *Bavaria*, *Anno Dom.* 1554.

* *Lib.* 2. *c.* 57.

Preſages of the taking of *Conſtantinople.*

Monſtrous Rains.

Earthquakes.

But if ſo prodigious and ſtrange things happen in the Heavens beſides the common order of Nature, ſhall we think it incredible that the like may happen in the Earth. *Anno Dom.* 542. the whole Earth quaked, Mount *Ætna* caſt forth flames and ſparks of fire, with which many houſes of the neighbouring Villages were burned. *Anno Dom.* 1531. in *Portugal* there was an Earthquake for eight days, and it quaked ſeven or eight times each day; ſo that in *Lisbon* alone it caſt down a thouſand and fifty houſes, and more than ſix hundred were ſpoiled. *Ferrara* lately was almoſt wholly demoliſhed by a fearful Earthquake. Above all which ever have been heard, is that Prodigy which happened in the time of *Pliny* at the death of *Nero* the Emperor, in the *Marucine* field, the whole Olive-field of *Vectius Marcellus*, a *Roman* Knight, going over the High-way, and the Fields which were againſt it coming into the place thereof. Why ſhould I mention the miracles of Waters, from whoſe depth and ſtreams, fires and great flames have oft broke forth. They tell out of St. *Auguſtin*, that the fire of the Sacrifice, which for thoſe ſeventy years of the Babylonian captivity endured under the Water, was extinguiſhed, *Antiochus* ſelling the Prieſthood unto *Jaſon*. What miracle is this, that the Fire ſhould live in the Water, above its force and natural efficacy, and that the Water ſhould forget the extinguiſhing faculty! Verily Philoſophers truly affirm that the Elements which are underſtood to be contrary, and to fight in variety among themſelves, are mutually joined and tied together by a marvellous confederacy.

The End of the Five and Twentieth Book.

BOOK

BOOK XXVI.

Of the FACULTIES *of* SIMPLE MEDICINS, *As alſo of their* Compoſition *and* Uſe.

THE PREFACE.

AMongſt the cauſes which we term healthful, and other remedies which pertain to the health of Man, and the expelling of Diſeaſes, Medicins eaſily challenge the prime place; which (as it is delivered by Solomon*) God hath produced out of the Earth, and they are not to be abhorred by a Wiſe man; for there is nothing in the World, which ſooner, and as by a miracle, aſſwageth the horrid torments of Diſeaſes. Therefore* Herophilus *called them fittingly adminiſtred,* The Hands of the Gods. *And hence it was that ſuch Phyſicians as excelled in the knowledge of Medicins, have amongſt the Ancients acquired an opinion of Divinity. It cannot by words be expreſſed what power they have in healing. Wherefore the knowledge of them is very neceſſary not onely for the preventirn, but alſo for the driving away of Diſeaſes.* The excellency of Medicins.

CHAP. I.

What a Medicin is, and how it differeth from nouriſhment.

WE define a Medicin to be that which hath power to change the body according to one or more qualities; and that, ſuch as cannot be changed into our Nature: contrary whereto we term that nouriſhment which may be converted into the ſubſtance of our Bodies. But we define them by the word *Power*, becauſe they have not an abſolute nature, but as by relation and depending upon the condition of the bodies by whom they are taken. For that which is medicin to one, is meat to another; and that which is meat to this, is medicin to that. Thus for example, Hellebore is nouriſhment to the Quail, but a medicin to man: Hemlock is nouriſhment to a Starling, but poiſon to a Gooſe: the Ferula is food to an Aſs, but poiſon to other Cattel. Now this diverſity is to be attributed to the different natures of Creatures. It is recorded in Hiſtory, that the ſame by long uſe may happen in men. They report that a Maid was preſented to *Alexander* the Great, who nouriſhed with *Napellus*, and other poiſons, had by long uſe made them familiar to her, ſo that the very breath ſhe breathed was deadly to the by-ſtanders. Therefore it ought to ſeem no marvel, if at any time it happen, that Medicins turn into the nature and nouriſhment of our bodies: for we commonly may ſee Birds and Swine feed upon Serpents and Toads without any harm: and laſtly,

——— Serpente Ciconia pullos
Nutrit, & inducit per devia rura lacerta:
Illi eadem ſumptis quærunt animalia pennis.
The Stork with Serpents and with Lizards caught,
In wayleſs places nouriſheth her brood:
And they the ſame purſue, when as they're taught
To uſe their Wing, to get their wiſh'd-for food.

CHAP. II.

The difference of Medicins in their matter and ſubſtance.

EVen as the concealed glory of worldly riches lieth hid in the bowels of the Earth, and depth of the Sea and Water, as Gold, Silver, and all ſorts of Metals, Gems, and pretious Stones, furniſhed with admirable Virtues; ſo we may behold the ſuperficies of this Earth cloathed with almoſt an infinite variety of Trees, Shrubs, and Herbs: where we may contemplate and wonder at the innumerable diverſities of Roots, Leaves, Flowers, Fruits, Gums, their Smells, pleaſant Taſtes and Colours, but much more at their Virtues. This ſame Mother Earth, as with her Breſts, nouriſheth marvellous diſtinct kinds of living Creatures, various in their ſpringing, increaſe and ſtrength, wherein the immenſe goodneſs of God, the great Architect and framer of all things, doth moſt clearly appear towards man, as who hath ſubjected to our government, as a Patrimony, ſo ample and plentiful proviſion of Nature for our delight in nouriſhment and neceſſity of healing. Therefore the ancient Phyſicians have rightly delivered, that all ſorts of Medicins may be abundantly had from living Creatures, Plants, the Earth, Water, and Air. The Earth the Mother of Riches and Medicins.

Medicins are taken from living Creatures either whole and entire, or elſe the parts and excrements of them. We oft-times uſe in Phyſick whole Creatures, as Foxes, Whelps, Hedge-hogs, Frogs, Snails, Worms, Crabs, and other living Creatures. We alſo make uſe of ſome parts of them, as the Liver of a Wolf or Goat, the Lungs of the Fox, the Bone of the Stags heart, *Cranium humanum*, Fat, Bloud, Fleſh, Marrow, the Cods of the *Caſtor*, or Beaver, which is therefore termed *Caſtoreum*, and ſuch What Medicins taken from living Creatures.

other particles that are uſeful in Phyſick. We know that alſo there are ſome Medicins taken from Excrements, as Horns, Nails, Hairs, Feathers, Skin; as alſo from Urin, Dung, Spittle, Honey, Eggs, Wax, Milk, Wool, Sweat, and others of this kind, under which we may comprehend Musk, Civet, Pearl, *Oeſipus*, and ſundry others of this nature.

What from Plants. We take Medicins from Plants, both whole, and alſo from their parts, whether Trees, Shrubs, or Herbs. For we oft-times uſe Succory, Marſh-mallows, Mallows, Plantain, and the like, whole: but otherwhiles onely the roots of Plants, their Pith, Wood, Bark, Shoots, Stalks, Leafs, Flowers, Seeds, Fruits, Juices, Gums, Roſins, Moſſes, and the like.

What from the Earth. Things taken from the Earth, for the uſe and matter of Medicin, are either Earths, Stones, or Minerals. The ſorts of Earth are Bole-Armenick, *Terra ſigillata*, Fullers-earth, Chalk, Potters-clay, and ſuch like. Stones, are the Pumice, Marchaſite of Gold, Silver, Braſs, Marble, the Load-ſtone, Plaiſter, Chalk, *Sulphur vivum*, *Lapis ſpecularis*, and others. Metals and Minerals, are Gold, Silver, Tin, Lead, Braſs, Iron, Steel, Antimony, Ceruſe, Brimſtone, Cinnabar, Litharge of Gold and Silver, Tutty, true Pompholyx, Verdigreece, Alum, Roman Vitriol, Copraſs white and green, Salts of ſundry kinds, both of Arſenicks, and ſuch like.

What from the Water. The following Medicins are from Freſh water, Rain water, Spring water, River water, and all things thence ariſing, as Water-Lentils, common Flags, Water-Lillies, Water-Mints, and all the Creatures that live therein. From the Salt water are taken Salt, *Alcyonium*, all ſorts of Coral, Shells of Fiſh, the Herb *Androſace* (which grows in plenty in the Marſhes at *Fontignan* and *Cape de Sete*) *Aſphaltum*, which is found in the Dead Sea.

What from the Air. From the Air proceeds *Manna*, therefore called *Mel Aerium* (*i.e.*) Honey of the Air, and alſo all other kinds of dew that are uſeful in Phyſick, by reaſon of the Virtues they receive from the Sun which raiſeth them up; from the Air, whereas they make ſome ſtay; as alſo from the Plants, whereupon they fall and reſide.

CHAP. III.

The differences of Simples in their Qualities and Effects.

ALl the mentioned ſorts of Simples are endued with one or more of the Four Faculties, whereof I now purpoſe to treat.

The firſt Faculty common to all the reſt, and as it were their foundation, flows from the four firſt qualities of the prime Bodies or Elements, that is, Heat, Coldneſs, Drineſs and Moiſture; and this either Simple or Compound, as one or two of theſe prime qualities exceed in the temper of the temper of the Medicin, as may appear by this following.

The *Simple* quality is either to Heat, Cool, Humect, or Dry.

The *Compound* ariſing from two joined qualities, either Heats and Dries, Heats and Moiſtens, Cools and Dries, Cools and Moiſtens.

Heat moderate, Heats, Attenuates, Rarifies, opens the Paſſages, Digeſts, Suppurates. Immoderate, Inflames and burns, Bites, whence follows Violent attraction, Rubrification, Conſumption, Colliquation, an Eſchar, Mortification.

Cold moderate, Cooleth, Condenſeth, Obſtructeth. Immoderate, Congeals, Stupefies, Mortifies.

Moiſture moderate, Humects, Lubricates, Levigates and mitigates, Glues. Immoderate, Obſtructs, lifts up into a flatulent tumour, eſpecially if it be a vaporous humidity.

Drineſs moderate, Dries, Rarifies, Attenuates. Immoderate, Binds, Contracts or ſhrinks, cauſeth Chops and Scales.

5. Simp. & 1. de aliment. The effect of theſe qualities is diſtinguiſhed, and as *Galen* obſerves, digeſted into theſe orders, which we term Degrees, ſo that by a certain proportion and meaſure they may ſerve to oppugn Diſeaſes, as the ſame *Galen* affirms. For to a Diſeaſe (for example) hot in the ſecond degree, no other Medicin muſt be uſed than that which is cold in the like degree: wherefore all ſimple Medicins are, Hot, Cold, Moiſt, or Dry; in the beginning, middle, or extreme, of the firſt, ſecond, third, or fourth degree.

The Heat, Coldneſs, Moiſture, Drineſs, of the firſt, ſecond, third, fourth degree, is either obſcure, manifeſt, vehement, or exceſſive.

Examples of the degrees of heat. An example of heat diſtinguiſhed thus by degrees, may be thus; warm water is temperate; that which is a little hotter, is the firſt degree of heat; if manifeſtly hot, it is in the ſecond degree; but if it heat more vehemently, it may be thought to come to the third; but if it ſcald, then we know that it hath arrived to the fourth degree of heat. Such alſo is the diſtinction of coldneſs, moiſture, and drineſs by degrees. Wherefore it will be worth our labour to give you examples of certain Medicins, diſtinguiſhed in their order and degree, by which you may the more eaſily give conjecture of the reſt.

Simple Medicins hot in the

Firſt degree. *Abſynthium*, *Althæa*, *Amygdala dulcia*, *Beta*, *Braſſica*, *Chamæmelum*, *Ladanum*, *Semen Lini*, *Saccarum*, *Ervum*, *ſive Orobus*, *Vinum novum*: for old is judged hot in the ſecond or third degree, as it is more or leſs years old.

Second degree. *Ammoniacum*, *Artemiſia*, *Anethum*, *Fœnugræcum*, *Maſtiche*, *Salvia*, *Marrubium*, *Meliſſa*, *Apium*, *Chamæpitys*, *Crocus*, *Ficus*, *Thus*, *Myrrha*, *Mel*, *Nux moſchata*, *Pix utraque*, *tum arida corporibus particuliſque ſolidioribus aptior*, *tum liquida delicatioribus*, *Scylla*, *Sarcocolla*, *Bryonia*, *Sal*, *Opopanax*, *Ammi*.

Third degree. *Abrotanum*, *Agnus caſtus*, *Aniſum*, *Aſarum*, *Ariſtolochia*, *Chamædrys*, *Sabina*, *Calamintha*, *Cinnamonum*, *Iris*, *Juniperus*, *Hyſſopus*, *Origanum*, *Sagapenum*, *Chelidonium majus*, *Ruta Sativa*.

Fourth degree. *Allium*, *Cæpa*, *Euphorbium*, *Naſturtium*, *Pyrethrum*, *Sinapi*, *Tithymalli*, *Anacardi*, *Chelido-*

Chelidonium minus, *Galeno*. Yet ours, by reaſon of the gentleneſs of the air, and moiſture of our ſoil, is not ſo acrid. *Ruta ſylveſtris*. This, as all wild and not cultivated things, becomes more ſtrong and acrid than the Garden-Rue.

Simples cold in the

First degree. *Atriplex*, *Hordeum*, *Cydonia mala*, *Malva*, *Pyra*, *Pruna*, *Roſa*, *Viola*.

Second degree. *Acacia*, *Cucurbita*, *Cucumis*, *Mala granata acida*, *dulcia enim temperata ſunt potius*, *Plantago*, *Polyganum*, *Solanum hortenſe*; *nam id quod ſomniferum dicitur*, *vi refrigerandi ad papaver accedit*.

Third degree. *Hyoſcyamus*, *Solanum ſomniferum*, *Portulaca*, *Sempervivum*, *Mandragora*.

Fourth degree. *Cicuta*, *Papaveris genera omnia*, *excepto Corniculato*; *huic enim incidendi & abſtergendi vim attribuit Gal. Certe nitroſum & ſalſum guſtu percipitur*, *quo fit ut calidæ & ſiccæ ſit naturæ*, *Opium*.

Simples moiſt in the

First degree. *Bugloſſum*, *Viola*, *Malva*, *Rapum*, *Spinacia*.

Second degree. *Ammoniacum*, *Lactuca*, *Cucurbita*, *Cucumis*, *Melones*, *Portulaca*.

Simples dry in the

First degree. *Thus*, *Chamæmelon*. *Braſſica*, *Sarcocolla*, *Crocus*, *Faba*, *Fœnugræcum*, *Hordeum integrum*.

Second degree. *Artemiſia*, *Pix arida*, *Orobus*, *Plantago*, *Balauſtia*, *Nux moſchata*, *Lens*, *Maſtiche*, *Mel*, *Sal*, *Anethum*, *Myrrha*.

Third degree. *Abrotonum uſtum*, *Abſynthium*, *Myrtus*, *Acetum*, *Aloe*, *Milium*, *Cuminum*, *Sanguis draconis*, *Galla*, *Sabina*.

Fourth degree. *Piper*, *Allium*, *Naſturtium*, *Sinapi*, *Euphorbium*.

Thoſe we have mentioned have of themſelves and their own nature all ſuch qualities; yet do they produce far other effects by accident, and beſides their own nature in our bodies, by reaſon of which they are termed accidental cauſes. This ſhall be made manifeſt by the following examples. The effects of the firſt qualities by accident.

External heat by accident refrigerates the body within, becauſe it opens the paſſages and pores, and calls forth the internal heat, together with the ſpirits and humours by ſweats: whence it follows that the digeſtion is worſe, and the appetite is diminiſhed. The ſame encompaſſing heat alſo humects by accident, whileſt it diffuſes the humours concrete with cold: for thus Venery is thought to humect.

The like may be ſaid of Cold, for that it heats, not by its proper and native, but by an adventitious force: whereof you may make trial in Winter, when as the ambient cold, by ſhutting the pores of the body, hinders the breathing forth and diſſipation of the native heat. Whence it is inwardly doubled, and the concoction better performed, and the appetite ſtrengthened. This ſame Cold alſo dries by accident, when as it by accident repercuſſes the humour that was ready to flow down into any part, and whileſt it concretes that which is gathered in the part: for thus, by the immoderate uſe of repercuſſers, an œdematous tumor proceeding from groſs and viſcid phlegm, degenerates into a *ſcirrhus*.

Drineſs and Moiſture, becauſe they are more paſſive qualities, ſhew their effects by not ſo manifeſt operations, as heat and cold do; but in compariſon of them they are rather to be judged as matter, or a ſubject.

CHAP. IV.

Of the Second Faculties of Medicins.

WE term thoſe the Second Faculties of Medicins, which have dependance upon the firſt, which are formerly mentioned, as it is the part of *Heat* to Rarifie, Attract, Open, Attenuate, Levigate, Cleanſe. Of *Cold*, to Condenſe, Repercuſs, Shut up, Incraſſate, Exaſperate, Conſtipate. Of *Moiſture*, to Soften, Relax. Of *Drineſs*, to Harden, Stiffen.

Hence we term that an attractive Medicin, which hath an attractive faculty, as on the contrary, that a Repercuſſive that repels; a detergent, that which cleanſes viſcous matter. We call that an Emplaſtick Medicin, which not onely ſhuts up the pores of the body, but reduces the liquid bodies therein contained to a certain equality and ſubſtance. Thus alſo Emollients, Relaxers, and the reſt, have their denominations from their effects, as we ſhall declare hereafter.

CHAP. V.

Of the Third Faculties of Medicins.

THe third Faculty of Medicins depends for the moſt part upon the firſt and ſecond Faculties ſometimes conjoined, otherwhiles ſeparate. Alſo ſometimes it follows neither of theſe Faculties, but a certain property and inexplicable quality, which is onely known by experience. Now the operations of this third Faculty are to agglutinate, to fill with fleſh, to cicatrize, to aſſwage pain, to move or ſtay the Urin, Milk, Seed, the Courſes, Sweats, Vomits, and perform ſuch like operations, in or about the body.

Thus the generation of fleſh is produced by the concourſe of two Faculties, that is, of drying and cleanſing. But drineſs and aſtriction produce a glutinating and cicatrizing faculty. A hot and attenuating faculty cauſeth Sweats, moves Urin, the Courſes, and the like in the body; but contrary Faculties retard and ſtop the ſame.

To mitigate pain, proceeds onely from the Faculty, to wit, from heat, or a moderately heating faculty;

faculty to procure reſt, from cold onely, or coldneſs joined with ſome moiſture. But to procure vomit, proceeds neither from the firſt nor ſecond faculty, but from a certain occult and eſſential property, which is naturally implanted in Agarick, and other nauſeous and vomitory Medicins.

CHAP. VI.

Of the Fourth Faculty of Medicins.

The fourth faculty of Medicins depends onely upon an occult property.

THe Fourth Faculty of Medicins is not of the ſame condition with thoſe that are formerly mentioned; for it depends not upon them, or any other manifeſt or elementary quality, but on an occult property of the whole ſubſtance; by means whereof it works rather upon this than that part, upon this rather than that humour. Wherefore Phyſicians cannot by any reaſon find out this faculty, but onely by experience, as we have ſaid a little before of Medicins procuring Vomit. Hence it is that names are given to thoſe Medicins from thoſe parts that they chiefly reſpect: For they are termed Cephalicks which reſpect the Head; as Betony, Marjoram, Sage, Roſemary, *Stœchas*. Pneumonicks, which reſpect the Lungs; as Liquorice, ſweet Almonds, Orris, Elecampane. Cordials, that ſtrengthen the heart; as Saffron, Cinamon, Citrons, but chiefly their Rinds, Bugloſs, Coral, Ivory. Stomachical, which reſpect the Stomach, and the orifice thereof; as Nutmeg, Mint, Aniſe, Maſtick, Pepper, Ginger. Hepaticks, which reſpect the Liver; as Wormwood, Agrimony, Spikenard, Succory, Sanders. Spleneticks, which have relation to the Spleen; as Tyme, *Epithymum*, Broom-flowers, Ceterach, Capers, the Bark of their Roots, the Bark of Tamariſk. Diureticks, ſuch as reſpect the Kidneys and Urinary paſſages; as the Roots of Smallage, Aſparagus, Fennel, Butchers-broom, the four greater Cold Seeds, Turpentine, Plantain, Saxifrage. Arthriticks, or ſuch as ſtrengthen the joints; as Cow-ſlips, *Chamæpitys*, Elecampane, Calamint, Hermodactyls, and the like.

To this Rank may be referred purging Medicins, which, furniſhed with a ſpecifick property, ſhew their efficacy on one Humour more than on another Humour, and that impact more in one part than in another. For thus Agarick chiefly draws phlegm from the Head and Joints, Rhubarb, draws choler chiefly from the Liver, and hurts the Kidneys. But let us here forbear the conſideration of things, as not pertaining to Surgery. But ſome Medicins of this kind are furniſhed with one ſimple faculty, otherſome with more, and thoſe contrary, whereof your taſte may give you ſufficient notice: for Rhubarb at the firſt touch of the tongue is found acrid and hot; but when you come to chaw and throughly to taſte it, you ſhall find it to partake of an earthly aſtriction. Therefore becauſe taſtes give notice of the faculties of Medicins, therefore I have thought good to treat of them briefly.

CHAP. VII.

Of Taſtes.

Lib. 1. *ſimpl.*

TAſte, as *Galen* delivers according to *Ariſtotle* and *Theophraſtus*, is a certain concoction of moiſture in drineſs, cauſed by means of heat, which we know or diſcern by the tongue well tempered, and fittingly furniſhed with ſpittle and his nerves. There are nine differences of taſtes; for there are three judged hot, to wit, the acrid, bitter, and ſalt: three cold, the acid, auſtere, and acerb: three temperate, the ſweet, the oily or fat, and the inſipid. Now they are thought ſo many according to the different degrees of concoction; for it appears greater in hot taſtes, and as it were a certain aſſation; but leſs in cold, but indifferent, and as it were an elixation in things temperate: therefore Nature obſerves this order in the concoction of ſapid bodies, that are the firſt the acerb taſte ſhould take place, then the auſtere, and laſtly the acid: from theſe (as it were) rudiments of concoction, ariſes an inſipid, then an oily, then a ſweet perfectly concocted and temperate. This concoction exceeding the bounds of mediocrity, there ariſes a ſalt taſte, then a bitter, and then an acrid with the higheſt exceſs of almoſt a fiery heat. Yet I would be thus underſtood, that all things that are by Nature ſapid, do not always aſcend to the height of ſweetneſs by the degrees of acerbity, auſterity, and acidity, as though it were of abſolute neceſſity, that all things that are ſweet, ſhould be acerb, auſtere, and acid. For there are many things found, eſpecially in Plants and their Fruits, which when they ſhall arrive to their perfection and maturity, are acid, bitter, or ſalt: but being yet unripe, and not come to full perfection, they have a certain ſweetneſs, which afterwards, by a further digeſtion, or perfection and concoction, acquire a bitter, auſtere, or acid taſte. For thus bitterneſs in Worm-wood and Aloes, acrimony in Pepper or Pellitory, is a perfection of Nature, as full ripeneſs and perfect concoction, and not an exceſs of heat in that *Species*. Alſo acerbity and auſterity is a perfection of Nature, and not a rudiment in Services and Cornelians; acidity or tartneſs is alſo in verjuice. But in very many things it ſo falls out, that the ſweet or fatty taſtes become ſo, and acquire their perfection by concoction, as in Grapes, Figs, Pears, Apples, and almoſt all other ſuch Fruits, as we uſually feed upon. Therefore I will now treat of each of them in order, firſt beginning with cold taſtes.

Differences of taſtes.

The acerb taſte.

The acerb taſte is cold and terreſtrial, and of a ſubſtance abſolutely groſs, being leſs humid then the auſtere, but much leſs than the acid. It notably cools and dries, it condenſates, binds, repels, eſpecially from the ſuperficies, and it alſo exaſperates; this taſte reſides, and may be found in Pomegranate Pills, Galls, Sumach, and Cypreſs-nuts.

The auſtere.

The auſtere is nigheſt in temper and effects to the acerb, but ſomewhat moiſter; for the acerb abſolutely conſiſts in a terreſtrial and cold ſubſtance. Wherefore this, increaſed by a degree of concoction, acquires more ſtore either of heat alone, or elſe of moiſture alone, or elſe of both together: moiſture,

moiſture, I ſay, and that is either Airy or elſe Watery. Therefore if theſe fruits, which before their maturity are acerb, have an acceſſion of heat, then do they become ſweet, as you perceive by Cheſnuts; but if there be an acceſſion of moiſture onely, and that more groſs, of acerb they become auſtere: for both the taſtes are in the like degree of cold, but the auſtere is the moiſter. But if to the ſame frigidity remaining in Fruits, a certain humidity accrew, then is there cauſed an acid taſte. But if they have an acceſſion of a wateriſh moiſture and heat, they will acquire a ſweet taſte, or elſe oily, if the humidity accrewing with the heat be airy.

I have judged it requiſite to admoniſh you hereof, that you might know by what means ſapid bodies mitigated become ſweet of acerb, as it were by theſe interpoſed degrees of auſterity, acidity, and oilineſs, as they acquire a various acceſſion of heat and moiſture ſeparately, or conjunctly.

Now by all that we have delivered, you may gather, that all acerb and auſtere things are cold and dry; and as they are cold, they repel and hinder defluxions: as they are dry and terreſtrial, they condenſate, incraſſate, conſtipate, and ſtraiten the paſſages; yea, and they alſo cicatrize: but acerb things perform this far more powerfully, as thoſe which are abſolutely terrene, cold, and dry, not partaking of moiſture or water. Now auſtere things conſiſt (as it were) in a middle matter, that is, in a more dilute terrene body, as it is apparent in Services, unripe Grapes, Cornelians, Medlars, Crabs, wild Pears, and all ſorts of unripe Fruits, whence it is termed a crude taſte.

The acid taſte is of a cold and wateriſh nature, but moſt ſubtle, by benefit whereof it penetrates and divides almoſt as powerfully as the acrid. It incides or divides, attenuates, bites, cleanſes, opens obſtructions, repels and dries. For by the means of the deep piercing cold, it repels all defluxions; and by the drying faculty, which is ſtrong even in its watery conſiſtence, it ſtays and ſtops all bleedings, the Hæmorrhoids and Dyſenteries. The force thereof is chiefly manifeſt in Vinegar, as alſo in the juice of Citrons, Sorrel, Cherries, Berberries, and the like. And this is the nature of cold taſtes, now it is time we ſpeak of ſuch as are temperate. The acid taſte.

The inſipid is unproperly termed a taſte, as that which is rather a privation of taſte, it is in ſome ſort cold, and of a very wateriſh and groſs nature, it inſpiſſates, conſtipates, and ſtupifies. This kind of taſte is chiefly manifeſt in Water, next in Gourds, Citruls, and many ſuch like things. The inſipid.

The oily taſte is hot, humid, airy; therefore it humects, relaxes, mollifies, lubricates. Of this kind are Oil, Butter, Fat which is not rancid by age, nor acrid by nature, as that of Lions and Foxes. The oily.

The ſweet taſte is made by a moderate and well concocting heat, conſiſting in a matter more tenuious and hot than the inſipid, but in ſomewhat more groſs than the oily, from which in the firſt qualities it doth not differ; therefore it is of a hot, airy, and temperate nature. Therefore every ſweet thing detergeth, levigates, concocts, ripens, relaxes, and aſſwageth pain. Examples of this taſte may be had in Sugar, Hony, Manna, ſweet Almonds, Milk, and other like. Now let us come to hot taſtes. The ſweet.

The ſalt taſte is hot and aſtringent, leſs earthy than the bitter, as that which reſides as it were in a middle matter. For it proceeds from an earthy drineſs, which is formerly torrified and attenuated by the force of heat in a watery humidity. Wherefore that which is ſalt contracts the pores, cuts, cleanſes, digeſts, or rather drics up the humours by the drineſs thereof, without any manifeſt ſenſe of heat, whence it is that it vindicates from putrefaction. Under this kind are contained all ſorts of Salt; as Salt-peter, *niter*, *ſal ammoniacum*, *ſal gemmæ*, common Salt, Sea-water, and ſuch other like. The ſalt.

The bitter taſte is hot, earthy, and drying; for the matter thereof is groſs and earthy, which the abounding heat hath torrified and dried up. Wherefore bitter things taken inwardly, purge and carry away ſuperfluous humours: and outwardly applied, they mundifie and deterge ulcers, they open the mouths and paſſages of the Veins oft-times by their abſtergent faculty, whence it is that they move the Courſes and Hæmorrhoids. The principal things endued with this taſte are Aloes, Gall, Wormwood, Gentian, the leſſer Centaury, Coloquintida, Fumitory, Soot, and ſuch like. The bitter.

The acrid taſte is hot, of a ſubtile and fiery nature; for it is kindled of a hot, ſubtle, and dry matter, neither can it conſiſt in any other. Therefore that which is acrid, heats, pricks, or bites the mouth by acrimony, it heats, and oft-times burns, it penetrates, opens the paſſages, attenuates, attracts and draws forth groſs humours, evacuates and ſends forth Urine, the Courſes, and Sweat: beſides it oft-times is ſeptick, bliſtering, and eſcharotick; and laſtly, burning and cauſtick. The ſeptick and putrefactive things are Sublimate, *Chamælen*, the juice of *Thapſia*. The Veſicatories are Dittander, Cantharides, Crow-foot, Muſtard, Pellitory of *Spain*, Euphorbium. But the cauſtick and eſcharotick are Lime, Oak-aſhes, and the like. The acrid.

But we know Medicins not onely by the taſte, but alſo by our other ſenſes, as Touch, Sight, Hearing, Smell. And as by the Taſte, ſo alſo by theſe we judge of, and try the goodneſs of Medicins, and diſtinguiſh the true legitimate from the adulterate. The Touch judges what are hot and cold, moiſt and dry, rough and gentle, or ſmooth, hard and ſoft, brittle or friable, glutinous and viſcid, drie or ſlippery. We approve of the goodneſs of Medicins by their colour, brightneſs or duskineſs, whereof the eye is judge; for we commend that Senna which is ſomewhat greeniſh, but diſlike the whitiſh: as alſo we like well of ſuch Caſſia as is black both within and without, ſhining and full, and not dry and ſhrunk up. Yet the judgment of the firſt qualities by the colour is deceitful, or none at all; for ſuch things as are white, or the colour of Snow, are not therefore cold: for ſundry of them are hot, as Lime. Neither are red things to be therefore judged hot, for Roſes are cool. Alſo Medicins are choſen by the ſmell; for ſuch as have a good, freſh, and a natural ſmell, are commonly hot, and in their perfect vigor. On the contrary, things that want ſmell, are for the moſt part cold and evanid. By Hearing we diſtinguiſh things full from ſuch as are empty: thus we chuſe Caſſia, which ſhaken, makes no noiſe with the grains or ſeeds ratling in it. Hitherto we have explained the firſt, ſecond, third, and fourth faculty of Medicins in general, and have

ſhewed

ſhewed how they may be found out: now muſt we more particularly treat of their ſecond and third faculties, becauſe by reaſon of thoſe they chiefly come into uſe in Surgery. Yet let me firſt briefly ſhew by what means and arts they may be prepared.

CHAP. VIII.

Of the Preparation of Medicins.

TO prepare Medicins, is nothing elſe, then by Art to make them more commodious for Uſe and Compoſition; whereby they are either made,

More gentle.

By *Bruiſing*; as when Medicins are broken by ſtriking and rubbing or grinding in a Mortar, and that either of Braſs, Iron, Lead, Glaſs, Wood, Marble, and other like; Conſidering the thing which is to be beaten, the ſtrength or force wherewith it muſt be performed, the time or ſpace, the ſituation, the things to be added, the conſiſtence which the thing beaten muſt be of.

More ſtrong.

By *Searſing*; whereby we ſeparate the Purer and Finer from the more Impure and Groſs, which is done by Sieves and Searſes made of Wood, Parchment, Horſe-hair, Silk, Lawn. Wherein is to be noted, that the ſame conſideration is to be had in Searſing, as in beating: therefore ſuch things as are to be finely powdered, muſt be ſearſed in a finer Searſe; ſuch as are more groſs, in a coarſer.

More pleaſant.

By *Diſſolving* or *Mollifying*; which is nothing elſe but a diſſolving of a Simple or a Compound Medicin of a thick or hard conſiſtence, either into a mean conſiſtence, or a little more liquid or ſoft, which is performed either by heat onely, for by heat gums and horns are mollified: or by liquor, as by Vinegar, Water, Wine, Juice of Limmons, &c.

More wholſom.

By *Deſiccation* or *hardning*; which is nothing elſe but the conſuming of the ſuperfluous and hurtful moiſture; and this is performed, either by the Sun, or by Fire. By *Infuſion*; which is nothing elſe but the tempering or macerating of a Medicin a little beaten or cut, in ſome liquor appropriate and fit for our purpoſe; as in Milk, Vinegar, Water, Oil, and the like, ſo long as the nature of the Medicin requires. To Infuſion, Nutrition may be reduced, which is nothing elſe but as it were a certain accretion of the Medicin, by being moiſtned, macerated, rubbed, or ground with ſome moiſture, eſpecially with heat. By *Burning*; that is, by conſuming the humidity which is in them. And that, either that they may be the better powdered, being otherwiſe too glutinous, or that they may lay aſide their groſs eſſence, and become of a ſubtiler temper; or that they may put off, or partly loſe ſome fiery quality, as Acrimony, *Gal. lib. 4. cap. 9. Simplicium.* Or that they may acquire a new colour. Now all things are burnt, either alone; as ſuch things as have a fatty moiſture, as Hairs, ſweaty Wooll, Horns: or elſe with ſome combuſtible matter, as Sulphur, Alum, Salt, Barley, &c.

More fit for mixture.

By *Boiling*, or *Elixation*; which is performed by a humid heat, as burning is by a drie; and that either that we may increaſe the weak faculties of ſuch Medicins as are boiled, by boiling them with ſuch as are ſtronger; or elſe to weaken ſuch as are too ſtrong, or elſe wholly to diſſipate ſuch as are contrary: Or that one faculty may ariſe of ſundry things of different faculties being boiled together, or for the longer keeping them, or bringing them to a certain form or conſiſtence: All which are done, by Fire, or Sun. By *Waſhing* or *Cleanſing*; whereby the impurity of the Medicin is waſted away or cleanſed; and ſuch things are either hard, as Metals, Stones, parts of living Creatures, condenſed Juices, and other like: Or ſoft, as Roſins, Gums, Fats, Oils. And theſe ought firſt to be finely beaten, that the water may penetrate in all their ſubſtance. Or to be diſſolved, and caſt into the Veſſel filled with Water, and ſo ſtirred, and then ſuffered to ſubſide, ſo that the Fat may ſwim aloft. And this muſt be done ſo long that the Water retain nothing thereof in colour, ſmell, or taſte.

CHAP. IX.

Of Repelling or Repercuſſive Medicins.

Aſtringents are underſtood by the name of Repellers.

The differences of Repercuſſives.

REpelling or Repercuſſive Medicins are cold, and of groſs and earthy parts; by which name alſo aſtringent Medicins are underſtood, becauſe they hinder the falling down of the humours upon the part. Repercuſſives are ſuch, either of their nature, and of themſelves, or elſe by accident, being not ſuch of their own nature. Theſe which of themſelves are ſuch, are of two kinds; for ſome are wateriſh and moiſt, without any aſtrictive faculty which almoſt wholly proceeds from an earthy eſſence; wherefore that faculty of Repelling which they poſſeſs, they have it wholly from coldneſs. Of this kind are Lettuce, Purſlain, Sow-Thiſtle, Ducks-meat, Kidney-wurt, Cucumers, Melons, Gourds, Houſe-leek, Mandrake-apples, Night-ſhade, Henbane, and the like, which cool powerfully, and unleſs they be taken away before the part wax blackiſh, they extinguiſh the natural heat. Otherſome are of an earthy eſſence, and therefore aſtrictive; but yet ſome of theſe are hot, otherſome cold. Such things as are cold of temper, and of an earthy conſiſtence, are properly and truly called Repellers. Of theſe ſome are Simple, otherſome Compound: the Simples are Plantain, Vine-leaves, Leaves of Roſes, Oaks, Brambles, Cypreſs,

preſs, Berberies, *Sumach*, all unripe Fruits, Verjuice, Vinegar, red Wine, the juice of ſower Pomgranats, *Acacia*, the Juice of Berberies and Quinces, *Hypociſtis*, Pomgranat Pills, Oak-bark, the Flowers of Wild Pomgranats, the Meal of Barley, Beans, Panick, Oats, Millet, *Orobus* mixed with Juices in form of a Pultis, Bole-armenick, *Sanguis Draconis*, Ceruſs, Litharge, *Terra Sigillata*, Fullers-earth, Chalk, Marl, the Load-ſtone, Lead, Corals, all Marchaſites, Antimony, *Spodium*, true *Pompholyx*, all ſorts of Earth, and other things of the like nature.

Now Compound things are, *Oleum roſaceum, omphacinum, myrtillorum, papaveris, cydoniorum, nenupharis, unguentum roſatum, album rhaſis, camphoratum, emplaſtrum diacalcitheos*, diſſolved in vinegar and oil of Roſes, *deſiccativum rubrum, populeon, emplaſtrum nigrum ſeu tetrapharmacum* of *Galens* deſcription, *empl. contra rupturam, de ceruſa, pro matrice.* All ſuch cold repercuſſives are more effectual if they be aſſociated with tenuity of ſubſtance, either of themſelves, or by mixture with ſome other things: for to this purpoſe we often mix Vinegar, Camphire, and the like things of ſubtil parts, with repercuſſives of groſs parts, that they may ſerve as vehicles to carry in the repercuſſive faculty. Repercuſſives of groſs parts and hot, are Wormwood, Centaury, Gentian, Agrimony, Savin, Coriander, Mint, Bay-leaves, Cardamomes, *Calamus aromaticus*, Aloes, Spikenard, Saffron, Nutmeg, Cinnamon, Amber, Salt, Alum, Coporas, *Sulphur, Oleum abſynthinum, Maſtichinum, Nardinum, Coſtinum, Ceratum, Gal. Stomachicum, Santalinum, Emplaſtrum Diacalcitheos.* But ſuch things as repel by accident, are Bandages, Compreſſers, Linnen cloths, and Rowlers of all ſorts, Caſes, Cauteries, Bloud-letting, Cupping, painful Frictions in the oppoſite parts, and other ſuch like things as are properly ſaid to make revulſion. The uſe of repercuſſives is to force back the humour which flows from any other place into the part, and thus they mitigate the heat of ſuch inflammation as that defluxion of humours hath cauſed, yea, oftimes to aſſwage and help pain, the Fever, Abſceſs, malign ulcers and mortification. Such repercuſſives muſt always be ſo oppoſed to the diſeaſe, that reſpect may be had to the temper, complexion, and particular nature of the part whereto they are applied: for all parts cannot equally bear the like force of repercuſſives, as nervous and other ſpermatick and cold parts. Furthermore there are ſome parts whereunto we may by no means apply repercuſſives, as the groins, arm-pits, and thoſe glandules or kernels which are behind the ears and brain, leſt the humour ſhould retire back into ſome of the principal parts: the like reaſon is alſo of bodies; for the bodies of Women, Children, Eunuchs, cannot endure ſo ſtrong repercuſſives and the like exceſs of cold as the manly and vigorous bodies may. Beſides, every diſeaſe requires not repercuſſives; for if the body be replete with ill humours, if it be plethorick, the uſe of repercuſſives, unleſs after general purgation, cannot be ſafe; as neither if the humour which is in motion ſhall be venenate, groſs, acrid, critical, or ſhall cauſe great pain in the part, for then on the contrary we muſt rather make uſe of attractives. But now if the diſeaſe be great, weak repercuſſives will avail nothing againſt it, as Lettuce againſt a great inflamation; and thou ſhalt do ill if thou ſet upon a ſmall defluxion with powerful repellers; for by that means the skin is ſtraitned, and the paſſages thereof ſtopt, whereby the inflamation is increaſed, or elſe brought to a *ſcirrhus*. Wherefore let the Surgeon have a care that he temper the force of his Repercuſſives according to the magnitude of the diſeaſe.

Why things of ſubtil parts are oft-times mixed with repercuſſives.

Repellers by accident.

When and to what parts repercuſſives muſt be applied.

CHAP. X.

Of attractive Medicins.

AN attractive Medicin is contrary to the repeller; the Greeks call it *Helcticum*, it is of a hot and thin ſubſtance, whereby it draweth forth into the ſuperficies of the body that which lieth hid in the center, although ſometimes it doth it by an occult quality, otherwhiles by accident, as by the acrimony. Thoſe things which by a manifeſt quality do attract, are either Simple or Compound.

What an attractive Medicin is.

The Simple are, *Bryonia, allium, cæpa, porrum, ariſtolochia, hermodactyli, cyclamen, lilium, ſigillum beatæ Mariæ, arum, aſarum, aſphodelus, gentiana, pyrethrum, ruta, ſabina, calamentum, omnes tithymallorum ſpecies, viſcum, abrotonum, anagallis, urtica, ranunculus, ſtruthium*, and ſuch like; *Ammoniacum, bdellium, galbanum, ſagapenum, euphorbium, aſphaltum, cinis è fœce vini vel aceti, calx viva, ſulphur, ſal ammoniacus, omnis ſalis ſpecies, auripigmentum, oleum vetus, adeps leonis, urſi, canis, anſeris, viperæ, ranarum, axungia porci, vetuſtate acris, aut attritu rotarum. Compoſita vero, ut oleum de ſpica, philoſophorum, de terebinthina, de croco, de ſcorpionibus, rutaceum, vulpinum, laurinum, anethinum, de vitriolo, unguentum Agrippæ, aragon, ſeu auxiliare, martiatum, enulatum, theriaca, mithridatum, empl. de meliloto, diachilon magnum & parvum, oxycroceum, divinum.*

Attractives by a manifeſt quality.

Thoſe things which draw by a ſecret property in Nature, as are the Load-ſtone, Quick-ſilver, Piony, Amber, all Antidotes and Triacles that are remedies againſt the bitings of venomous Beaſts, and all purging Medicins.

By an occult.

Thoſe which draw by accident, perform it otherwiſe than of their own Nature; they have that quality out of putrefaction and corruption, as Doves dung, Goats dung, Cows dung, Mans dung, and all kind of dungs: alſo Leven, old Cheeſe, and ſuch like.

By accident.

Cupping-glaſſes, Leeches, Syringes, rougher and harder Frictions, Sucking, Pain, ſtraight Ligations, Cauteries, do alſo draw, but after a different manner from them ſpoken of before.

Attractive Medicins muſt neither burn nor diſcuſs, and being very ſtrong and ſharp, they ſhould be tempered and mixed with Oil of Roſes, and other lenitives: but to weak ones ſhould be added Oil of Bays, *Calx viva*, and ſuch like to ſtrengthen them. The uſe of attractives is to draw poiſon toward the skin, and to haſten forward critical abſceſſes; and they make thoſe parts which are benummed and conſumed, to have life; they reſtore the refrigerated parts by drawing thither the ſpirits, they draw forth the viſcous filth of malign ulcers that lies hid in the nerves and hollow paſſages of them; they alſo draw out ſcales of bones, ſplinters of wood, nails, thorns, arrows, and that matter which is impact in hardned inflamations.

Their uſe.

CHAP.

CHAP. XI.

Of reſolving Medicins.

What a Reſolving Medicin is. The differences thereof.

THat is called a reſolving Medicin which by heat, and the tenuity of his ſubſtance openeth the pores, attenuates the humours, diſſipates and diſcuſſeth by evaporating the unprofitable matter. There are two ſorts of theſe kinds of Medicins, the one is called *Araeoticum*, or rarifying, the other is termed *Diaphoreticum*, or digeſting.

The *Araeoticum* by a mean heat, and not dry, and indued with a tenuity of ſubſtance, openeth and relaxeth the skin, and draweth forth the matter ſhut up under it, whereby it may eaſe pain, like as Anodynes, becauſe it doth not much depart from a temperate heat.

But the *Diaphoreticum* being much hotter, whatſoever ſticketh in the part being there impact, it doth by thin vapour inſenſibly diſſipate: therefore the acrid and hot things are in this caſe to be made uſe of rather than attractives, becauſe that cold and groſsneſs is more difficultly to be digeſted, and the length and involution of the ways being to be conſidered. The *Araeotick*, which we may call weak Reſolvers, are either Simple or Compound.

The Simples are theſe, *Biſmalva tota, parietaria, adianthum, mercurialis, ebulus, valeriana, roſmarinus, ſalvia, thymus, chamæmelum, melilotum, anethum, farina hordei, tritici, ſeminis lini, fœnugræci, nigella, furfur, adeps gallinæ, anſeris, anatis, cuniculi, vituli*; almoſt all Metals unleſs ſuch as are acrid. The Compounds are, *Oleum chamæmolinum, anethinum, liliaceum, catellorum, lumbricorum, Keirinum, de vitellis ovorum, de tritico, amygdalarum dulcium, unguentum de althæa, empl. diachylum, ireatum.* Diaphoreticks or digeſtives, are alſo both Simple and Compound: The Simple are *Ariſtolochia, enula campana, iris, cæpa ſcyllæ, ſigillum Salomonis, ſigillum Beatæ Mariæ, bryona, panis porcinus, dracunculus, aſphodelus, origanum, mentha, pulegium, ſabina, ſerpillum, calamentha, hyſſopus, urtica, artemiſia, lavendula, chamæpitys, aniſum, fœniculum, cuminum, piper, nux moſchata, coriandrum, baccæ lauri & juniperi, farina fabarum, lupinorum, orobi, milii, frumenti, furfur, mica panis, acetum tepidum, oxycratum, vinum vetus aut aromaticum, mel, aqua vitæ, muria, adeps tauri, equi, leonis, canis, hirci, medulla cervi, cruris bovis & arietis, ammoniacum, galbanum, opopanax, ſagapenum, myrrha, bdelium, thus, terebinthina, pix nigra, ladanum, ſtirax, calamita, benjoinum, ſtercus caprinum, columbinum, caninum, bubulum, & aliæ ſtercorum ſpecies.* Compound Diaphoreticks are, *Oleum amygdalarum amararum, juniperinum, laurinum, de ſcorpionibus, irinum, coſtinum, nardinum, de terebinthina, de croco, canabinum, raphaninum, è cucumere agreſti, vulpinum, rutaceum, philoſophorum, de lateribus, de euphorbio, de tartaro, de petroleo, de kerva, ſive recininum unguent. Arippæ, aragon, martiatum, enulatum, empl. de Vigo,* without addition, and with addition, *oxycroceum, diacalcitheos,* diſſolved in a digeſting oil to the form of a cerot.

Araeoticks are profitably uſed in the increaſe and ſtate of ſuperficial tumours.

The uſe of Diaphoreticks

But *Diaphoreticks* are not to be uſed in the increaſe of tumours, unleſs ſome aſtringent be added, leſt by their more ſtrong digeſtion, they ſhould draw and increaſe the defluxion: but when the tumors decline, they are then onely to be uſed in the parts chiefly where the skin is denſe and hard, and when the tumor is cold and groſs, and lying hid deep in the body, ſo that the virtue of Medicaments can hardly come thereto: but conſideration is to be had of the parts to which reſolutives are to be applied; for you may not apply Relaxers or Diaphoreticks to the Liver, Spleen, Stomach, or Bowels, unleſs you add ſome aſtringents, of which a great part muſt be Aromaticks.

To the parts where ſenſe is more dull, may be applied the ſtronger Diaphoreticks; but thoſe parts which are endued with a more exquiſite ſenſe, as the Eye and the Nerves, to them we muſt apply weaker. When the matter is groſs and cold, things cutting and attenuating, and then emollient are to be uſed, and ſo by degrees come to diaphoreticks; otherwiſe that onely is reſolved which is the moſt ſubtil of unprofitable matter, the groſſer becoming concrete and hardned. But if the part be afflicted with a continual defluxion, ſo that there may be danger of a Gangrene or Sphacel, it is not lawful then to make uſe of Reſolvers, but you muſt in the place where the humour flows, divide the skin by ſcarification, as it is moſt learnedly noted by *Hollerius*, in that profitable Book of his left to poſterity, whoſe Title is, *De Materia Chirurgica.*

CHAP. XII.

Of Suppuratives.

What a Suppurative Medicin is.

A Suppurative Medicin is ſaid to be that, which ſhutting the pores, and preventing tranſpiration by his emplaſtick conſiſtence, increaſeth the matter and native heat, and therefore turneth the matter caſt out of the Veſſels into *pus* and *ſanies*. It is of nature hot and moiſt, and proportionable to the native heat of the part to which it is applied, and of an emplaſtick conſiſtence, that ſo it may hinder the native heat from being exhaled; in which reſpect it differeth from emollients and malacticks, of which we ſhall ſpeak hereafter. There be two kinds of Suppuratives: for ſome do it of themſelves, and by their proper quality; others by accident. Thoſe things which by their own ſtrength do bring to ſuppuration, are either Simples or Compounds.

Differences of Suppuratives.

Simples are, *Radix liliorum, cæpa, allium, malvarum omnium folia & ſemina, bugloſſum, acanthus, ſenecio, violæ, parietaria, crocus, caules, ficus, paſſulæ mundatæ,* with a decoction of theſe things, *farina tritici, farina volatilis, farina hordei excorticati, lolii, ſeminis lini & fœnugræci, galbanum, ammoniacum, ſtyrax pinguis, ladanum, viſcum aucupatorum, thus, pix, cera, reſina, colla, adeps ſuillus, vitulinus, vaccinus, caprinus, butyrum, vitellus ovi, æſipus humida, ſtercus ſuillum, columbinum, caprinum, pueri.* Compounds are, *Oleum liliorum, lumbricorum, de croco, unguent. baſilicum, emplaſt. diachilon commune, magnum, de mucilaginibus.*

Suppuratives by accident.

Thoſe things do ſuppurate by accident, which work it onely by the means of an Emplaſtick conſiſtence

ſtence: for ſo oft-times aſtringents, becauſe they are of earthy and thick parts, are found to ſuppurate; ſuch are *unguentum de bolo nutritum*, and ſuch like. Such alſo are thoſe which by their coldneſs keep the heat in, and ſhut the pores. Hence it is that the qualities of Sorrel are commended to generate *pus*: for whileſt it keepeth the heat within, it increaſeth his effects, to the thickning of the ſuppurable matter, and the overcoming other rebellious qualities. We uſe things ripening in great inflammations, whoſe growth we cannot hinder with Repellers, or increaſe with Reſolvers or Diſcuſſers.

CHAP. XIII.

Of Mollifying things.

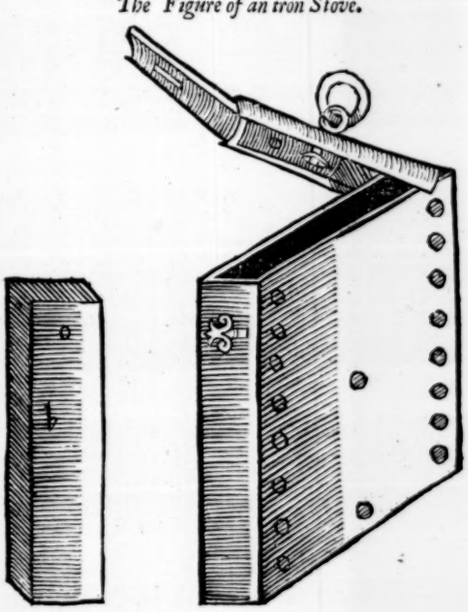
THat is defined to be a mollifying Medicin, which by a ſtronger heat than that which is proper to ſuppuratives, without any manifeſt quality of drying or moiſtning, again malaxeth or ſofteneth hardned bodies: wherefore this differs from that which ſuppurates, becauſe that they be hot in the firſt or ſecond degree, according to the ſeveral tempers of the body, or part to which it is applied, working rather by the quantity of heat, than the quality; contrariwiſe, that which mollifieth being indued with a greater heat, rather worketh by the quality of the heat, being otherwiſe in drineſs and moiſture temperate. *Gal. cap. 7. lib. 5. ſimp.* How Suppuratives and emollients differ.

Although as many things agree together in ſome reſpects, though of a diverſe nature, ſo many emollients are ſuch as are hot in the firſt degree, and drie in the ſecond and third, that ſo they may the better diſperſe and diffuſe that which is congealed, by taking away a little of the humidity, which is contained within the part affected: but not by exhauſting it wholly by the violence of heat or drineſs: for hereon would follow a greater hardneſs.

Things mollifying, are either Simple or Compound, and thoſe again ſtrong or weak. The weak are, *Radix liliorum alborum, cucumeris agreſtis, althææ, folia malvæ, biſmalvæ, liliorum, anethi ſummitates, viola, branca urſina, ſemen malvæ, biſmalvæ, lini, fœnugræci, carici pingues, paſſulæ mundatæ, pedum, capitum, inteſtinorum vervecinorum decoctum, adeps ex junioribus & caſtratis, domeſticis, fœminis animalibus, adeps, ſuillus, vitulinus, hœdinus, caprinus, bubulus, vulpinus, gallinaceus, anſerinus, anatinus, olorinus, efficaces.* The weaker are things more gentle; as, *Butyrum, lana ſuccida, cera pinguis, vitellus ovi, medulla ex oſſibus, cervina, ovilla, caprina.* The compound are oil, wherein are boiled mollifying herbs; as, *Oleum liliorum, chamæmelinum, amygdalarum dulcium.* Stronger emollients are, *Aceetum, adeps taurinus, urſinus, cervinus, leoninus, pardalinus, apri, equi ſevum, pinea, picea, abietina, terebinthina, ammoniacum, bdelium, ſtyrax, galbanum, ladanum, propoli, opopanax, ung. de althæa, emp. diachylon commune & magnum, de mucilaginibus, ceroneum, oxyceroeum Joannis de Vigo.* The differences of emollients.

We uſe emollients in ſcirrhous tumours of the muſcles, or in the lips of Ulcers, in any of the limbs, belly, glandules, bowels, by reaſon of a groſs, cold, and viſcous matter, either phlegmatick or melancholick. Yet thoſe tumors which come of melancholy, commonly turn to Cancers, which are exaſperated by mollifying things. On the contrary, ſuch as proceed from a phlegmatick matter, are brought to an equality of conſiſtence, by the uſe of emollients. Furthermore, there are three things obſervable in the uſe of emollients: the firſt is duly to conſider how much the affected part differs from his proper and natural temper and proportion, that ſo we may apply an equivalent remedy. The ſecond is, that we diſtinguiſh the natures of the parts. The third is, that we artificially gather after what manner this mollifying muſt be performed; that is, whether we ſhould mingle with the emollients deterſive or diſcuſſing Medicins. For there are many deſperate ſcirrhous tumours, that is, ſuch as cannot be overcome by any emollient Medicin, as thoſe which are grown ſo hard, that they have loſt their ſenſe; and thereupon are become ſmooth and without hairs. Here you muſt obſerve that the part ſometimes becomes cold in ſo great an exceſs, that the native heat plainly appears to languiſh, ſo that it cannot actuate any Medicin. That this languiſhing heat may be reſuſcitated, an iron ſtove ſhall be ſet near to the part, wherein a good thick piece of iron heated red hot ſhall be encloſed, for ſo the Stove will keep hot a long time. Their uſe. Things obſervable in the uſe of emollients.

The Figure of an iron Stove.



A *The caſe of the Stove.*
B *The iron Bat to be heated.*
C *The lid to ſhut the Stove.*

CHAP. XIV.

Of Deterſives, or Mundificatives.

A Deterſive is defined to be that which doth deterge or cleanſe an ulcer, and purge forth a double kind of excrement; of the which one is thicker, which is commonly called *ſordes*, which is drawn forth from the bottom of the ulcer, by the efficacious quality of the Medicins; the other is more thin and watery, which the Greeks call *Ichor*, the Latins *Sanies*, which is taken away by the drineſs of the Medicin; and therefore *Hippocrates* hath well adviſed that every ulcer muſt be cleanſed and dried.

Deterſives. Of Deterſives, ſome are ſimple, ſome compound, ſome ſtronger, ſome weaker. The ſimple are either bitter, ſweet, or ſowre: the bitter are *Gentiana, Ariſtolochia, iris, enula, ſcylla, ſerpentaria, centaurium minus, abſynthium, marrubium, perforata, abrotonon, apium, chelidonium, ruta, hyſſopus, ſcabioſa, artemiſia, eupatorium, aloe, fumus terræ, hedera terreſtris*; a *Lixivium* made with the aſhes of theſe things, *Lupini, orobus, amygdala amara, faba, terebinthina, myrrha, maſtiche, ſagapenum, galbanum, ammoniacum*, the galls of Beaſts, *ſtercus caprinum, urina bene cocta, ſquama æris, æs uſtum, ærugo, ſcoria æris, antimonium, calx, chalcitis, miſy, ſory, alumen*. The ſweet are *Viola, roſa, melilotum, ficus pingues, dactyli, uvæ paſſæ, glycyrrhiza, aqua hordei, aqua mulſa, vinum dulce, mel, ſaccarum, ſerum lactis, manna, thus*. The ſharp are all kind of ſowre things, *Capreoli vitium, acetum*, and other acid things. The Compound are, *Syrupus de abſynthio, de fumaria, de marrubio, de eupatorio, de artemiſia, acetoſus, lixivium, oleum de vitellis ovor. de terebinthina, de tartaro, unguentum mundificativum de apio, apoſtolorum, pulvis mercurialis*. We uſe

Their uſe. ſuch things as deterge, that the ſuperfluous matter being taken away, Nature may the more conveniently regenerate fleſh to fill up the cavity: But in the uſe of them, conſideration is firſt to be had of the whole body, whether it be healthy, plethorick, or ill diſpoſed; there is conſideration to be had of the part, which is moiſter and drier, indued with a more exquiſit or duller ſenſe. But oft-times acidents befal ulcers beſides nature, as a *Callus*, a defluxion of a hot or otherwiſe malign humour, and the like ſymptoms. Laſtly, conſideration is to be had, whether it be a new or inveterate ulcer; for from hence, according to the Indication, remedies are appointed different in quantity and quality: ſo that oft-times we are conſtrained to appoint the bitter remedy in ſtead of the ſweet. Neither truly with a painful and drie ulcer doth any other than a liquid deterſive agree: neither to be moiſt any other than that of a drie conſiſtence, as Powders.

CHAP. XV.

Of Sarcoticks.

No Medicin truly Sarcotick. THat Medicin is ſaid to be Sarcotick, which by its drineſs helps Nature to regenerate fleſh in an ulcer, hollow, and diligently cleanſed from all excrements. But this is properly done by bloud indifferent in quality and quantity. Wherefore, if we muſt ſpeak according to the truth of the thing, there is no Medicin which can properly and truly be called ſarcotick: For thoſe which vulgarly go under that name, are onely accidentally ſuch; as thoſe which without biting and eroſion, do drie up and deterge the excrements of an ulcer, which hinder the endeavour of Nature in generating of fleſh. For as by the Law of Nature, from that nouriſhment which flows to the nouriſhing of the part, there is a remain, or a certain thin excrement, flowing from ſome other place, called by the Greeks *Ichor*, and by the Latins *Sanies*. Thus by the corruption of the part there concretes another groſſer excrement, termed *Rypos* by the Greeks, and *Sordes* by the Latins. That makes the ulcer more moiſt, this more filthy. Hence it is, that every wound which requires reſtitution of the loſt ſubſtance, muſt be cured with two ſorts of Medicins, the one to drie up and waſte the ſuperfluous humidity thereof, the other to fetch off the filth: and by how much the wound is the deeper, by ſo much it requires more liquid Medicins, that ſo they may the more eaſily enter into every part thereof.

But diverſity of things ſhall be appointed according to the various temper of the part. For if the affected part ſhall be moiſt by Nature, ſuch things ſhall be choſen as ſhall be leſs drie: if on the contrary the part be drie, then ſuch things ſhall be uſed as be more drie; but many ſorts of Medicins ſhall be aſſociated with the ſarcoticks, according to the manifold complication of the affects poſſeſſing the ulcer. Therefore Nature onely is to be accounted the Workmaſter, and the efficient cauſe in the regenerating of fleſh, and laudable bloud the material cauſe, and the Medicin the helping or aſſiſting cauſe, or rather the cauſe without which it cannot be: as that by cleanſing and moderately drying without any vehement heat, takes away all hinderances of incarnation, and orders and fits the bloud to receive the form of fleſh. This kind of Medicin according to *Galen*, ought to be drie only in the firſt degree, leſt by too much drineſs it might drink up the bloud and matter of the future fleſh, which notwithſtanding is to be underſtood of Sarcoticks which are to be applied to a delicate and temperate body. For if the ulcer be more moiſt, or the body more hard than is fit, we may aſcend to ſuch things as are drie even in the third degree. And hence it is that ſuch drie Medicins may firſt be called Deterſives, and then preſently Sarcoticks. A Sarcotick Medicin is either ſimple or compound, ſtronger or weaker. Simple Sarcotick Medicins are,

Simple Sarcoticks. *Ariſtolochia utraque, iris, acorus, dracunculus, aſarum, ſymphyti omnia genera, betonica, ſanicula, mellifolium, lingua canis, verbena, ſcabioſa, pimpinella, hypericon, ſcordium, plantago, rubia major & minor, eorumque ſucci. Terebinthina lota & non lota, reſina pini, gummi arabicum, ſarcocolla, maſtiche, colophonia, manna, thuris, cortex ejuſdem, aloe, olibanum, myrrha, mel, vinum, ſanguis draconis, lithargyros, auri, ſpodium, pompholyx, tutia, plumbum uſtum lotum, ſcoria ferri*. The Compound

Compound Sarcoticks. Sarcoticks are, *Oleum hypericonis, ol. ovorum, maſtichinum, & cætera olea, quæ balſami nomine appellantur, unguentum aureum, emp. de betonica, Vigonis de janua, Emp. Gratia Dei, nigrum*. We uſe not Sarcoticks

before

before that the ulcer be cleanſed and freed from pain, defluxion, inflammation, hardneſs, and diſtemper. In uſing theſe things we conſider the temper of the body, and the affected part: For oftimes a part otherwiſe leſs dry by nature, requires a more powerful drying medicine, and ſtronger ſarcotick, than another part which is more dry, and this for ſome other reaſon, which ought to come into our conſideration: For example, the glans would be more dried than the prepuce, although it be of a temper leſs dry, becauſe it is the paſſage of the urine. Wherefore we muſt diligently obſerve the condition of the affected parts, and thence taking indication, make choice of more ſtrong ſarcoticks. Foth both that which is too little, and that which is too much ſarcotick, makes a ſordid ulcer: the firſt becauſe it dries not ſufficiently; the latter for that by its acrimony it cauſeth defluxion. Therefore diligent care muſt be uſed in the examination hereof.

CHAP. XVI.

Of Epuloticks, or ſkinning medicines.

AN Epulotick medicine is that which covereth the part with skin: it is ſaid to be ſuch as by drineſs and aſtriction without biting deſiccates, binds, and condenſates the fleſh into a certain callous ſubſtance, like to the skin, which we commonly call a cicatrice or ſcar: yet this, as the generating of fleſh, is the work of nature. A medicine therefore is ſaid to be Epulotick, for that it aſſiſts nature in ſubſtituting and generating a ſcar, in ſtead of the true skin, whilſt it conſumes the ſuperfluous humidities, condenſates, incraſſates, and binds the next adjacent fleſh: therefore it ought to dry more powerfully than a ſarcotick. Epulotick medicines are of three kinds: the firſt is the true epulotick, which onely dries and binds. The ſecond is an acrid and biting epulotick, which, for that it waſtes the proud fleſh, is called ſo; and this muſt be ſparingly uſed, and that only to hard and ruſtick bodies. The third is that which only dries without aſtriction. The things whereof they conſiſt are theſe: *Ariſtolochia utraque, gentiana, iris, centaurium majus, pentaphyllon, ſymphytum majus, chamædrys, betonica, cauda equina, cupatorium, verbenaca, plantaginis & ſymphyti folia, gallæ, baccæ myrti, glandes & earum calices, balauſtia, cupreſſi nuces, malicorium, cortex quercus, cortex tamaricis, cortex ligni aloes, acacia, colophonia, ſarcocolla, ſanguis draconis, ladanum, lithargyros auri, argenti, ceruſa, plumbum uſtum, alumen uſtum, tuthia, ſquamma æris & ferri, & eorum ſcoria, ærugo, flos æris, æs uſtum & lotum, ſulphur vivum, chryſocolla, corali, bolus armenus, terra ſigillata, cineres buccinarum, oſtreorum, ſilicis, oſſa uſta & ſiccata, caries lignorum, ung. diapompholygos, ung. alb. rhaſis, deſiccativum rubrum, emp. de ceruſa, de betonica, diacalcitheos, emp. nigrum.* Three ſorts of Epuloticks.

We uſe Epuloticks when as the ulcer is almoſt filled up, and equal to the adjacent skin. In the uſe of theſe we muſt alſo have reſpect to the tenderneſs and hardneſs of the body; for ſuch things as are corroſives to tender and delicate bodies, are epulotick to hard and ruſtick bodies. Alſo we muſt have regard, whether the body be plethorick, or replete with ill humours, for ſuch do not eaſily admit cicatrization. Alſo it is moſt worthy of your obſervation, to mark whether the ulcer that is to be cicatrized be fed or nouriſhed by the preſent defect of any part, as the liver, ſpleen, lungs, or a *varix* lying about it. for it cannot be cicatrized before theſe impediments (if any ſuch be) be taken away. Laſtly, the callous lips of an ulcer, unleſs they be ſcarified or ſoftened, hinder cicatrization. Therefore all ſuch defaults muſt be taken away, and then ſuch an epulotick applied, as may not by the too much drineſs leave the ſcar too hollow, or the too little, leave it too high. Their uſe.

CHAP. XVII.

Of Agglutinatives.

AGglutinating or agglutinative medicine is of a middle nature, between the ſarcotick and epulotick, more ſtrong than the former, and weaker than the latter, for it is dry to the ſecond degree. It by the drying and aſtrictive faculty, void of all deterſion, conjoins parts parts that are diſtant, or rather lends helping hands to nature the principal agent in this work. Glutinatives, whether they be ſtrong or weakly ſuch, do agglutinate either by their proper or accidental nature: Of this ſort are *Plantaginis omnes ſpecies, conſolida utraque, bugloſſa, millefolium, verbena, pimpinella, piloſella, cauda equina, ſempervivum, telephium, ſanicula, attractilis, folia quercus & dracunculi, ſalix, ebulus, ſambucus, pentaphyllon, veronica, cortex pini, ulmi, palmæ quercus. Aqua vitis, aq. e folliculis ulmi, ſuccus calaminthæ, vinum auſterum, terebinthina, myrrha, ſanguis draconis, bolus armenus, terra ſigillata, omnia denique acerba.* Agglutinative medicines.

Glutinatives by accident are thoſe that hinder defluxion, and bind the part, as Sutures, Bandages, Reſt, Rowlers, and the like. We uſe glutinative in green, and as yet bloudy wounds, whence the Greeks call a glutinative medicine *Enæma*, although ſometimes they are uſed to inveterate, malign, fiſtulous and ſinuous ulcers; for they hinder the defluxion from coming to the lips of ulcers. You muſt conſider, when as you intend to apply them, whether the skin be whole or no: For ulcers knit together, or heal more difficultly, if the skin be rubbed off, or cut, or otherwiſe loſt. Neither ought you to be unmindful of the forementioned cautions and indications drawn from the ſex, the tenderneſs or hardneſs of the affected body, the continuance and magnitude of the ulcer: for hence indication muſt be taken, what the quantity and quality of the medicin ought to be. Glutinatives by accident.

CHAP. XVIII.

Of Pyroticks, or cauſtick Medicines.

Three degrees of Cauſticks.

THat medicine is ſaid to be Pyrotick or Cauſtick, which by its acrimony and biting, commonly conſiſting in an earthy conſiſtence, either ſuperficially corrodes, or more deeply eats and putrefies, or laſtly, burns and conſumes the skin and fleſh, ſo that it even pierces into callous and hard bodies. Therefore there are three degrees of Pyroticks; for ſome are termed Cathereticks or corroding, for that they waſte the proud fleſh of an ulcerated or any other part, and theſe are judged the weaker ſort of the Pyroticks. Otherſome are termed Septick or putrifying, as thoſe which deſtroy and diſſolve the tender and new ſprung up fleſh, and raiſe bliſters in the skin, and theſe are more powerful than the cathereticks. Laſtly, there are otherſome termed moſt powerful Eſcharoticks, which by their fiery and terreſtrial quality cauſe eſchars or cruſts; whereupon they are alſo termed *Ruptoria*, and potential Cauteries: Now all theſe differences are taken from that they are more or leſs powerful, for it oft-times happens, that according to the different temper and conſiſtence of the parts, according to the longer or ſhorter ſtay, a Catheretick may penetrate as far as a Septick, and on the contrary, an Eſcharotick may enter no farther than a Septick. Theſe are judged

Cathereticks. Catheretick, *Spongia uſta, alumen uſtum & non uſtum, vitriolum uſtum, calx mediocriter lota, æruga, chalcanthum, ſquamma æris, oleum de vitriolo, trochiſci andronis, phaſionis, aſphodelorum, ung. Ægyptiacum, apoſtolorum, pulvis mercurii, arſenicum ſublimatum.*

Septicks and Veſicatories. Septicks and Veſicatories are, *Radix ſcillæ, bryoniæ, ſigill. beatæ Mariæ, bugloſſa, radix ranunculi, panis porcini, apium, riſus, lac tithymallorum, lac fici, euphorbium, anacardus, ſinapi, cantharides, arſenicum ſublimatum:* For all theſe weaken the native temper and conſiſtence of the part, and draw thereunto humors plainly contrary to nature.

Eſcharoticks. Their uſe. Eſcharoticks or Cauſticks are, *Calx viva, fæx vini cremata & præcipue aceti, ignis*, whereto are referred all Cauteries, as well actual as potential, whereof we ſhall treat hereafter. We uſe Cathereticks in tender bodies, and diſeaſes not very contumacious; therefore by how much they are leſs acrid and painful, by ſo much oft-times they penetrate the deeper, for that they are leſs troubleſome by delay; but we uſe Septicks, and ſometimes Eſcharoticks in ulcers that are callous, putrid, and of inexhauſted humidity, but principally in Cancers, Carbuncles, and exceſſive Hæmorrhagies. When as we make uſe of theſe, the patient muſt have a convenient diet appointed, muſt abſtain from wine: laſtly, they muſt not be uſed but with great diſcretion; for otherwiſe they may cauſe Feavers, great inflammations, intolerable pains, Swounings, Gangrenes, and Sphacels. Cauteries heedfully uſed, ſtrengthen and dry the part, amend an untameable diſtemper, dull the force of poyſon, bridle putrefaction and mortification, and bring ſundry other benefits.

CHAP. XIX.

Of Anodynes, or ſuch as mitigate or aſſwage pain.

What pain is.

BEfore we treat of Anodyne medicines, we think it fit to ſpeak of the nature of pain. Now pain is a ſorrowful and troubleſome ſenſe, cauſed ſome ſudden diſtemper, or ſolution of continuity. There are three things neceſſary to cauſe pain; The efficient cauſe, that is, a ſudden departure from a natural temper or union; the ſenſibleneſs of the body receiving the dolorifick cauſe: laſtly, the apprehenſion of this induced change, cauſed either by diſtemper or union; for otherwiſe with how exquiſite ſoever ſenſe the body receiving the cauſes indued with, unleſs it apprehend and mark it, there is no pain preſent. Hence is that Aphoriſm of *Hippocrates*, *quicunq; parte aliqua corporis dolentes dolorem omnino non ſentiunt, his mens ægrotat*, that is, Whoſoever pained in any part of their bodies do wholly feel no pain, their underſtanding is ill affected and depraved. Heat, cold, moiſture, and drineſs, induce a ſudden change of temper; and heat and cold cauſe ſharp pain, drineſs moderate, but moiſture ſcarce any at all: for moiſture cauſeth not pain ſo much by its quality, as it doth by the quantity. Both the forementioned qualities, eſpecially aſſociated with matter, as alſo certain external cauſes too violently aſſailing, ſuch as theſe that may cauſe contuſion, cut, prick, or too much extend. Wherefore pain is a ſymptom of the touch, accompanying almoſt all diſeaſes; therefore oft-times leaving theſe, they turn the counſel of the Phyſician to mitigate them, which is perfórmed either by mitigating the efficient cauſes of pain, or dulling the ſenſe of the part. Hereupon they make three differences of Anodynes: For ſome ſerve to cure the diſeaſe, otherſome to mitigate it, otherſome ſtupifie, and are narcotick. We term ſuch curative of the diſeaſes, which reſiſt, and are contrary to the cauſes of diſeaſes. Thus pain, cauſed by a hot diſtemper, is taken away by oil of Roſes, Oxycrate, and other ſuch like things, which amend and take away the cauſe of pain, to wit, the exceſs of heat. Pain cauſed by a cold diſtemper, is amended by *Oleum Laurinum, Nardinum, de Caſtoreo.* Pain occaſioned by two much drineſs, is helped by *Hydrelæum*, a bath of freſh and warm water. Laſtly, by this word Anodyne, taken in the largeſt ſenſe, we underſtand all purging medicines, Phlebotomy, Scarification, Cauteries, Cuppings, Glyſters, and other ſuch like things as evacuate any ſtore of the dolorifick matter.

What properly termed Anodynes are. But ſuch as are properly termed Anodynes, are of two ſorts: for ſome are temperate, others hot and moiſt in the firſt degree, and conſequently near to thoſe that are temperate: theſe preſerve the native heat in the proper integrity, thus they amend all diſtemperatures; of this kind are accounted Sallad oil, oil of ſweet Almonds, the yolks of eggs, and a few other ſuch like things, theſe ſtrengthen the native heat, that thus increaſed in ſubſtance, it may with the more facility overcome the cauſe of pain: beſides alſo, they rarifie, attenuate, digeſt, and conſequently evacuate both groſs and viſcid humors, as alſo cloudy flatulencies hindred from paſſing forth: ſuch are *flores chamæmeli, meliloti, crocus, oleum chamæmelinum, anethinum, oleum lini, oleum ex ſemine altheæ, lumbricorum, vorum, ex tritico, butyrum, lana ſuccida, ſuillus adeps, vitulinus, gallinaceus, anſerinus, humanus, ex anguilla enticula,*

cunicula, & aliis. Lac mulierbre, & vaccinum, mucago ſeminis lini, fœnugræci, althææ, malvæ, vel ejuſmodi ſeminum decoctum: as alſo *Decoctum liliorum, violariæ, capitis, pedum, & inteſtinorum arietis & hœdi.*

Narcoticks, or ſtupefying medicines, improperly termed Anodynes, are cold in the fourth degree, therefore by their exceſs of cold, they intercept or hinder the paſſage of the animal ſpirits to the part, whence it is that they take away ſenſe: of this ſort are *hyoſcyamus, cicuta, ſolanum manicum, mandragora, papaver, opium, arctiſſima vincula.* Narcotick improperly termed Anodynes.

You may make uſe of the firſt ſort of Anodynes in all diſeaſes, which are cured by the oppoſition of their contraries: but of the ſecond, to expugn pains that are not very contumacious, that by their application we may reſiſt defluxion, inflammation, the feaver, and other ſymptoms. But whereas the bitterneſs of pain is ſo exceſſive great that it will not ſtoop to other medicines, then at the length muſt we come to the third ſort of Anodynes. Yet oft-times the bitterneſs of pain is ſo great, that very narcoticks muſt be applied in the firſt place, if we would have the part and the whole man to be in ſafety. Yet the too frequent uſe of them, eſpecially alone without the addition of ſaffron, myrrh, *caſtoreum*, or ſome ſuch like thing, uſeth to be very dangerous: for they extinguiſh the native heat, and cauſe mortification, manifeſted by the blackneſs of the part. But intolerable pains, to wit, ſuch as are occaſioned by the exceſs of inflammation and gangrenes, may be ſooner mitigated by opening a vein, purging and ſcarifying the part affected, than either by properly termed anodynes or narcoticks, to wit, that pain may be the remedy of pain. By purgers we here underſtand not only ſuch as taken by the mouth, produce that effect; but alſo ſuch as outwardly applied perform the ſame, as thoſe whereof *Aetius* makes mention, As The uſe of them.

℞. *Pulpæ ſeu medul. colocynth. ſemin. eruc. rut. ſylveſt. elaterii, gr. cindii, lathyrid. expurgatar. galban. nitri, ceræ, ſingulorum,* ℥iv. *opopan.* ℥ij. *terebinth.* ℥vj. *terenda terito, & taurino felle paulatim irrigato, donec apte imbibantur.* Then apply it about the navel even to the ſhare, for thus it will purge by ſtool; if on the contrary you apply it to the bottom of the ſtomach, it will cauſe vomit. Another; ℞. *elaterii* ℥iij. *colocynth. ſquammæ æris radic. cucumer. agreſt. lathyrid. an.* ℥j. *aut pro lathyrid. tithymal. ſuccum terito & cribrato, at cum oleo plurimum ſalis habente ſubigito, magnam inde pilam e lana confertam hoc medicamento illitam, umbilico aut lumbis applicato.* Or, ℞. *fellis taurin.* ℥j. *gr. cindii virid.* ℥iv. *ſucci lupinor. virid.* ℥ij. *euphorb.* ℥j. *pulp. colocynth. tantundem adip. vulpin. recent.* ℥vj. *adip. viper.* ℥ij. ß. *ſtercor. muris,* ℥iv. *ſucci pæon. caſtor. ſingulor.* ℥iv *ol. liguſtrin.* ℥vi. *ol. antiq.* ℥j. *fiat unguentum vel oleum.* It purgeth without trouble, and beſides the other commodities it alſo is good againſt diſtraction or madneſs. Two ſpoonfuls is the greateſt quantity to be uſed at one time; for in ſome, one is ſufficient: anoint therewith the navel and thereabouts, and a juſt purgation will enſue thereupon, which if it ſhall flie out beyond your expectation, you may foment the belly with a ſponge moiſtened in warm wine and preſſed forth again, it will be preſently ſtayed. Moreover *Fernelius lib. 7. methodi*, makes mention of a laxative ointment. *Tetrab. 1. ſerm. 3 cap. 25.* Purgatives to be externally applied. The compoſition of a purging oil and ointment.

CHAP. XX.

Of the compoſition and uſe of Medicines.

HItherto we have ſpoken of the faculties of ſimple medicines; now we think good to ſay ſomething of the compounding of them: for ſo by the Architect are had and known every thing apart, and then he ſettles the workmen to the building, the conceived form of which hath been in his mind ever ſince he did enterpriſe it. Therefore the compoſition of divers medicaments with their qualities and effects, is a mingling appointed by the art of the Phyſician. Hence therefore *rheum, aloe, roſa, abſynthium*, although they have divers ſubſtances and faculties, yet are notwithſtanding called ſimple medicines, becauſe they have that variety from Nature, not from Art. But we many times call ſimple ſuch things as are compounded by art, as *oxym. ſimpl. oxyſacch. ſimplex*, as compared to greater compoſitions. And therefore oftentimes we uſe compound medicines, becauſe always the ſimple medicine alone, hath not ſtrength enough to oppugn the diſeaſe. For many times the ſick labour with manifold, and not ſimple affects, from which there being taken a various indication, we gather contrary ſimple medicines, to apply to every affect, in one compoſition. But oftentimes the nature of the part of the Patient, or of the body affected, requireth another kind of medicament which may be proper for the removing that diſeaſe; wherefore it is ſo made to oppugn the diſeaſe and not offend the body: and we mingle many other together, whoſe effects may temper one another. Moreover the compoſition of medicines was neceſſary, that becauſe thoſe things which have not a good taſte, colour, or ſmell, by Art, or compoſition, might be made more gratetul. Compound medicines of which we intend to ſpeak, are Glyſters, Suppoſitories, *Noduli*, Peſſaries, Oils, Liniments, Ointments, Emplaſters, Cerats, Pultiſſes, Cataplaſms, Fomentations, Embrocations, Epithemates, Veſicatories, Cauteries, *Collyria, Errhina*, Sneeling-powders, Maſticatories, Gargariſms, Dentifrices, Bags, Fumigations, Semicupiums, Baths. But firſt it is expedient that I ſay ſomething of weights and meaſures, with their notes, by which medicines commonly are meaſured and noted by Phyſicians. *Gal. 2. ſimp. 4. de ſanit. tuend.* The neceſſity of compound medicines.

CHAP XXI.

Of weights and meaſures, and the notes of both of them.

EVery weight ariſeth from a beginning and foundation, as it were; for as our bodies do ariſe of the four firſt ſimple bodies or elements, into which they are often reſolved: ſo all weights do ariſe from the grain, which is as it were the beginning and end of the reſt. Now hereby is underſtood, a barly-corn or grain, and that ſuch as is neither too dry, or overgrown with mouldineſs, or rancid, but well conditioned, and of an indifferent bigneſs. A grain the beginning of all weight. What is meant by a grain.

Obolus. Ten grains of theſe make an *Obolus*; two Oboli, or twenty grains make a ſcruple, three ſcruples,
A ſcruple. or ſixty grains make a dram, eight drams make one ounce, twelve ounces make one pound medi-
A dram. cinal,, which is for the moſt part the greateſt weight uſed by Phyſicians, and which they ſeldom ex-
An ounce. ceed; and it is reſolved into ounces, drams, ſcruples, *oboli* and grains, which is the leaſt weight.
A pound. To expreſs theſe weights we uſe certain notes; the pound is expreſſed by this note, ℔. the ounce by this ℥, the dram thus ʒ, the ſcruple thus ℈, the *obolus* with the beginning letter thus *obol.* the grain with his beginning letter thus, g. But ſometimes we meaſure the quantity of medicines by meaſures and not always by weights; and therefore we expreſs a handful by this note, m. a pugil thus, p. number thus, n. and the half part of every weight and meaſure is expreſſed by this note, ſ. put after every note of the aforeſaid weights and meaſures of the ſame ſort, as the half pound, ℔ ſ. the half ounce, ℥ ß. and ſo of the reſt. Moreover, in deſcribing the ſame medicament we uſe the notes ſometimes of weights, ſometimes of meaſures; and therefore it is to be noted that herbs, green or dry, are ſigned with theſe notes, m. p. but thoſe which are dry and to be brought to powder, with theſe notes, ℥.ʒ.p. Roots, by theſe notes, ℥.ʒ.p.m. Barks, by theſe notes, ℥.ʒ. Seeds, by theſe notes, ℥.ʒ. Fruits, by theſe notes, an.p.℥.ʒ.℈. Flowers, by theſe notes, p.m.℥.ʒ. Pulſes, by theſe notes, p.℥.ʒ.

All other medicaments either dry or liquid, are deſcribed with theſe notes, ℔.℥.ʒ.℈. obol. g.

Having expounded theſe things, let us come to the deſcription of compound medicines, beginning with glyſters firſt, as the remedy which is moſt common and familiar, and almoſt chiefly neceſſary of all others.

CHAP. XXII.

Of Glyſters.

What a glyſter is. A Glyſter is an injection prepared firſt and properly for the groſs inteſtines and fundament; for ſometimes glyſters are uſed and made for the ſtomach, ſpleen, reins, bladder, womb, meſentery, aud alſo for the head, from whence oftentimes by ſharp glyſters, the hurtful matter is brought downwards, as we ſee in Apoplexies. Therefore there is no part of the body which receives not ſome benefit by glyſters, but more or leſs according to the vicinity they have with the belly, and the ſtrength of the glyſter: for there are divers ſorts of glyſters, ſome emollients, others evacuating, ſome anodynes, ſome aſtringents, ſome cleanſing, ſome ſarcotick, and epulotick, and ſome may be ſaid to nouriſh. They may be all made of the parts of plants or beaſts, with compound medicines either ſolutive, or altering, and others according to the advice of the Phyſician. The parts of plants which are uſed to this purpoſe, are roots, ſeeds, leaves, flowers, fruits, ſhouts, juices, mucilages. Parts of beaſts are yolks of eggs and whites, hony, chickens, capons, old cocks well beaten, hands and feet of ſheep, the inteſtines, whey, milk, ſewet, axungia, and ſuch like in decoctions, wherein we mingle and diſſolve ſimple and compound medicines. We ſometimes uſe without any other medicament, to make a glyſter with oil alone, as oil of nuts for the Colick, of whey alone, the decoction of the head and feet of the ſheep alone, and of the decoction of Cicers and barly do we prepare Glyſters.

Differences of glyſters.

The materials of glyſters.

Their quantity The quantity of a Glyſter is ſometimes leſs according to the diverſe diſpoſition of men and their diſeaſes: for weak children the quantity is leſs: for women with child, and in the colick, dyſentery, lientery, or when much hardened excrement is within. But when we would abundantly move the excrement, and there is nothing that may hinder, the doſe of a glyſter for the moſt part is half a pound, one pound, or three quarters of a pound. The glyſter muſt be injected warm or hot, more or leſs, according to the nature or condition of the ſick: for being cold it offends the inteſtines, and the neighbouring nervous parts, which are cold of themſelves. It muſt be given by degrees, for being injected ſuddenly, the wind which is uſually in the guts will beat it back again, whence comes intolerable pain. But this will be more clear by that we ſhall teach concerning the differences of glyſters, whereof there ſhall be ſufficient examples.

An emollient glyſter. ℞. *malv. violar. biſmalv. acanth. an.* m. j. *radic. alth. lilior. an.* ℥j. *paſſul. ficuum ping.* ℥ ß. *fiat decoctio ap.* ℔j. *in qua diſſolve caſſ. butyr. recent. an.* ℥j. *ol. viol.* ℥iij. *fiat Clyſter.*

Glyſters that do evacuate, are prepared by the counſel of the Phyſician, and of divers Simples, being boiled for ſeveral purpoſes. Therefore if the humors be cold which are to be evacuated, the Glyſter ſhall be after this manner.

A glyſter to evacuate a cold phlegmatick humor. ℞. *Salviæ, origani, abrotoni, chamæm. melilot, an.* m. ß *ſeminum aniſi, fœnic. cumini, an.* ℥iij. *ſemin. cathar.* ʒij. Make a decoction of them, wherein diſſolve *Diaphon. Hier. Simpl. an.* ℥ ſ. *ol. aneth. chamæm. an.* ℥j. ß. *Mellis Antho. ſacc. rub. an.* ℥j. *fiat Clyſter.*

To evacuate Cholerick matter, prepare a Glyſter after this matter, ℞. *quat. remollient. paret. Cichor. endi. an.* m. ſ. *Semen. quat. frigid. Major. an.* ʒiij. *hordei integri,* p. j. Make a decoction of them, and diſſolve in it *Caſſ.* ℥j. *Ol. viol. mellis viol. an.* ℥ij. *fiat Clyſter.*

To evacuate melancholy, this Glyſter following will be uſeful. ℞. *Fumitor. Centaur. minoris, Mercurialis, an.* m. j. *Polyp. Qu. folicul. ſennæ, an.* ℥iij. *ſeminis agni caſti, Thymi, an.* ℥ij. Make a decoction and diſſolve therein *Confect. Hamech.* ℥ ß. *Caſſ. recens extract.* ℥iij. *olei violati, lilior. an.* ℥ ß. *Sac. rub. mellis viol. an.* ℥j ß. *ſalis,* ℥j. And thoſe Glyſters do not only evacuate the humors that offend, but alſo correct the diſtemper of the bowels and inward parts. For the Glyſters preſcribed againſt pituitous and melancholick matter, help the cold diſtemper; but that which is for choler, the hot diſtemper. Purging medicines, which are diſſolved in the decoction of Glyſters, are very ſtrong, as, *Confect. Hamech. Benedicta, Diaprun. Solutivum, Diaphenicon,* being uſed from ʒvj. to ℥j. at moſt: but the weaker and more gentle are *Catholicon, Caſſia, Hiera ſimplex,* from ℥vj. to ℥ij. at moſt.

An Anodyne glyſter. An Anodyne Glyſter is uſually made without ſuch things as purge or evacuate: as, ℞. *Flor. Chamæm. melil. Aneth. an.* p. j. *rad. Biſmal.* ℥j. boil them in milk, and to the decoction add, *Mucaginis ſeminis lini, fœnugræci, extractæ in aqua Malvæ,* ℥ij. *ſaccari albi, olei anethi, chamæmeli, an.* ℥j. *vitellos ovorum*

ovorum duos, fiat Clyſter. Theſe Glyſters ſhould be kept longer in the body, that ſo they may more eaſily mitigate pain.

An Aſtringent Glyſter.

The example of an aſtringent Glyſter. ℞. *Equiſeti, plantag. polygami, an.* m. j. boil them in *lacte uſtulato*, to ℥xij. to the decoction ſtrained add *Bol. armeni, ſanguinis draconis, an.* ʒij. *olei roſati*, ℥ij. *albumin. ovorum duorum, fiat Clyſter.* We uſe theſe kind of Glyſters in Dyſenteries, and in the immoderate flux of the Hæmorrhoid veins, having firſt evacuated the uſual excrements. Glyſters which be ſarcotick, epulotick, and cleanſers of the greater guts, and fit for the curing of ulcers, are to be prepared of ſuch medicines as are deſcribed before in their proper Chapters.

Nouriſhing Glyſters.

Alimentary Glyſters are made of the decoction of Chickens, Capons, Cocks, being boiled to a gelly, and ſtrongly preſſed forth. They are alſo prepared of Marrow gelly, which are not altogether ſo ſtrong as thoſe which are commonly taken by the mouth, becauſe the faculty of concoction in the guts, is much weaker than that of the ſtomach. Oftentimes alſo the matter of theſe kind of Glyſters is prepared in wine, where there is no pain of the head or fever, but more frequently in the decoction of Barly, and in Milk, adding the yolks of Eggs, and ſome ſmall quantity of white ſugar, leſt by the cleanſing faculty it move the guts to excretion. And therefore Sugar of Roſes is thought better, which is conceived to be ſomewhat binding. Here you may have examples of ſuch Glyſters. ℞. *Decoctionis Capi perfecte cocti* ℔. j. ß. *ſacchari albi*, ℥ß. *miſce, fiat Clyſter.* ℞. *Decocti Pulli & Galatinæ*, ℔. ß. *vini opt.* ℥iv. *fiat Clyſter.* ℞. *Decocti hordei mundati, & in cremorem redacti* ℔. ß. *lactis boni* ℔ j. *Vitellos ovorum duos, fiat Clyſter.* We uſe theſe kind of Glyſters to ſtrengthen children, old and weak men, and bodies that are in a Conſumption. But in the uſe of theſe there are three things to be obſerved: Firſt that the fæculent excrements may be taken away, either by ſtrength of nature, or by art, as by a Suppoſitory, or an emollient Glyſter, leſt the alimentary matter being mingled with them, ſhould ſo be infected and corrupted. The other is, that there be great quantity given, that ſo ſome may aſcend to the upper guts. That third is, that the ſick ſleep after the taking of it; for ſo it is more eaſily converted into nouriſhment, and the alimentary matter is better kept, for ſleep hindereth evacuations. In Glyſters of this kind we muſt beware of Salt, Hony and Oil; for the two firſt provoke excretion by their acrimony, and the laſt by his humidity doth relax and lubricate. They who think no kind of Glyſter can nouriſh or ſuſtain the body, rely upon this reaſon: That it is neceſſary whatſoever nouriſheth, ſhould have a triple commutation or concoction in the body: firſt, in the ſtomach; ſecondly, in the liver; thirdly, in all the members. But this is repugnant to reaſon and experience: to reaſon, for that a certain ſenſe of ſuch things as are defective, is implanted in all and every of the natural parts of our body. Therefore ſeeing nutrition is a repletion of that which is empty, without doubt the empty and hungry parts will draw from any place that nouriſhment that is fit and convenient for them, and in defect thereof, whatſoever they meet with, which by any familiarity may aſſwage and ſatisfie their deſire. But the alimentary Glyſters, by us deſcribed, conſiſt of things which agree very well with the nature of our bodies, and ſuch as are boiled and ordered with much art, ſo to apply the chylification to be performed in the ſtomach. Therefore they may be drawn in by the meſaraick veins of the guts; which according to *Galen*, have a certain attractive faculty. And thence they may be eaſily carried through the gate-vein, liver, and ſo over the whole body. And experience teacheth, that many ſick people, when they could take nothing by the mouth, have been ſuſtained many days by the help of theſe kind of Glyſters. What is more to be ſaid? We have ſeen thoſe who have taken a Suppoſitory by the fundament, and vomited it at the mouth; by which it alſo appeareth that ſomething may flow without danger of the ſick from the guts into the ſtomach.

Their uſe.

Their Argument that deny Glyſters to nouriſh.

Confuted firſt by reaſon.

Secondly, by experience.

Commonly they give Glyſters any hour of the day, without any reſpect of time; but it ſhould not be done unleſs a great while after meals, otherwiſe the meat, being hindred from digeſtion, will be drawn out of the ſtomach by the Glyſter.

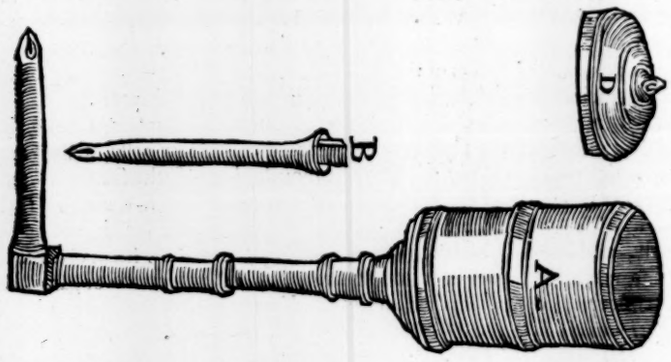
The common uſe of glyſters.

Glyſters are uſed to help the weaker expulſive faculty of the guts, and by conſequence alſo of the other parts, both that ſuch as through want of age, and old people, and ſuch as by reaſon of great imbecillity by ſickneſs cannot admit of a purging medicine, may by this means at leaſt eaſe themſelves of the trouble and burden of hurtful humors. *Galen* hath attributed to Storks the invention of Glyſters, which with their bills, having drunk Sea-water, which from ſaltneſs hath a purging quality, waſh themſelves by that part, whereby they uſe to bring away the excrements of their meats, and of the body. But a Glyſter is fitly taken after this manner: whileſt the Syringe is expreſſed, let the patient hold open his mouth; for by this means all the muſcles of the *Abdomen*, which help by compreſſion the excretion of the guts, are relaxed; Let him wear nothing that may gird in his belly, let him lie upon his right ſide, bending in a ſemicircular figure; and ſo the Glyſter will the more eaſily paſs to the upper guts, and (as it were) by an overflowing, wet and waſh all the guts and excrements. It hapneth otherwiſe to thoſe who lie upon their left ſide; for the Glyſter being ſo injected, is conceived to abide, and (as it were) to ſtop in the *Inteſtinum rectum*, or *Colon*, becauſe in this ſite theſe two inteſtines are oppreſſed, and as it were ſhut up with the weight of the upper guts. A little while he may lie upon his back after he hath received the Glyſter, and preſent after he may turn himſelf on either ſide. And if there be pain in any part, ſo long as he is able, may incline to that ſide; Moreover, becauſe there are many who cannot by any reaſon be perſwaded to ſhew their buttocks to him that ſhould adminiſter the Glyſter, a fooliſh ſhamefaſtneſs hindring them: therefore I thought good in this place to give the figure of an Inſtrument, with which one may give a Glyſter to himſelf, by putting up the pipe into the fundament, lifting the buttocks a little up. The pipe is marked with this letter *A*. The body of the Syringe, whereinto the Glyſter muſt be put, with this Letter *B*.

The ſick having received the glyſter muſt turn to their ſide grieved.

The

The figure of a Glyſter-pipe and Syringe, by beneſit whereof a man may give himſelf a Glyſter.



CHAP. XXIII.

Of Suppoſitories, Nodules, and Peſſaries.

A Suppoſitory is a certain medicament, formed like unto a tent, or gobbet of paſte, ſuch as is commonly uſed to fat Fowl. It is put into the fundament, that it might excite the ſphincther-muſcle to ſend forth thoſe excrements which are knit in the guts. Anciently it had the form of an Acorn, whence it is called to this day *Glans*. The Suppoſitories we now uſually make, have the form of a Peſſary, that is round and longiſh, in the form of a Wax-Candle. They

The differences. are either weak, ſtronger, or ſharp; the weak are made of the ſtalks or the roots of Beets, of Lard, boiled Hony with Salt, or of Caſtle-ſope. The ſtronger of purging powders, as *Hiera*, with Salt and Hony, or the juices of ſharp herbs, or mingled with the galls of beaſts. It is commonly made

The form. thus: as, ℞. *Mellis* ℥j. *Salis aut pulveris alterius irritantis* ʒj.

The uſe. ℞. *Mellis cocti* ℥j. *pul. Colocynthidos* ϑ ß. *Salis gemmæ* ϑj. *fiat Suppoſitorium.* We uſe Suppoſitories, when the ſick by his infirmity is unwilling, or not able to bear or away with a Glyſter, as in burning Feavers: or, when as one being injected, is ſlow and reſteth in the guts. And we uſe the ſharper Suppoſitories in ſoporiferous affects of the head, that they might provoke the dull faculty of the guts to expulſion. As alſo when the condition of the diſeaſe is ſuch, that by the uſe of Glyſters there is manifeſt hurt; as in an *Enterocele*, where the gut ſo ſwells, that over and above if it be filled by the glyſter infuſed, it would the more preſs the *Peritoneum*, ſo that ſtraight-ways by the relaxed or broken part it might eaſily be devolved into the Cod.

Nodules have the ſame uſe with Suppoſitories, and are oftentimes ſubſtituted in ſtead of Glyſters. They are made of gentle medicines, as the yelks of Eggs with a little Salt and Butter, or of Gall and Hony tied up in a cloth in the form of a Filbert; the ſtring of it may hang forth, whereby the Nodule

The form of a Nodule. in the fundament may be drawn forth. This deſcription may be an example of Nodules: ℞. *Vitellum unius ovi, cui adde ſalis modicum, fellis vervecis, mellis an.* ℥ ß. *butyri* ʒiij. *miſce, fiant Noduli filo appenſi.*

Peſſaries. A Peſſary is groſſer than a Suppoſitory, and is appointed for the womb, being made with Cotton-Wool or Silk ſteeped in ſome medicament, and then put into the neck of the womb.

Their uſe. A Peſſary is uſed either to ulcers of the neck of the womb, or for the procuring or ſtopping of the *Menſtrua*, or againſt ſordid and hurtful humors of the womb, cauſing hyſterical paſſions, and therefore to be wafted away and evacuated. Therefore in the compoſition of Peſſaries are uſed gums, juices, ſeeds of herbs, roots, and many other things, according to the advice of the Phyſician, they are alſo made of a ſolid conſiſtence, the bigneſs of a finger, that they may enter into the neck of the womb; theſe being tied with a ſtring, which muſt hang forth to pluck it out withall when occaſion ſerves. This following may be an example of their deſcription. ℞. *myrrh. aloes an.* ʒj. *ſabin. ſemin. nigel. artemiſ. an.* ʒij. *radic. ellebor. nig.* ʒj. *croci,* ϑj. *cum ſucco mercurial. & melle fiat Peſſus*; let it be tied to the thigh with a thred. Or thus, ℞. *maſtich. thuris, an.* ʒiij. *alum. roſ. rub. nuc. cupreſ. an.* ʒij. *ladan. hypoci, ſumach. myrtil. an.* ʒiij. *fiant peſſi cum ſucco arnogloſ. & cotoniorum.* According to this example others may be made for to mollifie, to bind, to cleanſe, to incarnate, to cicatrize and cover the ulcers of the womb: they are to be put up when the patient lieth in bed, and to be kept all night,

Peſſaries are alſo made of medicinable powders, not only mixed with ſome juice, but alſo with thoſe powders alone being put into a little bag of ſome thin matter, being ſtuffed with a little cotton, that it might be of a convenient ſtiffneſs, and this kind of Peſſaries may be uſed profitably in the falling of the mother,

An example of one mentioned by Rondoletius *in his book of inward Medicines, is as followeth.*

Againſt the ſuffocation of the Mother. ℞. *Benoioini, ſtyracis, caryoph. an.* ʒj. *gal. moſchi,* gr. vi. *fiat pulvis*; this being made up with cotton, may be put up into the body.

CHAP.

CHAP XXIV.
Of Oils.

PRoperly and commonly we call oil that juice which is preſſed forth of Olives; but the word is uſed more largely, for we call every juice of a fluxible, unctuous, and aiery ſubſtance, Oil. There are three differences of theſe oleaginous juices: The firſt is of thoſe things which yield oil by expreſſion, as well fruits as ſeeds being bruiſed, that by beating the oily juice may be preſſed forth; ſome are drawn without fire, as oil of ſweet and bitter almonds, oil of nuts, of *Palma Chriſti.* Others are made to run by the help of fire, by which means is gotten oil of bays, linſeed-oil, rape-oil, oil of hemp, and ſuch like: The manner of drawing oil from ſeeds is ſet down by *Meſue* in his third book.

The ſecond ſort of thoſe oils which are made by the infuſion of ſimple medicines in oil, wherein they leave their qualities: and this is done three ſeveral ways, the firſt is by boiling of roots, leaves, tops of flowers, fruits, ſeeds, gums, whole beaſts, with wine, water, or ſome other juice, with common or any other oil, until the wine, water, juice be conſumed, which you may perceive to be perfectly done, if you caſt a drop of the oil into the fire, and it maketh no noiſe but burneth. It is to be remembred that ſometimes the ſeeds or fruits are for a certain time to be macerated before they are ſet to the fire, but it muſt be boiled in a double veſſel, leſt the oil partake of the fire. The making oils by infuſion.

After this manner is made *oleum coſtinum, rutaceum, de croco, cydoniorum, myrtillorum, maſtichinum, de enphorbio, vulpinum, de ſcorpionibus,* and many others. The ſecond is by a certain time of maceration, ſome upon hot aſhes, others in horſe-dung, that by that moderate heat the oil might draw forth the effects of the infuſed medicines into it ſelf. The third is by inſolation, that is, when theſe or theſe flowers, being infuſed in oil, are expoſed to the Sun, that by the heat thereof the oil may change, and draw into himſelf the faculty of the flowers which are infuſed: of this kind are oil of roſes, camomil, dill, lilies, of water-lilies, violets and others, as you may ſee in *Meſue.*

The third kind is properly that of the Chymiſts, and is done by reſolution made after divers manners, and of this ſort there are divers admirable qualities of divers oleaginous juices, whether they be made by the Sun or Fire, or putrefaction, as we ſhall ſpeak in his place hereafter. The manner of oils by reſolution.

We uſe oils when we would have the virtue of the medicament to pierce deep, or the ſubſtance of the medicines mingled with the oil to be ſoft and gentle. Moreover when we prepare oils that ſhould be of a cooling quality the common oil of the unripe Olive is to be uſed: of that ſhould the oil of roſes be made.

Again when we would prepare oils of heating qualities, ſuch as are *Oleum Philoſophorum,* or of Tiles, ſweet and ripe oil is to be choſen.

CHAP. XXV.
Of Liniments.

A Liniment is an external medicine of a mean conſiſtence between an oil and an ointment, for it is thicker than an oil; for beſides oil it is compounded with butter, axungia and ſuch like, which is the reaſon why a Liniment is more efficacious in ripening and mitigating pain, than ſimple oil. The varieties of Liniments are drawn from their effects, ſome cool, others heat, ſome humect, ſome ripen, others by compoſition are made for divers uſes. The matter whereof they are uſually made, is oil, axungia, ſuet, butter, all thoſe things which have an oily ſubſtance or conſiſtence, as *ſtyrax liquida,* turpentine, the mucilages of fenugreek, marſh-mallows, marrow, and other like. To theſe are ſometimes added powders of roots, ſeeds, flowers, rinds, metals, but ſparingly, that the liniment may be of a liquid conſiſtence. What a liniment is.

An example of a liniment that is good to attenuate, heat, and digeſt, is this that followeth. ℞. *Ol. amygd. amar. lilior. an.* ℥j. *axung. anat. gallin. an.* ℥ß. *butyr. ſal expert.* ℥j. *mucag. ſem. alth. fœnugr. extract. in aq. hyſſop. an.* ℥ß. *pulver. croci, ireos, an.* ℈j. *fiat linimentum.* This may be an example of a liniment to humect and mollifie. ℞. *ol. amygd. dulc.* ℥ij. *axung. human.* ℥ß. *mucag. ſemin. malv. extract. in aq. parietar.* ℥ß. *fiat linimentum*: you may add a little ſaffron. There be many others like theſe which may be made for divers affects. They are eaſily applied to every part of the body, becauſe they are not ſo liquid as oils: the reaſon is, they are more agreeable to any of the parts. If they be to enter into any crooked narrow paſſage, ſuch as the ear, they muſt be more liquid, and have more oil: if they be to ſtick on the part, they will admit of more axungia and ſuet.

They are deceived who think that the difference between liniments and ointments is, that there is no wax in liniments as there is in unguents; for there be ſome unguents which admit not any wax to be added, as *Ægyptiacum,* and all ſuch as are uſed in gangrenes, and all ſorts of putrid ulcers; becauſe to theſe kinds of diſeaſes all fatty things, as oils, fats, roſins, and wax, are enemies. Therefore we ſubſtitute in the place of them in *Ægyptiacum,* hony and verdigreaſe; for of theſe it hath his conſiſtence, and his quality of cleanſing.

CHAP XXVI.
Of Ointments.

OIntments are of a more ſolid conſiſtence than Liniments, and are therefore of more force. Their differences are partly taken from their effects; for ſome heat, others cool, ſome dry, and ſome humect, ſome cleanſe, ſome corroborate, ſome waſte dead fleſh, and others cicatrize, Ointments and their differences.

cicatrize, partly from the variety of colours, partly from the firſt inventors, as *Album Rhaſis*, *Deſiccativum rubrum*: partly from the number of the ſimple medicaments whereof they be made, as, *Tetrapharmacum*, *Tripharmacum*, or *Nutritum*: partly from that medicament which is principal in the compoſition; hence are they called *Unguentum de Lithargyro*, *de Minio*, *Diapompholygos*, and ſuch like. They are compounded of herbs, roots, ſeeds, fruits, metals, and part of Beaſts; the juices and other liquid things being conſumed away by boiling, as we have ſaid in the Chapter of compound Oils. Herbs, and the parts of them, if they be dry, muſt be powdred, and alſo metals; but being green, they are boiled and ſtrained forth, and the juice ſo preſſed is waſted by boiling. Gums and Roſins ſome are powdred, others being put to ſome convenient liquor are diſſolved by fire: ſo wax is diſſolved in the Oil. In the compoſition of unguents this proportion is uſually obſerved, that for one ounce of powder, two ounces of Wax, and eight of oil is added: notwithſtanding for that Wax ſerveth only to the conſiſtence of the ointment, it is better to leave the quantity to the will of the Apothecary; but he may be more ſparing in adding Wax to the ointments in Summer than in Winter; for the heat of Summer, drying them, addeth to the conſiſtence: by examples propounded, theſe common precepts will more plainly appear.

Unguentum aſtringens. ℞. *Olei roſ.* ℥iv. *pil. lepor. bol. armen. terræ ſigil. an.* ℥j. *bal. Gallar. an.* ℥ß. *tritis terendis, & ſimul mixtis, addita cera quod ſufficit, fiat unguentum.* Here we muſt obſerve, that there be three ways of making ointments: The firſt is of thoſe which are made only by ſtirring or grinding in the Mortar without any fire, and ſo is made *Unguentum nutritum*. The ſecond is, when we diſſolve Wax in Oil, Fat, or ſome ſuch ſubſtance with fire: and being all diſſolved, we mingle the powders according to the proportion we noted before. After which manner are made *Unguentum Aureum*, *Baſilicon*, *Diapompholygos*, *Deſiccativum rubrum*, *Enulatum*. The third ſort is, when we bruiſe herbs with a peſtel, and mingle them with Axungia, boiling them together, and then ſtraining them, and the ointmen, is that which is ſtrained. Therefore let us proceed to explain this by examples.

Unguentum nutritum. ℞. *Lithar. auri triti & loti* ℔ ß. *olei roſ.* ℔. j. *aceti roſ.* ℥iv. *fiat Unguentum.* Firſt, we put the Litharge into the Mortar, pouring in a little Oil, and working it with a Peſtel, that it may grow thick, then with the Oil we put a little Vinegar, continually working, until they mingle into one body, now and then between whiles adding ſometimes a little Oil, ſometimes a little Vinegar, until the whole be brought to the conſiſtence of an ointment. If of an ointment of this kind thou wouldſt make a black plaiſter, by degrees conſume all the Vinegar, ſo ſhall the plaiſter ſhine and grow black.

Unguentum aureum. ℞. *Ceræ citr.* ℥vj. *olei boni* ℔ij. *tereb.* ℥ij. *reſin. & coloph. an.* ℥j ß. *olib. maſtich. an.* ℥j. *croci,* ℥j. *fiat Unguentum.* Firſt, diſſolve the Wax with a good part of Oil, then add the Roſin and Colophony broken ſmall. Theſe being diſſolved, take the compoſition from the fire, and then add the Turpentine, when the whole is ſomewhat cooled; add the *Olibanum* and Maſtick being finely powdred, then the Saffron, which ſhall be macerated in the reſt of the Oil.

Ung. Tetrapharmacum, ſeu Baſilicon. Tetrapharmacon is ſo called, becauſe it is made of four ſimple medicines, Wax, Roſin, Pitch, Tallow, of each a like quantity, and ſo equally mixed.

℞. *Reſin. picis nigr. adip. vituli, & ceræ an.* ℥ij. ß. *Olei veteris olivarum maturarum,* ℔j. ß. or if you would have it harder, ß. j. that ointment is alſo called *Baſilicon*, the Wax being cut ſmall and diſſolved in Oil, then add the reſt of the things, which being diſſolved, thou ſhalt have the deſired ointment.

Ung. Diapompholygos. ℞ *Olei roſ.* ℥ix. *cer. alb.* ℥iij. *ſucci ſolani hortenſis,* ℥iv. *Ceruſ. lot.* ℥j. *Pompholygos, plumbi uſti & loti, olib. puri, an.* ℥ ß. *fiat unguentum.* Diſſolve the Wax in the Oil with a gentle fire, then you ſhall take it from the fire, and add to the reſt of the ingredients, working them together in a ſtone Mortar, pouring on the juice by degrees, at leaſt ſo much of it as will incorporate.

Ung. deſiccativum rubrum. ℞. *Lap. calam. ter ſig. an.* ℥ij. *Litharg. auri ceruſ. an.* ℥j ß. *Camphor.* ℥ ß. *ceræ,* ℥ij ß. *Olei roſat. viol. an.* ℥iij. *fiat Unguentum.* Diſſolve the Wax in the Oil, then ſet it to cool, and work in the powders with a ſpatter, and at laſt add the Camphire diſſolved in a little Oil of Roſes, or Roſewater.

Ung. Enulatum. ℞. *Rad. enul. campan. cocti. cum aceto & contuſ. ut decet* ℔ ß. *Axung. porci, olei commu. an.* ℥i ß. *argen. vivi extincti, & tereb. lot. an.* ℥j. *ſal. commu. pulveriſati,* ℥ij. incorporate them according to art. The boiled roots muſt be drawn through a Sieve, which being boiled by a gentle fire with the *Axungia*, muſt be continually ſtirred, then put to the Salt with Oil and Wax: when you ſet it from the fire to cool, then add the Quickſilver, being killed with a little *Axungia* and Turpentine.

Ung. Album Rhaſis. De Althæa. ℞. *Olei roſat.* ℥ix. *ceruſ. alb.* ℥iij. *cer. alb.* ℥ij. make it thus: let the Ceruſs be finely powdred, and put into the Oil and Wax whilſt it is hot, and ſo work the whole together until they ſhall be brought into a body. ℞. *Rad. Alth.* ℔. j. *ſemi. lini, fænugr. an.* ℔ ß. *Scyllæ* ℥iij. *Olei com.* ℔. ij. *cer.* ℔. ß. *terebinth. gum. heder. galb. an.* ℥j. *coloph. & reſin.* ℥iij. The roots and ſeeds being bruiſed, are infuſed for three days in five pints of water; boil them until three ounces be conſumed, and then draw forth the Mucilage, and boil it with the Oil, then add Wax cut ſmall: theſe being taken from the fire, the *Galbanum* being diſſolved with Vinegar, and mingled with the Turpentine, muſt be added together with the Gum *Hederæ*, Colophony, and Roſin.

Ung. Populeum. ℞. *Ocul. populi alb.* ℔. j. ß. *fol. papaveris nigr. Mandrag. hyoſcyami, lactucæ, ſempervivi parvi & magni, violæ nigræ ſolani, umbilici Veneris, ſeu cymbalar. bardanæ, an.* ℥ ß. (*Cordus, Fernelius, & Nicolaus ſingulorum* ℥iij. *præſcribunt*) *Adipis ſuilli recentis ſalis expertis,* ℔ij. *vini boni,* ℔j. *fiat Unguentum.* The popular buds and Violet leaves muſt be bruiſed and macerated in the *Axungia* for the ſpace of two months, that is until the reſt of the herbs be ready; for they cannot be gathered before the Summer time, but the Poplar buds and Violets may be had in March. They muſt be bruiſed and mingled very well, and ſet in a warm place for eight days; then add one pint of ſtrong Vinegar, and boil them till it be conſumed, which may be perceived by caſting a little of it into the fire, then ſtrain it forth, and put up the ointment.

Ung. Apoſtolorum. ℞. *Tereb. cer. alb. æruginis. an.* ℥xiv. *Opop. flor. ſeu virid. æris (nam hic flos æris non proprie accipiter pro gran. quæ ſcintillant inſtar ab ære exiliunt dum a fabr. ferrar. aqua tingitur: ſed pro viridi æris uſurpatur, cujus contra maligna ulcera notæ ſunt vires, contra quæ omnino id Unguent. eſt comparat.) an.* ℥ij. *ammon.* ℥xiv. *ariſt. lon. thur. maſc. an.* ℥vj. *myr. & galb. an.* ℥iij. *bdel.* ℥vj. *Lith.* ℥ix. *ol.* ℔ij. *fiat Ung.* The Litharge is to be mingled with two ounces of Oil for the ſpace of five hours, and with a gentle fire to be boiled until it come to the conſiſtence

ſiſtence of Honey, and be always ſtirring leſt it burn: being taken from the fire and warm, the Wax and the Roſin being diſſolved, with the reſt of the Oil, muſt be added. Then put to it, when it is cooling, the Gums diſſolved in Vinegar, boiled and incorporated with the Turpentine. Then the *Ariſtolochia*, Myrrh, and Frankincenſe are to be mingled, and laſt of all the Verdigreaſe, being in fine Powder, and ſprinkled in: and ſo the Unguent is made. ℞ *Cortic. median. caſtan. cortic. median.* Comitiſſa. *querc. cortic. median. gland. myrtil. eqneſ. cortic. fabar. acinor. uvar. ſorbor. ſiccor. immatur. meſpillor. immaturor. rad. chelidon. folior. prunor. ſylveſt. an.* ℥ j. ß. *aquæ plantag.* ℔ viij. *cer. nov.* ℥ viij. ʃ. *olei myrtillor.* ℔ ij. ʃ. Then theſe things which follow being finely powdered, are to be ſprinkled in. ℞ *Pulveris corticis mediani caſtan. corticis mediani gland. cortic. median. arb. gland. id eſt, querc. gallar. an.* ℥ j. *cineris oſſ. cruris bovis, myrtill. acinor. uvar. ſorbor. ſiccor. an.* ℥ ʃ. *Trochiſcorum de carabe,* ℥ ij. *fiat Unguentum.* Firſt make a decoction *Corticis mediani arboris quercus, acini uvar. rad. chelid. meſpil. ſorbor. equiſ. ſeminis myrtil. folior. pruni ſylveſtris, cort. fabar. cortic. mediani gland. cortic. caſtan. & gallar.* in the Plantain Water for the ſpace of two hours, then ſtrain it, and divide the liquor into nine parts, waſhing the Wax diſſolved with the Oil of Myrtils ſeven times; the liquor being all ſpent, and the Wax and Oil being melted, then inſperge the Powders, *Gruris bovis, aſſium, cortic. med. cortic. querc. med. gland. caſtan. gallar. ſorbor. meſpil. ſeminum myrtil. acinor. uvar.* and at the laſt the Trochiſces *carab.* after this manner ſhall you make this Ointment. ℞ *Olei abſynth. maſtich. de ſtic. roſat. an.* ℥ ʃ. *pulver.* *ung. pro ſtomacho.* *abſynth. roſ. major. menth. an.* ℥ j. *caryoph. cinam. maſtich. galang. an.* ℥ j. Powder thoſe things which are to be powdered, and with a ſufficient quantity of Wax make a ſoft Ointment, wherewith let the ſtomach be anointed one hour before Meals continually. ℞ *Cer. alb.* ℔ ij. *ceruſ. litharg.* *ung. ad morſus rabioſos, ex li. 1. Gal. de comp. ſec. genera.* *auri, an.* ℔ j. *myrrh. medul. cervi, an.* ℥ ij. *thuris,* ℥ j. *olei,* ℔ ʃ. Boil the Litharge in the Oil to a mean conſiſtence, then add to the Wax and Ceruſs, and when it will not ſtick to the fingers, take it from the fire and put in the *Medulla*; when it beginneth to cool, the *Myrrha* and *Thus*, being finely powdered, muſt be caſt in by little and little, and the Ointment may be put up for uſe. The chops of the fundament, and emollient Peſſaries are likewiſe made of it, and it is very good againſt the bitings of mad Dogs, and the punctures of nerves and tendons, keeping wounds ſo that they do not agglutinate. ℞ *Picis pinguis,* ℔ j. *opopanacis in aceto forti, oleo liliorum, & veteri porci axungia* 3. *De comp. med. ſec. gen.* *cocti,* ℥ iij. *fiat Unguentum. Oleum ex ſinapi,* is good againſt thoſe bitings of mad Beaſts and punctured nerves; for it doth open wounds when they are cicatrized. Ointments are uſed to overcome the contumacy of a ſtubborn evil by their firm and cloſe ſticking to, eſpecially if there ſhall need no Medicin to go further into the body.

CHAP. XXVII.

Of Cerats and Emplaſters.

SUch affinity there is in the compoſition of a Cerat and Emplaſter, that oftentimes the one is taken for the other, as is uſually done in Ointments and Liniments. A Cerat is a compoſition more ſolid and hard than an Ointment, and ſofter than a Plaſter, having his name from Wax, which taking awry the fluidneſs of the Oil, bringeth him to his conſiſtence. The differences of Cerats are taken ſome from the parts by which they are called, as *Ceratum ſtomachicum*: ſome from the effects, as *Ceratum refrigerans Galeni*: others from the ſimple Medicaments which are the chief in the compoſition, as *Ceratum Santalinum*. The proper matter of Cerats is new Wax and Oils, being appropriated to the grief of theſe or thoſe parts; ſo that Liniments and Ointments do ſcarce differ from Cerats, if they admit of Wax: for if Ointment of Roſes ſhould have Wax added to it, it were no longer an Ointment but a Cerat. What a Cerat is. The differences.

Cerats which are made with Roſins, Gums, and Metals, do rather deſerve the names of Emplaſters than Cerats. And therefore *Ceratum ad Hernias* we commonly call *Emplaſtrum contra Ruptu-ram*. If that pain or inflammation do grieve any part, we make Cerats of Plaſter diſſolved with Oil, leſt that the more hard and heavy conſiſtence of the Emplaſter ſhould be troubleſom to the part, and hinder perſpiration: and therefore laying aſide the compoſition of Cerats, let us ſpeak of Emplaſters.

An Emplaſter is a compoſition which is made up of all kind of Medicins, eſpecially of fat and dry things, agreeing in one groſs, viſcous, ſolid, and hard body, ſticking to the fingers. The differences of Emplaſters are taken from thoſe things, which the variety of Ointments are taken from. Of thoſe things which go into the compoſition of an Emplaſter, ſome are onely uſed for their quality and faculty, as Wine, Vinegar, Juices. Others to make the conſiſtence, as Litharge (which according to *Galen*, is the proper matter of Emplaſters) Wax, Oil, and Roſin. Others be uſeful for both, as Gums, Metals, parts of Beaſts, Roſin, Turpentine to digeſt, to cleanſe and dry. Of Emplaſters, ſome are made by boiling, ſome are brought into a form without boiling; thoſe which be made without fire, do ſuddenly dry, nor are they viſcous: they are made with Meal and Powder, with ſome juice, or with ſome humid matter mingled with them. But Plaſters of this kind may rather be called hard Ointments or Cataplaſms: for Plaſters properly ſo called are boiled, ſome of them longer, ſome ſhorter, according to the nature of thoſe things which make up the compoſition of the Emplaſter: Therefore it will be worth our labour to know what Emplaſters do ask more, or which leſs boiling. For Roots, Woods, Leaves, Stalks, Flowers, Seed, being dried, and brought into Powder, are to be added laſt, when the Plaſter is boiled as it were, and taken from the fire, leſt the virtue of theſe things be loſt. But if green things are to be uſed in a compoſition, they are to be boiled in ſome liquor, and being preſſed forth, that which is ſtrained to be mingled with the reſt of the compoſition; or if there be juice to be uſed, it is to be bruiſed and preſſed forth, which is ſo to be boiled with the other things, that nothing for the quality is to remain with the mixture, as we uſe to do in *Empl. de Janua, ſeu Betonica, & Gratia Dei*. The ſame is to be done Emplaſters.

with

with Mucilages, but that by their clammineſs they do more reſiſt the fire. But there doth much of Oil and Honey remain in their Plaſters when they are made. Thoſe juices which are hardned by concretion, as *Aloes*, *Hypociſtis*, *Acacia*, when they are uſed in the compoſition of a Plaſter, and be yet new, they muſt be macerated and diſſolved in ſome proper liquor, and then they are to be boiled to the conſumption of that liquor. Gums, as *Opopanax*, *Galbanum*, *Sagapenum*, *Ammoniacum*, muſt be diſſolved in Wine, Vinegar, or *Aqua vitæ*, then ſtrained and boiled to the conſumption of the liquor, and then mixed with the reſt of the Plaſter. And that they may have the exact quantity of Gums and Pitch, it is neceſſary that firſt they be diſſolved, ſtrained, and boiled, becauſe of the ſticks and ſordid matter which are mingled with them. You muſt have reſpect alſo to the liquor you uſe to diſſolve them in; for Vinegar of the beſt Wine doth more powerfully penetrate, than that which is of weak and bad Wine.

Other Gums, which are drier, are to be powdered, and are to be mingled with Plaſters laſt of all. Metals, as *Æs uſtum*, *Chalcitis*, *Magnes*, *Bolus Armenius*, *Sulphur*, *Auripigmentum*, and others, which may be brought to Powder, muſt be mingled laſt, unleſs advice be given by long boiling to dull the fierce qualities of them. The like conſideration is to be had of Roſin, Pitch, and Turpentine, which muſt be put in after the Wax, and may not be boiled but very gently; but the Fats are mingled whileſt the other things are boiling. The Litharge is to be boiled with the Oil to a juſt conſiſtence, if we would have the Plaſter dry without biting. Ceruſs may endure as long boiling, but then the Plaſter ſhall not be white, neither will the Litharge of ſilver make a Plaſter with ſo good a colour as Litharge of gold. Moreover, this order muſt be obſerved in boiling up of Plaſters: the Litharge muſt be boiled to its conſiſtence; Juices or Mucilages are to be boiled away, then add the Fats, then the dry Roſin, Wax, Gums, Turpentine, and after them the powders: You ſhall know the Plaſter is boiled enough by its conſiſtence, groſs, hard, glutinous, and ſticking to the fingers, being cooled in the air, water, or upon a ſtone. Alſo you ſhall know it by its exact mixtion, if that all the things become one maſs hard to be broken.

Signs of a Plaſter perfectly boiled.

The quantity of things to be put into Plaſters.

The quantity of things which are to be put into a Plaſter can hardly be deſcribed, but an artificial conjecture may be given, by conſidering the medicaments which make the Plaſter ſtiff, and of a conſiſtence, and the juſt hardneſs and ſoftneſs they make being boiled. Wax is not put into ſuch Plaſters wherein is *Labdanum*, for that is in ſtead of Wax. For if there ſhall be in the compoſition of a Plaſter ſome emplaſtick Medicaments, the Wax ſhall be the leſs; contrariwiſe, if they ſhall be almoſt all liquid things, the Wax ſhall be increaſed ſo much as ſhall be neceſſary for the conſiſtence of the Plaſter. The quantity of the Wax alſo muſt be altered according to the time, or the air; therefore it is fit to leave this to the art and judgment of the Apothecary. Emplaſters are ſometimes made of Ointments by the addition of Wax, or dry Roſin, or ſome other hard or ſolid matter. Some would that a handful of Medicaments powdered, ſhould be mingled with one ounce, or an ounce and half of Oil, or ſome ſuch liquor, but for this thing, nothing can certainly be determined: onely in Plaſters deſcribed by the Ancients there muſt be great care had, wherein he muſt be very well verſed, who will not err in the deſcribing the doſe of them; and therefore we will here give you the more common forms of Plaſters.

Empl. de Vigo with Mercury. ℞ *Ol. chamæm. aneth. deſpica, liliacei, an.* ℥ ij. *ol. de croco,* ʒ j. *pingued. porci,* ℔ j. *pingued. vitul.* ℔ ß. *euphorb.* ʒ v. *thuris* ʒ x. *ol. lauri,* ℥ j. ß. *ranas viv.* nu. vj. *pingued. viper. vel ejus loco human.* ℥ ij. ß. *lumbricor. lotor. in vino* ℥ iij. ß. *ſucci ebuli, enul. ana* ℥ ij. *ſchœnanthi, ſtœchados, matricar. an.* m. ij. *vini odoriferi,* ℔ ij. *litharg. auri* ℔ j. *terebinth. claræ* ʒ ij. *ſtyracis liquid.* ʒ j. ß. *argenti vivi extincti*, ſo much as the preſent occaſion ſhall require, and the ſick ſhall be able to bear, and make up the Plaſter. To one pound of the Plaſter they do commonly add four ounces of Quick-ſilver, yet for the moſt part they do increaſe the doſe, as they deſire the Plaſter ſhould be ſtronger: the Worms muſt be waſhed with fair Water, and then with a little Wine to cleanſe them from their earthy filth, of which they are full, and ſo the Frogs are to be waſhed and macerated in Wine, and ſo boiled together to the conſumption of a third part; then the Squinanth muſt be bruiſed, the Feverfew and the Stœchas cut ſmall, and they being added, to be boiled to the conſumption of one pint, and being boiled ſufficiently, the decoction being cooled ſhall be ſtrained and kept; and the Litharge is to be infuſed for twelve hours in the Oil of Chamomile, Dill, Lillies, Saffron, and the axungies above ſpoken of. Then boil them all with a gentle fire, by and by taking it from the fire, and add one quart of the decoction above ſpoken of, then ſet it to the fire again that the decoction may be conſumed, and then by degrees add to the reſt of the decoction: the Oil of Spike ſhall be reſerved unto the laſt, which may give the Plaſter a good ſmell. Then are added the juices of Walwort and Enula, which muſt be boiled until they be waſted away. Afterwards it being taken from the fire, to the compoſition is added the Frankincenſe and Euphorbium, and white Wax as much as ſhall ſuffice. When the whole maſs ſhall cool, then at laſt is mingled the Quick-ſilver extinct, Turpentine, Oil of bitter Almonds, Bays, Spike, of Line, Styrax and Axungia, being continually ſtirred, and it ſhall be made up upon a ſtone into rolls. Unleſs the Quick-ſilver be well extinguiſhed, it will run all into one place, and unleſs you tarry until the compoſition cool, it will vapour away in fume.

Ceratum œſipi ex Philagrio. ℞ *Croci* ʒ ij. *bdelii, maſtich. ammon. ſtyrac. liquid. an.* ℥ ß. *ceræ alb.* ℔ ß. *tereb.* ℥ vj. *medul. cruris vaccæ, adipis anſerini, an.* ℥ j. *œſypi, vel ſi deſit, axung. gallin.* ℥ ix. *olei nard. quantum ſatis ad magdaleones formandos, expreſſionis ſcillæ,* ʒ j. ß. *olibani, ſevi vitul.* ℥ j. The *œſypus, ſepum, adeps, medulla, cera*, are to be diſſolved together; when they cool, add the *Ammoniacum* diſſolved in the decoction of Fœnugreek and Chamomile, half an ounce, and ſo much juice of Squils, then put to the Styrax and Turpentine, ſtirring them continually; then add the *Bdelium*, *Olibanum*, Maſtick, Aloes, brought into fine Powder, and when they are perfectly incorporated into a maſs, let them be made up with *Oleum nardinum* into rolls.

De gratia Dei. ℞ *Terebinth.* ℔ ß. *reſin.* ℔ j. *cer. alb.* ℥ iv. *maſtich.* ℥ j. *fol. verben. beton. pimpinel. an.* m. j. The Herbs being green, the

the tops are to be cut and bruiſed in a ſtone Mortar, and boiled in red Wine to the conſumption of one third part. To the ſtrained Liquor add Wax cut into ſmall pieces, and being diſſolved by the fire; the liquor being conſumed put to the Roſin, when it ſhall cool add the Maſtick powdered, working it with your hands, by which it may be incorporated with the reſt of the things.

℞ *Succi beton. plantag. apii, an.* ℔ j. *ceræ, picis, reſin. tereb. an.* ℔ ß. *fiat. empl.* The Juices are to be mingled with the Wax being diſſolved, and boiling them until three parts be conſumed, add the Roſin and Pitch, which being diſſolved and hot, muſt be ſtrained, and then add the Turpentine, and make up the Plaſter. *De Janua, ſeu de Betonica.*

℞ *Croci, picis com.* (or rather *picis naval.* becauſe this emplaſter is uſed to diſcuſs and draw forth the matter which cauſeth the pain of the joints) *coloph. ceræ, an.* ʒij. *tereb. galb. ammon. thuris, myrrhæ, maſtich. an.* ʒv. ß. The *cera, pix,* and *colophonia* are by little and little to be diſſolved, to which add the gums diſſolved according to art, and mingled with the terebinth; and taking it from the fire add the *thus, myrrha,* and at laſt the *crocus* in fine powder, and then make it up into rowls with Oil of Worms. *Emplaſtrum Oxycroceum.*

℞ *Ol. com.* ℔ ij. *ceruſ. ſubtiliſ.* ℔ j. boil them together with a gentle fire, ſtirring them continually until they come to the body of an emplaſter: if you would have the Plaſter whiter, take but ʒ ix. of the Oil. *De ceruſa.*

℞ *Litharg. triti, acet. fortiſ. an.* ℔ ß. *ol. antiq.* ℔ j. *fiat emplaſtrum:* let the Oil be mingled with the Litharge for the ſpace of twelve hours, then boil them until they come to a good conſiſtence, putting in the Vinegar by little and little; but you ſhall not take it from the fire until the Vinegar be quite waſted away. *Tripharmacum, ſeu nigrum.*

℞ *Ol. vet.* ℔ iij. *axung. vet. ſine ſale,* ℔ ij. *litharg. trit.* ℔ iij. *vitriol.* ʒ iv. let the Oil be mingled with the Litharge for the ſpace of twelve hours, and boil them to a good conſiſtence, then add to the axungia, ſtirring them continually with a Spatter made of the Palm-tree, Reed, or Willow, and being ſufficiently boiled, take it from the fire, and add the Vitriol in fine powder. *Diapalmæ, ſeu diacalcitheos.*

℞ *Picis naval. aloes, an.* ʒ iij. *litharg. ceræ, coloph. galban. ammoniac. an.* ʒ ij. *viſci querni,* ʒ vj. *gypſi uſt. utriuſque ariſtoloch. an.* ʒ iv. *myrrhæ, thuris, an.* ʒ vj. *tereb.* ʒ ij. *pulveris vermium terreſtrium, gallar. utriuſque conſolid. bol. arm. an.* ʒ iv. *ſang. humani,* ℔ j. *fiat. emplaſt.* If you would have it of a very good conſiſtence, you may add of the Oil of Myrtils or Maſtick, ℔ ß. you ſhall make it thus: Take the skin of a Ram cut in pieces, and boil it in an hundred pints of Water and Vinegar until it come to a glue or ſtiff gelly, in which you ſhall diſſolve the *viſc. querc.* then add the Pitch and Wax broken into ſmall pieces, and if you will you may add the Oil with them, afterwards the *galban.* and *ammoniac.* diſſolved in Vinegar, being mingled with the terebinth, may be added. Then add the Litharge, *gypſum, bol. ariſtoloch. conſolida, vermes, & ſang. human.* At laſt the Myrrh, *thus, colophon,* and *aloe,* ſtirring them continually; and that they may be the better mingled, work the Plaſter with a hot Peſtle in a Mortar. *Contra Ruptu-ram.*

℞ *Mucag. ſem. lini, rad. alth. fœnugr. median. corticis ulmi, an.* ʒ iv. *olei liliacei, cham. aneth. an.* ʒ j. ß. *ammon. opopanac. ſagap. an.* ʒ ß. *croci,* ʒ ij. *ceræ nov.* ℔ ß. *tereb.* ʒ ß. *fiat. empl. Fernelius* hath ʒ xx. of Wax: the Wax being cut ſmall muſt be mingled with the Oils and the Mucilages, ſtirring them continually with a wooden Spatter till the liquor be conſumed. Then the gums diſſolved and mingled with the terebinthina muſt be added, and laſt of all the Saffron finely powdered. *De Mucaginibus.*

℞ *Ol. roſ. myrtil. ung. populeon, an.* ʒ iv. *pinguedinis gallin.* ʒ ij. *ſebi arietis caſtrati, ſepi vaccini, an.* ʒ vj. *pingued. porci,* ʒ x. *litharg. auri, argenti, an.* ʒ iij. *ceruſ.* ʒ iv. *minii,* ʒ iij. *tereb.* ʒ iv. *ceræ q. ſ. fiat emplaſtrum vel ceratum molle.* The *lithargyros, ceruſa,* and *minium,* are to be brought into fine powder, ſeverally being ſprinkled with a little Roſe water, leſt the fineſt of it ſhould fly away; theſe being mingled with the Oil of Roſes and Myrtles, with a gentle fire may be boiled until they come to the conſiſtence of Honey; then add the *axungiaes,* and boil them till the whole grow black, after add the *ſebum,* and that being diſſolved, take it from the fire, and then add the *unguentum populeon,* and ſome Wax if there be need; and ſo bring it to the form of a Plaſter. *De minio.*

℞ *Litharg. puri pul.* ʒ xij. *ol. irin. chamæm. aneth. an.* ʒ viij. *mucag. ſem. lini, fœnug. rad. alth. ficuum ping. uvar. paſſar. ſucci ireos, ſcillæ, æſipi, ichthyocollæ, an.* ʒ xij. ß. *tereb.* ʒ iij. *reſ. pini, ceræ flavæ, an.* ʒ ij. *fiat emplaſtrum:* The Litharge is to be mingled with the Oil before it be ſet to the fire, then by a gentle fire it is to be boiled to a juſt conſiſtence; after the mucilage by degrees muſt be put in, which being conſumed the juices muſt be added and the ichthyocolla, and they being waſted too, then put to the Wax and Roſin, then taking the whole from the fire, add the *æſipus* and *terebinthina.* *Diachylon magnum.*

We uſe Plaſters when we would have the remedy ſtick longer and firmer to the part, and would not have the ſtrength of the Medicament to flie away or exhale too ſuddenly. The uſe of Plaſters.

CHAP. XXVIII.

Of Cataplaſms and Pultiſſes.

CAtaplaſms are not much unlike to Emplaſters leſs properly ſo called, for they may be ſpred upon linnen cloths and ſtoups like them, and ſo applied to the grieved parts. They are compoſed of Roots, Leaves, Fruits, Flowers, Seeds, Herbs, Juices, Oils, Fats, Marrows, Meals, Roſins. Of theſe ſome muſt be boiled, others crude. The boiled are made of Herbs boiled tender, and ſo drawn through an hair Searſe, adding Oils and Axungiaes thereto. The crude are made of Herbs beaten, or their juices mixed with Oil and Flower, or other Powders appropriate to the part or diſeaſe, as the Phyſician ſhall think fit. The quantity of Medicins entering theſe compoſitions can ſcarce be defined, for that they muſt be varied as we would have the compoſition of a ſofter or harder body. Verily they ought to be more groſs and denſe when as we deſire to ripen any thing, but more ſoft and liquid when we endeavour to diſcuſs. We uſe Cataplaſms to aſſwage pain, digeſt, diſcuſs and reſolve unnatural tumors and flatulencies. They ought to be The matter of Cataplaſms. Their uſe.

moderately hot and of ſubtle parts, ſo to attract and draw forth; yet their uſe is ſuſpected, the body being not yet purged, for thus they draw down more matter into the affected part. Neither muſt we uſe theſe when as the matter that is to be diſcuſſed is more groſs and earthy, for thus the ſubtler parts will be onely diſcuſſed, and the groſs remain impact in the part, unleſs your Cataplaſm be made of an equal mixture of things, not onely diſcuſſing, but alſo emollient, as it is largely handled by *Galen.* *Lib. 2. ad glauc. ubi de ſcirrho.*

This ſhall be largely illuſtrated by examples. As, ℞ *Medul. panis,* ℔ ß. *decoquantur in lacte pingui, adde olei chamæm.* ℥ ß. *axung. galin.* ℥ j. *fiat cataplaſma.* Or, ℞ *Rad. alth.* ℥ iij. *fol. malv. ſenecionis, an.* m. j. *ſem. lini, fœnug. an.* ʒ ij. *ficus, ping.* nu. vj. *decoquantur in aqua, & per ſetaceum tranſmittantur, addendo olei lilior.* ℥ j. *far. hord.* ℥ ij. *axung. porcin.* ℥ j. ß. *fiat cataplaſma.* Or, ℞ *Far. fab. & orob. an.* ℥ ij. *pulv. chamæm. & melil. an.* ʒ iij. *ol. irin. & amygd. amar. an.* ℥ j. *ſucci rut.* ℥ ß. *fiat cataplaſma.* Pultiſes differ not from Cataplaſms, but that they uſually conſiſt of Meals boiled in Oil, Water, Honey, or Axungia. Pultiſes for the ripening of tumors are made of the Flour of Barley, Wheat and Milk, eſpecially in the affects of the entrails; or elſe to drie and bind, of the Meal of Rice, Lentils, or *Orobus*, with Vinegar; or to cleanſe, and they are made of Honey, the Flour of Beans and Lupines, adding thereto ſome old Oil, or any other Oil of hot quality, and ſo making a diſcuſſing Pultiſe. Alſo Anodyne Pultiſes may be made with Milk; as thus for example, ℞ *Farin. triticeæ,* ℥ ij. *micæ panis puriſſimi,* ℥ iij. *decoquantur in lacte, & fiat pulticula.* ℞ *Farin. hordei & fab. an.* ℥ ij. *far. orob.* ℥ iij. *decoquantur in hydromeilte, addendo mellis* quart. j. *olei amyg. amar.* ℥ ij. *fiat pulticula.* We uſe Pultiſes for the ſame purpoſe as we do Cataplaſmes, to the affects both of the internal and external parts. We ſometimes uſe them for the killing of Worms, and ſuch are made of the Meal of Lupines boiled in Vinegar, with an Oxes gall, or in a decoction of Wormwood, and other ſuch like bitter things.

An Anodyne Cataplaſm. A ripening Cataplaſm. A diſcuſſing Cataplaſm. How Pultiſes differ from Cataplaſms. A ripening Cataplaſm.

CHAP. XXIX.

Of Fomentations.

A *Fotus* or Fomentation is an evaporation or hot lotion, chiefly uſed to mollifie, relax, and aſſwage pain, conſiſting of Medicins having theſe faculties. A Fomentation commonly uſeth to be moiſt, being uſually made of the ſame things as Embrocations, to wit, of Roots, Seeds, Flowers, boiled in Water or Wine. The roots here uſed are commonly of Mallows, Marſh-mallows, and Lillies. The Seeds are of Mallows, Marſh-mallows, Parſley, Smallage, Line, Fenugreek. Flowers are of Camomil, Melilot, Figs, Raiſins, and the like: all which are to be boiled in Wine, Water, or Lye, to the conſumption of the third part, or the half: as,

℞ *Rad. alth. & lil. an.* ℥ ij. *ſem lini, fœnug. cumin. an.* ʒ iij. *flo. cham. melil. & aneth. an.* p. j. *ſummit. orig.* m. ß. *bulliant in æquis partibus aquæ & vini, aut in duabus partibus aquæ, & una vini, aut in Lixivio cineris ſarmentorum, ad tertiæ partis conſumptionem, fiat fotus.* In imitation hereof you may eaſily deſcribe other Fomentations, as occaſion and neceſſity ſhall require.

We uſe Fomentations before we apply Cataplaſms, Ointments, or Plaſters to the part, that ſo we may open the breathing places or pores of the skin, relax the parts, attenuate the humour, that thus the way may be the more open to the following Medicins. The body being firſt purged, Fomentations may be uſed to what parts you pleaſe. They may be applied with a female Spunge, for it is gentler and ſofter than the male: with Felt, woollen Cloths, or the like dipped in the warm decoction wrung out, and often renewed; otherwiſe you may fill a Swines bladder half full (eſpecially in pains of the ſides) of the decoction, or elſe a ſtone-bottle, ſo to keep hot the longer; yet ſo, that the bottle be wrapped in Cotton, Wool, or the like ſoft thing, that ſo it may not by the hardneſs and roughneſs offend the part, according to *Hippocrates.* *2. De victu in acutis.*

Their uſe.

CHAP. XXX.

Of Embrocations.

AN *Embroche* or Embrocation, is a watering, when as from an high we (as it were) ſhower down ſome moiſture upon any part. This kind of remedy is chiefly uſed in the parts of the head, and it is uſed to the coronal ſuture, for that the skull, is more thin in that part, ſo that by the *ſpiracula* or breathing places of this ſuture, more open than thoſe of the other ſutures, the force of the Medicin may more eaſily penetrate unto the *Meninges*, or membrans of the brain. The matter of Embrocations is Roots, Leaves, Flowers, Seeds, Fruits, and other things, according to the intention and will of the Phyſician. They are boiled in Water and Wine, to the half or third part. Embrocations may alſo be made of Lye or Brine againſt the cold and humid affects of the brain. Sometimes of Oil and Vinegar, otherwhiles of Oil onely. ℞ *Fol. plantag. & ſolan. an.* m. j. *ſem. portul. & cucurb. an.* ʒ ij. *myrtil.* ʒ j. *flor. nymph. & roſ. an.* p. ß. *fiat decoct. ad* ℔ j. *cum aceti* ℥ ij. *ſi alte ſub eundem ſit ex qua irrigetur pars inflammata.*

What an Embrocation is.

In affects of the brain, when we would repercuſs, we often and with good ſucceſs uſe Oil of Roſes with a fourth part of Vinegar.

We uſe Embrocations, that together with the air drawn into the body by the *Diaſtole* of the Arteries, the ſubtler part of the humour may penetrate, and ſo cool the inflamed part; for the chief uſe of Embrocations is in hot affects. Alſo we uſe Embrocations, when as for fear of an hæmorrhagy, or the flying aſunder of a broken or diſlocated member, we dare not looſe the bandages wherein the member is bound. For then we drop down ſome decoction or oil from high upon the bandages, that by theſe the force of the medicin may enter into the affected member.

Their uſe.

CHAP.

CHAP. XXXI.

Of Epithemes.

Epithema, or an Epitheme, is a compoſition uſed in the diſeaſes of the parts of the lower and middle belly, like to a fomentation, and not much unlike an embrocation. They are made of Waters, Juices, and Powders, by means whereof they are uſed to the heart, cheſt, liver, and other parts. Wine is added to them for the more or leſs penetration, as the condition of the hot or cold affect ſhall ſeem to require; for if you deſire to heat, more Wine muſt be added, as in ſwooning by the clotting of bloud, by the corruption of the ſeed, by drinking ſome cold poiſon; the contrary is to be done in a fainting by diſſipation of the ſpirits by feveriſh heats, alſo Vinegar may be added. The matter of the Medicins proper to the entrails is formerly deſcribed, yet we commonly uſe the *ſpecies* of Electuaries, as the *ſpecies elect. triaſantali*, the Liver being affected, and Diamargariton in affects of the heart. The proportion of the Juices or Liquors to the Powders uſes to be this, to to every pint of them ℥ j. or ʒ j. ß. of theſe, of Wine or elſe of Vinegar ʒ j. You may gather this by the following example: What an Epitheme is. In the ſixth Chapter.

℞ *Aqu. roſ. bugl. borag. an.* ℥ iij. *ſucci ſcabioſ.* ℥ ij. *pul. elect. diamarg. frigid.* ℥ ij. *cort. citri ſicci* ℥ j. *coral. roſ. ebor. an.* ʒ ß. *ſem. citri & card. ben. an.* ʒ ij. ß. *croci & moſchi, an. gr.* v. *addendo vini albi* ℥ ij. *fiat Epithema pro corde.* A cordial Epitheme.

Epithemes are profitably applied in hectick and burning Fevers to the Liver, heart, and cheſt, if ſo be that they be rather applied to the region of the lungs than of the heart; for the heat of the lungs being by this means tempered, the drawn in air becomes leſs hot in the peſtilent and drying Fevers. They are prepared of humecting, refrigerating, and cordial things, ſo to temper the heat, and recreate the vital faculty. Sometimes alſo we uſe Epithemes to ſtrengthen the heart, and drive therehence venenate exhalations, lifted or raiſed up from any part which is gangrenate or ſphacelate. Some Cotton, or the like, ſteeped or moiſtned with ſuch liquors and powders warmed, is now and then to be applied to the affected entrail: this kind of remedy, as alſo all other topick and particular Medicins, ought not to be uſed, unleſs you have firſt premiſed general things. Their uſe.

CHAP. XXXII.

Of Potential Cauteries.

That kind of Pyrotick which is termed a Potential Cautery, burns, and cauſeth an eſchar. The uſe of theſe kinds of Cauteries is to make evacuation, derivation, revulſion, or attraction of the humours by thoſe parts whereto they are applied. Wherefore they are often and with good ſucceſs uſed in the punctures and bites of venomous Beaſts, in a venomous, as alſo in a peſtilent Bubo and Carbuncle, unleſs the inflammation be great: for the fire doth not onely open the part, but alſo retunds the force of the poiſon, calls forth, and plentifully evacuates the conjunct matter. Alſo they are good in phlegmatick and contumacious tumours; for by their heat they take away the force and endeavours of our weak heat. Alſo they are profitably applied to ſtanch bleedding, or eat and waſte the ſuperfluous fleſh of ulcers and wens, to bring down the callous lips of ulcers, and other things too long here to inſiſt upon. The uſe of potential Cauteries.

The materials of theſe Cauteries are Oak-aſhes, Pot-aſhes, the aſhes of Tartar, of Tithymals or Spurges, the Fig-tree, the ſtalks of Coleworts, and Beans, cuttings of Vines, as alſo *ſal ammoniacum*, *alkali*, *axungia vitri*, *ſal nitrum*, Roman Vitriol, and the like; for of theſe things there is made a Salt, which by its heat is cauſtick and eſcharotick, like to an hot iron and burning coal: Therefore it violently looſes the continuity by eating into the skin, together with the fleſh thereunder. I have thought good here to give you divers forms of them. The matter of them.

Take of unquencht Lime extinguiſhed in a bowl of Barbers Lye three pounds: When the Lye is ſetled let it be ſtrained, and into the ſtraining put of *Axungia vitri*, or Sandiver, calcined Argol, of each two pounds, of *Sal nitrum & ammoniacum*, of each four ounces, theſe things muſt be beaten into a groſs powder, then muſt they be boiled over the fire, and after the boiling let them remain in the Lye for four and twenty hours ſpace, being often ſtirred about, and then ſtrained through a thick and double linnen cloth, leſt any of the earthy droſs get thorow together with the liquor. This ſtrained liquor, which is as clear as Water, they call *Capitellum*, and they put it in a brazen Baſin, ſuch as Barbers uſe, and ſo ſet it upon the fire, and as ſoon as it boils, they keep it with continual ſtirring, leſt the Salt ſhould adhere to the Baſin; the *Capitellum* being half boiled away, they put in two ounces of powdered vitriol, ſo to haſten the falling of the eſchar, and ſo they keep the Baſin over the fire till all the liquor be almoſt waſted away. Then they cut iuto pieces the Salt or that earthy matter which remains after the boiling away of the *Capitellum*, and with a Knife or hot iron Spatula, form them into Cauteries of ſuch figure and magnitude as they think fitting, and ſo they lay them up, or keep them for uſe in a Vial or Glaſs cloſely ſtopped, that the air get not in: Or, The forms of them.

Take a bundle or ſufficient quantity of Bean-ſtalks or husks of Colewort ſtalks two little bundles, of cuttings of Vines four handfuls, burn them all to aſhes, which put into a Veſſel of River-water, ſo let them infuſe for a days ſpace, being ſtirred ever now and then; to this add two pounds of unquenched Lime, of *Axungia vitri* half a pound, of calcined Tartar two pounds, of *Sal niter* four ounces, infuſe all theſe, being made into powder, in the foreſaid Lye for two or three days ſpace, often ſtirring it, then ſtrain the *Capitellum* or liquor through a thick cloth until it become clear. Put it into a Baſin, and ſet it over the fire, and when as the moiſture is almoſt

wholly ſpent, let two or three ounces of Vitriol be added; when the moiſture is ſufficiently evaporated, make cauteries of that which remains, after the formerly mentioned manner.

Take of the aſhes of ſound, knotty old Oak as much as you pleaſe, make thereof a Lye; pour this Lye again upon other freſh aſhes of the ſame Wood: let this be done three or four times, then quench ſome Lime in this Lye, and of theſe two make a *Capitellum*, whereof you may make moſt approved Cauteries: For ſuch aſhes are hot in the fourth degree; and in like ſort the ſtones, whereof the Lime by burning becomes fiery and hot to the fourth degree: Verily I have made Cauteries of Oak-aſhes onely, which have wrought quickly and powerfully. The *Capitellum* or Lye is thought ſufficiently ſtrong, if that an Egg will ſwim therein without ſinking. Or,

The ſign of good *Capitellum.*

Take of the aſhes of Bean-ſtalks three pounds, of unquencht Lime, Argol, of the aſhes of Oak-wood, being all well burnt, of each two pounds. Let them for two days ſpace be infuſed into a veſſel full of Lye made of the aſhes of Oak-wood, and be often ſtirred up and down. Let this Lye then be put into another veſſel, having many holes in the bottom thereof, covered with ſtrums or ſtraw-pipes, that the *Capitellum* flowing thorow theſe ſtrait paſſages may become more clear. Let it be put twice or thrice upon the aſhes, that ſo it may the better extract the heat and cauſtick quality of the aſhes. Then putting it into a Barbers Baſin, ſet it over the fire, and when it ſhall begin to grow thick the fire muſt be increaſed, and Cauteries made of this concreting matter.

The faculty of the ſilken Cautery.

The following Cauteries are the beſt that ever I made trial of, as thoſe that applied to the arm in the bigneſs of a Peaſe, in the ſpace of half an hour without pain, eſpecially if the part of it ſelf be painleſs and free from inflammation, eat into the skin and fleſh even to the bone, and make an ulcer of the bigneſs of ones fingers end, and they leave an Eſchar ſo moiſt and humid, that within four or five days ſpace it will fall away of it ſelf without any ſcarification. I have thought good to call theſe Cauteries Silken or Velvet ones, not onely for that they are like Silk, gentle and without pain, but chiefly becauſe I obtained the deſcription of them of a certain Chymiſt (who kept it as a great ſecret) for ſome Velvet and much entreaty. Their deſcription is this:

The cauſe of the name.

Their deſcription.

Take of the aſhes of Bean-ſtalks, of the aſhes of Oak-wood well burnt, of each three pounds, let them be infuſed in a pretty quantity of River water, and be often ſtirred up and down, then add thereto of unquencht Lime four pounds, which being quencht, ſtir it now and then together for two days ſpace, that the *Capitellum* may become the ſtronger, then ſtrain it through a thick and ſtrong linnen cloth, and thus ſtrained, put it three or four times upon the aſhes, that ſo it may draw more of the cauſtick faculties from them, then boil it in a Barbers Baſin, or elſe an earthen one well leaded, upon a good Charcoal fire, until it become thick. But a great part of the ſecret or Art conſiſts in the manner and limit of this boiling; for this *Capitellum* becoming thick and concreting into Salt, muſt not be kept ſo long upon the fire, until all the moiſture ſhall be vaniſhed and ſpent by the heat thereof: for thus alſo the force of the foreſaid Medicins, which alſo conſiſts in a ſpirituous ſubſtance, will be much diſſipated and weakned; therefore before it be come to extreme drineſs, it ſhall be taken from off the fire, to wit, when as yet there ſhall ſome thick moiſture remain, which may not hinder the Cauteries from being made up into a form. The made up Cauteries ſhall be put up into a Glaſs moſt cloſely luted or ſtopped, that the air may not diſſolve them, and ſo they ſhall be laid up and kept in a dry place. Now becauſe the Powder of Mercury is near to Cauteries in the effect and faculty thereof, which therefore is termed *Pulvis Angelicus*, for the excellency, therefore I have thought good to give you the deſcription thereof, which is thus:

The deſcription of Mercury or Angelical powder.

℞ *Auripigmenti citrini, floris æris, an.* ℥ ij. *ſalis nitri,* ℔ j. ℈. *alumin. rochæ,* ℔ ij. *vitrioli* ℔ iij. Let them all be powdered, and put into a Retort, having a large Receiver well luted put thereto. Then ſet the Retort over a Fornace, and let the diſtillation be made firſt with a gentle fire, then encreaſed by little and little, ſo that the Receiver may wax a little reddiſh.

℞ *Argenti vivi,* ℔ ſ. *aquæ fortis,* ℔ j. *ponantur in phiala, & fiat pulvis, ut ſequitur.*

Take a large earthen pot, whereinto put the Vial or bolt-head wherein the *Argentum vivum* and *Aqua fortis* are contained, ſetting it in aſhes up to the neck thereof, then ſet the pot over a Fornace, or upon hot Coals, ſo that it may boil and evaporate away the *Aqua fortis*; neither in the *interim* will the Glaſs be in any danger of breaking when all the water is vaniſhed away, which you may know is done when as it leaves ſmoaking; ſuffer it to become cold, then take it forth of the aſhes, and you ſhall find calcined Mercury in the bottom, of the colour of red Lead, ſeparated from the white, yellow, or black excrement; for the white that concretes in the top is called Sublimate, which if it ſhould remain with the calcified Mercury, you ſhall make it into powder, and put it in a braſs veſſel upon ſome coals, ſtirring or turning it with a Spatula for the ſpace of an hour or two: for thus it will loſe a great part of the acrimony and biting, whence it will become leſs painful in the operation.

CHAP. XXXIII.

Of Veſicatories.

What Veſicatory and rubrifying Medicins are.

VEſicatory and rubrifying Ointments, Cataplaſms, or Plaſters, are made of acrid Medicins; which have power to draw forth to the ſuperficies of the body ſuch humours as lie deep, by exulcerating the skin and cauſing bliſters. Their matter is the ſame with ſeptick medicins; as, *Sinapi, anacordus, cantharides, euphorb. radices ſcyllæ, bryon.* and the like, which with Hony, Turpentine, Leaven, Gum, or Roſin, may be made into Cataplaſms, Ointments, or Plaſters; therefore the compoſure of Veſicatories, or rather their conſiſtence differs not from that of hard or ſoft Unguents. Therefore I will give you one example or deſcription of them, which is thus:

The deſcription of a Veſicatory.

℞ *Cantharid. euphorbii, ſinapi, an.* ℥ ſ. *mellis anacardini,* ℥ j. *modico aceti, & fermenti quod ſit ſatis, excipiantur, & fiat veſicatorium.* Some of the Ancients think it better to make up theſe Medicins with

with water rather than with vinegar, becauſe experience teacheth that vinegar abates the ſtrength of muſtard. We uſe this kind of medicin in long diſeaſes, when as we cannot any thing prevail with other medicins; eſpecially in the Head-ach, Meagrim, Epilepſie, Sciatica, Gout, the bites and punctures of venomous creatures, peſtilent Carbuncles, and other inveterate and contumacious diſeaſes. Their uſe.

Alſo we uſe them. when as we would reſtore life and ſtrength to a dead or decayed part, for thus they are drawn back together with the heat; for which purpoſe we muſt make choice of more gentle Veſicatories, as ſuch which onely rubrifie, ſo that the part may onely become red, and not be burnt: the part muſt firſt be ſtrongly rubbed, that the decayed and dull heat may be rouzed and ſtirred up, the pores of the skin more opened, that the force of the Medicin may enter the deeper into the body.

CHAP. XXXIV.

Of Collyria.

A *Collyrium* is a Medicin proper for the Eyes, made of Powder finely levigated and ground into the form of *Alchohol*, as the Arabians and our Alchymiſts term it: yet the word in a more general acception, is uſed for any liquid Medicin, made with Liquors and Powders, and applied or uſed to any part. Wherefore *Collyria* are of three kinds, ſome are moiſt or liquid, which are properly called *Collyria*; others drie, which are of the ſame conſiſtence with Trochiſces; others have the conſiſtence of Honey, or a liniment. The liquid ſerve for the greater and leſſer corners of the Eyes; thoſe of the conſiſtence of Honey are meet for the Apple of the Eye, but the drie are to be made into Powder, and ſo blown into the Eyes: alſo ſometimes they are to be diſſolved in ſome juice, or other convenient liquor, that ſo they may be made into moiſt *Collyria*. What a *Collyrium* is. The differences of them. Their uſe.

Therefore *Collyria* have diverſe uſes, and are applied to ſeveral parts according to the intention and counſel of the Phyſician: for liquid *Collyria* put into the corners of the eyes do more readily mitigate the heat of their inflammation, by reaſon they enter more eaſily by the tenuity of their ſubſtance; ſuch things as have a more firm conſiſtence adhere more tenaciouſly, and work more certainly. Moiſt *Collyria* are made of Juices, Mucilages, Waters of Herbs, Flowers, Seeds, Metalline bodies, Galls, and other ſuch like Medicins, which are Repercuſſives, Reſolvers, Detergents, Anodynes, and the like, according to the nature of the preſent diſeaſe.

Sometimes they are made of Juices and diſtilled Waters onely; otherwhiles Powders or drie *Collyria* made into Powder, are mixed with them, together with the white of an Egg. Powders are preſcribed to ʒ ij. and liquors to ʒ iv. or ʒ v. in Medicins for the Eyes; but for other parts, as when it is to be injected into the Urinary paſſage, they may be preſcribed to the quantity of a pint. Drie *Collyria* are made of Powders exceeding finely beaten or ground, and incorporated with ſome juice, whence it is that they differ little from Trochiſces. Wherefore the *Collyrium album Rhaſis* is now uſually termed a Trochiſce, and kept with them. Catharetick Powders are not applied in the form of a moiſt *Collyrium*, but in the form of a liniment, that is, incorporated with Fat or Oil. All theſe things ſhall be made more plainly by the following examples. Their matter.

℞ *Aq. plant. & roſar.* ʒ ij. *album ovi unum bene agitatum, miſce, fiat collyrium.* ℞ *Aq. roſar. & viol. an.* ʒ iij. *trochiſ. alb. Rhaſ. cum. opio,* ʒ ij. *fiat collyrium.* Or ℞ *Decoct. fænug.* ʒ iij. *mucag, ſem. lini,* ʒ ij. *ſacchar. cand.* ʒ j. *croci,* ℈ j. *fiat collyr.* ℞ *Thuris, myrrh.* ℈ ij. *tut. præpar. & antimon. lot. an.* ʒ ij. *cum ſucco chelidon. fiat collyrium in umbra ſiccand.* ℞ *Fellis perdic. aut lepor.* ʒ ſ. *ſucci fœnicul.* ʒ j. *ſacchar. cand.* ʒ ij. *ſyrup. roſ. excipiantur, fiat collyrium.* A Repercuſſive *Collyrium*. An Anodyne. A Detergent.

We uſe *Collyria* in Wounds, Ulcers, Fiſtulaes, Suffuſions, Inflammations, and other diſeaſes of the Eyes.

CHAP. XXXV.

Of Errhines and Sternutatories.

ERrhines are Medicins appointed to be put into the Noſe to purge the Brain of its excrementitious humours by the Noſtrils, or to deterge ſuch excrements as are therein, by reaſon of an *Ozæna, Polypus*, or the like diſeaſe. Errhines are either liquid or drie, or elſe hard, and of the conſiſtence of an emplaſter. Liquid Errhins, which uſually are to purge the head, are made of the juices of Herbs, as Beets, Coleworts, Marjerom, Pimpernel, Hyſſop or Balm, or of their decoctions taken alone, or mixed with Wine, or Syrup, as *oxymel ſcillit.* Syrup of Hyſſop, Roſes, or *mel anthoſat.* ſometimes Powders are mixed with the Liquors, as of Pepper, *Euphorb.* Pellitory of *Spain*, Hore-hound, *nigel. Rom. caſtor.* Myrrh, white Ellebore, Sow-bread, and other like, in a ſmall quantity, to wit, to ʒ j. little more or leſs according to the vehemency of the diſeaſe. We will make this more plain by examples. What an Errhine is. Their differences.

℞ *Succi betæ, majoran. braſſic. an.* ʒ j. *depurentur, & modice bulliant cum vini albi,* ʒ ij. *oxymel. ſcillit.* ʒ ß. *fiat Errhinum.* When as you deſire to attract more powerfully from the brain, you may diſſolve in Errhins ſome purging Medicins; as Agarick, *diaphœnicon. ſenna, carthamus*, and the like: hence doth ariſe the diſtinction of Errhins into ſuch as are meet to purge phlegm, choler, and melancholy. This following example is ſet down by *Rondeletius.* ℞ *Rad. pyreth. irid. an.* ʒ j. *puleg. calam. orig. an.* m. j. *agar. trochiſc.* ʒ iij. *flor. anthos & ſtœchad. an.* p. j. *fiat decoctio in colatur.* ℔ j. *diſſolve mellis anthoſati & ſcillit. an.* ʒ iij. *fiat caput purgium.* But it is better to this purpoſe to make uſe of purging Simples, as Agarick, Turbith, Coloquintida, and the like, then of Compoſitions, as *Diaphœnicon*, for theſe make the decoction more thick, and leſs fit to enter the paſſages of the Noſtrils, and the ſieve-like bones, but apt rather there to cauſe obſtruction, and intercept the freedom of reſpiration. The form of one. An Errhine purging phlegm.

℞ *Succi betæ,* ʒ j. *aq. ſalv. & beton. an.* ʒ ij. ſ. *caſtor.* ℈ ß. *piper. & pyreth. an.* ℈ j. *fiat caput purgium.* An Errhin with Powder.

Dric Errhines that are termed ſternutatories, for that they cauſe ſneezing, are made of powders onely, to which purpoſe the laſt mentioned things are uſed; as alſo aromatick things in a ſmall quantity, as to ʒ ij. at the moſt: as, ℞ *Major. nigel. caryoph. zinzib. an.* ϑ j. *acor. pyreth. & panis porcin. an.* ϑ ß. *euphorb.* ϑ j. *terantur, & in nares mittantur, aut inſufflentur.* Errhines of the conſiſtence of Emplaſters, by the Latins vulgarly called *Naſalia*, are made of the deſcribed Powders or Gums diſſolved in the juice of ſome of the forementioned herbs, incorporated with Turpentine and Wax, that ſo they may the better be made into a pyramidal form to be put into the noſtrils. As ℞ *Majoran. ſalv. nigel.* ϑij. *pip. alb. caryoph. galang. an* ϑ j. *pyreth. euphorb. an.* ʒ ß. *panis porcin. ellebor. alb. an.* ϑ j. *terantur, & in pulverem redigantur.* And then with Turpentine and Wax as much as ſhall be ſufficient; make them up into *Naſalia* of a pyramidal or taper faſhion. We uſe Errhines in inveterate diſeaſes of the brain; as the Epilepſie, fear of blindneſs, an Apoplexy, Lethargy, Convulſion, the loſt ſenſe of Smelling: yet we firſt uſe general remedies and evacuations, leſt by ſneezing and the like concuſſion of the brain for the excluſion of that which is offenſive thereto, there ſhould be made a greater attraction of impurity from the ſubjacent parts. Liquid things muſt be drawn up into the noſtrils warm out of the palm of the hand, to the quantity of ʒ ß. the mouth being in the interim filled with water, leſt the attracted liquor ſhould fall upon the palat, and ſo upon the lungs: drie Errhines are to be blown into the noſe with a pipe or quill: ſolid ones muſt be faſtned to a thred, that they may be drawn forth as need requires, when as they are put up into the noſtrils. The morning (the belly being empty) is the fitteſt time for the uſe of Errhines. If by their force the noſe ſhall be troubled with an itching, the pain thereof muſt be mitigated by Womans milk, or Oil of Violets. The uſe of attractive Errhines is hurtful to ſuch as are troubled with diſeaſes of the Eyes, or ulcers in the noſe, as it oft-times falls out in the *Lues Venerea*: wherefore in this caſe it will be beſt to uſe Apophlegmatiſms which may divert the matter from the Noſe.

A Sternutatory.

CHAP. XXXVI.

Of Apophlegmatiſms, or Maſticatories.

Apophlegmatiſmoi in Greek, and *Maſticatoria* in Latine, are Medicins which kept or held in the mouth and ſomewhat chawed, do draw by the mouth forth of the brain excrementitious humours, eſpecially phlegm: now they are chiefly made four manner of ways; the firſt is when as the Medicins are received in Honey or Wax, and formed into Pills, and ſo given to chaw upon. The ſecond is, when as the ſame things are bound up in a fine linnen cloth, ſo to be held in the mouth. The third is, when as a decoction of acrid Medicins is kept in the mouth for a pretty ſpace. The fourth is, when as ſome acrid Medicin, or otherwiſe drawing phlegm, as pellitory of *Spain*, Maſtich, and the like, is taken of it ſelf to the quantity of a Haſel-nut, and ſo chawed in the mouth for ſome ſpace. The matter of Maſticatories is of the kind of acrid Medicins, as of Pepper, Muſtard, Hyſſop, Ginger, Pellitory of *Spain*, and the like; amongſt which you muſt make choice chiefly of ſuch as are not troubleſom by any ingrate taſte, that ſo they may be the longer kept in the mouth with the leſs offence and loathing. Yet Maſticatories are ſometimes made of harſh or acerb Medicins; as of Berberies, the ſtones of Prunes or Cherries, which held for ſome ſpace in the mouth, draw no leſs ſtore of phlegm than acrid things; for the very motion and rowling them up and down the mouth attracts becauſe it heats, compreſſes and expreſſes: the quantity of the Medicin ought to be from ß. to ʒ j. ß. as, ℞ *Pyreth. ſtaphyſag. an.* ʒ j. ß. *maſtich.* ʒ ß. *pulverentur & involvant. nodulis in maſticatoria.* Or ℞ *Zinzib. ſinap. an.* ʒ. j. *euphorb.* ϑ ij. *piper.* ʒ ß. *excipiantur melle, & fiant paſtilli pro maſticatoriis.* ℞ *Hyſſop. thym. origan. ſalv. an.* p. j. boil them in water to waſh the mouth withall. Or ℞ *Zinzib. caryoph. an.* ʒ j. *pyreth. pip. an.* ʒ ß. *ſtaphyſagr.* ʒ ij. *maſtiches* ʒ ß, *excipiantur, fiant paſtilli pro maſticatoriis.* We uſe maſticatories in old diſeaſes of the brain, dimneſs of the ſight, deafneſs, puſtles of the head and face, and ſometimes to divert the excrements which run to the Noſe being ulcerated.

What an Apophlegmatiſm is.

The differences,

The uſe of Maſticatories

Maſticatories are very hurtful to ſuch as have their Mouths or Throats ulcerated, as alſo to them whoſe lungs are ſubject to inflammations, diſtillations and ulcers; for then Errhines are more profitable to derive the matter of the diſeaſe by the noſtrils. For though the humour drawn from the Brain into the mouth by the means of the maſticatory, may be thence caſt forth by coughing and ſpitting, yet in the interim Nature will be ſo inured to that paſſage for the humour, ſo that it will run that way when as we ſleep, and fall down upon the parts thereunder, weak either by Nature or by Accident.

To whom hurtful.

The time fitteſt for the uſe of Apophlegmatiſms is the morning, the body being firſt purged; if any ingrateful taſte remain in the mouth, or adhere to the tongue by uſing of Maſticatories, you ſhall take it away by waſhing the mouth with warm water, or a decoction of Liquorice and Barley.

CHAP. XXXVII.

Of Gargariſms.

A Gargle or Gargariſm is a liquid compoſition fit for to waſh the mouth and all the parts thereof, to hinder defluxion and inflammation, to heal the ulcers, which are in thoſe parts, to aſſwage pain. Their compoſition is two-fold, the firſt is of a decoction of Roots, Leaves, Flowers, Fruits, and Seeds fit for the diſeaſe: now the decoction is to be made either in fair water alone, or with the admixture of white or red wine, or in the decoction of Licorice and Barley, or of pectoral things, as the intention of the Phyſician is to repel, cool, or hinder inflammation; as in the tooth-ach cauſed by matter which is yet in motion; to diſcuſs, as in the tooth-ach already at the height;

What a Gargle is.

The differences thereof.

height; or to cleanſe, as in the ulcers of the mouth; or to dry and bind, as when it is fit to heal the ulcers already cleanſed.

The other way of making of Gargariſms is without decoction, which is, when as we make them either of diſtilled Waters onely, or by mixing them with Syrups, Mucilages, Milk, the Whey of Goats milk carefully ſtrained. There are mixed ſometimes with a decoction, diſtilled Waters and Mucilages, *Mel roſatum*, *oxymel ſimplex*, *diamoron*, *dianucum*, *hiera picra*, *oxyſaccharum*, *ſyrup. de roſis ſiccis*, *ſyrupus acetoſus*, and other things, as the preſent caſe ſhall ſeem to require; as Alum, *Balauſtia*, Myrrh, *Olibanum*, Ginger, Pepper, Cinamon, drie Roſes, and many ſuch things; even ſo that oft-times there enter into Gargles ſuch Medicins as have force to draw from the brain, as Pellitory of *Spain*, Carthamus, Turbith, and ſuch things as have no bitterneſs, which is the cauſe that neither Agarick nor Coloquintida ought to enter into Gargariſms. Their matter.

The quantity of liquor for a Gargariſm is commonly from ℔ ß. to ℔ j. mix therewith ſome ℥ij. of Syrups, but put Powders ſparingly, as ſome ʒ iij. Alum may ſometimes be put into ℥ vj. let mucilages be extracted out of ʒ ij. of Seeds: let theſe ſerve for ſome examples.

℞ *Plant. polygon. oxaliclis, an.* m.j. *roſar.rub.* pß. *hordei* p j. *fiat decoctio ad.* ℥ viij. *in qua diſſolve ſyrupi myrtillorum,* ℥ vj. *dianucum* ℥ ß. *fiat Gargariſma.* Or, ℞ *Chamæmel. aneth. an.*pj. *roſ.rub.*pß. *paſſul.mund. & fœnum, an.* p iij. *decoquantur in æquis partibus vini & aquæ, ad* ℥ vj. *addendo mucag. ſem. lini, & fœnugr. an.* ℥ ij. *fiat Gargariſma.* An aſtringent Gargle. An Anodyne Gargle.

Or elſe, ℞ *Aq. plantag. liguſt. abſynth. an.*℥ij. *mellis roſati colati* ℥vj. *ſyrup. roſar. ſiccar. & de abſynth. an.* ℥ vj. *fiat Gargariſma.*

We uſe Gargles in the Morning faſting after general Purgations; they are ſometimes taken or uſed cold, when as malign, acrid, and thin humours fall down, ſometimes warm; but let theſe things be done according as the Phyſician ſhall adviſe. A deterſive.

CHAP. XXXVIII.

Of Dentifrices.

DEntifrices are Medicins prepared and ſerving divers ways to cleanſe, whiten, and faſten the Teeth; for from their uſe they take their name. Of theſe, ſome are dry, otherſome moiſt: of the dry, ſome have the form of opiates, others of Powder groſly beaten, but the moiſt are commonly made by diſtillation; the matter of drie Dentifrices is taken from detergent and drying things, ſuch as are Coral white and red, Harts-horn, Scuttle-bones, Alum, Cryſtal, Pumice, Salt-nitre, myrrh, Frankincenſe, *Balauſtia*, Acorns, all ſorts of ſhells of Fiſhes: all theſe are to be made into Powder either by burning, or without it; for Scuttle-bones burnt caſt forth a ſtinking and unpleaſant ſmell. To theſe for Smell ſake are added certain aromatick things, as Cinamon, Cloves, Nutmegs, and the like: ſuch Powders if mixed with ſome Syrups, as *oxymel ſcilliticum*, or with mucilage of Gum Arabick and Tragacanth, will become Opiats, to be made into a pyramidal form of ſome fingers length, round and ſquare, and ſharp pointed, that dried they may ſerve for Dentifrices. What a dentifrice is. The differences. The matter whereof they conſiſt.

Sometimes emollient Roots are boiled with Salt or Alum, that dried again they may be uſed for Dentifrices: moiſt ones are made of drying herbs, diſtilled together with drying and aſtringent things.

All the differences ſhall appear by the following examples. ℞ *Lapidis ſpong. pumicis & cornu cervi uſt. an.* ʒ ij. *coral. rub. & cryſtal. an.* ʒ j. *alum. & ſal. uſt. an.* ʒ j. ß. *cinamon. & caryoph. roſar. rub. pulver. an.* ʒ ij. *fiat pulvis pro dentifricio.* Or, ℞ *Oſſis ſæpiæ,* ʒ ß. *maſtiches, coralli rubri uſti, an.* ʒ ij. *corn. cervi uſti,* ʒ j. ß. *aluminis, carbonis, roriſmar. an.* ʒ j. *cinam.* ʒ ij. *fiat pulvis pro dentifricio.* Or, ℞ *Oſſis ſæpiæ, alum. & ſalis uſti, an.* ʒ j. *cryſtalli, glandium, myrrhæ, thuris, an.* ʒ ij. *corticis granatorum, macis, cinam. an.* ʒ j. *fiat pulvis qui excipiatur mucagine gummi tragacanth. & formentur pyramides longæ, ſiccand. pro dentifricio.* Or ℞ *Rad. malv. junior. & biſmalv. an.* ʒ ij. *coquantur in aqua ſalſa aut aluminoſa, deinde ſiccentur in furno pro dentifricio.* ℞ *Sali* ℥ vj. *alumin.* ʒ iij. *thuris, maſtiches, ſanguis draconis, an.* ʒ ß. *aquæ roſ.* ℥ vj. *diſtillentur in alembico vitreo pro dentifricio.* A Powder for a Dentifrice.

Dentifrices are not onely known good to poliſh, cleanſe, and ſtrengthen the teeth; but we alſo oft-times uſe them for the Tooth-ach, the Diſeaſes of the mouth, and ulcers of gums. You may uſe them in the morning, before and after meat. Their uſe.

The Ancients of Lentisk-wood made themſelves Tooth-picks, and ſuch devices to ſtrengthen their looſe Teeth, which alſo at this day is in uſe with thoſe of *Languedock*, with whom this Wood is plentiful, ſo that it may be brought thence for the uſe of Noble-men and Gentlemen; Myrrh may alſo ſerve for this ſame uſe, and any other aſtringent Wood.

Our people commonly uſe the ſtalks of Fennel, yet have they no faculty to faſten the Teeth, but their ſmell is grateful.

CHAP. XXXIX.

Of Bags or Quilts.

PHyſicians term a bag or *ſaculus*, the compoſition or mixture of drie and powdered Medicins put in a bag; therefore it is as it were a drie fomentation. Their differences are not drawn from any other thing than from the variety of the part whereto they are applied: ſuch as are for the head muſt be made into the faſhion of a Cap; thoſe which be for the whole ventricle muſt be made into the form of a Cithern; thoſe for the Spleen, like to an Oxes Tongue: laſtly, ſuch as are for the Liver, Heart, and other parts, muſt be made according to the figure of thoſe parts. Their matter is uſually taken from whole Seeds fried in a Frying-pan, or made into powder; there are ſome- What a bag or quilt is. Their differences.

ſometimes added Roots, Flowers, Fruits, Rinds, Cordial Powders, and other drie Medicins, which may be eaſily brought into Powder, and conduce to the grieved parts; the quantity is different according to the magnitude of the affected parts: In the Books of Practiſers it is commonly found preſcribed from ℥ iij. to ℥ vj. ß. Sometimes Flowers and dry Herbs are preſcribed by handfuls and pugils: and here there is need of an artificial conjecture to conceive and appoint a fit quantity of Powders: but let us give you ſome examples.

A quilt for the ſtomach. ℞ *Roſar. rub.* p.j. *maſtich.* ℥ ß. *coralli rub.* ℥iij. *ſem. aniſi, & fœnic. an.* ℥ ij. *nucis moſchat.* ℥ j. *ſummitat. abſynth. & menth. an.* m.j. *tritis omnibus, fiat ſacculus conſutus & compunctus pro ventriculo.*

A cap for a cold head. ℞. *Furfuris macri,* p. j. *milii.* ℥ j. *ſalis,* ℥ ij. *roſar, rub. flor. roriſmar. ſtœchados, caryoph. an.* m ij. *fol. beton. & ſalv. an.* ℥iij. *tritis omnibus fiat cucupha, interſuta & calefacta fumo thuris, & ſandarachæ exuſtorum, capiti apponatur.*

A quilt for the heart. ℞ *Flor. borag. bugloſſ. & viol. an.* p.ij. *cortic. citri ſicci, macis ligni aloes, raſuræ eboris, an.* ℥ j. *oſſis de corde cervi, croci, an.* ℈ ij. *fol. meliſſ.* m. ß. *pulveris diambræ,* ℥ ß. *contritis omnibus fiat ſacculus e ſerico pro corde, irrorandus aqua ſcabioſæ.*

Their uſe. We uſe bags for the ſtrengthening of the noble parts, as the brain, heart, liver: as alſo for thoſe leſs noble, as the ſtomach: laſtly for diſcuſſing flatulencies in what part ſoever: as in the Colick, and in a baſtard pluriſie proceeding from flatulencies. The powders muſt be ſtrewed upon carded bombaſt, that they run not together, and then they muſt be ſewed up or quilted in a bag of Linnen or Taffaty.

We often-times moiſten theſe bags in Wine or diſtilled water, and ſometimes not with the ſubſtance thereof, but by the vapour onely of ſuch liquors put into a hot diſh: thus oft-times the bags are heated by the vapour onely, and oft-times at the fire in a diſh by often turning them. Theſe if intended for the heart, ought to be of Crimſon or Scarlet Silk, becauſe the Scarlet-berry, called by the *Arabians Kermes*, is ſaid to refreſh and recreate the heart. Certainly they muſt always be made of ſome fine thing, whether it be Linnen or Silk.

CHAP. XL.

Of Fumigations.

What a Fumigation is. Their differences and matter. *Suffitus* or Fumigation is an evaporation of Medicins having ſome viſcous and fatty moiſture: of Fumigations ſome are drie, and otherſome moiſt, the drie have the form of Trochiſces or Pills: their matter ought to be fatty and viſcous, ſo that it may ſend forth a ſmoak by being burnt: ſuch are *Ladanum*, Myrrh, Maſtick, Pitch, Wax, Roſin, Turpentine, *Caſtoreum*, *Styrax*, Frankincenſe, *Olibanum*, and other gums, which, may be mixed with convenient Powders: for they yield them a body and firm conſiſtence; the fumigations that are made of Powder only, yield neither ſo ſtrong nor long a fume.

A Cephalick Fume. The quality of the Powders muſt be from ℥ ß. to ℥ j. ß. but the Gums to ℥ ij. as, ℞ *Sandarachæ, maſtiches, roſar. an.* ℥ j. *benjoini, galang. an.* ℥ iij. *terebinthin. excipiantur, & fiant trochiſci, quibus incenſis ſuffumigentur tegumenta capitis.* ℞ *Marchaſitæ,* ℥ ij. *bdelii, myrrhæ, ſtyracis, an.* ℥j. ß. *ceræ flavæ, & terebinth. quod ſufficit, fiant formulæ pro ſuffumigio.* ℞ *Cinnabaris,* ℥ ij. *ſtyracis & benjoini, an.* ʒ ij. *cum terebinth. fiant trochiſci pro ſuffumigio per embotum.*

For the hardneſs of the ſinews. For the relicks of the *Lues Venerea.* We uſe Fumigations in great obſtructions of the Brain, Ulcers of the Lungs, the *Aſthma*, an old Cough, Pains of the Sides, Womb, and the diſeaſes of ſome other parts; ſometimes the whole body is fumigated, as in the cure of the *Lues Venerea* to procure ſweat: ſometimes onely ſome one part whereto ſome relicks of the *Lues* adheres: ſuch Fumigations are made of *Cinnabaris*, wherein there is much *Hydrargyrum.* The Fume muſt be received by a funnel, that ſo it may not be diſperſed, but may all be carried unto the part affected, as is uſually done in the affects of the Womb and Ears.

The manner of uſing them. In fumigations for the Brain and Cheſt, the vapour would be received with open mouth, which thence may paſs by the weaſon into the Cheſt, by the Palat and Noſtrils into the Brain: but in the interim let the head be vailed, that none of the vapour may flie away. Moiſt Fumigations are made ſomewhiles of the decoction of herbs, otherwhiles of ſome one ſimple Medicin boiled in oil; ſometimes a hot fire-ſtone is quencht in Vinegar, Wine, *Aqua Vitæ*, or the like liquor, ſo to raiſe a humid vapour. We oft-times uſe this kind of Fumigation in overcoming ſchirrhous affects, when as we would cut, diſcuſs, penetrate deep, and drie: take this as an example thereof.

The manner of a moiſt Fumigation. ℞ *Laterem unum ſatis craſſum, aut marchaſitam ponderis* lb j. heat it red hot, and then let it be quencht in ſharp Vinegar, pouring thereon in the mean while a little *Aqua Vitæ*, make a Fumigation for the grieved part.

Fumes of the decoction of Herbs do very little differ from Fomentations properly ſo called; for they differ not in the manner of their compoſure, but onely in the application to the affected parts: therefore let this be an example of a humid Fumigation.

A moiſt Fume for the ears. ℞ *Abſynth. ſalv. rut. origan. an.* p.j. *rad. bryon. & aſar. an.* ℥ ß. *ſem. ſinap. & cumin. an.* ʒ ij. *decoquantur in duabus partibus aquæ, & una vini pro ſuffitu auris cum emboto:* and oft-times ſuch Fumigations are made for the whole body, whereof we ſhall treat hereafter.

CHAP. XLI.

Of a particular or Half-Bath.

What an *Inſeſſus* is. A *Semicupium* or Half-bath, is a Bath for the one half of the body; that is, for the parts from the belly downwards: it is called alſo an *Inſeſſio*, becauſe the Patient ſitteth to bathe in the decoction of Herbs: in which form and reſpect a *Semicupium* differs from a Fomentation;

tation; for it is compoſed of the ſame matter, to wit a decoction of Herbs, Roots, Seeds, Fruits, but in this the quantity of the decoction is the greater, as we ſhall teach by the following example. The matter.

℞ *Malv. biſmalv. cum toto, an.* m.j. ℈. *beton. ſaxifrag. pariet. an.* m.j. *ſem. melon. milii ſolis, alkekengi, an.* ℥ iij. *cicer. rub.* p. ij. *rad. apii, graminis, fœniculi, eryngii, an.* ℥ j. *decoquantur in ſufficiente aquæ pro inſeſſu.* A half-bath for the ſtone in the kidnies.

We uſe theſe half-baths in affects of the Kidnies, Bladder, Womb, Fundament, and lower belly, or otherwiſe when as the Patient by reaſon of weakneſs and fear of diſſipating the ſpirits, cannot ſuffer or away with a whole Bath. The manner of uſing it is thus: Fill ſome Bags with the boiled herbs, or other parts of Plants, and cauſe the Patient to ſit upon them; yet in the interim keep the vapours from the head leſt they ſhould offend it, by caſting over it a linnen cloth, or elſe let him not enter thereinto until the vapour be exhaled. The uſe. The manner of uſing it.

CHAP. XLII.

Of Baths.

BAths are nothing elſe than as it were a fomentation of the whole body, both for preſerving health, and the cure of Diſeaſes: this is a very commodious form of Medicin, and among other external Medicins much celebrated by the Greek, Arabian, and Latin Phyſicians. For a Bath, beſides that it digeſts the acrid humours, and ſooty excrements lying under the skin, mitigates pains and wearineſs, and corrects all exceſs of diſtemper: moreover in the cure of Fevers, and many other contumacious and inveterate Diſeaſes it is the chief and laſt remedy, and as it were the refuge of health, ſtored with pleaſing delight. Baths are of two ſorts, ſome Natural, others Artificial. Natural, are thoſe which of their own accord, without the operation or help of Art, prevail or excel in any Medicinal quality. For the water which of it ſelf is devoid of all quality that is perceivable by the taſte, if it chance to be ſtraitned through the veins of Metals, it furniſhes and impregnates it ſelf with their qualities and effects: hence it is that all ſuch water excells in a drying faculty, ſometimes with cooling and aſtriction, and otherwhiles with heat and a diſcuſſing quality. The Baths whoſe waters being hot or warm, do boil up, take their heat from the cavities of the Earth and Mines filled with fire; which thing is of much admiration whence this fire ſhould ariſe in ſubterrene places, what may kindle it, what feed or nouriſh it for ſo many years, and keep it from being extinct. Some Philoſophers would have it kindled by the beams of the Sun, others by the force of Lightning penetrating the bowels of the Earth; others by the violence of the Air vehemently or violently agitated, no otherwiſe then fire is ſtruck by the colliſion of a Flint and Steel,. Yet it is better to refer the cauſe of ſo great an affect unto God the maker of the Univerſe, whoſe providence piercing every way into all parts of the World, enters and governs the ſecret parts and paſſages thereof. Notwithſtanding they have ſeemed to have come neareſt the truth, who refer the cauſe of heat in Waters unto the ſtore of Brimſton contained in certain places of the Earth, becauſe among all Minerals it hath moſt fire and matter fitteſt for the nouriſhing thereof. Therefore to it they attribute the flames of fire which the *Sicilian* Mountain *Ætna* continually ſends forth. Hence alſo it is that the moſt part of ſuch waters ſmell of Sulphur, yet others ſmell of Alum, others of Nitre, others of Tar, and ſome of Coperas. The Faculties of Baths. Their differences. Natural Baths.

Now you may know from the admixture of what Metalline bodies the Waters acquire their faculties by their taſte, ſent, colour, mud, which adheres to the channels through which the water runs, as alſo by an artificial ſeparation of the more terreſtrial parts from the more ſubtil. For the earthy droſs which ſubſides or remains by the boiling of ſuch waters, will retain the faculties and ſubſtance of Brimſtone, Alum, and the like Minerals: beſides alſo, by the effects and the cure of theſe or theſe Diſeaſes, you may alſo gather of what nature they are. Wherefore we will deſcribe each of theſe kinds of Waters by their effects, beginning firſt with the Sulphureous. How to know whence the Baths have their efficacy.

Sulphureous Waters powerfully heat, dry, reſolve, open, and draw from the center unto the ſurface of the body; they cleanſe the skin troubled with Scabs and Tetters; they cauſe the itching of ulcers, and digeſt and exhauſt the cauſes of the Gout, they help pains of the Colick and hardned Spleens. But they are not to be drunk, not onely by reaſon of their ungrateful ſmell and taſte, but alſo by reaſon of the maliciouſneſs of their ſubſtance, offenſive to the inner parts of the body, but chiefly to the liver. The condition of natural ſulphureous waters.

Aluminous waters taſte very aſtrictively; therefore they drie powerfully, they have no ſuch manifeſt heat, yet drunk, they looſe the belly: I believe by reaſon of their heat and nitrous quality they cleanſe and ſtay defluxions, and the Courſes flowing too immoderately; they alſo are good againſt the Tooth-ach, eating Ulcers, and the hidden abſceſſes of the other parts of the mouth. Of aluminous waters.

Salt and nitrous Waters ſhew themſelves ſufficiently by their heat: they heat, dry, bind, cleanſe, diſcuſs, attenuate, reſiſt putrefaction, take away the blackneſs coming of bruiſes, heal ſcabby and malign ulcers, and help all œdematous tumors. Of ſalt and nitrous.

Bituminous Waters heat, digeſt, and by long continuance ſoften the hardned ſinews; they are different according to the various conditions of the bitumen that they waſh, and partake of the qualities thereof. Of bituminous.

Brazen Waters, that is, ſuch as retain the qualities of braſs; heat, drie, cleanſe, digeſt, cut, bind, are good againſt eating Ulcers, Fiſtulaes, the hardneſs of the Eye-lids, and they waſte and eat away the fleſhy excreſcences of the Noſe and Fundament. Of brazen.

Iron Waters cool, drie, and bind powerfully, therefore they help abſceſſes, hardned milts, the weakneſſes of the ſtomach and ventricle, the unvoluntary ſhedding of the Urin, and the too much flowing terms, as alſo the hot diſtemper of the Liver and Kidnies. Some ſuch are in *Lucan* Territory in *Italy*. Of iron.

Leaden Waters refrigerate, drie, and perform ſuch other operations as Lead doth; the like may be Of Leaden.

be ſaid of thoſe Waters that flow by Chalk, Plaſter, and other ſuch Minerals, as which all of them take and perform the qualities of the bodies by which they paſs.

Of hot baths. How Waters or Baths help cold and moiſt diſeaſes, as the Palſie, Convulſion, the ſtiffneſs and attraction of the Nerves, trembling, palpitations, cold diſtillations upon the joints, the inflations of the members by a dropſie, the Jaundice by obſtruction of a groſs, tough, and cold humour, the pains of the ſides, colick, and kidnies, barrenneſs in women, the ſuppreſſion of their Courſes, the ſuffocation of the Womb, cauſleſs wearineſs: thoſe diſeaſes that ſpoil the skin, as tetters, the leproſie of both ſorts, the ſcab, and other diſeaſes ariſing from a groſs, cold, and obſtruct humour, for they provoke ſweats.

To whom hurtful. Yet ſuch muſt ſhun them as are of a cholerick nature, and have a hot liver, for they would cauſe a *Cachexia* and Dropſie by over-heating the liver. Cold Waters or Baths heal the hot diſtemper of the body and each of the parts thereof, and they are more frequently taken inwardly than applied outwardly; they help the laxneſs of the bowels, as the reſolution of the retentive faculty of the ſtomach, Entrails, Kidnies, Bladder, and they alſo add ſtrength to them. Wherefore they both temper the heat of the liver, and alſo ſtrengthen it, they ſtay the *Diarrhœa*, Dyſentery, Courſes, unvoluntary ſhedding of Urin, the *Gonorrhœa*, Sweats and bleedings. In this kind are chiefly commendable the Waters of the Spaw in the Country of *Liege*, which inwardly and outwardly have almoſt the ſame faculty, and bring much benefit without any inconvenience, as thoſe that are commonly uſed in the drinks and broths of the Inhabitants.

The faculties of cold baths.

The Spaw.

Of artificial baths. In imitation of natural Baths, there may in want of them be made artificial ones, by the infuſing and mixing the Powders of the formerly deſcribed Minerals; as Brimſtone, Alum, Nitre, Bitumen: alſo you may many times quench in common or rain water, Iron, Braſs, Silver and Gold heated red hot, and ſo give them to be drunk by the Patient; for ſuch waters do oft-times retain the qualities and faculties of the Metals quenched in them, as you may perceive by the happy ſucceſs of ſuch as have uſed them againſt the Dyſentery.

The faculty of a Bath of warm water. Beſides theſe, there are alſo other Baths made by Art of ſimple Water, ſometimes without the admixture of any other thing, but otherwhiles with medicinal things mixed therewith, and boiled therein. But after what manner ſoever theſe be made, they ought to be warm, for warm water humects, relaxes, mollifies the ſolid parts, if at any time they be too drie, hard and denſe; by the aſcititious heat it opens the pores of the skin, digeſts, and attracts, and diſcuſſes fuliginous and acrid excrements remaining between the fleſh and the skin. It is good againſt Sun-burning and wearineſs, whereby the ſimilar parts are dried more than is fit. To conclude, whether we be too hot or cold, or too drie, or be nauſeous, we find manifeſt profits by Baths made of ſweet or warm water, as thoſe that may ſupply the defect of frictions and exerciſes: for they being the body to a mediocrity of temper, they increaſe and ſtrengthen the native colour, and by procuring ſweat diſcuſs flatulencies: therefore they are very uſeful in hectick Fevers, and in the declenſion of all Fevers, and againſt raving and talking idlely, for the procuring ſleep. But becauſe water alone cannot long adhere to the body, let Oil be mixed or put upon them, which may hold in the water, and keep it longer to the skin.

Why we put Oil into Baths.

Theſe Baths are good againſt the inflammations of the lungs and ſides, for they mitigate pain, and help forward that which is ſuppurative to excluſion, when as general remedies according to Art have preceded; for otherwiſe they will cauſe a greater defluxion to the afflicted parts: for a Bath (in *Galens* opinion) is profitably uſed to Diſeaſes when as the morbifick matter is concocted. To this purpoſe is choſen Rain-water, then River-water, ſo that it be not muddy, and then Fountain-water; the water of ſtanding Lakes and Fens is not approved of, for it is fit that the water which is made choice of for a Bath of ſweet water, ſhould be light and of ſubtil parts; for Baths of waters which are more than immoderately hot or cold, yield no ſuch commodity but verily they hurt in this, that they ſhut up or cloſe the pores of the body, and keep in the fuliginous excrements under the skin; other Baths of ſweet or freſh water conſiſt of the ſame matter as Fomentations do; whence it is that ſome of them relax, others mitigate pain, others cleanſe, and otherſome procure the Courſes, that is compounded of a decoction of Ingredients or Plants having ſuch operations. To theſe there is ſometimes added Wine, otherwhiles Oil, ſometimes freſh Butter or Milk, as when the Urin is ſtopped, when Nephritick pains are violent, when the Nerves are contracted, when the habit of the body waſtes and wrinkles with a hectick drineſs, for this corrugation is amended by relaxing things, but it is watered, as it were fatted by humecting things which may penetrate and tranſfuſe the oily or fatty humidity into the body thus rarified and opened by the warmneſs of a Bath.

Anodyne Baths are made of a decoction of Medicins of a middle nature, ſuch as are temperate and relaxing things, with which we may alſo ſometimes mix reſolving things; they are boiled in Water and Wine, eſpecially in pains of the Colick proceeding from vitreous phlegm, or groſs and thick flatulencies contained or ſhut up in the Belly, Kidnies, or Womb. In ſuch Baths it is not fit to ſweat, but onely to ſit in them ſo long until the bitterneſs of the pain be aſſwaged or mitigated, leſt the powers weakned by pain, ſhould be more reſolved by the breaking forth of ſweat: emollients are ſometimes mixed with gentle detergents, when as the skin is rough and cold, or when the ſcails or cruſt of ſcabs is more hard than uſual, then in concluſion we muſt come to ſtrong deterſives and driers; laſtly, to drying and ſomewhat aſtrictive Medicins ſo to ſtrengthen the skin, that it may not it ſelf ſo caſie and open to receive defluxions. By giving you one example, the whole manner of preſcribing a Bath may appear.

Why we muſt not continue in the bath till we ſweat.

A mollifying and anodyne Bath. ℞ *Rad. lilior. biſmalv. an.* ℔ ij. *malv. pariet. violar. an.* m. ß. *ſem. lini, fœnug. biſmalv. an.* ℔ j. *flor. cham. melil. anethi. an.* p. vj. *fiat decoctio in ſufficienti aquæ quantitate, cui permiſceto olei liliorum & lini ana* ℔ ij. *fiat balneum in quo diutius natet æger.*

Cautions to be obſerved in the uſe of Baths though noble remedies approved by uſe and reaſon, yet unleſs they be fitly and diſcreetly uſed in time, plenty, and quality, they do much harm; for they cauſe ſhakings and chilneſs, pains,

denſity

denſity of the skin, or too much rarefaction thereof, and oft-times a reſolution of all the faculties. Wherefore a man muſt be mindful of theſe cautions before he enter into a Bath: Firſt, that there be no weakneſs of any noble and principal bowel, for the weak parts eaſily receive the humors which the Bath hath diffuſed and rarified, the ways lying open, which tend from the whole body to the principal parts. Neither muſt there be any plenty of crude humours in the firſt region, for ſo they ſhould be attracted and diffuſed over all the body: therefore it is not onely fit that general Purgations ſhould precede, but alſo particular by the Belly and Urine: beſides, the Patient ſhould be ſtrong, that can faſting indure a Bath as long as it is needful. Laſtly, the Bath ought to be in a warm and ſilent place, leſt any cold air by its blowing, or the Water by its cold appulſe, cauſe a ſhivering or ſhaking of the body, whence a Fever may enſue.

The morning is a fit time for bathing, the ſtomach being faſting and empty, or ſix hours after meat, if it be requiſite that the Patient ſhould bathe twice a day, otherwiſe the meat yet crude would be ſnatched by the heat of the Bath, out of the ſtomach into the Veins and habit of the body. Many, of all the ſeaſons of the year, make choice of the Spring and end of Summer, and in theſe times they chuſe a clear day, neither troubled with ſtormy winds, nor too ſharp an air. As long as the Patient is in the Bath, it is fit that he take no meat, unleſs peradventure to comfort him he take a little bread moiſtned in Wine, or the juice of an Orange, or ſome Damask Prunes to quench his thirſt: his ſtrength will ſhew how long it is fit that he ſhould ſtay in; for he muſt not ſtay there to the reſolution of his powers, for in Baths the humid and ſpirituous ſubſtance is much diſſipated. Coming forth of the Bath, they muſt preſently get them to bed, and be well covered, that by ſweating, the excrements, drawn unto the skin by the heat of the Bath, may break out: the Sweat cleanſed, let them uſe gentle Frictions, or Walking; then let him feed upon meat of good juice and eaſie digeſtion, by reaſon that the ſtomach cannot but be weakned in ſome ſort by the Bath.

The fitteſt time for bathing.

How to order the Patient coming forth of the Bath.

The quantity of meat is judged moderate, the weight whereof ſhall not oppreſs the ſtomach: Venery after bathing muſt not be uſed, becauſe to the reſolution of the ſpirits by the Bath, it adds another new cauſe of further ſpending or diſſipating them. Some wiſh thoſe that uſe the Bath by reaſon of ſome contraction, pain, or other affects of the Nerves, preſently after bathing, to dawb or beſmear the affected nervous part with the Clay or Mud of the Bath, that by making it up as it were in this place, the virtue of the Bath may work more effectually, and may more throughly enter into the affected part.

Theſe cautions being diligently obſerved, there is no doubt but the profit by Baths will be great and wonderful: the ſame things are to be obſerved in the uſe of Stoves, or Hot-houſes, for the uſe and effects of Baths and Hot-houſes is almoſt the ſame, which the ancients therefore uſed by turn, ſo that coming forth of the Bath they entered a Stove, and called it alſo by the name of a Bath, as you may gather from ſundry places of *Galen* in his *Methodus Med.* wherefore I think it fit in the next to ſpeak of them.

CHAP. XLIII.

Of Stoves or Hot-houſes.

STOves are either drie or moiſt: Drie, by raiſing a hot and drie airy exhalation, ſo to imprint their faculties in the body, that it thereby waxeth hot, and the pores being opened, run down with ſweat. There are divers ways to raiſe ſuch an exhalation: at *Paris*, and whereſoever there are Stoves or publick Hot-houſes, they are raiſed by a clear fire put under a vaulted Furnace, whence it being preſently diffuſed, heats the whole Room; Yet every one may make himſelf ſuch a Stove as he ſhall judge beſt and fitteſt.

The differences of Stoves.

How made.

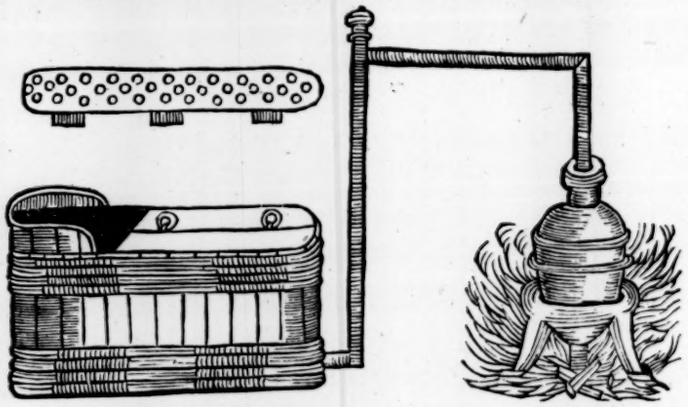
Alſo you may put red hot Cogle-ſtones or Bricks into a Tub, having firſt laid the bottom thereof with Bricks or iron Plates, and ſo ſet a ſeat in the midſt thereof; wherein the Patient ſitting, well covered with a Canopy drawn over him, may receive the exhalation ariſing from the ſtones that are about him, and ſo have the benefit of ſweating: but in this caſe we muſt oft look to and ſee the Patient; for it ſometimes happens that ſome, neglected by their Keepers otherwiſe imployed, become faint, and their ſenſe failing them by the diſſipation of their ſpirits by the force of the hot exhalation, have ſunk down with all their bodies upon the ſtones lying under them, and ſo have been carried half dead and burnt into their beds. Some alſo take the benefit of ſweating in a Fornace or Oven, as ſoon as bread is drawn out thereof. But I do not much approve of this kind of ſweating, becauſe the Patient cannot as he will, much leſs as he pleaſeth, lie or turn himſelf therein.

Humid Stoves or Sudatories are thoſe wherein Sweat is cauſed by a vapour or moiſt heat: this vapour muſt be raiſed from a decoction of Roots, Leaves, Flowers, and Seeds, which are thought fit for this purpoſe; the decoction is to be made in Water or Wine, or both together. Therefore let them all be put into a great veſſel well luted, from the top of whoſe cover Iron or Tin pipes may come into a Bathing Tub ſtanding near thereto, between the two bottoms thereof, by means whereof the hot vapour may enter thereinto, and diffuſe it ſelf therein. Now it is fit the Bathing-tub ſhould be furniſhed with a double bottom, the one below and whole, the other ſomewhat higher and perforated with many holes, whereupon the Patient ſitting, may receive a Sudorifick vapour over all his body: now this vapour, if at any time it become too hot, muſt be tempered by opening the hole, which muſt for the ſame purpoſe be made in the top of the Pipe, that ſo it may be opened and ſhut at pleaſure. In the interim the Tub ſhall be cloſely covered wherein the Patient ſits, he putting forth onely his head, that ſo he may draw in the cold air. In defect of ſuch Pipes, the Herbs ſhall be boiled by themſelves in a Caldron or Kettle, and this ſhall be ſet thus hot into the Bathing-tub at the Patients feet, and ſo by caſting into it heated ſtones, a great and ſudorifick vapour ſhall be raiſed.

A vaporous Stove or Bath.

The

The delineation of a Bathing-tub having a double bottom, with a Veſſel near thereto, with Pipes coming therefrom, and entering between the two bottoms of the Tub.



CHAP. XLIV.

Of Fuci, *that is, Waſhes, and ſuch things for the ſmoothing and beautifying of the skin.*

THis following Diſcourſe is not intended for thoſe Women which addicted to filthy luſt, ſeek to beautifie their Faces as baits and allurements to filthy pleaſures: but it is intended for thoſe onely, which the better to reſtrain the wandring luſts of their husbands, may endeavour by Art to take away thoſe ſpots and deformities which have happened to fall on their faces either by accident or Age.

As the colour of the skin is, ſuch is the humour that is thereunder.

The colour that appears in the face, either laudable or illaudable, abundantly ſhews the temper both of the body, as alſo of thoſe humours that have the chief dominion therein: for every humour dies the skin of the whole body, but chiefly of the face, with the colour thereof: for choler bearing ſway in the body, the face looks yellowiſh; phlegm ruling, it looks whitiſh or pale; if melancholy exceed, then blackiſh or ſwarth; but if bloud have the dominion, the colour is freſh and red. Yet there are other things happening externally which change the native colour of the face, as Sunburning, cold, pleaſure, ſorrow, fear, watching, faſting, pain, old diſeaſes, the corruption of meats and drinks: for the flouriſhing colour of the cheeks is not onely extinguiſhed by the immoderate uſe of Vinegar, but by drinking of corrupt Waters the face becomes ſwollen and pale.

On the contrary, laudable meats and drinks make the body to be well coloured and comely, for that they yield good juice, and conſequently a good habit. Therefore if the ſpots of the face proceed from the plenitude and ill diſpoſition of humours, the body ſhall be evacuated by bloud-letting; if from the infirmity of any principal bowel, that muſt firſt of all be ſtrengthened; but the care of all things belongs to the Phyſician: we here onely ſeek after particular remedies which may ſmooth the face, and take away the ſpots and other defects thereof, and give it a laudable colour.

Waters where with to waſh the face.

Firſt the face ſhall be waſhed with the water of Lilly-flowers, of Bean-flowers, Water-lillies, of diſtilled Milk, or elſe with the Water wherein ſome Barley or Starch hath been ſteeped. The dried face ſhall be anointed with the Ointments preſently to be deſcribed; for ſuch waſhing cleanſeth and prepareth the Face to receive the force of the Ointments, no otherwiſe than an alumed Lye prepares the hairs to drink up and retain the colour that we deſire. Therefore the Face being thus cleanſed and prepared, you may uſe the following Medicins, as thoſe that have a faculty to beautifie, extend, and ſmooth the skin: as,

Compound liquors wherewith to waſh the face.

℞ *Gum. tragacanth. conquaſſ.* ℥ ij. *diſtemperentur in vaſe vitreo cum* ℔ ij. *aquæ communis ſic gummi diſſolventur, inde albeſcet aqua.* Or elſe, ℞ *Lithargyri auri,* ℥ ij. *ceruſ. & ſalis com. an.* ℥ ß. *aceti aquæ plant. an.* ℥ ij. *caphur.* ℥ ß. *macerentur lithargyros & ceruſa in aceto ſeorſim per tres aut quatuor horas, ſal vero & camphora in aqua quam inſtituto tuo aptam delegeris:* then filter them both ſeveral and mix them together being ſo filtered, when as you would uſe them.

Virgins milk.

℞ *Lactis vaccini,* ℔ ij. *aranciorum & limon. an.* nu.iv. *ſaccari albiſſimi, & alum. roch. an.* ℥ j. *deſtillentur omnia ſimul:* let Limons and Oranges be cut into ſlices, and then be infuſed in Milk, adding thereto the Sugar and Alum, then let them all be diſtilled together in *Balneo Mariæ*; the water that comes thereof will make the face ſmooth and lovely. Therefore about bed-time it will be good to cover the Face with linnen cloths dipped therein. A Water alſo diſtilled of Snails gathered in a Vine-yard, Juice of Limons, the Flowers of white Mullain mixed together in equal proportion with a like quantity of the liquor contained in the bladders of Elm-leaves, is very good for the ſame purpoſe. Alſo this,

℞ *Micæ panis albi,* ℔ iv. *flor. fabar. roſar. alb. flor. nenuph. lilior. & ireos, an.* ℔ ij. *lactis vaccini,* ℔ vj. *ova,* nu.viij. *aceti opt.* ℔ j. *diſtillentur omnia ſimul in alembico vitreo, & fiat aqua ad faciei & manuum lotionem.* Or ℞ *Olei de tartaro,* ℥ iij. *mucag. ſem. pſilii,* ℥ j. *ceruſ. in oleo roſ. diſſolut.* ℥ j. ſ. *borac. ſal. gem. ar.* ℥ j. *fiat linimentum pro facie.* Or ℞. *Caponem vivum, & caſeum ex lacte caprino recenter confectum, limon.* nu.iv. *ovor.* nu.iv. *ceruſ. lot. in aq. roſar.* ℥ ij. *boracis,* ℥ j. ß. *camph.* ℥ ij. *aq. flor. fabar.* ℔ iv. *fiat omnium infuſio per* xxiv. *horas, poſtea deſtillentur in alembico vitreo.*

The marrow of Sheeps-bones good to ſmooth the face.

There is a moſt excellent *fucus* made of the marrow of Sheeps-bones, which ſmooths the roughneſs of the skin, beautifies the face; now it muſt be thus extracted. Take the bones, ſevered from the fleſh by boiling, beat them, and ſo boil them in water; when they are well-boiled, take them from the fire, and when the water is cold, gather the fat that ſwims upon it, and therewith anoint

your

your face when as you go to bed, and waſh it in the morning with the formerly preſcribed Water.

℞ *Salis ceruſſ.* ʒ ij. *ung. citrin. vel ſpermat. ceti,* ℥ j. *malaxentur ſimul, & fiat linemtntum, addendo olei ovor.* ʒ ij. The *Sal ceruſſæ* is thus made: Grind Ceruſs into very fine powder, and infuſe ℔ j. thereof in a bottle of diſtilled Vinegar for four or five days, then filter it, then ſet that you have filtred in a glazed earthen veſſel over a gentle fire until it concrete into Salt, juſt as you do the *capitellum* in making of Cauteries. How to make *Sal ceruſſa.*

℞ *Excrementi lacert. oſſis ſæpiæ, tartari, vini albi, raſur. corn. cerv. farin. oriz. an. partes æquales, fiat pulvis, infundatur in aqua diſtillata amygdalarum dulcium, limacum vinealium, flor. nenuph. huic addito melis albi par poudus:* let them all be incorporated in a marble Morter, and kept in a glaſs or ſilver veſſel, and at night anoint the face herewith; it wonderfully prevails againſt the redneſs of the face, if after the anointing it you ſhall cover the face with a linnen cloth moiſtned in the former deſcribed Water.

℞ *Sublim.* ʒ j. *argent viv. ſaliv. extinct.* ʒ ij. *margarit. non perforat.* ʒ j. *caph.* ʒ j. ß. *incorporentur ſimul in mortario marmoreo, cum piſtillo ligneo, per tres horas ducantur & fricentur, reducanturque in tenuiſſimum pulverem, confectus pulvis abluatur aqua myrti & deſiccetur, ſerveturque ad uſum, adde foliorum auri & argenti,* nu. x. When as you would uſe this powder, put into the palm of your hand a little Oil of Maſtich, or of ſweet Almonds, then preſently in that Oil diſſolve a little of the deſcribed powder, and ſo work it into an ointment, wherewith let the face be anointed at bed-time: but it is fit firſt to waſh the face with the formerly deſcribed water, and again in the morning when you ariſe.

When the face is freed from wrinkles and ſpots, then you may paint the cheeks with a roſie and flouriſhing colour; for of the commixture of white and red ariſeth a native and beautiful colour: for this purpoſe take as much as you ſhall think fit of Braſil and Alchunet; ſteep them in Alum-water, and therewith touch the cheeks and lips, and ſo ſuffer it to dry in: there is alſo Spaniſh red made for this purpoſe; others rub the mentioned parts with a Sheeps-skin died red: moreover the friction that is made by the hand onely, cauſeth a pleaſing redneſs in the face, by drawing thither the bloud and ſpirits. How to paint the face.

CHAP. XLV.

Of the Gutta Roſacea, *or a fiery face.*

THis Treatiſe of *Fuci*, puts me in mind to ſay ſomething in this place of helping the preternatural redneſs which poſſeſſeth the noſe and cheeks, and oft-times all the face beſides, one while with a tumor, otherwhiles without, ſometimes with puſtles and ſcabs, by reaſon of the admixture of a nitrous and aduſt humour. Practitioners have termed it *Gutta roſacea.* This ſhews both more and more ugly in Winter than in Summer, becauſe the cold cloſeth the pores of the skin, ſo that the matter contained thereunder is bent up for want of tranſpiration, whence it becomes acrid and biting, ſo that as it were boiling up, it lifts or raiſeth the skin into puſtles and ſcabs; it is a contumacious diſeaſe, and oft-times not to be helped by Medicin. Why worſe in Winter then in Summer.

For the general method of curing this diſeaſe, it is fit that the Patient abſtain from Wine, and from all things in general that by their heat inflame the bloud, and diffuſe it by their vaporous ſubſtance: he ſhall ſhun hot and very cold places, and ſhall procure that his belly may be ſoluble, either by Nature or Art. Let bloud firſt be drawn out of the *baſilica*, then from the *vena frontis*, and laſtly from the vein of the noſe. Let Leeches be applied to ſundry places of the face, and cupping-glaſſes with ſcarification to the ſhoulders. Diet.

For particular or proper remedies, if the Diſeaſe be inveterate, the hardneſs ſhall firſt be ſoftned with emollient things, then aſſaulted with the following ointments, which ſhall be uſed or changed by the Chirurgeon as the Phyſician ſhall think fit. Remedies.

℞ *Succi citri,* ℥ iij. *ceruſ. quantum ſufficit ad eum inſpiſſandum, argenti vivi cum ſaliva & ſulphure vivo extincti* ʒ ß. *incorporentur ſimul, & fiat unguentum.* An approved Ointment.

℞ *Boracis,* ʒ ij. *farin. cicer. & fabar. an.* ʒ j. ß. *caph.* ʒ j. *cum melle & ſucco cepæ fiant trochiſci:* when you would uſe them, diſſolve them in Roſe and Plantain water, and ſpread them upon linnen cloths, and ſo apply them on the night-time to the affected parts, and ſo let them oft-times be renewed.

℞ *Unguenti citrini recenter diſpenſati,* ʒ ij. *ſulphuris vivi,* ℥ ß. *cum modico olei ſem. cucurb. & ſucci limonum, fiat unguentum:* with this let the face be anointed when you go to bed, in the morning let it be waſhed away with Roſe-water, being white by reaſon of bran infuſed therein: moreover ſharp Vinegar boiled with Bran and Roſe-water, and applied as before, powerfully takes away the redneſs of the face.

℞ *Ceruſ. & litharg. auri, ſulphuris vivi pulveriſati, an.* ʒ ß. *ponantur in phiala cum aceto & aqua roſarum:* linnen cloths dipped herein ſhall be applied to the face on the night, and it ſhall be waſhed in the morning with the Water of the infuſion of Bran: this kind of Medicin ſhall be continued for a Moneth.

℞ *Sanguinis tauri,* ℔ j. *butyri recentis,* ℔ ß. *fiat diſtillatio utatur.* The liquor which is diſtilled for the firſt days is troubled and ſtinking, but thoſe paſſed, it becometh clear and well ſmelling. Some boil Bran in Vinegar and the water of Water-lillies, and in this decoction they diſſolve of Sulphur and Camphire a fit proportion to the quantity of the decoction, and they apply a cloth moiſtned in this Medicin to the face in the evening.

℞ *Album. ovor.* nu. ij. *aquæ roſ.* ʒ j. ß. *ſucci plantag. & lapath. acut. an.* ℥ j. ß. *ſublimati,* ∋ j. *incorporentur in mortario marmoreo.* ℞ *Axung. porci decies in aceto lotæ,* ℥ iv. *argenti vivi,* ʒ j. *aluminis, ſulphuris vivi, an.* ʒ j. *piſtentur omnia diu in mortario plumbeo, & fiat unguentum, argentum vivum non debet niſi extremo loco affundi.* ℞ *Rad. lapath. acut. & aſphodel. an.* ʒ ij. *coquantur in aceto ſcillitico, poſtea tundan-*

tundantur, & ſetaceo trajiciantur, addendo auripigmenti, ℥ ij. *ſulphuris vivi,* ℥ x. let them be incorporated, and make an Ointment to be uſed to dry up the puſtles.

To dry up the Puſtles.

℞. *Rad. liliorum ſub cineribus coctorum,* ℥ iv. *piſtillo tuſis, & ſetaceo trajectis, adde butyri recentis, & axung. porci, lotæ in aceto, an* ℥ j. *ſulphuris vivi,* ℥ iij. *camphor.* ℈ iij. *ſucci limonum quantum ſufficit, malaxentur ſimul, & fiat unguentum.* ℞ *Lactis virginalis,* ℔ ß. *aluminis,* ℥ ß. *ſulphuris vivi,* ℥ j. *ſucci limonum,* ℥ iv. *ſalis com.* ℥ ß. let them all be diſtilled in a glaſs Alembick, and the water kept for the forementioned uſes.

℞ *Lapath. acut. plantag. & aſphodel. an* ℥ j. ß. *olei vitel. ovor.* ℥ j. *terebinth. venet.* ℥ ß. *ſucci limonum,* ℥ iij. *alum. combuſt.* ℥ j. *argenti vivi extinct.* ℥ j. *olei liliorum,* ℥ ß. *tundantur omnia in mortario plumbeo, addendo ſub finem argent. vivæ in mortario adhæreſcat.* The juice of Onions beaten with Salt, or Yolks of Eggs are good for the ſame purpoſe.

To kill Tetters.

For ſtaying and killing of Ring-worms and Tetters, the leaves of Hellebore beaten with Vinegar are good, the milk of the Fig-tree is good of it ſelf, as alſo that of the Spurges, or Muſtard diſſolved in ſtrong Vinegar with a little Sulphur. Or,

℞ *Sulphuris, calcanthi, & aluminis, an.* ℥ j. *macerentur in aceto forti, trajiciantur per lineum,* apply the expreſſed juice. Others macerate an Egg in ſharp Vinegar, with Coperas and *ſulphur vivum* beaten into fine powder, then they ſtrain or preſs it through a linnen cloth.

But ſeeing the forementioned Medicins are acrid, and for the moſt part eating and corroding, it cannot be but that they muſt make the skin harſh and rough; therefore to ſmooth and levigate it again, you ſhall make uſe of the following ointment.

To ſmooth the skin.

℞ *Tereb. ven. tam diu lotæ, ut acrimoniam nullam habeat, butyri ſalis expertis, an.* ℥ j. ß. *olei vitel. ovor.* ℥ j. *axung. porci in aqua roſarum lotæ,* ℥ ß. *ceræ parum, fiat linimentum ad uſum.* To the ſame purpoſe you may alſo make uſe of ſome of the fore-mentioned Medicins.

CHAP. XLI.

To black the Hair.

What things are fit to die the hair.

AT firſt the hairs (to take the *fucus* or tincture, and to retain it) muſt be prepared with Lye, wherein a little Roch-alum is diſſolved. Thus the fatty ſcales may be waſhed and taken away, which hinder, and (as it were) keep away the *fucus*, that it cannot adhere or penetrate into the body of the hair. Then muſt we come to particular or proper and fitting Medicins for this purpoſe. Theſe ought to be aromatick and cephalick, and ſomewhat ſtiptick, that by their odoriferous and aſtringent power that may ſtrengthen the animal faculty. Furthermore, they muſt be of ſubtil parts, that they may enter even into the inner roots of the hairs.

℞ *Sulphuris, vitrioli, gallarum, calcis vivæ, lithargyri, an.* ℥ ij. *ſcoriæ ferri,* ℥ ß. *in pollinem reducantur, & cum aq. communi incorporentur, ut inde fiat maſſa:* with this at bed time let the hairs be rubbed, and in the morning let them be ſmoothed with the ſame.

℞ *Calcis lotæ,* ℥ j. *lithargyri utriuſque* ℥ ß. *cum decocto gallarum, corticum nucum, fiat maſſa, addendo olei chamæm.* ℥ ij. ℞ *Litharg. auri,* ℥ ij. *ciner. clavellat.* ℥ j. ß. *calcis viv.* ℥ j. *diſſolve omnia cum urina hominis donec acquirant conſiſtentiam unguenti pro unctione capillorum.* ℞ *Calcis lotæ,* ℥ ij. *cum decoct. ſalv. & cort. granat. fiat paſta ad formam pultis ſatis liquidæ:* let the hair at bed-time be died herewith, and waſhed in the morning with Wine and Water.

How to waſh lime.

Now the manner of waſhing lime is thus: Infuſe in ten or twelve pints of fair water one pound of Lime, then pour out the water by ſtopping the veſſel, putting more in the ſtead thereof; the third time in ſtead of common water pour thereon the water of the decoction of Sage and Galls, let the Lime lie therein for ſo many hours, then in like manner pour it off by ſtopping the Veſſel; and thus you ſhall have your Lime well waſhed. There is alſo found a way how to die or black the hair by onely pouring of ſome liquor thereon: as, ℞ *Argenti puriſſimi,* ℥ ij. *reducantur in tenuiſſimas lamina, ponantur in ampulla vitrea cum* ℥ ij. *aquæ ſeparationis auri & argenti & aquæ roſar.* ℥ vj.

A water to black the hair.

The preparing of this water is thus: put into a Vial the water of ſeparation and the ſilver, and ſet it upon hot coals ſo to diſſolve the ſilver, which being done, then take it from the fire, and when it is cold, add thereto the Roſe-water. But if you would black it more deeply, add more ſilver thereto; if leſs, then a ſmaller quantity: to uſe it, you muſt ſteep the Comb wherewith you comb your head in this water.

℞ *Plumbi uſti,* ℥ ij. *gallarum non perforat. cortic. nucum, an.* ℥ iij. *terræ ſigill. ferret. biſpan. an.* ℥ ij. *vitriol. rom.* ℥ vj. *ſalis gem.* ℥ j. *caryoph. nucis moſch. an.* ℥ j. *ſalis ammon. aloes, an.* ℥ ß. *fiat pulvis ſubtiliſſimus:* let this powder be macerated in Vinegar for three days ſpace, then diſtil it all in an Alembick; the water that comes therefrom is good for the foreſaid uſe. The following Medicin is good to make the hairs of a flaxen colour. ℞ *Flor. geniſt. ſtœchad. & cardamom. an.* ℥ j. *lupinor. conquaſſat. raſur. buxi, corticis citri, rad. gentian. & berber. an.* ℥ j. ß. *cum aqua nitri; fiat lenta decoctio:* herewith bathe and moiſten the hairs for many days.

To make the hair of a flaxen colour.

CHAP. XLII.

Of Pſilothra, *or Depilatories: and alſo of Sweet Waters.*

A Depilatory.

MEdicins to fetch off hair, which by the Greeks, are termed *Pſilothra*, and *Depilatoria* in Latin vulgarly, are made as you may learn by theſe following examples: ℞ *Calcis vivæ* ℥ iij. *auripigmenti,* ℥ j. let the lime be quenched in fair water, and then the orpiment added with ſome aromatick thing: have a care that the Medicin lie not too long upon the part, otherwiſe it will burn; and this Medicin muſt be made to the conſiſtence of a Pultis and applied warm, firſt foment-

ſomenting the part with warm water: for then the hair will fall off by gentle rubbing or waſhing it with warm water: but if there happen any excoriation thereupon, you may help it by the uſe of *Unguentum roſatum*, or ſome other of the like faculty.

Another.

℞ *Calcis viv. aurip. citrin. an.* ℥ j. *amyl. ſpumæ argent.* ℥ ß. *terantur & incorporentur cum aq. com. bulliant ſimul:* you ſhall certainly know that it is ſufficiently boiled, if putting thereinto a Gooſes Quill, the Feathers come preſently off: ſome make into powder equal parts of unquenched Lime and Orpiment, they tie them up in a cloth, with which being ſteeped in water, they beſmear the part, and within a while after by gentle ſtroaking the head, the hair falls away of it ſelf. The following Waters are very fitting for to waſh the hands, face, and whole body, as alſo Linen, becauſe they yield a grateful ſmell: the firſt is Lavender-water thus to be made. ℞ *Flor. Lavend.* ℔ iv. *aqua roſar. & vini alb. an.* ℔ ij. *aq. vitæ,* ℥ iv. *miſceantur omnia ſimul, & fiat diſtillatio in balneo Mariæ*: the ſame Water may alſo be had without diſtillation, if you put ſome Lavender flowers in fair water, and ſo ſet them to Sun in a Glaſs, or put them in *balneo*, adding a little Oil of Spike and Musk. Clove-water is thus made. ℞ *Caryoph.* ℥ ij. *aq. roſar.* ℔ ij. *macerentur ſpatio* xxiv. *horarum, & diſtillentur in balneo Mariæ.* Sweet-water commonly ſo called, is made of divers odoriferous things put together; as thus, ℞ *Menthæ, marjoranæ, hyſſopi, ſalviæ, roriſmarini, lavendulæ, an.* m.ij. *radicis ireos,* ℥ ij. *caryophillorum, cinamoni, nucis moſchatæ, ana* ℥ ß. *limonum* nu. iv. *macerentur omnia in aqua roſarum, ſpacio viginti quatuor horarum, diſtillentur in balneo Mariæ, addendo Moſchi* ℈ ß.

Sweet Waters.

Lavender Water.

Clove Water.

Sweet Water.

The End of the Six and Twentieth Book.

BOOK XXVII.

OF DISTILLATION.

CHAP. I.

What Diſtillation is, and how many kinds thereof there be.

HAving finiſhed the Treatiſe of the Faculties of Medicins, it now ſeems requiſite that we ſpeak ſomewhat of Chymiſtry, and ſuch Medicins as are extracted by fire. Theſe are ſuch as conſiſt of a certain fifth eſſence ſeparated from their earthy impurity by Diſtillation, in which there is a ſingular, and almoſt divine efficacy in the cure of Diſeaſes. So that of ſo great an abundance of the Medicins, there is ſcarce any which at this day Chymiſts do not diſtil, or otherwiſe make them more ſtrong and effectual than they were before. Now Diſtillation is a certain Art or way by which the liquor or humid part of things, by the virtue and force of fire, or ſome ſemblable heat (as the matter ſhall ſeem to require) is extracted or drawn, being firſt reſolved into vapour, and then condenſed again by cold. Some call this Art *Sublimation*, or Subliming, which ſignifies nothing elſe but to ſeparate the pure from the unpure; the parts that are more ſubtil and delicate from thoſe that are more corpulent, groſs, and excrementitious; as alſo to make thoſe matters whoſe ſubſtance is more groſs, to become more pure and ſincere, either for that the terreſtrial parts are ill united and conjoined, or otherwiſe confuſed into the whole, and diſperſed by the heat and ſo carried up; the other groſſer parts remaining together in the bottom of the Veſſel. Or diſtillation is the extraction or effuſion of moiſture diſtilling drop by drop, from the noſe of the Alembick, or any ſuch like Veſſel. Before this effuſion or falling down of the Liquor, there goes a certain concoction performed by the virtue of heat, which ſeparates the ſubſtances of one kind from thoſe of another that were confuſedly mixed together in one body, and ſo brings them into one certain form or body, which may be good and profitable for divers Diſeaſes. Some things require the ſteat of a clear fire, others a flame, others the heat of the Sun, others of Aſhes, or Sand, or the Filings of Iron; others Horſe-dung, or boiling Water, or the oily vapour or ſteam thereof. In all theſe kinds of fires, there are four conſiderable degrees of heat. The firſt is contained in the limits of warmth, and ſuch is warm water, or the vapour of hot Water. The ſecond is a little hotter, but yet ſo as the hand may abide it without any harm; ſuch is the heat of aſhes. The third exceeds the vehemency of the ſecond; wherefore the hand cannot long endure this without hurt; and ſuch is the heat of Sand. The fourth is ſo violent that it burneth any thing that cometh near; and ſuch are the filings of Iron.

What Diſtillation is.

Four degrees of heat.

The firſt degree is moſt convenient to diſtil ſuch things as are ſubtil and moiſt, as Flowers. The ſecond ſuch as are ſubtil and dry, as thoſe things which are odoriferous and aromatical, as Cinamon, Ginger, Cloves. The third is fitteſt to diſtil ſuch things as are of a more denſe ſubſtance and fuller of Juice; ſuch as are ſome Roots and Gums. The fourth is fit for Metals and Minerals, as Alum, Vitriol, Amber, Jet, *&c.* In like manner you may diſtil without heat; as we uſe to do in thoſe things which are diſtilled by ſtraining, as when the more pure is drawn and ſeparated from that which is moſt unpure and earthy, as we do in *Lac Virginale*, and other things which are ſtrained through an Hypocras bag, or with a piece of cloth cut in form of a Tongue, or by ſetling, or by a veſſel made of Ivy wood: ſometimes alſo ſome things may be diſtilled by coldneſs of humidity, and we make the Oil of Tartar, Myrrh, and Vitriols, by laying them upon a marble in a cold and moiſt place.

What heat fitteſt for what things.

CHAP. II.

Of the matter and form of Fornaces.

The matter the beſt for Fornaces.

THe matter and form of Fornaces uſes to be diverſe; for ſome Fornaces uſe to be made of Bricks and Clay, otherſome of Clay onely, which are the better and more laſting, if ſo be the Clay be fat and well tempered with Whites of Eggs and Hair. Yet in ſudden occaſions when there is preſent neceſſity of diſtillation, Fornaces may be made of Bricks, ſo laid together that the joints may not agree, but be unequal; for ſo the ſtructure will be the ſtronger, The beſt and fitteſt form of a Fornace for diſtillation is round; for ſo the heat of the fire carried up equally diffuſes it ſelf every way, which happens not in a Fornace of another Figure, as ſquare or triangular, for the corners diſperſe and ſeparate the force of the fire. Their magnitude muſt be ſuch as ſhall be fit for the receiving of the Veſſel. For their thickneſs ſo great as neceſſity ſhall ſeem to require. They muſt be made with two bottoms, diſtinguiſhed as it were into two Forges, one below which may receive the aſhes of the coals or the like other fuel, the other above to contain the burning coals or fire. The bottom of this upper muſt either be an iron grate, or elſe it muſt be perforated with many holes, that ſo the aſhes may the more eaſily fall down into the bottom, which otherwiſe would extinguiſh the fire; yet ſome Fornaces have three partitions, as the Fornace for Reverberation. In the firſt and loweſt the aſhes are received, in the ſecond the coals are put, and in the third the matter which is calcined or elſe diſtilled. The third ought to have a ſemicircular cover, that ſo the heat or flame may be reflected upon the contained matter. The lower partition ſhall have one or more doors, by which the fallen-down aſhes may be taken forth, but the upper muſt have but one whereby the coals or wood may be put in. But in the top or upper part of the Fornace where it ſhall ſeem moſt fit, there ſhall be two or three holes made, that by them you may blow the fire, and that the ſmoak may more freely paſs out. But theſe fore-mentioned doors muſt have their ſhutters, much like an Ovens mouth. But in defect of a Fornace, or fit matter to build one withall, we may uſe a Kettle, ſet upon a Treefot, after the manner that we ſhall preſently declare, when we come to ſpeak of that diſtillation which is to be made by *Balneum Mariæ*.

A round form the beſt for Fornaces.

CHAP. III.

Of Veſſels fit for Diſtillation.

VEſſels for Diſtillation conſiſt of different matter and form; for they are either of Lead, Tin. or Braſs, or elſe earthen Veſſels; and theſe are ſometimes leaded, ſometimes not: or elſe they are of Gold, Silver, or Glaſs. Now for leaden Veſſels they are worſe than the reſt, and utterly to be refuſed, eſpecially when as the liquors which are drawn by them are to be taken into the body by the mouth, by reaſon of the malignant qualities which are ſaid to be in Lead; by which occaſion *Galen* condemns thoſe waters which run, and are contained in leaden pipes, which by reaſon of their ſaltiſhneſs and acrimony which ſavors of Quickſilver, cauſe Dyſenteries. Therefore you may perceive ſuch Waters as are diſtilled through a leaden head to be indued with a more acrid and violent piercing vapour, by reaſon the portion of that ſaltneſs diſſolved in them, and as it were ſhaven from the Alembick, or head, defiles the diſtilled Liquors, and whitens and turns them into a milky ſubſtance: but Copper or Braſs heads are more hurtful than Lead, for they make the Waters that come through them to ſavour or participate of Braſs. Thoſe that are of Gold and Silver are leſs hurtful; but the greatneſs of the coſt hinders us from making heads of ſuch Metals; therefore we muſt have a great care that our Veſſels for Diſtillation be either of Potters metal leaded, or elſe of Braſs, or of that Jug-metal which is commonly called *Terra Betovacenſis*, and theſe rather than of Lead, or any other Metal. Verily Glaſſes are thought the beſt; and next to them earthen Veſſels leaded, then of Jug-metal, and laſtly theſe of Tin. There is great variety of Veſſels for diſtillation in form and figure; for ſome are of an Oval or Cylindrical figure, that is, of a round and longiſh, others are twined and crooked, others of other ſhapes, as you may ſee in the beaks of the Chymiſts. Of this almoſt infinite variety of Figures I will in fit place give you the delineation and uſe of ſuch as ſhall ſeem to be moſt neceſſary.

Leaden Veſſels ill.

Braſs worſe.

The beſt Veſſels for Diſtillation.

CHAP. IV.

What things are to be conſidered in Diſtillation.

FIrſt make choice of a fit place in your houſe for the Fornace, ſo that it may neither hinder any thing, nor be in danger of the falling of any thing that ſhall lie over it. When you ſhall diſtil any thing of a malign or venenate quality, ye ſhall ſtand by it as little as you may, leſt the vapour ſhould do you any harm: when you provide Glaſs Veſſels for Diſtillation, make choice of ſuch as are exquiſitely baked, without flaws or cracks, and ſuch as are every where ſmooth. Let not the fire at firſt be very violent, not onely for fear of breaking the Veſſels, but alſo for that the firſt fire in Diſtillation muſt be gentle, and ſo increaſed by little and little. The things to be diſtilled ought not to be put in too great quantity into the body of the Still, leſt they ſhould riſe up or flie over; hot things that they may be more effectual muſt be twice or thrice diſtilled, by pouring upon them their own diſtilled Water, or other freſh materials, or elſe by diſtilling them ſeverally and by themſelves: of this kind are Gums, Wax, Fats, or Oils.

How things muſt be often diſtilled.

But

But in each other repeated distillations you must something lessen the force of the fire; for the matter attenuated by the former distillation cannot afterward endure so great heat: but aromatick things, as Cloves, Cinnamon, *&c.* as also the chymical oils of Sage, Rosemary, Thyme, *&c.* ought not to be distilled or rectified over again, for that we must presently after the first distillation have a diligent care to separate them from the phlegm, that is the more watery substance of the whole liquor, to which purpose we must have regard to that which is distilled, for there are some things which send over their phlegm, as Vinegar, others wherein it comes last, as * *Aqua vitæ.*

* By *Aqua vitæ* in this and most other places is meant nothing but the spirit of Wine.

If you would give to things to be distilled another taste or smell than that which they have naturally, you may mix them with some odoriferous thing, as Cinnamon, Camphire, or Musk, or the like, as you please, and so distil them together. The distilled liquors drawn by the heat of ashes or sand, savour of and retain a certain *empyreuma*, or smatch of the fire; for the helping of which, you shall put them into glasses close stopt, and so expose them to the Sun, and now and then open the glasses that this fiery impression may exhale, and the *Phlegmon* be consumed, if that there shall be any. But though in all distillation there are many things to be observed, yet are there two things chiefly worthy of note. The first is, the matter that is to be distilled and wrought upon, that is, of what kind it is, and what the Nature thereof may do and suffer. The other is the Furnace, which ought to be provided of a convenient matter, and figure of that which is to be distilled; for you cannot draw any thing of any matter, neither of every mixture being distilled, can you rightly expect Oil or Water: For mixt bodies do not consist of an equal portion of the four Elements, but some are more aery, others more fiery, some participate more of the Water, others more of the Earth, and that presently from their original. Therefore as watery things yield more Water; so airy and fiery things yield more Oil when they are distilled; neither are all instruments fit for the extracting of every liquor. Moreover you must note, that the watery liquor sometimes comes forth in the first place, and presently after by the help of a stronger fire follows the oily, which we find happens as often as the Plant or parts of the Plants which are distilled, are of a cold temperament; for in hot things it happens otherwise, for the first liquor which comes forth is oily, and the following waterish.

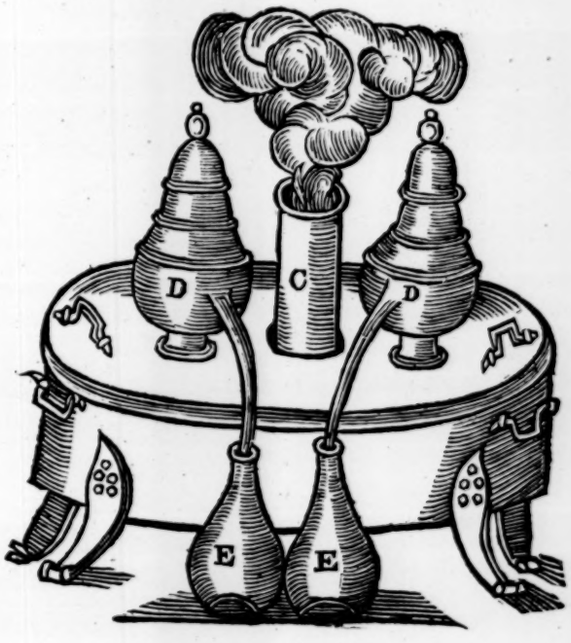
CHAP. V.

Of what fashions the Vessels for the distilling of Waters ought to be.

The parts of an Alembick.

FOr the distilling of any kind of Waters, two kind of Vessels are necessary, which are comprehended under this original name of an Alembick. They call one of them the body, or containing Vessel, the other the head, that is, the cap or top, wherein the ascending vapours are condensated or turned into water. It is called the head, because it stands over the body, like as an head; from the head there comes out a pipe or nose, whereby the distilled liquor flows drop by drop into the Receiver, as you may see by the Figure.

Of what fashion the Vessels for the distilling of Waters ought to be.

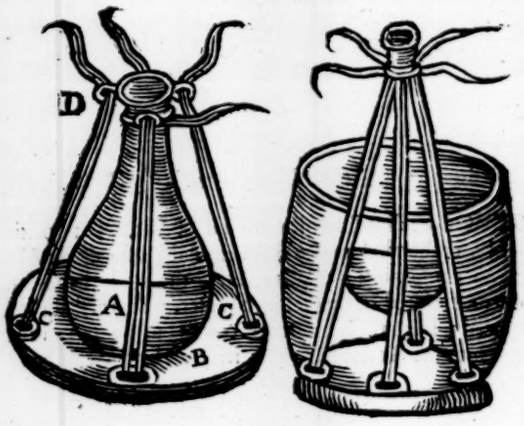


A *Shews a brass Kettle full of Water.* B *The cover of the Kettle perforated in two places to give passage forth to the Vessels.* C *A Pipe or Chimney added to the Kettle, wherein the fire is contained to heat the water.* D *The Alembick consisting of his body and head.* E *The Receiver whereinto the distilled liquor runs.*

The Effigies of another Balneum Mariæ, *not ſo eaſily to be removed as the former.*

A *Shews the Veſſel of Copper that contains the Water.*
B *The Alembick ſet in water.*

But leſt the bottom of the Alembick being half full, ſhould float up and down in the water, and ſo ſtick againſt the ſides of the Kettle; I have thought good to ſhew you the way and means to prevent that danger.



A *Shews the Veſſel or Glaſs Alembick.*
B *A plate of Lead whereon it ſtands.*
C *Strings that binds the Alembick to the plate.*
D *Rings through which the ſtrings are put to faſten the Alembick.*

You may diſtil the liquors of things by the vapour or ſteam of boiling water, if ſo be that you be provided of Veſſels and forms made after this following manner.

A Furnace with his Veſſels to diſtil liquors with the ſteam of boiling water.

A *Shew the head of the Alembick.*
B *The body thereof, placed in a braſs Veſſel made for that purpoſe.*
C *A braſs Veſſel perforated in many places to receive the vapour of the Water. This Veſſel ſhall contain the Alembick compaſſed about with Saw-duſt, not only that it may the better and longer retain the heat of the vapour, but alſo leſt it ſhould be broken by the hard touch of the brazen Veſſel.*
D *Shews the braſs Veſſel containing the water as it is placed in the Fornace.*
E *The Fornace containing the Veſſel.*
F *A Funnel by which you may now and then pour in water, inſtead of that which is vaniſhed and diſſipated by the heat of the fire.*
G *The Receiver.*

Why thoſe things that are diſtilled in *Balneo Mariæ* retain more of the ſtrength of things.

Now for the faculties of diſtilled Waters *it is* certain that thoſe which are drawn in *Balneo Mariæ* or a double veſſel, are far better and efficacious, becauſe they do not onely retain the ſmell of the things which are diſtilled, but alſo the taſte, acidity, harſhneſs, ſweetneſs, bitterneſs, and other qualities, ſo that they will neither favor of ſmoak nor burning; for the mild and gentle heat of a bath contains by its humidity, the more ſubtil parts of the Plants that are diſtilled, that they may not be diſſipated and

and exhaled, contrary to which it uſually happens in things which are diſtilled by the burning heat of Wood or Coals: for theſe have a certain nitrous and acrid taſte, ſavouring of the ſmoak of fire. Beſides, they acquire a malign quality from the veſſels out of which they are diſtilled, eſpecially if they be of Lead, whence they contract qualities hurtful to the principal, vital, and natural parts.

Therefore the Plants which are thus diſtilled, if they be bitter by nature, preſently become inſipid, as you may perceive by Wormwood-water thus diſtilled. Thoſe things which are diſtilled in *Balneo Mariæ* are contained in a glaſs Veſſel, from which they can borrow no malign quality. Therefore the matters ſo drawn are more effectual and pleaſing in taſte, ſmell, and ſight. You may draw Waters not onely from one kind of plant, but alſo from many compounded and mixed together: of theſe ſome are alimentary, others Medicinal, yea and purging; others acquired for ſmell, others for waſhing or ſmoothing of Womens faces, as we ſhall ſhew hereafter.

CHAP. VI.

How the materials muſt be prepared before Diſtillation.

THings before they be put in the Alembick muſt undergo a preparation, that is, they muſt be cut ſmall, beaten and macerated, that is, ſteeped in ſome liquor, that ſo they may be the more eaſily diſtilled and yield the more water, and retain their native ſmell and faculties; yet ſuch preparation is not convenient for all things; for there be ſome things which need no inciſion or maceration, but muſt rather be dried before they be diſtilled, as Sage, Thyme, Roſemary, and the like, by reaſon of their too much humidity; it will be ſufficient to ſprinkle other things with ſome liquor onely. In this preparation there are two things obſervable, to wit, the time of the infuſion, and condition of the liquor wherein theſe things ought to be infuſed. The time of the infuſion is different according to the variety of the matter to be macerated; for things that are hard, ſolid, dry or whole, muſt be longer macerated than ſuch as are tender, freſhly gathered or beaten: whence it is that Roots and Seeds require a longer time of infuſion; flowers and leaves a ſhorter, and the like of things. The liquors where infuſion muſt be made, ought to be agreeable to the other things infuſed. For hot ingredients require hot liquors, and cold ſuch as are cold, wherein they may be infuſed. What things need not to be macerated before they be diſſolved.

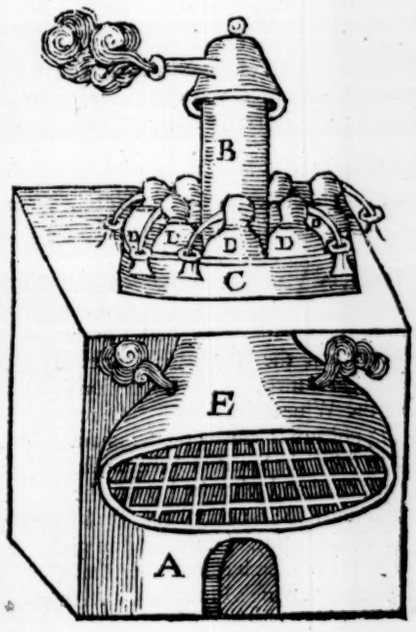
Such things as have not much juice, as Betony, Wormwood, and the like, or which are very odoriferous, as all aromatick things, would be infuſed by Wine; ſo to preſerve their ſmell, which otherwiſe by the force of the fire, by reaſon of the tenuity of the ſubſtance eaſily vaniſhes. But if we deſire that the diſtilled liquor ſhould more exactly retain and have the faculty of the things whereof it is diſtilled, then muſt you infuſe it in the juice thereof, to ſome ſuch appropriate liquor that it may ſwim in it whileſt it is diſtilled, or at leaſt let it be ſprinkled therewith. The maceration of Plants in their own juice.

CHAP. VII.

Of the Art of Diſtilling of Waters.

BEfore I deſcribe the manner how to diſtil Waters, I think it not amiſs briefly to reckon up how many ſorts of diſtilled Waters there be, and what the faculties of them are. Therefore of Diſtilled Waters ſome are medicinal, as the Waters of Roſes, Plantain, Sorrel, Sage, and the like: others are alimentary, as thoſe Waters that we call Reſtauratives; otherſome are compoſed of both, ſuch as are theſe reſtaurative Waters which are alſo mixed with Medicinal things; others are purging, as the diſtilled water of green and freſh Rhubarb; otherſome ſerve for ſmoothing the skin, and others for ſmell; of which ſort are thoſe that are diſtilled of aromatick things. The varieties of diſtilled waters.

The delineation of a Balneum Mariæ, *which may alſo ſerve to diſtil with aſhes.*



To diſtil Roſe-water, it will be good to macerate the Roſes before you diſtil them for the ſpace of two or three days, in ſome formerly diſtilled Roſe water, or their preſſed-out juice, luting the Veſſel cloſe; then putting them into an Alembick cloſely luted to his head and his Receiver, and ſo put into a *Balneum Mariæ*, as we have formerly deſcribed. Roſe-water.

A *Shews the Fornace with the hole to take forth the aſhes.*
B *Shews another Fornace as it were ſet in the other: now it is of Braſs, and runs through the midſt of the Kettle made alſo of Braſs, that ſo the contained water or aſhes may be the more eaſily heated.*
C *The Kettle wherein the Water, Aſhes or Sand, are contained.*
D *The Alembick ſet in the Water, Aſhes or Sand, with the Mouths of the Receivers.*
E *The bottom of the ſecond braſs Fornace, whoſe top is marked with* B, *which contains the fire.*

The diſtilled Alimentary liquors are nothing elſe than thoſe that we vulgarly call Reſtauratives; this is the Reſtauratives.

the manner and art of preparing them. Take of Veal, Mutton, Kid, Capon, Pullet, Cock, Partridge, Pheaſant, as much as ſhall ſeem fit for your purpoſe: cut it ſmall, and leſt it ſhould require heat, or *empyreuma* from the fire, mix therewith a handful of French Barley, and of red Roſe-leaves dry and freſh, but firſt ſteeped in the juice of Pomgranats, or Citrons and Roſewater with a little Cinnamon.

But if you deſire that this Reſtaurative ſhould not onely be Alimentary, but alſo Medicinal, you ſhall add thereto ſuch things as ſhall reſiſt the diſeaſe, ſuch as are Cordial Powders, as of *El. Diamargarit. frigid. de gemmis, aromat. roſat.* Conſerve of Bugloſs, Borrage, Roots, Herbs, Seeds, and other things of that kind. But if it be in a peſtiferous ſeaſon, Treacle, Mithridate and other Antidotes ſhall be added; each of theſe ſhall be laid in ranks or orders one over another, which is vulgarly termed *ſtratum ſuper ſtratum*, in a glaſs Alembick, and diſtilled in *Balneo Mariæ* with the heat of Aſhes, or elſe of warm Sand, as the Figure ſhews.

Another way of making reſtaurative Liquors.

There may be made other Reſtauratives in ſhorter time with leſs labour and coſt. To this purpoſe the fleſh muſt be beaten and cut thin, and ſo thruſt through with a double thred, ſo that the pieces thereof may touch each other; then put them into a Glaſs, and let the thred hang out; ſo ſtop up the Glaſs cloſe with a linnen cloth, Cotton or Tow, and lute it up with Paſte made of Meal and the Whites of Eggs,; then ſet it up to the neck in a Kettle of Water, but ſo that it touch not the bottom, but let it be kept upright by the formerly deſcribed means; then make a gentle fire thereunder, until the contained fleſh by long boiling ſhall be diſſolved into juice, and that will commonly be in ſome four hours ſpace. This being done, let the fire be taken from under the Kettle, but take not forth the Glaſs before the Water be cold, leſt the fire being hot it ſhould be broken by the ſudden appulſe of the cold air. Wherefore when as it is cold, let it be opened, and the thred with the pieces of fleſh be drawn forth, ſo that onely the juice may be left remaining; then ſtrain it through a bag, and aromatize it with Sugar and Cinnamon, adding a little juice of Citron, Verjuice or Vinegar, as it ſhall beſt like the Patients palat.

After this manner you may quickly, eaſily, and without great coſt have and prepare all ſorts of Reſtauratives, as well medicated as ſimple. But the force and faculty of purging Medicins is extracted after a clean contrary manner than the Oils and Waters which are drawn of aromatick things, as Sage, Roſemary, Thyme, Anniſeeds, Fennel, Cloves, Cinnamon, Nutmegs, and the like. For the ſtrength of theſe, as that which is ſubtil and airy, flies upward in diſtillation; but the ſtrength of purging things, as Turbith, Agarick, Rhubarb, and the like, ſubſides in the bottom. For the purgative faculty of theſe purgers inſeparably adheres to the bodies and ſubſtances.

Now for ſweet Waters and ſuch as ſerve to ſmooth the skin of the face, they may be diſtilled in *Balneo Mariæ*, like as Roſe-water.

CHAP. VIII.

How to diſtil Aqua Vitæ, *or the Spirits of Wine.*

TAke of good White or Claret Wine or Sack which is not ſowre or muſty, nor otherwiſe corrupt, or of the Lees, that quantity which may ſerve to fill the Veſſel wherein you make the diſtillation to a third part; then put on your head furniſhed with the noſe or pipe, and ſo make your diſtillation in *Balneo Mariæ*. The oftner it is diſtilled, (or as they term it) rectified, the more noble and effectual it becomes. Therefore ſome diſtil it ſeven times over.

Spirit of Wine ſeven times rectified.

At the firſt diſtillation it may ſuffice to draw a fourth or third part of the whole; to wit, of twenty four pints of Wine or Lees, draw ſix or eight pints of diſtilled liquor.

At the ſecond time the half part, that is, three or four pints.

At the third diſtillation the half part again, that is, two pints; ſo that the oftner you diſtil it over, the leſs liquor you have, but it will be a great deal the more efficacious. I do well like that the firſt diſtillation be made in Aſhes, the ſecond in *Balneo Mariæ*. To conclude, that *Aqua vitæ* is to be approved of, neither is it any oftner to be diſtilled, which put into a Spoon or Sawcer, and there ſet on fire, burns wholly away and leaves no liquor or moiſture in the bottom of the Veſſel; if you drop a drop of oil into this ſame Water, it continually falls to the bottom; or if you drop a drop into the palm of your hand, it will quickly vaniſh away, which are two other notes of the probation of this liquor.

The faculties of the Spirit of Wine.

The faculties and effects of *Aqua vitæ* are innumerable; it is good againſt the Epilepſie, and all cold Diſeaſes, it aſſwages the pain of the Teeth, it is good for punctures and wounds of the Nerves, Faintings, Swounings, Gangrenes and mortifications of the fleſh, as alſo put to other Medicins for a vehicle.

The diſtilling of Wine and Vinegar is different.

There is this difference between the diſtilling of Wine and Vinegar; Wine being of an airy and vaporous ſubſtance, that which is the beſt and moſt effectual in it, to wit, the airy and fiery liquor, comes from it preſently at the firſt diſtillation. Therefore the reſidue that remains in the bottom of the veſſel, it is of a cold dry and acrid nature; on the contrary, the Water that comes firſt from Vinegar, being diſtilled, is inſipid and flegmatick. For Vinegar is made by the corruption of Wine, and the ſegregation of the fiery and airy parts; wherefore the Wine being ſowre, there remains nothing of the former ſubſtance but phlegm; wherefore ſeeing phlegm is chiefly predominant in Vinegar, it firſt riſes in diſtillation. Wherefore he that hopes to diſtil the Spirit of Vinegar, he muſt caſt away the phlegmatick ſubſtance, that firſt ſubſtance that firſt riſes, and when by his taſte he ſhall perceive the ſpirit of Vinegar, he ſhall keep the fire thereunder until the flowing liquor ſhall become as thick as honey; then muſt the fire be taken away, otherwiſe the burning of it will cauſe a great ſtink.

The Veſſels fit to diſtil *Aqua Vitæ* and Vinegar are divers, as an Alembick or Retort ſet in Sand or Aſhes; a Copper or Braſs bottom of a Still, with a head thereto, having a Pipe coming forth thereof

which

which runs into a Worm or Pipe faſtned in a Barrel or Veſſel filled with cold Water, and having the lower end coming forth thereof; whoſe figure we ſhall give you when as we come to ſpeak of the drawing of Oils out of Vegetables.

CHAP. IX.

Of the manner of Rectifying, that is, how to increaſe the ſtrength of Waters that have been once diſtilled.

TO rectifie the Waters that have been diſtilled in *Balneo Mariæ*, you muſt ſet them in the Sun in glaſſes well ſtopped and half filled, being ſet in Sand to the third part of their height, that the Water waxing hot by the heat of the Sun, may ſeparate it ſelf from the phlegm mixed therewith, which will be performed in 12 or 15 days. The firſt way. There is another better way to do this, which is to diſtil them again in *Balneo* with a gentle fire, or if you will put them into a Retort furniſhed with his Receiver, and ſet them upon Chryſtal or Iron bowls, or in an Iron mortar directly oppoſite to the beams of the Sun, as you may learn by theſe enſuing ſigns. The ſecond.

A Retort with his Receiver, ſtanding upon Chryſtal bowls, juſt oppoſite to the Sun-beams.

A *Shews the Retort.*
B *The Receiver.*
C *The Chryſtal bowls.*

Another Retort with his Receiver, ſtanding in a Marble or Iron Mortar, directly oppoſite to the Sun.

A *Shews the Retort.*
B *The Marble or Iron Mortar.*
C *The Receiver.*

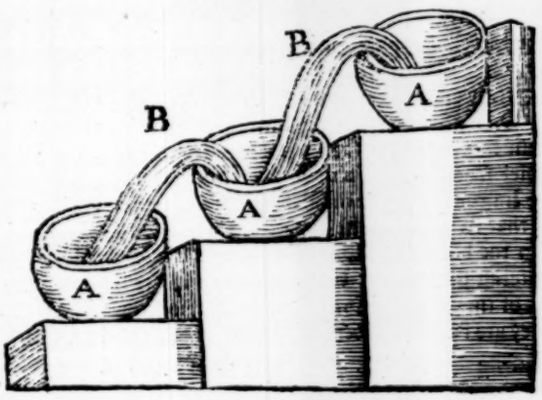
CHAP. X.

Of Diſtillation by filtring.

YOu ſhall ſet three Baſins or Veſſels of convenient matter in that ſite and order that each may be higher than other; that which ſtands in the higheſt place, ſhall contain the liquor to be diſtilled; and that which ſtands loweſt ſhall receive the diſtilled liquor. Out of the firſt and ſecond Veſſel ſhall hang ſhreds or pieces of Cloth or Cotton, with their broader ends in the liquor or upper Veſſel; and the other ſharper ends hanging down, whereby the more ſubtil and defecate liquor may fall down by drops into the Veſſel that ſtands under it; but the groſſer and more feculent part may ſubſide in the firſt and ſecond Veſſel. You by this means may at the ſame time diſtil the ſame liquor divers times, if you place many Veſſels one under another after the fore-mentioned manner, and ſo put ſhreds into each of them, ſo that the loweſt Veſſel may receive the purified liquor. In ſtead of this diſtillation Apothecaries oft-times uſe Bags.

This manner of diſtillation was invented to make more clear and pure Waters, and all juices and compoſitions, which are of ſuch a liquid conſiſtence. You may take an example from *Lac Virginis*, or Virgins milk, of which this is the deſcription. ℞ *Litharg. auri diligenter pulveriſ.* ℥ iij. *macerentur in aceti boni* ℥ vj. *trium horarum ſpatio, ſeorſim etiam in aqua plantag. ſolani, roſar. aut commun. ſal. infundatur*; then diſtil them both by ſhreds, then mix the diſtilled liquors, and you ſhall have that which for the milky whiteneſs is termed Virgins Milk; being good againſt the redneſs and pimples of the face, as we have noted in our Antidotary. *Lac Virginis.* *Cap. 44. of fucs.*

The deſcription of Veſſels to perform the diſtillation or filtration by ſhreds.



A *Shews the Veſſel.*
B *The Cloths or Shreds.*

CHAP.

CHAP. XI.

What, and how many ways there are to make Oils.

Oil's by Expreſſion.

YOu may by three means eſpecially draw to extract the Oils that you deſire. The firſt is by Expreſſion; and ſo are made the Oils of Olives, Nuts, Seeds, Fruits, and the like. Under this is thought to be contained Elixation, when as the beaten materials are boiled in Water, that ſo the Oil may ſwim aloft, and by this means are made the Oils of the Seeds of Elder and Dane-wort, and of Bay-berries. Another is by Infuſion, as that which is by infuſing the parts of Plants and other things in Oils. The third is by Diſtillation, ſuch is that which is drawn by the heat of the fire, whether by aſcent or by deſcent, or by concourſe: The firſt way is known by all; now it is thus: Take Almonds in their husks, beat them, work them into a maſs, then put them into a bag made of hair, or elſe of ſtrong cloth firſt ſteeped in Water or in white Wine, then put them into a Preſs and ſo extract their Oil. You may do the ſame in Pine-apple-kernels, Hazel-nuts, Coco-nuts, Nutmegs, Peach-kernels, the Seeds of Gourds, and Cucumers, Piſtick-nuts, and all ſuch oily things. Oil of Bays may be made of ripe Bay-berries newly gathered; let them be beaten in a Mortar and ſo boiled in a double Veſſel, and then forthwith put into a Preſs, ſo to extract Oil as you do from Almonds, unleſs you had rather get it by boiling as we have formerly noted. Oil of Eggs is made of the Yolks of Eggs boiled very hard; when they are ſo, rub them to pieces with your fingers, then fry them in a Pan over a gentle fire, continually ſtirring them with a Spoon until they becom red, and the Oil be reſolved and flow from them; then put them into a hair-cloth, and ſo preſs forth the Oil. The Oils prepared by Infuſion are thus made; make choice of good Oil, wherein let Plants, or Creatures, or the parts of them be macerated for ſome convenient time, that is, until they may ſeem to have transfuſed their faculties into the Oil, then let them be boiled, ſo ſtrained or preſſed out. But if any aquoſity remain, let it be evaporated by boiling. Some in compounding of Oils add Gums to them, of which though we have formerly ſpoken in our Antidotary, yet have I thought good to give you this one example. ℞ *Flor. hyper.* ℔ ſ. *immittantur in phialam cum flo. cent. & gum. elemi, an.* ʒ ij. *olei com.* ℔ ij. Let them be expoſed all the heat of Summer to the Sun. If any will add *Aquæ vitæ* wherein ſome Benzoin is diſſolved, he ſhall have a moſt excellent Oil in this kind. Oil of Maſtich is made *Ex olei roſati* ʒ xij. *maſtich.* ʒ iij. *vini optimi* ʒ viij.. Let them all be boiled together to the conſumption of the Wine, then ſtrain the Oil and reſerve it in a Veſſel.

By Infuſion.
By Diſtillation

Oil of Bayberries.

Of Eggs.

Oil of St. *Johns* Wort.

CHAP. XII.

Of extracting of Oils of Vegetables by Diſtillation.

ALmoſt all herbs that carry their Flowers and Seeds in an umble, have ſeeds of a hot, ſubtil, and airy ſubſtance, and conſequently oily. Now becauſe the oily ſubſtance that is contained in ſimple bodies, is of two kinds; therefore the manner alſo of extracting is two-fold. For ſome is groſs, earthy, viſcous, and wholly confuſed and mixed with the bodies out of which they ought to be drawn, as that which we have ſaid is uſually extracted by Expreſſion; this becauſe it moſt tenaciouſly adheres to the groſſer ſubſtance and part of the body, therefore it cannot by reaſon of this natural groſsneſs, be lifted up, or aſcend. Otherſome are of a ſlender and airy ſubſtance, which is eaſily ſevered from their body, wherefore being put to diſtillation it eaſily riſes: ſuch is the oily ſubſtance of aromatick things, as of Juniper, Anniſeeds, Cloves, Nutmegs, Cinamon, Pepper, Ginger, and the like odoriferous and ſpicy things. This is the manner of extracting Oils out of them; let your matter be well beaten and infuſed in water to that proportion, that for every pound of the material, there may be ten pints of water; infuſe it in a Copper bottom, having a head thereto either tinned or ſilvered over, and furniſhed with a cooler filled with cold water. Set your Veſſel upon a Fornace having a fire in it, or elſe in Sand or Aſhes. When as the water contained in the head ſhall wax hot, you muſt draw it forth, and put in cold, that ſo the Spirits may the better be condenſed, and may not flie away: you ſhall put a long necked Receiver to the noſe of the Alembick, and you ſhall increaſe the fire, until the things contained in the Alembick boil.

What Oils are to be drawn by Expreſſion.

The firſt manner of drawing Oils by diſtillation.

Another way.

There is another manner of performing this diſtillation: The matter preſerved and infuſed as we have formerly declared, ſhall be put in a braſs or copper bottom covered with his head, to which ſhall be fitted, or well luted, a Worm of Tin; this Worm ſhall run through a barrel filled with cold water, that the Liquor which flows forth with the Oil, may be cooled in the paſſage forth; at the lower end of this Worm you ſhall ſet your Receiver. The fire gentle at the firſt, ſhall be increaſed by little and little, until the contained matter, as we formerly ſaid, do boil; but take heed that you make not too quick or vehement a fire, for ſo the matter ſwelling up by boiling, may exceed the bounds of the containing veſſel, and ſo violently flie over.

Obſerving theſe things, you ſhall preſently at the very firſt ſee an oily moiſture flowing forth together with the wateriſh. When the Oil hath done flowing which you may know by the colour of the diſtilled liquor, as alſo by the conſiſtence and taſte, then put out the fire; and you may ſeparate the Oil from the Water by a little Veſſel made like a Thimble and tied to the end of a ſtick; (or, which is better, with a Glaſs Funnel or Inſtrument made of Glaſs for the ſame purpoſe.) Here you muſt alſo note that there be ſome Oils that ſwim upon the top of the water, as Oil of Anniſeeds; otherſome on the contrary, which fall to the bottom, as Oil of Cinamon, Mace, and Cloves.

What Oils fall to the bottom.

Moreover you muſt note that the wateriſh moiſture, or Water that is diſtilled with Oil of Anniſeed and Cinamon, is whitiſh, and in ſucceſs of time, will in ſome ſmall proportion turn into Oil. Alſo theſe Waters muſt be kept ſeveral, for they are far more excellent than thoſe that are diſtilled by *Balneo Mariæ*,

Mariæ, especially those that first come forth together with the Oil. Oils are of the same faculties with the bodies from whence they are extracted, but much more effectual: for the force which formerly was diffused in many pounds of this or that Medicin, is after distillation contracted into a few drams. For example, the faculty that was dispersed over one pound of Cloves, will be contracted into two ounces of oil at the most: and that which was in a pound of Cinamon will be drawn into ℥ j. ß. or ℥ ij. at the most of Oil. But to draw the greater quantity with the lesser charge, and without fear of breaking the Vessels, whereto Glasses are subject, I like that you distil them in Copper Vessels: for you need not fear that the Oil which is distilled by them will contract an ill quality from the Copper: for the waterish moisture that flows forth together therewith will hinder it, especially if the Copper shall be tinned or silvered over. I have thought good to describe and set before your eyes the whole manner of this operation.

A Fornace with set Vessels to extract the Chymical Oils, or Spirits of Sage, Rosemary, Tyme, Lavender, Anniseeds, Fennel seeds, Cloves, Nutmegs, Cinamon, Pepper, Ginger, and the like; as also to distil the spirit of Wine, of Vinegar and Aqua Vitæ. *Instead of the Barrel and Worm, you may use a head with a bucket or rowler about it.*

A *Shews the bottom, which ought to be of Copper and tinned on the inside.*
B *The Head.*
C *The Barrel filled with cold water to refrigerate and condensate the Water and Oil that run through the Pipe or Worm that is put through it.*
D *A Pipe of Braß or Lattin, or rather a Worm of Tin running through the Barrel.*
E *The Alembick set in the Fornace with the fire under it.*

Now because we have made mention of Cinamon, Pepper, and other Spices which grow not here with us, I have thought good to describe these out of *Thevets* Cosmography, he having seen them growing. Pepper grows upon Shrubs in *India*, these Shrubs send forth little branches whereon hang clusters of Berries, like to Ivy-berries, or bunches of small black Grapes or Currans: the leaves are like those of the Citron-tree, but sharpish and pricking. The description of Pepper.

The *Indians* gather those Berries with great diligence, and stow them up in large Cellars, as soon as they come to perfect maturity. Wherefore it oft-times happens that there are more than 200 Ships upon the Coast of the lesser *Java*, an Island of that Country, to carry thence Pepper and other Spices. Pepper is used in Antidotes against Poisons; it provokes urin, digests, attracts, resolves, and cures the bites of Serpents. It is properly applied and taken inwardly against a cold stomach: in Sauces it helps concoction and procures appetite: you must make choice of such as is black, heavy, and not flaccid. The Trees which bear white, and those that bear black Pepper, are so like each other, that the Natives themselves know not which is which, unless when they have their fruit hanging upon them, as the like happens upon our Vines which bear black and white Grapes. The uses thereof.

The Tree that yields Cinamon grows in the Mountains of *India*, and hath leaves very like to Bay-leaves: branches and shoots at certain times of the year are cut from this Tree, by the appointment of the King of that Province, the Bark of which is that we term Cinamon. This is sold to no stranger unless at the Kings pleasure, and he setting the price thereof, it is not lawful for others to cut thereof. The Cinamon Tree.

Galen writes that Cinamon is of very subtil parts, hot in the third degree, and partaking of some astriction; therefore it cuts and dissolves the excrements of the body, strengthens the parts, provokes the Courses when as they stop by reason of the admixture of gross humours: it sweetens the breath, and yields a fine taste and smell to Medicins, Hippocras, and Sauces. Of Cinamon there is made an excellent Water against all cold Diseases, and also against Swounings, the Plague, and Poisons. The composition thereof is this: Take of the choicest and best Cinamon one pound, beat it grosly, and put thereto of Rose water four pints, of white wine half a pint: being thus mixed, put them into a Glass, and so let them stand in infusion 24 hours, often stirring of them. Then distil them in *Balneo Mariæ*, closely luting the Receiver and Vessels, lest the spirit should flie away. *7. Simp.* An excellent Cinamon Water.

CHAP. XIII.

Another manner how to draw the Essence and Spirits of Herbs, Flowers, Seeds, and Spices; as also of Rhubarb, Agarick, Turbith, Hermodactyls, and other Purgers.

YOu may extract the Essences and Spirits of the things mentioned in the title of this Chapter, as thus: Take Sugar, Rhubarb, Cinamon, or any other Material you please, cut it small, or else beat it, then put it into a Glass with a long neck, and pour thereupon as much *Aqua vitæ* as shall be sufficient to cover the Materials or ingredients, and to over-top them some fingers bredth, then stop up the Glass very close, that no air enter thereinto: Thus suffer it to infuse for eight days in *Balneo*, with a very gentle heat; for thus the *Aqua vitæ* will extract the faculties of the Ingredients

dients which you ſhall know that it hath done, when as you ſhall ſee it perfectly tinctured with the colour of the ingredients. The eight days ended, you ſhall put this ſame *Aqua vitæ* into another Veſſel filled with the like quantity of the ſame materials prepared after the ſame manner, that it may alſo take forth the tincture thereof, and do thus three or four times, until the *Aqua vitæ* be deeply tinctured with the colour of the infuſed Ingredients.

A ſign that the ſpirit of Wine hath fetcht out the ſtrength of the ingredients.

But if the materials from whence you deſire to extract this ſpirit or eſſence, be of great price, as *Lignum Aloes*, *Rhubarb*, *&c.* you muſt not think it ſufficient to infuſe it once onely, but you muſt go over it twice, or thrice, until all the efficacy be extracted out thereof; you may know that it is all wholly inſipid.

A ſign that the ingredients have loſt their ſtrength.

Theſe things thus done, as is fitting, put all the liquor tinctured and furniſhed with the colour and ſtrength of the Ingredients, into an Alembick, filled and cloſely luted to its head, and ſo put into *Balneum Mariæ*, that ſo you may extract or draw off the *Aqua vitæ*, to keep for the like purpoſe, and ſo you ſhall have the ſpirit and eſſence remaining in the bottom.

Now if you deſire to bring this extract to the height of honey, ſet it in an earthy-pot well leaded, upon hot aſhes, ſo that the thin part thereof may be evaporated, for thus at length you ſhall have a moſt noble and effectual eſſence of that thing which you have diſtilled, whereof one ſcruple will be more powerful in purging, than two or three drams of the thing it ſelf.

CHAP. XIV.

How to extract Oil out of Gums, condenſed Juices, and Roſins, as alſo out of ſome Woods.

What a Retort is.

ALL Oils that are drawn out of Gums, Oily Woods, and Metals, are extracted by that veſſel which we vulgarly term a Retort. It muſt be made of Glaſs, or Jug-metal, well leaded, and of ſuch bigneſs as ſhall be convenient for the operation you intend, though commonly it ſhould be made to hold ſome gallon and an half of water; the neck thereof muſt be a foot and a half or at leaſt a foot long. The Receiver is commonly a Vial whereinto the neck of the Retort is fitted and inſerted. Then the Retort ſhall be ſet in an earthen filled with aſhes, or Sand, and ſo ſet into a Fornace, as you may ſee by this Figure.

The Figure of a Fornace, with his earthen Pan and Receiver.

A *Shews the Fornace.* B *The earthen Pan or Veſſel to ſet the Retort in.* C *The Retort or Cucurbite.* D *The Receiver.*

The differences of Gums.

Of Gums, ſome are liquid, ſome ſolid; and of the ſolid, ſome are more ſolid than otherſome; thoſe that are ſolid are more troubleſom to diſtil than the liquid, for they are not ſo eaſily diſſolved or melted, neither do they yield ſo well to the fire, ſo that oft-times they are burnt before they be diſſolved; whence it is that ſome for every pound of ſolid Gum, add two or three pounds of moſt clear and liquid Oil of Turpentine.

Cautions in diſtilling of Gums.

Beſides, liquid things are alſo hard to be diſtilled, becauſe when as they come to be through-hot at the fire, they ſwell up ſo much, that they exceed, or run out of the Retort, and ſo fall into the Receiver, as they were put into the Retort, eſpecially if ſo be that the fire be too hot at the firſt. Many to ſhun this inconvenience, add to the things put into the Retort, ſome Sand, as it were to balaſt it withal,

How to make Oil of Turpentine.

Oil of Roſin and Turpentine is thus made; Take two or three pounds of Turpentine and put it into a Retort of ſuch largeneſs that three parts thereof might remain empty, and for every pound of Turpentine add three or four ounces of Sand; then place the Retort in an earthen Pan filled with ſifted aſhes, and ſet it upon the Fornace as is fit, and to the neck thereof fit and cloſely lute a Receiver. Laſtly, Kindle there-under a ſoft fire at the firſt, leſt the contained materials ſhould run over; increaſe this fire by little and little, and take heed that the things become not too hot on a ſudden. At the firſt a clear and acid liquor will drop out, wherein a certain ſediment uſes to concrete; then will flow forth a moſt clear oil, ſomewhat reſembling the watry and phlegmatick liquor: then muſt the fire be ſomewhat increaſed, that the third oily, clear, thin, and very golden coloured liquor may riſe and diſtil: but then alſo a clearer and more violent fire muſt be raiſed, that ſo you may extract an Oil, that will be red like a Carbuncle, and of a conſiſtence indifferently thick. Thus therefore you may extract four kinds of Liquors out of Turpentine, and receive them being different in ſeveral Receivers; yet I judge it better to receive them all in one, that ſo by diſtilling them again afterwards you may ſeparate your deſired Oil; now there will ten or twelve ounces of Oil flow from a pound of Turpentine. This kind of Oil is effectual againſt the Palſie, Convulſions, Punctures of the Nerves, and wounds of all the nervous parts.

How to make Oil of Wax.

But you ſhall thus extract Oil out of Wax: Take one pound of Wax, melt it, and put it into a Glaſs Retort ſet in Sand or Aſhes, as we mentioned a little before in drawing Oil of Turpentine, then diſtil it, by increaſing the fire by degrees. There diſtils nothing forth of Wax, beſides an oily ſubſtance and a little *Phlegma*, yet portion of this oily ſubſtance preſently concretes into a certain butter-like matter, which therefore would be diſtilled over again: you may draw ℥ vj. or vij. of Oil from one pound of Wax.

The faculties thereof.

This Oil is effectual againſt Contuſions, and alſo very good againſt cold affects.

CHAP.

CHAP. XV.

Of extracting Oils out of the harder sorts of Gums; as Myrrh, Mastich, Frankincense, and the like.

SOme there be who extract these kinds of Oils with the Retort set in Ashes or Sand, as we mentioned in the former Chapter, *Of Oils of more liquid Gums*, adding for every pound of Gum two pints of *Aqua Vitæ*, and two or three ounces of Oil of Turpentine, then let them infuse for eight or ten days in *Balneo Mariæ*, or else in Horse dung; then set it to distil in a Retort. Now this is the true manner of making Oils of Myrrh; Take Myrrh made into fine Powder, and therewith fill hard Eggs in stead of their Yolks, being taken out; then place the Eggs upon a Gridiron, or such like Grate, in some moist place, as a Cellar, and set under them a Leaden-earthen pan; the Myrrh will dissolve into an oily water, which being presently put into a Glass and well stopped, with an equal quantity of rectified *Aqua Vitæ*, and so set for three or four moneths in hot Horse dung, which past, the vessel shall be taken forth, and so stopped that the contained liquor may be poured into an Alembick, for there will certain gross setling by this means remain in the bottom, then set your Alembick in *Balneo*, and so draw off the *Aqua Vitæ* and phlegmatick liquor, and there will remain in the bottom, a pure and clear Oil, whereto you may give a curious colour by mixing therewith some Alkanet, and a smell by dropping thereinto a little Oil of Sage, Cinamon, or Cloves.

How to make Oil of Myrrh.

How to give it a pleasing colour and smell.

Now let us shew the Composition and manner of making of Balsams, by giving you one or two examples; the first of which is taken out of *Vesalius* his Surgery; and is this,

℞ *Terebinth. opt.* ℔ j. *ol. laur.* ℥ iv. *gum. elem.* ℥ iv. ℈. *thuris, myrrhæ, gum. hederæ, centaur. majoris, ligni aloes, an.* ℥ iij. *galangæ, caryophyl. consolidæ majoris, Cinamoni, nucis moschat. zedoariæ, zinzib. dictamni albi, an.* ℥ j. *olei vermium terrestrium,* ℥ ij. *aqua vitæ* ℔ vj.

Vesalius his Balsam.

The manner of making it is thus; Let all these things be beaten and made small, and so infused for three days space in *Aqua Vitæ*, then distilled in a Retort, just as we said you must distil Oil of Turpentine and Wax. There will flow hence three sorts of Liquors; the first wateriih and clear, the other thin and of pure golden colour, the third of the colour of a Carbuncle, which is the true Balsam. The first liquor is effectual against the weakness of the stomach coming of a cold cause, for that it cuts phlegm and discusses flatulencies; the second helps fresh and hot bleeding wounds, as also the Palsie; the third is chiefly effectual against these same effects. The composition of the following *Balsamum* is out of *Fallopius*, and is this. ℞ *Terebinth. claræ,* ℔ ij. *olei de semine lini,* ℔ j. *resinæ pini,* ℥ vij. *thuris, myrrhæ, aloes, masticbes, sarcocol. an.* ℥ iij. *macis ligni aloes, an.* ℥ ij. *croci* ℥ ℈. Let them all be put into a glass Retort, set in ashes and so distilled. First there will come forth a clear water, then presently after a reddish oil, most profitable for wounds.

Fallopius his Balsam.

Now you must know that by this means we may easily distil all Axungiaes, Fats, parts of Creatures, Woods, all kinds of Barks and Seeds, if so be that they be first macerated as they ought to be, yet so that there will come forth more watry than oily humidity. Now for that we formerly frequently mentioned *Thus* or Frankincense, I have here thought good out of *Thevets* Cosmography to give you the Description of the Tree from which it flows. The Frankincense Tree (saith he) grows naturally in *Arabia*, resembles a Pine, yielding a moisture that is presently hardned, and it concretes into whitish clear grains, fatty within, which cast into the fire, take flame. Now Frankincense is adulterated with Pine-rosin and Gum, which is the cause that you shall seldom find that with us, as it is here described; you may find out the deceit thus, for that neither Rosin nor any other Gum takes flame; for Rosin goes away in smoke, but Frankincense presently burns. The smell also bewrays the counterfeit, for it yields no grateful smell as Frankincense doth. The *Arabians* wound the Tree that so the liquor may the more readily flow forth, whereof they make great gain. It fills up hollow ulcers and cicatrizes them; wherefore it enters as a chief ingredient into artificial Balsam; Frankincense alone made into Powder and applied, stanches the bloud that flows out of the wounds.

What Frankincense is.

The faculties thereof.

Matthiolus saith, that it being mixed with Fullers-earth, and oil of Roses, is a singular remedy against the inflammation of the Brests of Women lately delivered of child.

CHAP. XVI.

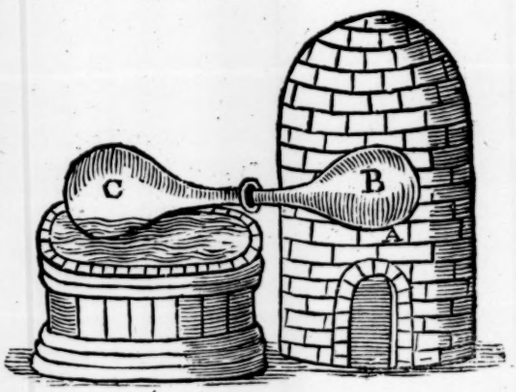
The making of Oil of Vitriol.

TAke ten pounds of Vitriol, which being made into Powder, put it into an earthen pot, and set it upon hot coals until it be calcined, which is when as it becomes reddish; after some five or six hours, when as it shall be throughly cold, break the pot, and let the Vitriol be again made into Powder, that so it may be calcined again, and you shall do thus so often and long until it shall be perfectly calcined, which is when as it shall be exactly red; then let it be made into Powder, and put it into an earthen Retort, like that wherein *Aqua fortis* is usually drawn, adding for every pound of your calcined Vitriol of Tile-sherds, or powdered Brick one quarter; then put the Retort furnished with its Receiver into a Fornace of Reverberation, always keeping a strong fire, and that for the space of 48 hours, more or less according to the manner and plenty of distilling liquor. You shall know the distillation is finished when as the Receiver shall begin to recover his native perspicuity, being not now filled with vaporous spirits, wherewith as long as the humour distills it is repleniished and looks white.

The sign of perfectly calcined vitriol.

A Fornace or Reverberation furniſhed with his Retort and Receiver.

Now for the Receiver there are two things to be obſerved. The firſt is, that it be great and very capacious, that it may not be diſtended and broken by the abundant flowing of vaporous ſpirits, as it doth oft-times happen; another thing is, that you ſet it in a veſſel filled with cold water, leſt it ſhould be broken by being over-hot; you may eaſily perceive all this by this Figure.



A *Shews the Fornace.*
B *The Retort.*
C *The Receiver.*
D *The Veſſel filled with cold Water.*

CHAP. XVII.

A Table or Catalogue of Medicins and Inſtruments ſerving for the Cure of Diſeaſes.

MEdicins and Medicinal meats fit for the cure of Diſeaſes, are taken from living Creatures, Plants, and Minerals. From living Creatures are taken, *Horns, Hoofs, Hairs, Feathers, Shells, Sculls, Scales, Sweats, Skins, Fats, Fleſh, Bloud, Entrails, Urin, Bones, Extreme parts, Heart, Liver, Lungs, Brain, Womb, Seeundine, Teſticles, Pizzle, Bladder, Sperm, Tail, Coats of the Ventricle, Exſpirations, Briſtles, Silk, Webs, Tears, Spittle, Honey, Wax, Eggs, Milk, Butter, Cheeſe, Marrow, Rennet.*

Smells whether they be ſtinking or ſweet, as alſo Poiſons: whole Creatures themſelves: as, *Foxes, Whelps, Hedg-hogs, Frogs, Worms, Crabs, Cray-fiſhes, Scorpions, Horſleeches, Swallows, Dungs.*

From Plants, that is, Trees, Shrubs, and Herbs, are taken, *Roots, Moſs, Pith, Sieus, Buds, Stalks, Leaves, Flowers, Cups, Fibers, or Hairy threads, Ears, Seeds, Bark, Wood, Meal, Juices, Tears, Oils, Gums, Roſins, Rottenneſs, Maſs or Spiſſament, Manna,* which falling down like Dew upon Plants preſently concretes. Whole Plants, as *Mallows, Onions,* &c.

Metals or Minerals are taken either from the Water or Earth, and are either kinds of Earth, Stones, or Metals, &c. The kinds of Earth are, *Bole-Armenick, Terra ſigillata, Fullers-earth, Chalk, Oker, Plaſter, Lime.* Now the kinds of Stones are, *Flints,* Lapis Judaicus, Lapis Lyncis, *the Pumice,* Lapis Hæmatites, Amiantus, Galactites, *Spunge-ſtones, Diamonds, Sapphire, Chryſolite, Topace, Load-ſtone, the* Pyrites *or Fire-ſtone, Alabaſter, Marble, Cryſtal,* and many other precious Stones. The kinds of Salts as well Natural as Artificial are, *Common Salt,* Sal Nitrum, Sal Alkali, Sal Ammoniacum, *Salt of Urin, Salt of Tartar,* and generally all Salts that may be made of any kind of Plants. Thoſe that are commonly called Minerals, are, *Marchaſite, Antimony, Muſcovy-glaſs, Tutty, Arſnick, Orpiment, Lazure, or Blue, Roſe-agar, Brimſtone, Quick-ſilver, White Coperas, Chalcitis, Pſory, Roman Vitriol, Colcother, Vitriol or Green Coperas,* Alumen ſciſſile, *Common Alum,* Alumen Rotundum, Alumen liquidum, Alumen plumoſum, Borax *or Burrace,* Bitumen, Naptha, Cinnabaris, *or Vermilion, Litharge of Gold, Litharge of Silver,* Chryſocolla, Scandaracha, *Red Lead, White Lead, and divers other.* Now the Metals themſelves are, *Gold, Silver, Iron, Lead, Tin, Braſs, Copper, Steel, Lattin,* and ſuch as ariſe from theſe; as the *Scales, Verdigreaſe, Ruſt,* &c. Now from the Waters, as the Sea, Rivers, Lakes, and Fountains, and the mud of theſe Waters, are taken divers Medicins, as *White and Red Coral, Pearls,* and infinite other things which Nature the Hand-maid of the great Architect of this World, hath produced for the cure of Diſeaſes; ſo that into what part ſoever you turn your eyes, whether to the ſurface of the Earth, or the bowels thereof, a great multitude of Remedies preſent themſelves to your view. The choice of all which is taken from their ſubſtance, or quantity, quality, action, place, ſeaſon, ſmell, taſte, ſight, figure, and weight, other circumſtances, as *Sylvius* hath abundantly ſhewed in his Book written upon this Subject. Of theſe Simples are made divers Compoſitions; as, *Collyria, Caputpurgia, Eclegmata, Dentifrices, Dentiſcalpia, Apophlegmatiſmi, Gargariſms, Pills, Boles, Potions, Emplaſters, Unguents, Cerats, Liniments, Embrocations, Fomentations, Epithemes, Attractives, Reſolvers, Suppuratives, Emollients, Mundificatives, Incarnatives, Cicatrizers, Putrifiers, Corroſives, Aglutinatives, Anodynes, Apozemes, Julips, Syrups, Powders, Tablets, Opiats, Conſerves, Preſerves, Confections, Rowls, Vomits, Sternutatories, Sudorificks, Clyſters, Peſſaries, Suppoſitories, Fumigations, Trochiſces, Frontrails, Caps, Stomachers, Bags, Baths, Half-baths, Virgins Milk,* Fuci, *Pications, Depilatories, Veſicatories, Potential Cauteries, Noſe-gays, Fans, Canopies, or* extended cloths to make wind, *Artificial Fountains* to diſtil or drop down Liquors.

Now thoſe that are thonght to be nouriſhing Medicins are, *Reſtauratives, Culliſes, Expreſſions, Gellies, Ptiſans, Barly-creams, Panadoes, Almond milk, March-panes, Wafers, Hydroſacchar, Hydromel,* and ſuch other drinks; *Mucilages, Oxymel, Oxycrate, Roſe-Vinegar, Hydrælium, Metheglin, Sider, Drink of Cervices, Ale, Beer, Vinegar, Verjuice, Oil, Steeled Water, Water brewed with Bread-crums, Hippocras, Perry,* and ſuch like.

Waters and diſtilled Oils, and divers other Chymical Extractions: As the Waters and Oils of hot, drie and aromatick things, drawn in a Copper Alembick, with a cooler, with ten times as much water in weight as of Herbs; now the Herbs muſt be drie, that the diſtillation may the better ſucceed.

Waters are extracted out of Flowers put into a Retort, by the heat of the Sun, or of Dung, or of an heap of preſſed-out Grapes, or by *Balneo,* if there be a Receiver, put and cloſely luted thereto. All kinds of Salt of things calcined, diſſolved in Water, and twice or thrice filtred, that ſo they may become more pure and fit to yield Oil.

Other

Other Diſtillations are made either in Cellars by the coldneſs or moiſtneſs of the place, the things being laid either upon a Marble, or elſe hanged up in a Bag; and thus is made Oil of Tartar, and of Salts, and other things of an aluminous nature.

Bones muſt be diſtilled by deſcent, or by the joining together of Veſſels. All Woods, Roots, Barks, Shells of Fiſhes, and Seed, or Grains, as of Corn, Broom, Beans, and other things whoſe juice cannot be got out by expreſſion, muſt be diſtilled by deſcent, or by the joining together of Veſſels in a Reverberatory Fornace.

Metals calcined and having acquired the Nature of Salt, ought to be diſſolved and filtred, and then evaporated till they be drie; then let them be diſſolved in diſtilled Vinegar, and then evaporated and dried again; for ſo they will eaſily diſtil in a Cellar upon a Marble or in a Bag. Or elſe by putting them into a glaſſie Retort, and ſetting it in Sand, and ſo giving Fire thereto by degrees, until all the watery humidity be diſtilled; then change the Receiver, and lute another cloſe to the Retort, then increaſe the Fire above and below, and thus there will flow forth an Oil very red coloured. Thus are all Metalline things diſtilled, as Alums, Salts, &c.

Gums, *Axungiæ*, and generally all Roſins, are diſtilled by a Retort ſet in an earthen Veſſel filled with Aſhes upon a Fornace; now the fire muſt be increaſed by little and little according to the different condition of the diſtilled matters.

The Veſſels and Inſtruments ſerving for Diſtillation are commonly theſe.

BOttoms of Alembicks. *The heads of them, from whence the liquors drop. Refrigeratories. Veſſels for ſublimation. For reverberation. For diſtilling by deſcent. Crucibles and another ſuch. Veſſels for Calcination, Hair-ſtrainers, Bags, Earthen Platters. Veſſels for circulation, as Pelicans, Earthen Baſins for filtring, Fornaces, the ſecret fornaces of Philoſophers, the Philoſophers Egg, Cucurbites Retorts, Bolt-heads, Urinals, Receivers, Veſſels ſo fitted together that the lowermoſt receives the mouth of the uppermoſt, whence they may be termed conjoined Veſſels: they are uſed in diſtilling* per deſcenſum. *Marbs exquiſitely ſmooth for diſtillations to be made in Cellars, Pots to diſſolve calcined Metals in.*

A Catalogue of the Surgeons Inſtruments mentioned in this whole Work.

RIngs *wherein little Lancets lie hid, to open Impoſthumes. Trunks or hollow Inſtruments going with ſprings. A vent, or cooler for the womb made like a Peſſary. Hollow Tents. Sundry Cauteries, as flat, round, ſharp-pointed, cutting, &c. Conſtrictory rings to twitch or bind the Columella.* Speculum Oris, Ocul. Ani, Uteri. *A Trunk or Pipe with an actual Cautery in it. Crooked Knives. A Pipe in form of a Quill. Divers Truſſes, with one or more bolſters. A ſhoulder-band to be put about the neck, to hold up a Trueſs. A Needle to draw through a golden Wier, &c. Pipes with feneſtels, and Needles fit for ſutures. Cutting Mullets. Mullets onely to hold and not to cut. Mullets to take forth ſplinters of bones. Mullets to draw Teeth. An Inciſion knife. Scrapers to plain or ſmooth the bones, or elſe to cut them. Cutting or hollow Scrapers. A leaden Mallet to drive the Scrapers or Chizzels into the ſcull. A Gimblet in ſhape and uſe, reſembling that which Coopers uſe to lift up the ſunk ſtaves of their cask withall. Levatories of which kind is the three-footed one. Old Levatories, which taken up by their handles, and their tongues being put under the depreſt bones, lift them up. Saws. A Deſquamatory Trepan. Pliers to take forth ſplinters of bones. A Gimblet to perforate the ſkull. A Trepan fit to divide the ſkull, with the Scrue, Point, or Piercer, Brace, and Cover or Cap, that keeps it from running in too far. A Plate to ſet one foot of the Compaſs upon. A cutting pair of Compaſſes both open and ſhut, a fit inſtrument to depreſs the* Dura Mater *without hurting thereof. A Syringe to make injection withall. A pair of Pincers with holes through them to take up the ſkin for making a Seton. Setons as well drie as moiſtned with ointments. The Beaks of Crows, Parats, Swans, Ducks, Lizards, Cranes, are either ſtrait, crooked, toothed, or ſmooth. Catch-hullets, and Pliers to draw forth pieces of mail, and ſplinters of bones that lie deep in. Hollow and ſmooth Dilaters diverſly made for the different wounds of the parts. Probes fit for to put flamulaes into wounds; and theſe are either ſtrait or crooked, perforated or unperforated. Scrued Mullets to draw forth barbed heads of arrows, and the like. Lancets to let bloud, and ſcarifie, as well ſtrait as crooked. A* Pyulcos, *or Matter-drawer.* Ligatures, Bands, Swathes, Thongs of Leather, Woollen, Linnen, round, ſlit, ſown together, *Again ſome are upper binders, other under-binders. Again, theſe are either expreſſing or elſe containing, and that either the applied Medicin, or the lips of wounds, or members put in a fit poſture, which therefore they call a Sarcotick Ligature. Thred, Bottoms or Clews of Thred or Yarn. Pledgets, Compreſſes, Bolſters, doubled Cloths.* Ferulæ, *or Splints. Caſſes, Boxes, Junks, Gloſſocomies.* Ambi, *a kind of Gloſſocomy. A Pully with its wheels, and wooden, and iron Pins whereon the wheels may run. Ropes as well to draw and extend, as hold up the member,* &c. *Scrue-pins, A Handvice, Hooks, Buttons or Stays to faſten to the ſkin to hold together the lips of the wouds, Lint cuſhions, Pillows, Linnen Cloths. Files,* Dentiſcalpia, Dentifricia, Dentiſpicia. *Catheters, Guiders of the Work. A Bathing Chair or Seat, Bathing Tubs, Half Tubs, Caldrons, Funnels, with all other circumſtances belonging to a Bath. Stoves, or Hot-houſes to ſweat in. Cocks to turn and let out Water. A Gimblet to break the Stone. Hooks, Hollow Probes ſlit on the upper ſides. Winged Inſtruments to draw forth ſtones. An Inſtrument to cleanſe the Bladder. Spatulaes ſtraight and crooked. Cupping-glaſſes, Horns, Pipes, or Catheters to wear Caruncles. Artificial members, as Eyes of Gold enamelled,* &c. *An Urinal or Caſe to ſave the water in. An Artificial Yard. Crutches, Nipples, or Leaden Covers for ſore Breſts. Griffins Talons to draw forth a* Mola *out of the Womb. A Sucking Glaſs to draw a Breſt withall. Peſſaries both long and oval. Syringes to give Glyſters, as alſo to make injection into the Ears and Womb.*

The Effigies of *HIPPOCRATES* of *COOS*, the Prince of PHYSICIANS.

INvictum, Hippocrates, *quòd te potuere ſuperbæ*
Eoî numquam flectere Regis opes,
Cecropidæ fronti ex auro fulgente coronam
Promeriti memores impoſuere tuæ.
Gratia ſed levis eſt, Actæis tantus Athenis
Nec fuit hinc uni quàm tibi partus honos.
Nam quòd quæ recreent languentia corpora morbo
Pæonias fueris promere largus opes;
Sed tua tam fundit, quàm magni machina Mundi
Gratia, & inſignis tam tua fama volat.

BON. GRA. *Pariſ. Medic.*

SELECT APHORISMS concerning SURGERY,

Collected out of the Aphoriſms of the *Great* HIPPOCRATES.

Aphor.27. Sect.6. WHoſoever being ſuppurate or hydropical, are burnt, or cut therefore, if all the Matter or Water flow forth at once, they certainly die.

31. 6. The drinking of Wine, or a Bath, Fomentation, Bloud-letting, or Purging, help the pains of the Eyes.

38. 6. Such as have hidden, or not ulcerated Cancers, had better not to cure them. For healed, they quickly die; not cured, they live the longer.

55. 6. Gouty pains uſually ſtir in the Spring and Fall.

28. 6. Eunuchs are not troubled with the Gout, neither do they become bald.

49. 6. Whoſoever are troubled with the Gout, have eaſe in forty days, the inflammation ceaſing.

66.5. In great and dangerous Wounds, if no ſwelling appear, it is ill.

67. 5. Soft tumours are good, but crude ones ill.

25. 6. For an *Eryſipelas*, or Inflammation to return from without inwards, it is not good; but to come from within outwards, is very good.

19. 7. An *Eryſipelas* coming upon the bearing of a bone, is evil.

20. 7. Putrefaction or ſuppuration coming upon an *Eryſipelas*, is ill.

21. 6. If *Varices* or Hæmorrhoids happen to ſuch as are mad, their madneſs ceaſes.

21. 7. A flux of bloud enſuing upon a great pulſation in ulcers, is ill.

26. 2. It is a better that a Fever happen upon a Convulſion, than a Convulſion upon a Fever.

4. 6. Thoſe Ulcers that have the skin ſmooth or ſhining about them, are evil.

18. 6. The Wound is deadly whereby the Bladder, Brain, Heart, Midriff, any of the ſmall Guts, Stomach, or Liver are hurt.

45. 6. Whatſoever Ulcers are of a years continuance or more, the bone muſt neceſſarily ſcale, and the ſcars become hollow.

2. 7. The bone being affected, if the fleſh be livid, it is ill.

14. 7. Stupidity and lack of Reaſon upon a blow on the Head, is evil.

24. 7. A *Delirium* happens if a bone (to wit, the skull) be cut even to the hollowneſs thereof.

Whileſt *Pus* or matter is in generating, Pains and Fevers happen rather than when it is already made.

18. 5. Cold things are hurtful to the Bones, Teeth, Nerves, Brain, Spinal Marrow; but hot things are good.

46. 2. Two Pains infeſting together, but not the ſame place, the more vehement obſcures the other.

74. 7. A corruption, an Abſceſs of the bone is cauſed by the corruption of the fleſh.

50. 6. *Coacar. prænot.* a livid or drie Ulcer, or yellowiſh, is deadly.

19. 6. When as a Bone, or Griſtle, or Nerve, or ſmall portion of the Cheek, or the Prepuce is cut aſunder, it neither increaſes, nor grows together.

24. 6. *Aph. & 513. Coacar.* If any of the ſmall guts be cut, it knits not again.

50. 7. Thoſe that have the Brain ſphacelate, that is, corrupt, they die within three days; if they eſcape theſe, they recover.

9. 7. Bleeding at a wound cauſing a Convulſion, is the fore-teller of death.

20. 5. Cold is biting to Ulcers, hardens the skin, cauſes pain, not eaſily coming to ſuppuration, blackneſs, aguiſh ſhakings, convulſions, cramps.

50. 8. *Coac.* Thoſe who have the Temples cut, have a convulſion upon the parts contrary to the Section.

44. 7. Whoſoever being ſuppurate are burnt or cut, if pure and white quitture ſhall flow forth, they eſcape; but if that which is bloudy, feculent, and ſtinking, then they die.

Galen Comment. ad Aphor. 29. 2. It is not fit to take in hand to cure ſuch as are in a deſperate caſe, but to leave them, one foretelling the end of the diſeaſe.

*Celſus, cap.*10. *lib.*20. It is better to trie a doubtful remedy than none at all.

The Effigies of GALEN the Prince of PHYSICIANS next to HIPPOCRATES.

ÆQuum erat Hippocratem *divino è ſemine Divûm*
Orbem muneribus conciliare ſibi:
Scripta ſed involvit tam multo ænigmate, verum
Ut quamvis ſolers nullus habere queat;

Rules

Rules of Surgery by the AUTHOR.

1. PRactice is an Operation agreeable to the Rules and Laws of the Theory.
2. Health is not received by Words, but by Remedies fitly uſed.
3. Remedies known and approved by Uſe and Reaſon, are to be preferred before ſuch as are unknown, or but lately found out.
4. Science without Experience gets the Phyſician no great credit with the Patient.
5. He that would perform any great and notable Work, muſt diligently apply himſelf to the knowledge of his ſubject.
6. It is the part of a good Phyſician to heal the diſeaſe, or certainly to bring it to a better paſs, as Nature ſhall give leave.
7. The Surgeon muſt be active, induſtrious, and well-handed, and not truſt too much to Books.
8. He that hath not been verſed in the operations of the Art, nor a frequent auditor of the Lectures of ſuch as are learned therein, and ſets forth himſelf for a brave Surgeon, for that he hath read much, he is either much deceived or impudent.
9. He ſhall never do any thing praiſe-worthy that hath got his Maſtery in Surgery by Gold, not by Uſe.
10. You ſhall comfort the Patient with hope of Recovery, even when as there is danger of death.
11. To change Phyſicians and Surgeons is troubleſom, but not good for the Patient.
12. Though the Diſeaſe prove long, yet it is not fit that the Phyſician give over the Patient.
13. Great wounds of large Veſſels are to be judged deadly.
14. Every contuſion muſt be brought to ſuppuration.
15. As the nature or kind of the diſeaſe muſt be known, ſo alſo muſt the remedy.
16. An Abſceſs of the bone of the Palat, is in danger to cauſe a ſtinking breath.
17. Bleeding cauſed by heat, muſt be repreſt by cold.
18. Wounds of nervous parts require Medicins which by the ſubtilty of the parts may enter in and draw from far.
19. It is not fit for ſuch as have Ulcers in their Legs, either to walk, ſtand or ſit, but to reſt themſelves in bed.
20. All biting and acrid Medicins are offenſive to clean Ulcers.
21. For reſtoring of diſlocations you muſt hold them faſt, ſtretch them out, and force them in.
22. A great Gangrene admits no cure but cutting.
23. A monſter is a thing diſſenting from the Laws of Nature.
24. Wounds of the Cheſt preſently become ſanious and purulent.
25. The wounds made by all venomous Creatures are dangerous.
26. The South wind blowing, wounded members eaſily become mortified.
27. Such as are wounded, and deſire to be quickly whole, muſt keep a ſpare diet.
28. Untemperate bodies do not eaſily recover of diſeaſes.
29. Round Ulcers, unleſs they be drawn into another figure, do not eaſily heal up.
30. An Eryſipelatous Ulcer requires purgation by ſtool.
31. Crying is good for an Infant, for it ſerves in ſtead of exerciſe and evacuation.
32. Grief is good for none but ſuch as are very fat.
33. Idleneſs weakens and extinguiſheth the native heat.
34. An ill-natured Ulcer yields not, unleſs to a powerful Remedy.
35. A Bath reſolves and diſcuſſes humours, and gently procures ſweat.
36. Cold diſeaſes are troubleſom to cold people, and hard to be helped; but in young bodies they are neither ſo troubleſom, nor contumacious.
37. Exerciſed Bodies are leſs ſubject to diſeaſes.
38. Moiſt Bodies though they need ſmall nouriſhment, yet ſtand they in need of large evacuation.
39. Sick people die ſooner of a hot diſtemper than of a cold, by reaſon of the quick and active operation of fire.
40. The quitture that flows from an ulcer is laudable, which is white, ſmooth and equal.

The End of the Seven and Twentieth Book.

BOOK

BOOK XXVIII.

How to make Reports and to Embalm the Dead.

Why a Surgeon muſt be careful in making of Reports.

NOw it onely remains that we inſtruct the Surgeon in making and framing his Report or Opinion, either of the Death of any perſon, or of the weakneſs or deprivation of any member in the function or execution of its proper office and duty. Herein it is meet that he be very conſiderate, that is to ſay, ingenious or wiſe in making his Report, becauſe the events of Diſeaſes are often-times doubtful and uncertain, neither can any man fore-tell them certainly, whether they will be for life or death, by reaſon of the manifold nature of the Subject of which we ſpeak, and alſo the uncertain condition of the humours both in their kind and motion. Which was the cauſe why *Hippocrates* even in the firſt of his Aphoriſms pronounceth that Judgment is difficult. But firſt of all, it is very expedient that a Surgeon be of an honeſt mind, that he muſt always have before his eyes a careful regard of true piety, that is to ſay, the fear of God and faith in Chriſt, and love toward his Neighbors, with hope of life everlaſting, leſt that he being carried away by favour, or corrupted with money or rewards, ſhould affirm or teſtifie thoſe wounds to be ſmall that are great, and thoſe great that are ſmall; for the report of the wound is received of the Surgeon according to the Civil Law.

What judgment is difficult.

Wounds termed great for three reſpects.

It is recorded in the Works of ancient Phyſicians, that Wounds may be called great for three reſpects. The firſt is by reaſon of the greatneſs of the diſſolved Unity, or reſolution of Continuity; and ſuch are theſe wounds, which made by a violent ſtroke with a Back-ſword have cut off the Arm or Leg, or overthwart the Breſt. The ſecond is by reaſon of the dignity or worthineſs of the part; now this dignity dependeth on the excellency of the action; therefore thus any little wound made with a Bodkin, or Knife, in any part whoſe ſubſtance is noble, as in the Brain, Heart, Liver, or any other part whoſe action and function is neceſſary to preſerve life, as in the Weaſon, Lungs, or Bladder, is judged great. The third is, by reaſon of the greatneſs and ill habit, or the abundance of ill humours, or debility of all the wounded body; ſo thoſe wounds that are made in the nervous parts, and old decaied people, are ſaid to be great. But in ſearching of wounds let the Surgeon take heed that he be not deceived by his Probe. For many times it cannot go into the bottom of the wound but ſtoppeth and ſticketh by the way, either becauſe he hath not placed the Patient in the ſame poſture wherein he was when he received his hurt; or elſe for that the ſtroke being made down-right, ſlipt aſide to the right or left hand, or elſe from below upwards, or from above downwards, and then he may expect that the wound is but little, and will be cured in a ſhort time, when it is like to be long in curing, or elſe mortal. Therefore from the firſt day it behooveth him to ſuſpend his judgment of the wound until the ninth, for in time the accidents will ſhew themſelves manifeſtly whether they be ſmall or great, according to the condition of the wound or wounded bodies, and the ſtate of the air according to his primitive qualities, or venomous corruption.

How long a Surgeon muſt ſuſpend his judgment in ſome caſes.

General ſigns whereby we judge of Diſeaſes.

But generally the ſigns whereby we may judge of diſeaſes whether they be great or ſmall, of long or ſhort continuance, mortal or not mortal, are four. For they are drawn either from the nature and eſſence of the Diſeaſe, or from the cauſe or effects thereof, or elſe from the ſimilitude, proportion, and compariſon of thoſe Diſeaſes, with the ſeaſon or preſent conſtitution of the times. Therefore if we are called to the cure of a green wound, whoſe nature and danger is no other but a ſimple ſolution of Continuity in the muſculous fleſh, we may preſently pronounce that wound to be of no danger, and that it will ſoon be cured. But if it have an Ulcer annexed unto it, that is, if it be ſanious, then we may ſay it will be more difficult and long in curing; and ſo we may pronounce of all Diſeaſes, taking a ſign of their eſſence and nature. But of the ſigns that are taken of the cauſes, let this be an example. A wound that is made with a ſharp-pointed and heavy weapon, as with an Halberd being ſtricken with great violence, muſt be accounted great, yea and alſo mortal, if the accidents be correſpondent.

But if the Patient fall to the ground through the violence of the ſtroke, if a cholerick vomiting follow thereon, if his ſight fail him, together with a giddineſs, if bloud come forth at his eyes and noſtrils, if diſtraction follow with loſs of memory and ſenſe of feeling, we may ſay that all the hope of life remaineth in one ſmall ſign which is to be deduced from the affects of the wound. But by comparing it unto the ſeaſon that then is, and diſeaſes that then aſſault Mans Body, we may ſay, that all thoſe that are wounded with Gun-ſhot, are in danger of death, as it happened in the Skirmiſhes at the Siege of *Roan*, and at the battle of Saint *Denis*. For at that time, whether it were by reaſon of the fault of the Heavens, or Air, through the evil humours of mans body, and the diſturbance of them, all wounds that were made by Gun-ſhot, were for the moſt part mortal. So likewiſe at certain ſeaſons of the year, we ſee the Small-pox and Meazles break forth in children, as it were by a certain peſtilent contagion to the deſtruction of children onely, inferring a moſt cruel vomit and laſk; and in ſuch a Seaſon the judgment of thoſe Diſeaſes is not difficult. But you by the following ſigns may know what parts are wounded. If the Patient fall down with the ſtroke, if he lie ſenſleſs as it were aſleep, if he avoid his excrements unwittingly, if he be taken with giddineſs, if bloud come out at his Ears, Mouth, and Noſe, and if he vomit choler, you may underſtand that the skull is fractured, or pierced through, by the defect of his underſtanding and diſcourſe. You alſo may know when the skull is fractured, by the judgment of your external ſenſes, as if by feeling it with your finger you find it elevated or depreſſed beyond the natural limits, if by ſtriking it with the end of a Probe, when the *Pericranium* or nervous film that inveſteth the skull is cut croſs-wiſe, and ſo divided

Wounds deadly by the fault of the air.

Signs of a fractured skull.

vided there from it, it yield a baſe and unperfect ſound like unto a pot-ſherd that is broken, or rather like to an earthen Pitcher that hath a cleft, or rent therein.

But we may ſay, that death is at hand if his Reaſon and Underſtanding fail him, if he be ſpeechleſs, if his light forſake him, if he would tumble headlong out of his bed, being not at all able to remove the other parts of his body; if he have a continual Fever, if his tongue be black with drineſs, if the edges of the wound be black or drie, and caſt forth no ſanious matter, if they reſemble the colour of ſalted fleſh, if he have an Apoplexy, Phrenſie, Convulſion or Palſie, with an involuntary excretion, or abſolute ſuppreſſion of the Urine and Excrements. You may know that a man hath his throat, that is, his weaſon and wind-pipe cut: Firſt by the ſight of his wound, and next by the aboliſhment of the function or office thereof both ways, for the Patient can neither ſpeak nor ſwallow any meat or drink; and the parts that are cut aſunder, divide themſelves by retraction upwards or downwards one from another, whereof cometh ſudden or preſent death. You may know that a Wound hath pierced into the breſt or concavity of the body, if the air come forth at the wound making a certain whizzing noiſe, if the Patient breath with great difficulty, if he feel a great heavineſs or weight on or about the midriff, whereby it may be gathered that a great quantity of bloud lieth upon the place or midriff, and ſo cauſeth him to feel a weight or heavineſs, which by little and little, will be caſt up by vomiting. But a little after a Fever cometh, and the breath is unſavoury and ſtinking, by reaſon that the putrifying bloud is turned into *ſanies*: the Patient cannot lie but on his back, and he hath an often deſire to vomit, but if he eſcape death, his wound will degenerate into a Fiſtula, and at length will conſume him by little and little.

Signs of death by a wound on the head.

Signs that the throat is cut.

Signs that a wound hath pierced in the concavity of the cheſt.

We may know that the Lungs are wounded by the foaming and ſpumous bloud coming out both at the wound, and caſt up by vomiting; he is vexed with a grievous ſhortneſs of breath, and with pain in his ſides. We may perceive the Heart to be wounded by the abundance of bloud that cometh out of the wound, by the trembling of all the whole body, by the faint and ſmall pulſe, paleneſs of the face, cold ſweat, with often ſwooning, coldneſs of the extreme parts, and ſudden death.

Signs that the Lungs are wounded.

That the heart is wounded.

When the Midriff (which the *Latins* call *Diaphragma*) is wounded, the Patient feeleth a great weight in that place, he raveth and talketh idlely, he is troubled with ſhortneſs of wind, a cough, and fit of grievous pain, and drawing of the intrails upwards. Wherefore when all theſe accidents appear, we may certainly pronounce that death is at hand.

The Midriff.

Death appeareth ſuddenly, by a wound of the hollow Vein, or the great Artery, by reaſon of the great and violent evacuation of bloud and ſpirits, whereby the functions of the Heart and Lungs are ſtopped and hindered.

The *Vena Cava* and great Artery.

The Marrow of the back-bone being pierced, the Patient is aſſaulted with a Palſie or Convulſion very ſuddenly, and ſenſe and motion faileth in the parts beneath it, the excrements of the bladder are either evacuated againſt the Patients will, or elſe are altogether ſtopped.

The ſpinal marrow.

When the Liver is wounded much bloud cometh out at the wound, and pricking pain diſperſeth it ſelf even unto the ſword-like griſtle, which hath its ſituation at the lower end of the breſt-bone called *Sternon*: the bloud that followeth from thence down into the inteſtines doth oft-times infer moſt malign accidents, yea, and ſometimes death.

The Liver.

When the Stomach is wounded, the meat and drink come out at the wound, there followeth a vomiting of pure choler, then cometh ſweating and coldneſs of the extreme parts, and therefore we ought to prognoſticate death to follow ſuch a wound.

The Stomach.

When the Milt or Spleen is wounded, black and groſs bloud cometh out at the wound, the Patient will be very thirſty, with pain on the left ſide, and the bloud breaks forth into the belly, and there putrefying cauſeth moſt malign and grievous accidents, and often-times death to follow.

The Spleen.

When the guts are wounded, the whole body is griped and pained, the excrements come out at the wound, whereat alſo oft-times the guts break forth with great violence.

The Guts.

When the Reins or Kidnies are wounded the Patient will have great pain in making his Urin, and the bloud cometh out together therewith; the pain cometh down even unto the Groin, and Yard, and Tetticles.

The Kidnies.

When the Bladder and Ureters are wounded, the pain goeth even unto the intrails; the parts all about and belonging to the Groin, are diſtended, the Urine is bloudy that is made, and the ſame alſo cometh oftentimes out of the wound.

The Bladder.

When the Womb is wounded the bloud cometh out at the privities, and all other accidents appear like as when the Bladder is wounded.

The Womb.

When the Sinews are pricked or cut half aſunder, there is great pain in the affected place, and there followeth a ſudden Inflammation, Flux, Abſceſs, Fever, Convulſion, and oftentimes a Gangrene or Mortification of the part, whereof cometh death, unleſs it be ſpeedily prevented.

The Nerves.

Having declared the ſigns and tokens of wounded parts, it now remaineth that we ſet down other ſigns of certain kinds of death, that are not common, or natural, whereabout when there is great ſtrife and contention made, it oftentimes is determined and ended by the judgment of the diſcreet Phyſician or Surgeon.

Therefore if it chance that a Nurſe either through drunkenneſs or negligence, lies upon the Infant lying in bed with her, and ſo ſtifles and ſmothers it to death: if your judgment be required, whether the Infant died through the default or negligence of the Nurſe, or through ſome violent or ſudden diſeaſe that lay hidden and lurking in the body thereof, you ſhall find out the truth of the matter by theſe ſigns following.

Signs that an Infant is ſmothered, or over-laid.

For if the Infant were in good health before; if he were not froward or crying; if his mouth and noſtrils, now being dead, be moiſtned or bedewed with a certain foam; if his face be not pale, but of a violet or purple colour; if when the body is opened the Lungs be found ſwollen and puffed up, as it were with a certain vaporous foam, and all other intrails ſound; it is a token that the Infant was ſtifled, ſmothered or ſtrangled by ſome outward violence.

If the Body or dead Corps of a man be found lying in a Field, or Houſe alone, and you be called by a Magiſtrate to deliver your opinion, whether the man were ſlain by Lightning or ſome other violent death; you may by the following ſigns find out the certainty hereof.

Signs of ſuch as are ſlain by Lightning.

For every body that is blaſted or ſtricken with lightning, doth caſt forth or breath out an unwholſome, ſtinking or ſulphureous ſmell, ſo that the Birds and Fowls of the air, or Dogs will not once touch it, much leſs prey or feed upon it: the part that was ſtricken often times ſound, and without a wound; but if you ſearch it well, you ſhall find the bones under the skin to be bruiſed, broken or ſhivered in pieces.

Lib.2.cap.54.

But if the Lightning hath pierced into the body, with making a wound therein (according to the judgment of *Pliny*) the wounded part is far colder than all the reſt of the body. For lightning driveth the moſt thin and fiery air before it, and ſtriketh it into the body with great violence, by the force whereof the heat that was in the part is ſoon diſperſed, waſted, and conſumed. Lightning doth always leave ſome impreſſion or ſign of ſome Fire either by uſtion or blackneſs: for no Lightning is without Fire.

Moreover whereas all other living Creatures when they are ſtricken with Lightning, fall on the contrary ſide, onely man falleth on the affected ſide, if he be not turned with violence toward the coaſt or region from whence the lightning came.

If a man be ſtricken with Lightning while he is aſleep, he will be found with eyes open; contrariwiſe, if he be ſtricken while he is awake, his eyes will be cloſed, as *Pliny* writeth. *Philip Commines* writeth that thoſe Bodies that are ſtricken with lightning, are not ſubject to corruption as others are.

Therefore in ancient time it was their cuſtom neither to burn nor bury them; for the brimſtone which the Lightning bringeth with it, was unto them in ſtead of Salt, for that by the drineſs and fiery heat thereof it did preſerve them from putrefaction.

Signs of wounds given to a living or dead man.

Alſo it may be inquired in judgment, Whether any that is dead and wounded, received theſe wounds alive or dead. Truly the wounds that are made of a living man, if he die of them, after his death will appear red and bloudy, with the ſides or edges ſwollen, or pale round about: contrariwiſe, thoſe that are made in a dead man, will be neither red, bloudy, ſwollen nor puffed up. For all the faculties and functions of life in the body do ceaſe and fall together by death; ſo that thenceforth no ſpirits nor bloud can be ſent, or flow into the wounded place. Therefore by theſe ſigns which ſhall appear, it may be declared that he was wounded dead or alive.

Signs whether one be hanged alive or dead.

The like queſtion may come in judgment when a man is found hanged, whether he were dead or alive. Therefore if he were hanged alive, the impreſſion or print of the rope will appear red, pale, or black, and the skin round about it will be contracted or wrinkled, by reaſon of the compreſſion which the cord hath made; alſo oftentimes the head of the *aſpera arteria* is rent and torn, and the ſecond ſpondyl, and the neck luxated or moved out of his place. Alſo the arms and legs will be pale by reaſon of the violent and ſudden ſuffocation of the ſpirits: moreover there will be a foam about his mouth, and a foamy and filthy matter hanging out of his noſtrils, being ſent thither both by reaſon that the Lungs are ſuddenly heated and ſuffocated, as alſo by the convulſion and concuſſion of the brain, like as it were in the Falling-ſickneſs. Contrariwiſe, if he be hanged dead, none of theſe ſigns appear: for neither the print of the rope appears red or pale, but of the ſame colour as the other parts of the body are, becauſe in dead men the bloud and ſpirits do not flow to the grieved parts.

Whether one found dead in the Water, came therein alive or dead.

Whoſoever is found dead in the Waters, you ſhall know whether they were thrown into the Water alive or dead. For all the belly of him that was thrown in alive will be ſwollen and puffed up by reaſon of the water that is contained therein; certain clammy excrements come out at his mouth and noſtrils, the ends of his fingers will be worn and excoriated, becauſe that he died ſtriving and digging or ſcraping in the ſand or bottom of the River, ſeeking ſomewhat whereon he might take hold to ſave himſelf from drowning. Contrariwiſe, if he be thrown into the Waters, being dead before, his belly will not be ſwollen, becauſe that in a dead man all the paſſages and conduits of the body do fall togeter, and are ſtopped and cloſed, and for that a dead man breaths not, there appeareth no foam nor filthy matter about his mouth and noſe, and much leſs can the tops of his fingers be worn and excoriated, for when a man is already dead, he cannot ſtrive againſt death.

But as concerning the bodies of thoſe that are drowned, thoſe that ſwim on the upper part of the Water being ſwollen or puffed up, they are not ſo by reaſon of the water that is conteined in the belly, but by reaſon of a certain vapour, into which a great portion of the humors of the body are converted by the efficacy of the putrefying heat. Therefore this ſwelling appeareth not in all men which do periſh, or elſe are caſt out dead into the Waters, but onely in them which are corrupted with the filthineſs or muddineſs of the Water, long time after they were drowned, and caſt on the ſhore.

Of ſuch as are ſmothered by Charcoal.

But now I will declare the accidents that come to thoſe that are ſuffocated and ſtifled or ſmothered with the vapour of kindled or burning Charcoals, and how you may fore-tell the cauſes thereof by the hiſtory following. In the year of our Lord God 1575. the tenth day of *May*, my ſelf with *Robert Gleauline* Doctor of Phyſick, was ſent for by Mr. *Hamel*, an Advocate of the Court of *Parliament* at *Paris*, to ſee and ſhew my opinion on two of his ſervants, of whom the one was his Clerk, and the other his Horſe-keeper. All his Family ſuppoſed them dead, becauſe they could not perceive or feel their Arteries to beat, all the extreme parts of their bodies were cold, they could neither ſpeak nor move, their faces were pale and wan, neither could they be raiſed up with any violent beating or plucking by the hair. Therefore all men accounted them dead, and the queſtion was onely of what kind of death they died, for their Maſter ſuſpected that ſome body had ſtrangled them; others thought that each of them had ſtopped one anothers wind with their hands: and others judged that they were taken with a ſudden Apoplexy. But I

preſently

preſently enquired, whether there had been any fire made with Coals in the houſe lately? whereunto their Maſter giving ear, ſought about all the corners of the Chamber, (for the Chamber was very little and cloſe) and at laſt found an earthen pan with Charcoal half-burned: which when we once ſaw, we all affirmed with one voice, that it was the cauſe of all this misfortune, and that it was the malign fume and venomous vapour which had ſmothered them, as it were by ſtopping the paſſages of their breath. Therefore I put my hand to the regions of their hearts, where I might perceive that there was ſome life remaining by the heat and pulſation that I felt, though it were very little, wherefore we thought it convenient to augment and increaſe it. Therefore firſt of all artificially opened their mouths, which were very faſt cloſed, and ſticking obſtinately together; and thereinto both with a ſpoon and alſo with a ſilver pipe, we put *Aqua vitæ* often diſtilled with diſſolved *Hiera* and Triacle; when we had injected theſe Medicins often into their mouths, they began to move and to ſtretch themſelves, and to caſt up and expel many viſcous excremental and filthy humours at their mouths and noſtrils, and their Lungs ſeemed to be hot, as it were in their throats.

Therefore then we gave them vomitories of a great quantity of *Oxymel*, and beat them often violently on the laſt ſpondil of the back, and firſt of the loins, both with the hand and knee (for unto this place the orifice of the ſtomach is turned) that by the power of the vomitory Medicin and concuſſion of the ſtomach, they might be conſtrained to vomit. Neither did our purpoſe fail us, for preſently they voided clammy, yellow and ſpumous phlegm and bloud.

But we not being contented with all this, blowed up into their noſtrils, out of a Gooſe-quill, the powder of *Euphorbium*, that the expulſive faculty of the brain might be ſtirred up to the expulſion of that which oppreſſed it; therefore preſently the brain being ſhaken, or moved with ſneezing, and inſtimulated thereunto by rubbing the Chymical oil of Mints on the Palate and on the Cheeks, they expelled much viſcous and clammy matter at their noſtrils.

Then we uſed Frictions to their arms, leggs, and back-bones, and miniſtred ſharp Clyſters, by whoſe efficacy the belly being abundantly looſened, they began preſently to ſpeak, and to take things that were miniſtred unto them of their own accord, and ſo came to themſelves again.

In the doing of all theſe things, *James Guillemeau* Surgeon to the King at *Paris*, and *John* of St. *Germans* the Apothecary, did much help and further us.

In the Afternoon that the matter being well begun might have good ſucceſs, *John Hauty* and *Lewis Thibaut*, both moſt learned Phyſicians, were ſent for unto us, with whom we might conſult on other things that were to be done. They highly commended all things that we had done already, thought it very convenient that Cordials ſhould be miniſtred unto them, which by ingendering of laudable humours, might not onely generate new ſpirits, but alſo attenuate and putrefie thoſe that were cloudy in their bodies. The reſt of our conſultation was ſpent in the inquiry of the cauſe of ſo dire a miſchance. For they ſaid it was no new or ſtrange thing, that men may be ſmothered with the fume and cloudy vapour of burning Coals.

For we read in the Works of *Fulgoſius*, *Volaterenus*, and *Egnatius*, that as the Emperour *Jovinian* travelled in Winter time towards *Rome*, he being weary in his journey, reſted at a Village called *Didaſtanes*, which divideth *Bithynia* from *Galatia*, where he lay in a Chamber that was newly made, and plaſtred with Lime, wherein they burned many Coals, for to drie the Work or Plaſtering, that was but as yet green on the Walls or Roofs of the Chamber. Now he died the very ſame night being ſmothered or ſtrangled with the deadly and poiſonous vapour of the burned Charcoal, in the midſt of the night; this happened to him in the eighth moneth of his Reign, the thirteenth year of his Age, and on the twentieth day of *Auguſt*. But what need we to amplifie this matter by the ancient Hiſtories, ſeeing that not many years ſince three ſervants died in the houſe of *John Bigine* Goldſmith, who dwelt at the turning of the Bridge at the Change, by reaſon of a fire made with Coals in a cloſe Chamber without any Chimney where they lay: and as concerning the cauſes, theſe were alledged; Many were of Opinion that it happened by the default of the vapour proceeding from the burned Coals, which being in a place void of all Air or Wind, infers ſuch like accidents as the vapour or Muſt of new Wine doth, that is to ſay, pain and giddineſs of the head. For both theſe kinds of Vapour, beſides that they are crude, like unto thoſe things whereof they come, can alſo very ſuddenly obſtruct the original of the Nerves, and ſo cauſe a Convulſion, by reaſon of the groſsneſs of their ſubſtance.

Lib. 9. cap. 12. lib. 23. An Hiſtory.

For ſo *Hippocrates* writing of thoſe accidents that happen by the vapour of new Wine, ſpeaketh; If any man being drunken, do ſuddenly become ſpeechleſs and hath a convulſion, he dieth, unleſs he have a Fever therewithal; or if he recover not his ſpeech again when his drunkenneſs is over. *Sect. 5. Aph. 5.*

Even on the ſame manner the vapour of the Coals aſſaulting the Brain, cauſed them to be ſpeechleſs, unmoveable, and void of all ſenſe, and had died ſhortly, unleſs by miniſtring and applying warm Medicins into the mouth and to the noſtrils, the groſsneſs of the vapour had been attenuated, and the expulſive faculty moved or provoked to expel all thoſe things that were noiſom: and alſo although at the firſt ſight the Lungs appeared to be grieved more then all the other parts, by reaſon that they drew the malign vapour into the body, yet when you conſider them well, it will manifeſtly appear that they are not grieved, unleſs it be by the ſympathy or affinity that they have with the brain when it is very grievouſly afflicted.

The proof hereof is, becauſe preſently after there followeth an interception or defect of the Voice, Senſe and Motion: which accidents could not be, unleſs the beginning or original of the Nerves were intercepted or letted from performing its function, being burthened by ſome matter contrary to Nature.

The occaſion of the death of ſuch as have the Apoplexy.

And even as thoſe that have an Apoplexy do not die but for want of reſpiration, yet without any offence of the Lungs, even ſo theſe two young mens deaths were at hand, by reaſon that their reſpiration or breathing was in a manner altogether intercepted, not through any default of the Lungs,

Lungs, but of the Brain and Nerves diſtributing ſenſe and motion to the whole body and eſpecially to the inſtruments of reſpiration. Others contrariwiſe contended and ſaid, that there was no default in the Brain, but conjectured the interception of the vital ſpirits letted or hindered from going up into the brain from the heart, by reaſon that the paſſages of the Lungs were ſtopped, to be the occaſion that ſufficient matter could not be afforded for to preſerve and feed the animal ſpirit. Which was the cauſe that thoſe young men were in danger of death, for want of reſpiration, without which there can be no life.

For the heart being in ſuch a caſe, cannot deliver it ſelf from the fuliginous vapours that encompaſs it, by reaſon that the Lungs are obſtructed by the groſsneſs of the vapour of the Coals, whereby inſpiration cannot well be made, for it is made by the compaſſing air drawn into our bodies: but the air that compaſſeth us doth that which Nature endeavoureth to do by inſpiration, for it moderateth the heat of the heart, and therefore it ought to be endued with four qualities. The firſt is, that the quantity that is drawn into the body be ſufficient. The ſecond is, that it be cold, or temperate in quality. The third is, that it be of a thin and mean conſiſtence. The fourth is, that it be of a gentle benign ſubſtance.

But theſe four conditions were wanting in the air which thoſe two young men drew into their bodies being in a cloſe Chamber.

Conditions of the air good to breath in.

For firſt it was little in quantity, by reaſon that ſmall quantity that was contained in that little cloſe Chamber, was partly conſumed by the fire of coals, no otherwiſe than the air that is contained in a Cupping-glaſs is conſumed in a moment by the flame ſo ſoon as it is kindled.

Furthermore it was neither cold nor temperate, but as it were inflamed with the burning fire of Coals.

Thirdly, It was more groſs in conſiſtence than it ſhould be, by reaſon of the admixtion of the groſſer vapour of the coals: for the Nature of the air is ſo that it may be ſoon altered, and will very quickly receive the forms and impreſſions of thoſe ſubſtances that are about it.

Laſtly, it was noiſom and hurtful in ſubſtance, and altogether offenſive to the airy ſubſtance of our bodies. For Charcoals are made of green wood burnt in pits under ground, and then extinguiſhed with their own fume or ſmoak, as all Colliers can tell. Theſe were the opinions of moſt learned men, although they were not altogether agreeable one unto another, yet both of them depended on their proper reaſons. For this at leaſt is manifeſt, that thoſe paſſages which are common to the Breſt and Brain, were then ſtopped with the groſsneſs of the vapours of the coals: whereby it appeareth that both theſe parts were in fault, for as much as the conſent and connexion of them with the other parts of the body is ſo great, that they cannot long abide ſound and perfect without their mutual help by reaſon of the loving and friendly ſympathy and affinity that is between all the parts of the body one with another.

Wherefore the ventricles of the Brain, the paſſages of the Lungs, and the ſleepy Arteries being ſtopped, the vital ſpirit was prohibited from entering into the Brain, and conſequently the animal ſpirit retained and kept in, ſo that it could not come or diſperſe it ſelf through the whole body, whence happeneth the defect of two of the faculties neceſſary for life.

Of the ſigns of Virginity.

It many times happeneth, and is a queſtion too frequently handled, concerning Womens Maidenheads; whereof the judgment is very difficult. Yet ſome ancient Women and Midwives will brag that they aſſuredly know it by certain and infallible ſigns. For (ſay they) in ſuch as are Virgins there is a certain membrane of parchment-like skin in the neck of the Womb, which will hinder the thruſting in of the finger if it be put in any thing deep; which membrane is broken when firſt they have carnal copulation, as may afterwards be perceived by the free entrance of the finger. Beſides, ſuch as are deflowered have the neck of their womb more large and wide; as on the contrary, it is more contract, ſtrait, and narrow in Virgins. But how deceitful and untrue theſe ſigns and tokens are, ſhall appear by that which followeth; for this membrane is a thing preternatural, and which is ſcarce found to be in one of a thouſand, from the firſt conformation. Now the neck of the Womb will be more open or ſtrait, according to the bigneſs and age of the party. For all the parts of the body have a certain mutual proportion and commenſuration in a well made body.

Lib. de error. popul.

Joubertus hath written, that at *Lectaure* in *Gaſcony*, a Woman was delivered of a child in the nineth year of her age, and that ſhe is yet alive, and called *Joan de Parie*, wife to *Videau Beche* the Receiver of the Amercements of the King of *Navarre:* which is a moſt evident aegument, that there are ſome Women more able to accompany with a man at nine years old, than many other at fifteen, by reaſon of the ample capacity of their womb, and the neck thereof: beſides alſo, this paſſage is enlarged in many by ſome accident, as by thruſting their own fingers more ſtrong thereinto by reaſon of ſome itching, or by the putting up of a Nodule or Peſſary, of the bigneſs of a mans Yard, for to bring down the Courſe. Neither to have milk in their breſts is any certain ſign of loſt Virginity. For *Hippocrates* thus writes: But if a Woman which is neither with child, nor hath had one, have milk in her breſts, then her Courſes have failed her.

Aph. 39. ſect. 5.

Moreover, *Ariſtotle* reports that there be men who have ſuch plenty of milk in their breſts, that it may be ſucked or milked out,

Lib. 4. de Hiſt. animal. c. 20. Lib. 12. de ſubtilitate.

Cardan writes, that he ſaw at *Venice* one *Anthony Buſſey*, ſome 30 years old, who had milk in his breſt in ſuch plenty, as ſufficient to ſuckle a child, ſo that it did not onely drop but ſpring out with violence like to a womans milk. Wherefore let Magiſtrates beware, leſt thus admoniſhed, they too raſhly aſſent to the reports of Women. Let Phyſicians and Chirurgeons have a care leſt they do too impudently bring Magiſtrates into an errour, which will not redound ſo much to the Judges diſgrace as to theirs.

But if any deſire to know whether one be poiſoned, let him ſearch for the ſymptoms and ſigns in the fore-going and particular Treatiſe of Poiſons. But that this doctrine of making Reports may be the eaſier, I think it fit to give preſidents, in imitation whereof the young Chirurgeon may frame

others.

others. The first president shall be of death to ensue; a second of a doubtful judgment of life and death; the third of an impotency of a member; the fourth of the hurting of many members.

I *A.P.* Chirurgeon of *Paris*, this twentieth day of *May*, by the command of the Council, entered into the house of one *John Brossey*, whom I found lying in bed, wounded on his head, with a wound in his left temple, piercing the bone with a fracture, and effracture or depression of the broken bone, scales and *meninges* into the substance of the brain, by means whereof his pulse was weak, he was troubled with raving, convulsion, cold sweat, and his appetite was dejected. Whereby may be gathered that certain and speedy death is at hand. In witness whereof I have signed this Report with my own hand. A certificate of death.

By the Coroners command I have visited *Peter Lucey*, whom I found sick in bed, being wounded with a Halbard on his right thigh. Now the wound was of the bredth of three fingers, and so deep that it pierces quite through his thigh with the cutting also of the Vein and Artery, whence insued much effusion of bloud, which hath exceedingly weakned him, and caused him to swound often; now all his thigh is swollen, livid, and gives occasion to fear worse symptoms, which is the cause that the health and safety of the party is to be doubted of. Another in a doubtful case.

By the Justices command I entered into the house of one *James Bertey*, to visit his own brother; I found him wounded in his right arm, with a wound of some four fingers bigness, with the cutting of the tendons bending the leg, and of the Veins, Arteries, and Nerves. Wherefore I affirm that he is in danger of his life, by reason of the malign symptoms that usually happen upon such wounds, such as are great pain, a Fever, Inflammation, Abscess, Convulsion, Gangrene, and the like. Wherefore he stands in need of provident and careful dressing, by benefit whereof if he escape death, without doubt he will continue lame during the remainder of his life, by reason of the impotency of the wounded part. And this I affirm under my hand. In the loss of a member.

We the Surgeons of *Paris*, by the command of the Senate, this twentieth day of *March*, have visited Master *Lewis Vertoman*, whom we found hurt with five wounds. The first inflicted on his head, in the middle of his fore-head-bone, to the bigness of three fingers, and it penetrates even to the second table, so that we were forced to pluck away three splinters of the same bone. The other was athwart his right cheek, and reacheth from his ear to the midst of his nose, wherefore we stitched it with four stitches. The third is on the midst of his belly, of the bigness of two fingers, but so deep that it ascends into the capacity of the belly, so that we were forced to cut away portion of the Kall coming out thereat, to the bigness of a Walnut, because having lost its natural colour, it grew black and putrefied. The fourth was upon the back of his left hand, the bigness almost of four fingers, with the cutting of the Veins, Arteries, Nerves, and part of the bones of that part; whence it is that he will be lame of that hand, howsoever carefully and diligently healed. Another in the hurts of divers parts.

Now because by hurting the spinal marrow men become lame sometimes of a leg, it is fit you know that the spinal marrow descends from the brain like a Rivulet for the distribution of the Nerves, which might distribute sense and motion to all the parts under the head; wherefore if by hurting the spinal marrow the Patients arms or hands are resolved or numb, or wholly without sense, it is a sign these nerves are hurt which come forth of the fifth, sixth, seventh *Vertebræ* of the neck. But if the same accidents happen to the thigh, leg, or foot with refrigeration, so that the excrements flow voluntarily, without the Patients knowledge, or else are totally suppresst, it is a sign that the sinews which proceed from the *Vertebræ* of the loins and holy-bone are hurt, or in fault; so that the animal faculty bestowing sense and motion upon the whole body, and the benefit of opening and shutting of the sphincter muscle of the bladder and fundament, cannot shew it self in these parts, by which means sudden death happens, especially if there be difficulty of breathing therewith.

Being to make Report of a Child killed by the Mother, have a care that you make a discreet Report, whether the child were perfect in all the parts and members thereof, that the Judge may equally punish the author thereof. For he meriteth far greater punishment, who hath killed a child perfectly shaped and made in all the members; that is, he which hath killed a live child, than he which hath killed an *Embryon*, that is, a certain concretiou of the spermatick body. For *Moses* punisheth the former with death, as that he should give life for life, but the other with a pecuniary mulct. But I judg it fit to exemplifie this report by a president. A caution in making Report of a Woman with child being killed.

I *A.P.* By the Judges command visited Mistriss *Margaret Ulmargy*, whom I found sick in bed, having a strong Fever upon her, with a convulsion and efflux of bloud out of her womb, by reason of a wound in her lower belly, below her navel on the right side, penetrating into the capacity of her belly, and the wound therein; whence it hath come to pass, that she was delivered before her time of a male child, perfect in all his members, but dead, being killed by the same wound, piercing through his scull into the marrow of the brain. Which in a short time will be the death of the Mother also. In testimony whereof, I have put my hand and seal.

The manner how to Embalm *the Dead.*

I Had determined to finish this my tedious work with the precedent Treatise of Reports; but a better thought came into my head, which was, to bring Man, whose cure I had undertaken, from his Infancy to his End, and even to his Grave; so that nothing might be here defective which the Surgeon might by his Profession perform about Mans body either alive or dead. Verily there hath scarce ever been a Nation so barbarous, which hath not only been careful for the Burial, but also for the Embalming or preserving of their dead bodies. For the very *Scythians*, who

The care of the *Scythians* in the embalming their dead.

have seemed to exceed other Nations in barbarousness and inhumanity, have done this; for (according to *Herodotus*) the *Scythians* bury not the corps of their King, before that being imbowelled and stuffed full of beaten Cypress, Frankincense, the Seeds of Parsley, and Anise, he be also wrapped in Cere-cloths. The like care hath also possessed the minds of the *Ethiopians*, for having disburthened the corps of their friends of their entrails and flesh, they plastered them over, and then they thus rough-cast them, they painted them over with colours so to express the dead to the life; they inclosed them thus adorned in a hollow pillar of Glass, that thus inclosed they may be seen and yet not annoy the Spectators with their smell. Then were they kept for the space of a year, in the hands of their next kindred; who, during this space, offered and sacrificed to them. The year ended, they carried them forth of the City, and placed them about the Walls each in his proper Vault, as *Herodotus* affirms. But this pious care of the dead did far otherwise affect the *Egyptians* than it did other Nations: For they were so studious to preserve the memory of their Ancestors, that they embalmed their whole body with aromatick ointments, and set them in translucent Urns, or glass Cells, in the more eminent and honoured part of their houses, that so they might have them daily in their sight, and might be as monuments and inciters to stir up them to imitate their Fathers and Grandsires Vertues. Besides also the bodies thus embalmed with aromatick and balsamick ointments, were in stead of a most sure pawn, so that if any *Egyptian* had need of a great sum of money, they might easily procure it of such as knew them and their neighbours, by pawning the dead body of some of their dead Parents. For by this means the Creditor was certain, that he which pawned it, would sooner lose his life than break his promise. But if all things so unhappily succeeded with any, so that through poverty he could not fetch home his pawn again, but was forced to forego it, he was so infamous amongst all men, during the rest of his life, as one banished, or forlorn; and losing his freedom he shall become a servant, yea, scorned and reviled of all men, he should be accounted unworthy to enjoy the light and society of men. And certainly the *Egyptians* understanding the life which we here lead, to be of short continuance, comparison being made with that which we are to live after separation of the soul from the body, they were more negligent in building their houses they dwelt in, but in rearing the Pyramids which should serve them in stead of Sepulchres, they were so beyond reason sumptuous and magnificent, that for the building one of these Edifices so renowned over all the World, which King *Cheopes* begun, a hundred thousand men were every three moneths, for twenty years space there kept at work: It was five furlongs, and being square, each side was 800 foot long, and so much in height. Almost all the pieces of marble went to the building thereof, were thirty foot long, engraven and carved with various workmanship, as *Herodotus* reports. But before the bodies were committed to these magnificent Sepulchres, they were carried to the Salters and Embalmers, who for that purpose had allowance out of the publick stock. These besmeared them with aromatick and balsamick Ointments, and sewed up the incisions they made, then strewed them over with Salt, and then covered them with Brine for 70 days; which being expired, they washed them, being taken thence, and all the filth being taken off, they wrapped them in Cotten cloths, glued together with a certain gum; then their Kinsmen placed them thus ordered in a woodden Coffin carved like to a man. This was the sacred and accustomed rite of Embalming and Burying dead bodies amongst the *Egyptians* which were of the richer sort. Our Countrymen the *French*, stirred up with the like desire, embalm the bodies of their Kings and Nobles with Spices and sweet Ointments. Which custom they may seem piously and christianly to have taken from the Old and New Testament, and the ancient and laudable custom of the Jews: for you may read in the New Testament that *Joseph* bought a fine linnen cloth, and *Nicodemus* brought a mixture of Myrrh and Aloes about 100 pound weight, that they might embalm and bury the body of *Jesus Christ* our Saviour, for a sign and argument of the renovation and future integrity which they hoped for by the Resurrection of the dead. Which thing the *Jews* had received by Tradition from their Ancestors. For *Joseph* in the Old Testament commanded his Physicians that they should embalm the dead body of his Father with Spices.

Lib. 3. Of the *Egyptians.*

The reason of building of the *Egyptians* Pyramids.

Lib. 2.

John 19.39.

Gen 50.2.

The manner of embalming for a long continuance.

But the body which is to be embalmed with Spices for very long continuance, must first of all be imbowelled, keeping the heart apart, that it may be embalmed and kept as the Kinsfolks shall think fit. Also the brain, the scull being divided with a Saw, shall be taken out. Then shall you make deep incisions along the arm, thighs, legs, back, loins and buttocks, especially where the greater Veins and Arteries run, first that by this means the bloud may be pressed forth: which otherwise would putrefie and give occasion and beginning to putrefaction to the rest of the body; and then that there may be space to put in the aromatick powders; the whole body shall be washed over with a Sponge dipped in *Aqua vitæ* and strong Vinegar, wherein shall be boiled Wormwood, Aloes, Coloquintida, common Salt and Alum. Then these incisions, and all the passages and open places of the body, and the three bellies shall be stuffed with the following Spices grosly powdered. ℞ *Pulv. rosar. chamæm. melil. balsami, menthæ, anethi, salviæ, lavend. rorismar. marjoran. thymi, absynthii, cyperi, calami aromat. gentianæ, ireos florent. assæ odoratæ, caryophyll. nucis moschat. cinnamomi, styracis, calamitæ. benjoini, myrrhæ, aloes, santal. omnium quod sufficit.* Let the incisions be sewed up, and the open spaces that nothing fall out; then forthwith let the whole body be anointed with Turpentine dissolved with Oil of Roses and Camomil, adding, if you shall think it fit, some Chymical Oils of Spices, and then let it be again strewed over with the fore-mentioned Powder; then wrap it in a linen cloth, and then in Cere-cloths.

How to embalm bodies when as we want spices.

Lastly, let it be put in a Coffin of Lead sure soldered and filled up with drie sweet herbs. But if there be no plenty of the fore-mentioned Spices, as it usually happens in besieged Towns, the Surgeon shall be contented with the powder of quenched lime, common ashes made of Oak-wood.

For thus the body being over and above washed in strong Vinegar or Lye, shall be kept a long time if so be that a great dissolving heat do not bear sway, or if it be not put in a hot and moist place.

And

And this condition of time and place is the cauſe why the dead bodies of Princes and Kings, though embalmed with Art and coſt, within the ſpace of ſix or ſeven days, in which they are kept to be ſhewed to the people after their embalming, do caſt forth ſo grievous a ſcent, that none can indure it; ſo that they are forced to be put in a leaden Coffin. For the air which encompaſſeth them groweth ſo hot by reaſon of the multitude of people flowing to the ſpectacle, and the burning of lights night and day, that the ſmall portion of the native heat which remaineth being diſſipated, they eaſily putrefie, eſpecially when as they are not firſt moiſtened and macerated in the liquor of aromatick things, as the Egyptians anciently uſed to do, ſteeping them in brine for 70 days, as I formerly told you out of *Herodotus*. I put in mind hereby, uſe, that ſo the embalming may become the more durable, to ſteep the bodies (being imbowelled, and pricked all over with ſharp bodkins, that ſo the liquor hindering putrefaction may penetrate the deeper into them) in a wooden Tub filled with ſtrong Vinegar of the decoction of aromatick and bitter things, as Aloes, Rue, Wormwood, and Coloquintida; and there keep them for twenty days, pouring thereinto eleven or twelve pints of *Aqua vitæ*. Then taking it forth, and ſetting it on the feet, I keep it in a clear and drie place. I have at home the body of one that was hanged, which I begged of the Sheriff, embalmed after this manner; which remains ſound for more than 25 years, ſo that you may tell all the muſcles of the right ſide, (which I have cut up even to their heads, and plucked them from thoſe that are next them for diſtinctions ſake, that ſo I may view them with mine eyes, and handle them with my hands as often as I pleaſe, that by renewing my memory I may work more certainly and ſurely, when as I have any more curious operation to be performed) the left ſide remain whole, and the Lungs, Heart, *Diaphragma*, Stomach, Splene, Kidnies, Beard, Hairs, yea and the Nails, which being pared, I have often obſerved to grow again to their form and bigneſs.

Why the bodies of our Princes, how well ſoever embalmed, corrupt in a few days.

And let this be the bound of this our immenſe labour, and by Gods favour, our reſt; to whom Almighty, All-powerful, Immortal and Inviſible, be aſcribed all honour and glory for ever and ever. *Amen.*

Labor improbus omnia vincit.

The End of the Treatiſe of Reports, and Embalming the Dead.

BOOK XXIX.

The Apology and Treatiſe, containing the Voyages made into divers places, by Ambroſe Parey *of* Laval *in* Maine, *Counſellor and Chief Chirurgeon to the King.*

TRuly I had not put my hand to the Pen, to write on ſuch a thing, were it not that ſome have impudently injured, taxed, and more through particular hatred, diſgraced me, than for zeal or love they bear to the publick good; which was, concerning my manner of tying the Veins and Arteries, writing thus as followeth:

Of what the Adverſary acuſeth the Author.

Male igitur & nimium arroganter inconſultus & temerarius quidam, vaſorum uſtionem poſt emortui membri reſectionem à veteribus omnibus plurimum commendatam & ſemper probatam damnare auſus eſt, novum quendam deligandi vaſa modum, contra veteres omnes medicos, ſine ratione, experientiâ & judicio docere cupiens, nec animadvertit majora multo pericula ex ipſa vaſorum deligatione quam acu partem ſanam profunde transfigendo adminiſtrari vult, imminere quam ex ipſa uſtione. Nam ſi acu nervoſam aliquam partem, vel nervum ipſum pupugerit, dum ità novo & inuſitato modo venam abſurde conatur conſtringere, nova inflammatio neceſſario conſequetur, à qua Convulſio & à convulſione cita mors. Quorum ſymptomatum metu Galenus non ante tranſverſa vulnera ſuere audebat (quod tamen minus erat periculoſum) quam muſculorum aponeuroſes denudaſſet. Adde quod forcipes quibus poſt ſectionem iterum carnem dilacerat, cum retracta verſus originem vaſa ſe poſſe extrahere ſomniat, non minorem adferant dolorem quam ignita ferramenta admota. Quod ſi quis laniatum expertus incolumis evaſerit, is Deo optimo maximo, cujus beneficentia crudelitate iſta & carnificina liberatus eſt, maximas gratias habere & ſemper agere debet; which is thus: Ill then, and too arrogantly a certain indiſcreet and raſh perſon would blame and condemn the cauterizing of Veſſels after the amputation of a rotten and corrupted member, much praiſed and commended, and always approved by the Ancients; deſiring to ſhew and teach us without Reaſon, Judgment, and Experience, a new way to tie the Veſſels, againſt the opinion of the ancient Phyſicians, taking no heed, nor being well adviſed, that there happens far greater perils and accidents, through this new way of tying the Veſſels (which he will have to be made with a Needle, piercing deeply the ſound part) then by the burning and uſtion of the ſaid Veſſels; for if the Needle ſhall prick any nervous part, yea the Nerve it ſelf, when he ſhall by this new and unaccuſtomed way, abſurdly conſtrain the vein by binding it, there muſt neceſſarily follow a new Inflammation; from the Inflammation a Convulſion, from a Convulſion, Death: for fear of which accidents, *Galen* never durſt ſtitch tranſverſal wounds, (which notwithſtanding were leſs dangerous) before he had diſcovered the Aponeuroſes of the Muſcles. Moreover the Pincers with which, after the ſection, the fleſh is again dilacerated, while he thinks to draw the Veſſels out which are drawn in toward their original, bring no leſs pain than the cautering irons do. And

The words of the Adverſary.

if any one having experimented this new manner of cruelty have eſcaped danger, he ought to render thanks to Almighty God for ever, through whoſe goodneſs he hath been freed from ſuch tyranny, feeling rather his executioner than his methodical Chirurgeon.

The Authors anſwer.

O what ſweet words are here, for one who is ſaid to be a wiſe and learned Doctor? he remembers not that his white beard admoniſheth him, not to ſpeak any thing unworthy of his age, and that he ought to put off and drive out of him all envy and rancour conceived againſt his neighbour. So now I will prove by Authority, Reaſon and Experience, that the ſaid Veins and Arteries ought to be tied.

Authorities.

AS for Authorities, I will come to that of that worthy man *Hippocrates*, who wills and commands the cure of Fiſtulaes in the Fundament by ligature, as well to conſume the calloſity, as to avoid hæmorrhagy. In the Book of Fiſtulaes of the Fundament, Chap. 3. Book 5. leaf 4.

Galen, Treatiſe 2. chap. 17. in his Method, ſpeaking of a Flux of Bloud made by an outward cauſe, of whom ſee here the words, *It is* (ſaith he) *moſt ſure to tie the root of the Veſſel, which I underſtand to be that which is moſt near to the Liver or the Heart.*

Avicen, Treatiſe 3. Doct. 1. chap. 3. commands to tie the Vein and the Artery, after it is diſcovered towards his original.

Guido of *Cauliac*, ſpeaking of the wounds of the Veins and Arteries, injoineth the Chirurgeon to make the ligature in the Veſſel.

Maſter *Hollier* in the 3. Book, chap. 4. of the matter of Chirurgery, ſpeaking of a flux of bloud, commands expreſly to tie the veſſels.

Calmetheus in 12. chap. of the wounds in the Veins and Arteries, tells a moſt ſure way to ſtay a flux of bloud by ligature of the Veſſel.

Celſus, Chap. 26. Book. 5. from whom the ſaid Phyſician hath ſnatched the moſt part of his Book, chargeth expreſly, to tie the Veſſels in a flux of bloud happening to wounds, as a remedy moſt eaſie and moſt ſure.

Veſalius in his Chirurgery, Chap. 4. Book 3. willeth that the Veſſel be tied in a flux of bloud.

John de Vigo, Book 1. Treatiſe 1. tteating of Hæmorrhagy in bleeding wounds, commands to tie the Vein and the Artery.

Tegaultius, Chap. 12. Book 2. treating of the means to ſtay the flux of bloud, commands to pinch the Vein or Artery with a Crow or Parrots bill, then to tie it with a very ſtrong thred.

Peter of *Argillata* of *Bullonge*, Treatiſe 4. Chap. 11. Book 1. diſcourſing of a flux of bloud, and the means to ſtop it, giveth a fourth way expreſly, which is made by ligature of the Veſſels.

John Andreas a Cruce, a *Venetian*, Book 1. Sect. 3. Chap. 16. Pag. 5. upon the 88 Chapter of the Book of *Paul*, makes mention of a method to ſtay a flux of bloud by the ligature of the Veſſels.

D' Alechamp commands to tie the Veins and Arteries.

See then (my little good man) the Authorities which command you to tie the Veſſels. As for the Reaſons, I will debate of them.

The Hæmorrhagy (ſay you) is not ſo much to be feared in the ſection of the Kall, as that of the Varices, and the inciſion of the temporal Arteries, as after the Amputation of a member. Now you your ſelf command that in cutting the Varices, the flux of bloud be ſtopped by the ligature of the Veſſels. In the Book 2. Chap. of Angealogy, leaf 176. you command the ſame in the Book of Stitches, Chap. 1. ſpeaking of the ſtitch with the amputation and ſection of the Kall, changed by the outward air; ſee here your own words: After that muſt be conſidered concerning the Kall: for if there be any part corrupted, putrefied, withered, or blackiſh: firſt having tied, for fear of a flux of bloud, you do not bid afterwards to have it cauteriſed. But to ſay the truth, you have your eyes ſhut, and all your ſenſes dulled, when you would ſpeak againſt ſo ſure a method, and that it is not but through anger and an ill will. For there is nothing which hath more power to drive Reaſon from her ſeat, than Choler and Anger. Moreover when one comes to cauterize and diſmember the parts, oftentimes when the Eſchar comes to fall off, there happens a new flux of bloud: As I have ſeen divers times, not having been yet inſpired by God, with ſo ſure a means then when I uſed the heat of fire. Which if you have not found, or underſtood this method in the Books of the Ancients, you ought not thus to tread it under your feet, and ſpeak unluckily of one, who all his life hath preferred the profit of the Common-wealth before his own particular. It is not more than reaſonable to be found upon the ſaying of *Hippocrates*, in the Chapter of Burning, Book 2. Leaf 206. upon whoſe Authority you ſerve your ſelf, which is thus. That what the medicament cureth not, the iron doth; and what the iron doth not amend, the fire exterminateth: It is a thing which ſavours not of a Chriſtian, to fall to burning at the firſt daſh, without ſtaying for any more gentle remedies. As you your ſelf write in the firſt Book, leaf 5. ſpeaking of the conditions required in a Chirurgeon to cure well; which paſſages you borrow from ſome other place: for that which may be done gently without fire, is much more commended than otherwiſe. Is it not a thing which all Schools hold as a Maxim, that we muſt always begin with moſt eaſie remedies, which if they be not ſufficient, we muſt then come to extreme, following the doctrine of *Hippocrates*? *Galen* commands in the place before alledged, to treat or dreſs the diſeaſed quickly, ſafely, and with the leaſt pain that is poſſible.

Galen in Book 4. of the *Meth.* and in the Book of Art of *Hippocrates*, Aph. 2. Book 1. In the Book of *Arte Parva.*

Let us come to Reaſon.

NOw ſo it is, that one cannot apply hot irons but with extreme and vehement pain in a ſenſible part void of a Gangrene, which would be cauſe of a Convulſion, Fever, yea, oft-times of Death. Moreover it would be a long while afterwards before the poor Patient were cured, becauſe that by the action of the fire there is made an eſchar, which proceeds from the ſubject fleſh, which being fallen, Nature muſt regenerate a new fleſh in ſtead of that which hath been burned; as alſo the bone remains diſcovered and bare; and by this means, for the moſt part there remains

Of what the Eſchar is made.

mains an ulcer incurable. Moreover there is yet another accident. It happeneth that oftentimes the cruſt being fallen off, the fleſh not being well renewed, the bloud iſſueth out as it did before. But when they ſhall be tied, the ligature falls not off until the firſt fleſh have very well covered them again: which is proved by *Galen* in the fifth Book of his *Meth.* ſaying, that Eſcharotick Medicins which cauſe a Cruſt or Eſchar, whenſoever they fall off, leave the part more bare than the natural habit requires. For the generation of a cruſt proceeds from the parts ſubject, and which are ſituate round about it, being alſo burned, as I may ſay: wherefore by how much the part is burnt, by ſo much it loſeth the natural heat. Then tell me when it is neceſſary to uſe eſcharotick Medicins, or cautering irons? 'Tis when the flux of bloud is cauſed by eroſion, or ſome gangrene or putrefaction. Now is it thus? in freſh bleeding wounds there is neither gangrene, nor putrefaction. Therefore, the cauteries ought not to be there applied. And when the Ancients commanded to apply hot irons to the mouths of the veſſels, it hath not been onely to ſtay the flux of bloud, but chiefly to correct the malignity, or gangrenous putrefaction which might ſpoil the neighbouring parts. And it muſt be here noted, that if I had known ſuch accidents to happen, which you have declared in your Book, in drawing and tying the veſſels, I had never been twice deceived; nor would I ever have left by my writings to poſterity, ſuch a way of ſtopping a flux of bloud. But I writ it after I had ſeen it done, and did it very often with happy ſucceſs. See then what may happen through your inconſiderate counſel, without examining, or ſtanding upon the facility of tying the ſaid veſſels. For ſee, here is your ſcope and propoſition, to tie the veſſels after amputation is a new remedy, ſay you, then it muſt not be uſed; it is an ill argument for a Doctor.

Words of the Adverſary.

But as for that (ſay you) one muſt uſe fire after the amputation of members, to conſume and drie the putrefaction, which is a common thing in gangrenes and mortifications, that indeed hath no place here, becauſe the practice is to amputate the part above that which is mortified and corrupted; as *Celſus* writes and commands, to make the amputation upon the ſecond part, rather than to leave any whit of the corrupted. I would willingly ask you, if when a vein is cut tranſverſe, and that it is very much retracted towards the original, whether you would make no conſcience to burn till that you had found the orifice of the vein or artery; and if it be not more eaſie onely with a Crow-bill to pinch and draw the veſſel, and ſo tie it? In which you may openly ſhew your ignorance, and that you have your mind ſeized with much rancor and choler. We daily ſee the ligature of the veſſels practiſed with happy ſucceſs, after the amputation of a part, which I will now verifie by Experiences and Hiſtories, of thoſe to whom the ſaid ligature hath been made, and perſons yet living.

Propoſitions of the Adverſary.

In Book 5. ch. 26. and Book 7. ch. 33.

In the chap. of Cutting, Book 2.

Experiences. A notable Hiſtory.

The 16. of *June* 1582. in the preſence of Mr. *John Liebaud* Doctor in the Faculty of Phyſick at *Paris*, *Claud. Viard* ſworn Surgeon, Mr. *Mathurin Huron* Surgeon of Monſieur *de Souvray*, and my ſelf, *John Charbonel* Maſter Barber-Surgeon of *Paris*, well underſtanding the Theorick and Practick of Surgery, did with good dexterity amputate the left leg of a Woman tormented the ſpace of three years with extreme pain, by reaſon of a great *Caries* which was in the bone *Aſtragal*, *Ceboides*, great and little *focil*, and through all the nervous parts, through which ſhe felt extreme and intolerable pains night and day: ſhe is called *Mary* of *Hoſtel*, aged 28 years or thereabouts, wife of *Peter Herve* Eſquire of the Kitchin to the Lady *Ducheſs* of *Uzez*, dwelling in the ſtreet of *Verbois*, on the other ſide St. *Martin* in the Fields, dwelling at the ſign of the St. *Johns* head; where the ſaid *Charbonel* cut off the ſaid leg the bredth of four large fingers below the Knee, and after that he had inciſed the fleſh, and ſawed the bone, he griped the vein with a Crow-bill, then the artery, then tied them; from whence I proteſt to God (which the company that were there can witneſs) that in all the operation that was ſuddenly done, there was not ſpilt one Porrenger of bloud; and I bid the ſaid *Charbonel* to let it bleed more, following the precept of *Hippocrates*, that it is good in all wounds and inveterate ulcers, to let the bloud run; by this means the part is leſs ſubject to inflammation. The ſaid *Charbonel* continued the dreſſing of her, who was cured in two moneths, without any flux of bloud happening unto her, or other ill accident; and ſhe went to ſee you at your lodging being perfectly cured.

The operation of *Charbonel*.

In the 7. Cent. of the Book of Ulcers.

Another Hiſtory of late memory, of a Singing-man of our Ladies Church, named Mr. *Colt*, who broke both the bones of his leg which were cruſhed in divers pieces, inſomuch that there was no hope of cure, to withſtand a Gangrene and mortification, and by conſequence death. Monſieur *Helin* Doctor Regent in the Faculty of Phyſick, a man of honour and good knowledge, *Claud. Viard* and *Simon Peter*, ſworn Surgeons of *Paris*, men well exerciſed in Surgery; and *Balthazar* of *Leſtre*, and *Leonard de Leſchenal*, Maſter Barber-Surgeons, well experimented in the operations of Surgery, were all of opinion, to withſtand the accidents aforeſaid, to make entire amputation of the whole leg, a little above the broken and ſhivered bones and the torn nerves, veins, arteries; the operation was nimbly done by the ſaid *Viard*, and the bloud ſtanched by the ligature of the veſſels in the preſence of the ſaid *Helin*, and Mr. *Tonſard* great Vicar of our Ladies Church, and was continually dreſſed by the ſaid *Leſchenal*, and I went to ſee him otherwhiles: he was happily cured without the application of hot irons, and walketh luſtily with a wooden leg.

Another Hiſtory.

Operation done by *Viard*.

In the year 1583. the 10. day of *December*, *Touſſiant Poſſon* born at *Ronieville*, at this preſent dwelling at *Beauvais* near *Dourdan*, having his leg all ulcered, and all the bones cariez'd and rotten, prayed me for the honour of God to cut off his leg, by reaſon of the great pain, which he could no longer endure. After his body was prepared, I cauſed his leg to be cut off, four fingers below the *rotula* of his knee, by *Daniel Powlet* one of my ſervants, to teach him, and to embolden him in ſuch works; and there he readily tied the veſſels to ſtay the bleeding, without application of hot irons, in the preſence of *James Guillemau* ordinary Surgeon to the King, and *John Charbonel* Maſter Surgeon of *Paris*: and during the cure was viſited by Mr. *Laſſile* and Mr. *Courtin*, Doctors Regent in the Faculty of Medicin at *Paris*. The ſaid operation was made in the houſe of *John Gobel* Inn-keeper, dwelling at the ſign of the White Horſe in the Greve. I will not here forget to ſay, that

Another Hiſtory.

Another Hiſtory. the Lady Princeſs of *Montpenſier*, knowing that he was poor and in my hands, gave him money to pay for his Chamber and Diet, He was well cured, God be praiſed, and is returned home to his houſe with a woodden leg.

A Gangrene happening by an Anticedent cauſe. A Gangrene happened to half of the leg to one named *Nicolas Meſnager*, aged 76 years, dwelling in St. *Honores* ſtreet, at the ſign of the Basket, which happened to him through an inward cauſe, ſo that we were conſtrained to cut off his leg to ſave his life: and it was taken off by *Anthony Renaud*, Maſter Barber-Surgeon of *Paris*, the 16. day of *December* 1583. in the preſence of M. *Le Fort*, and M. *La Nave*, ſworn Surgeons of *Paris*; and the bloud was ſtanched by the Ligature of the Veſſels, and he is at this preſent cured and in health, walking with a woodden leg.

Another Hiſtory. A Water-man at the Port of *Neſle*, dwelling near Monſieur *de Mas*, Poſt-maſter, named *John Bouſſereau*, in whoſe hands a Musket brake aſunder, which broke the bones of his hand, and rent and tore the other parts in ſuch ſort, that it was needful and neceſſary to make amputation of the hand two fingers above the wriſt: which was done by *James Guilleman*, then Surgeon in ordinary to the King, who dwelt at that time with me. The operation likewiſe being readily done, and the bloud ſtanched by the ligature of the veſſels, without burning irons, he is at this preſent living.

Operation done by *Guilleman*.

Another Hiſtory. Operation done by the Author. A Merchant Grocer dwelling in St. *Denis* ſtreet at the ſign of the great *Tournois*, named *the Judge*, who fell upon his head, where was made a wound near the temporal muſcle, where he had an artery opened, from whence iſſued forth bloud with great impetuoſity, inſomuch that common remedies would not ſerve the turn; I was called thither, where I found Mr. *Ruſſe*, Mr. *Cointeret*, Mr *Viard*, ſworn Surgeons of *Paris*, to ſtay bloud; where preſently I took a needle and thred and tied the artery, and it bled no more after that, and was quickly cured. Mr. *Roſſellet* can witneſs it, not long ſince Deacon of your Faculty, who was in the cure with us.

Another Hiſtory. Another operation. A Serjeant of the Chaſtlet dwelling near St. *Andrew des Arts*, who had a ſtroke of a Sword upon the throat in the Clacks Meadow, which cut aſunder the jugular vein extern: as ſoon as he was hurt he put his handkerchief upon the wound, and came to look me at my houſe, and when he took away his handkerchief, the bloud leaped out with great impetuoſity: I ſuddenly tied the vein toward the root; he by this means was ſtanched and cured, thanks be to God. And if one had followed your manner of ſtanching bloud by cauteries, I leave it to be ſuppoſed whether he had been cured; I think he had been dead in the hands of the Operator. If I would recite all thoſe whoſe veſſels were tied to ſtay the bloud, which have been cured, I ſhould not have ended this long time; ſo that methinks there are Hiſtories enough recited to make you believe the bloud of veins and arteries is ſurely ſtanched without applying any outward cauteries.

Du Bartas.

He that doth ſtrive againſt Experience,
Deigns not to talk of any learned Science.

Book 6. c. 4. Book 2. c. 4. Book 3. c. 9. Sect. 7. NOw my little Maſter, ſeeing that you reproach me that I have not written all the operations of Surgery in my Works, which the Ancients write of, I ſhould be very ſorry for it: for then indeed might you juſtly call me *Carnifex*. I have left them becauſe they are too cruel, and am willing to follow the Moderns, who have moderated ſuch cruelty: which notwithſtanding you have followed ſtep by ſtep, as appeareth by the operations, here written, extracted from your Book, which you have drawn here and there from certain ancient Authors, ſuch as follow, and ſuch as you have never practiſed nor ſeen.

The Firſt Operation.

In the ſecond Book of the Chapter of *Hypoſpatiſm*, Book 4. ch. laſt of the Meth. In the 4. ch. of the 16. Book of my Work. Book 6. c. 7. Book 2. c. 5. TO inveterate fluxions of the Eyes, and Meagrims, *Paulus Ægineta* as alſo *Albucaſis* command to make *Arteriotomy*; ſee here the words of the ſame *Ægenete*. You mark the arteries which are behind the Ears, then divide them in cutting to the very bone, and make a great inciſion, the bredth of two fingers, even till the artery be found, as you command to be done in your Book; but I holding the opinion of *Galen*, who commands to dreſs the diſeaſe quickly, ſafely, and with the leaſt pain that is poſſible; I teach the young Surgeon the means to remedy ſuch evils in opening the arteries behind the ears, and thoſe of the temples, with one onely inciſion, as a letting bloud, and not to make a great inciſion, and cut out work for a long time.

The Second.

In the 2. Book chap. of *Periſcythiſm*. In the 26. ch. of the 9. Book of my Works. TO Fluxions which are made a long time upon the Eyes, *Paul Ægenete* and *Albucaſis* command to make inciſion, which they call *Periſcythiſmos* or *Augiology* of the Greeks; and ſee here the words of *Paul*: *In this Operation firſt the head is ſhaved, then taking heed of touching the temporal muſcles, a tranſverſe inciſion muſt be made, beginning at the left temple, and finiſhing at the right*; which you have put in your Book word for word, without changing any thing: which ſheweth openly you are a right Wound-maker, as may be ſeen in the Chapter which you call the Crown-cut, which is made half round under the Coronal ſuture from one temple to another, even to the bone. Now I do not teach ſuch a cruel kind of remedy, but inſtruct the Operator by Reaſon, Authority, and notable proof of a ſure and certain way to remedy ſuch affections without butchering men in this kind.

The third Operation.

The third. Book 6. ch. 44. Book 2. ch. 3. Book 3. ch. 22. IN the cure of *Empyema*, *Paul Ægenete*, *Albucaſis* and *Celſus* commanded to apply ſome thirteen, others fifteen Cauteries to give iſſue to the matter contained in the breſt, as the ſaid *Celſus* in the aforeſaid place appointeth for Aſthmatick people, which is a thing out of all reaſon (with reſpect to their honor be it ſpoken) that ſince the Surgeons ſcope is to give iſſue to the matter therein contained, there is no other queſtion then to make apertion, to evacuate the matter in the moſt inferiour part, I have ſhewed the young Surgeon the means to do it ſafely, without tormenting the Patients for nothing.

The

The Fourth Operation.

IN Paps that are too great, *Paul Æginet* and *Albucasis* commands to make a cross-incision, to take out all the fat, and then join together the wound by stitch: in brief, it is to flay a man alive, which I have never practised, nor counsel it to be done by the young Surgeon.

Guido of *Cauliac* the 2. Treatise, doct. 1. c. 1. Book 7. c. 10. book 6. c. 46. book 2. c. 47.

The Fifth Operation.

Albucasis and *Paul Æginet* will cauterize the Liver and the Splene with hot irons, which the Moderns have never practised; for indeed Reason is manifestly repugnant thereunto.

The Sixth Operation.

IN the *Paracentesis* which is made in the third kind of Dropsie called *Ascites*, *Celius Aurelianus* commandeth diverse apertions to be made in the belly. *Albucasis* applies nine actual Cauteries, that is to say, four about the Navel, one upon the Stomach, and one upon the Splene, one upon the Liver, two behind the Spondyls, one of them near the breast, the last near the Stomach. *Ætius* is likewise of the same opinion, to open the belly with diverse cauteries. *Paul Æginet* commands to apply five actual cauteries to make the said *Paracentesis*. But abhorring such a kind of burning, of which you speak much in your third Book. I shew another kind of practice, the which is done by making a simple incision in the said belly, as may be seen in my Works, with happy success, I do not teach young men in my Works the manner of burning, which the Ancients have called *infibulare*, that is not in practice, though *Celsus* writeth of it.

In the first Book ch. 29, and 30. also in b. 2. c. 32. b. 6. c. 47, and 48. In the 5. book ch. 1. *De internis morbis*, book 1. c. 33. book 3. sect. 2. chap. 89. book 6. chap. 50. In the 3. book 12. ch. 6, 7.

The Seventh Operation.

IN the Sciatick proceeding from an internal cause, and because the viscous humours displace the bones, *Paul* commands to burn or cauterize the said joint to the bone: *Dioscorides* commands the same, which I do not find expedient, taking indication from the subjacent parts: for there where one would burn, it is in the place of four twin-muscles, under which passeth the great nerve descending from the Holy-bone; which being burnt I leave it to your censure what might happen, as *Galen* remarketh speaking of the *ustion* which must be made in the shoulders, called *humerus*.

In the 7. book c. 25. book 6. c. 76. book 2. c. 72. upon the sentence 49. of the first section of the Book of Arts.

The Eighth Operation.

IN the outward luxation of the Spondyls, *Hippocrates* commands to bind the man right upon a Ladder, the arms and legs tied and bound: then afterwards having raised the Ladder to the top of a Tower, or the ridge of an house, with a great rope in a pully, then to let the Patient fall plumb down upon the hard pavement; which *Hippocrates* says was done in his time. But I do not shew of any such way of giving the Strapado to men; but I shew the Surgeon, in my Work, the way to reduce them surely, and without great pain. Moreover I should be sorry to follow the saying of the said *Hippocrates*, in the third Book *De Morbis*, who commands in the disease called *Volvulus*, to cause the belly to be blown with a pair of Bellows, putting the nosel of them into the *intestinum rectum*, and then blow there till the belly be much stretched, afterwards to give an emollient Clyster, and to stop the Fundament with a Sponge. Such practice as this is not made now adays, therefore wonder not if I have not spoken of it. And you not being contented to patch together the operations of the aboveSaid Authors, you have also taken divers in my Works, as every man may know: which sheweth manifestly that there is nothing of your own in your *Surgeons Guide*. I leave out divers other unprofitable operations which you quote in your Book, without knowing what Beasts they are, in never having seen them practised; but because you have found them written in the Books of the Ancients, you have put them into your Book.

Sentence the 22, and 23. of the third section of the Book of the Joints, c. 16. of the 15 Book.

Moreover you say that you will teach me my lesson in the operations of Surgery, which I think you cannot do: because I have not onely learned them in my study, and by the hearing of many years the lessons of Doctors of Physick: but as I have said before in my Epistle to the Reader, I was resident the space of three years in the Hospital of *Paris*, where I had the means to use and learn divers works of Surgery, upon divers Diseases, together with the Anatomy, upon a great number of dead bodies, as oftentimes I have sufficiently made trial publickly in the Physicians School at *Paris*, and my good luck hath made me seen much more. For being called to the service of the King of *France*, (four of which I have served) I have been in company at Battles, Skirmishes, Assaults and Besieging of Cities and Fortresses; as also I have been shut up in Cities with those that have been besieged, having charge to dress those that were hurt. Also I have dwelt many years in this great and famous City of *Paris*, where (thanks be to God) I have lived in very good reputation amongst all men, and have not been esteemed the least in rank of men of my Profession, seeing there was not any cure, were it never so difficult and great, where my hand and my counsel have not been required, as I make it appear in this my Work. Now dare you (these things being understood) say you will teach me to perform the works of Surgery, since you never went further than your study? The operations of the same are four in general (as we have declared heretofore) where you may make but three; that is to say, join that which is separated, separate that which was conjoined, and to take away that which was superfluous, and the fourth which I make, is as much necessary, an industrious invention to add to Nature that which is wanting, as I have shewed here above. Also it is your will that the Surgeon make but three operations above-said, without medling to ordain a simple Cataplasm, saying it is that which comes to your part belonging to the Physician. And that the Ancients (in the discourse which you have made to the Reader) have divided the practice of Physick into three kinds, that is to say, Diet, Medicin, and Chirurgery. But I would willingly demand of you, who hath made the partition, and where any thing should be done? who are those which are content with their part, without any enterprise upon the other? For *Hippocrates*, *Galen*, *Ætius*, *Avicen*, in brief, all the Physicians, as well Grecks and Latins as Arabians, have never so treated of the one, that they have not treated of the other, for the great affinity and tie that there is between them two; and it should be very difficult to do otherwise. Now when you will vilifie Chirurgery so much, you speak against your self; for in your Epistle you have dedicated to Monsieur *Martignes*, you say, that Chirurgery is the most noble part of Physick, as well by

reason

reason of the original antiquity, necessity, as certainty in her actions; for she works *Luce aperta*, as learnedly writeth *Celsus* in the beginning of the Seventh Book; therefore it is to be believed you never went out of your Study, but to teach *Theorick* (if you have been able to do it.)

A fair similitude.

The operations of Chirurgery are learnt by the eye, and by the touch. I will say that you much resemble a young Lad of *Low-Britany*, of plum buttocks, where was stuff sufficient, who demanded leave of his Father to come to *Paris*, to take *France*; being arrived, the Organist of our Ladies Church met with him at the Palace-gate, who took him to blow the Organs, where he was remaining three years: he saw he could somewhat speak *French*, he returns to his Father, and told him that he spake good *French*, and moreover he knew well to play on the Organs: his Father received him very joyfully, for that he was so wise and learned in a short time. He went to the Organist of their great Church, and prayed him to permit his Son to play on the Organs, to the end he might know whether his Son was become so skilful a Master as he said he was; which the Organist agreed to very willingly. Being entered to the Organs, he cast himself with a full leap to the Bellows; the Master Organist bid him play, and that he would blow: then this good Master answers, *Let him play himself on the Organs if he would for him, he could do nothing but play on the Bellows.* I think also, my little Master, that you know nothing else, but to prattle in a chair; but I will play upon the Keys and make the Organs sound: (that is to say) I will do the operations of Chirurgery, that which you cannot in any wise do, because you have not gone from your Study or the Schools, as I have said before. But also as I have said already in the Epistle to the Reader, that the Labourer doth little profit by talking of the Seasons, discourse of the manner of tilling the Earth, to shew what Seeds are proper to each soil; all which is nothing if he put not his hand to the Plough, and couple the Oxen together. So likewise it is no great matter if you do not know the *Practick*; for a man may execute Chirurgery well, although he have no tongue at all. As *Cornelius Celsus* hath very well remarked in his first Book, when he saith, *Morbos non eloquentia, sed remediis curari, quæ si quis elinguis, usu discretus bene norit, hunc aliquanto majorem medicum futurum quam si sine usu linguam suam excoluerit*; that is to say, Diseases are not to be cured by Eloquence, but by Remedies well and duly applied, which if any wise and discreet man though he have no tongue, know well the use thereof, this man in time shall become the greater Physician, than if without practice his tongue were dipt with Oratory, the which you your self confess in your said Book by a Tetrastich which is thus:

To talk's not all in Chirurgions Art,
But working with the hands;
Aptly to dress each grieved part,
And guide fire, knife, and bands.

Aristotle in the first Book of his Metaphysicks, the first Chapter, saith, Experience is almost like unto Science; and by the same, Art and Science have been invented. And indeed we see these which are experimented, attain sooner to that which they intend, than those which have Reason and not Experience, because that the said Experience is a knowledge of singular and particular things; and Science on the contrary, is a knowledge of things universal. Now that which is particular is more healable than that which is universal; therefore those which have Experience are more wise and more esteemed, than those which want it, by reason they know what they do. Moreover I say, that Science without Experience, bringeth no great assurance.

Alciat, a Doctor of *Milan*, boasted one day of himself, that his glory was greater and more famous than that of Counsellors, Presidents, Masters of Request, because that it was by his Science and his Instructions that they became such: but he was answered by a Counsellor, that he was like unto a Whet stone, which made the Knife sharp and ready to cut, not being able so to do it it self; and alledged the Verses of *Horace*, that,

Fungebatur vice cotis acutum
Reddere quæ ferrum valet, exors ipsa secandi.

See you now (my little Master) my answers to your calumniations, and pray you, if you bear a good mind (to the publick good) to review and correct your Book, as soon as you can, and not to hold young Chirurgeons in this errour by the reading of the same, where you teach them to use hot irons after the amputation of members, to stay a flux of bloud, seeing there is another means and not so cruel, and more sure and easie. Moreover if to day after an assault of a City, where divers Souldiers have had arms and legs broken and shot off by Cannon-bullets, Cutlas and other instruments of War, to stay the flux of bloud, if you should use hot irons, it would be needful to have a Forge, and much Coals to heat them: and also the Souldiers would hold you in such horrour for this cruelty, that they would kill you like a Calf, even as in times past they did one of the chiefest Chirurgeons of *Rome*, which may be found written before, in the third Chapter of the Introduction of Surgery, the first Book. Now lest the Sectators of your writings should fall into such inconveniency, I pray them to follow the method aforesaid, the which I have shewed to be true and certain, and approved by Authority, Reason, and Experience.

The Voyage of Thurin, 1535.

MOreover I will here shew to the Readers the places where I have had means to learn the Art of Surgery, for the better instructing of the young Surgeon: and first in the year 1536. the King of *France* sent a great Army to *Thurin*, to recover the City and Castles which the Marques of *Guast*, Lieutenant-General of the Emperour, had taken: where the High Constable of *France* the Great Master, was Lieutenant-General of the Army, and Monsieur *de Montain* Colonel-General of the Foot, of which I was then Surgeon. A great part of the Army arrived in the Country of *Suze*;

we

we found the Enemy which ſtopt the paſſage, and had made certain Forts, and Trenches, inſomuch that to hunt them out and make them leave the place, we were forced to fight, where there were divers hurt and ſlain, as well of the one ſide as of the other: but the enemies were conſtrained to retire, and get into the Caſtle, which was cauſed partly by one Captain *Ratt*, who climed with divers Souldiers of his company upon a little Mountain; there where he ſhot directly upon the enemies, he received a ſhot upon the ancle of his right foot, wherewith preſently he fell to the ground; and ſaid then, Now is the *Ratt* taken. I dreſſed him, and God healed him. We entered the throng iuto the City, and paſſed over the dead bodies, and ſome which were not yet dead; we heard them cry under our Horſes feet, which made my heart relent to hear them. And truly I repented to have forſaken *Paris* to ſee ſuch a pitiful ſpectacle. Being in the City, I entered into a Stable thinking to lodge my own, and my mans horſe, where I found four dead Souldiers and three which were leaning againſt the wall, their faces wholly diſfigured, and neither ſaw nor heard, nor ſpake; and their clothes did yet flame with Gun-powder which had burnt them. Beholding them with pitty, there happened to come an old Souldier who asked me if there were any poſſible means to cure them; I told him no: he preſently approached to them, and cut their throats without choler. Seeing this great cruelty I told him he was a wicked man; he anſwered me that he prayed to God, that whenſoever he ſhould be in ſuch a caſe, that he might find ſome one that would do as much to him, to the end he might not miſerably languiſh. And to return to our former diſcourſe, the enemy was ſummoned to render, which they ſoon did, and went out, their lives only ſaved, with a white ſtaff in their hands; the greateſt part whereof went and got to the Caſtle of *Villane*, where there was about 200 Spaniards; Monſieur the Conſtable would not leave them behind, to the end that the way might be made free. This Caſtle is ſeated upon a little mountain, which gave great aſſurance to them within, that one could not plant the Ordnance to beat upon it, and they were ſummoned to render, or that they ſhould be cut in pieces; which they flatly refuſed, making anſwer, *That they were as faithful ſervants to the Emperor, as Mounſieur the Conſtable could be to the King his Maſter.* This anſwer heard, they made by force of arms, two great Cannons to be mounted in the night with cords and ropes, by the Swiſſers and Lanſquenets; when as the ill luck would have it, the two Cannons being ſeated, a Gunner by great negligence ſet on fire a great bag of gun-powder, wherewith he was burned together with ten or twelve Souldiers; and moreover the flame of the powder was a cauſe of diſcovering the Artillery, which made them, that all night they of the Caſtle did nothing but ſhoot at that place where they diſcovered the two pieces of Ordnance, wherewith they killed and hurt a great number of our people.

The retiring of the enemy.

Hiſtory.

Brave anſwer of the Souldiers.

The next day early in the morning a Battery was made, which in a few hours made a breach, which being made, they demanded to parly with us; but twas too late for them for in the mean time our *French* foot ſeeing them amazed, mounted to the breach, and cut them all in pieces, except a fair young luſty Maid of *Piedmont*, which a great Lord would have kept and preſerved for him to keep him company in the night, for fear of the greedy Wolf. The Captain and Enſign were taken alive, but ſoon after were hanged upon the gate of the City, to the end they might give example and fear to the imperial Souldiers not to be ſo raſh and fooliſh, to be willing to hold ſuch places againſt ſo great an army. Now all the ſaid Souldiers of the Caſtle, ſeeing our people coming with a moſt violent fury, did all their endeavor to defend themſelves, they killed and hurt a great company of our Souldiers, with Pikes, Muskets, and Stones, where the Surgeons had good ſtore of work cut out. Now at that time I was a freſh-water Souldier, I had not yet ſeen wounds made by gun-ſhot at the firſt dreſſing. It is true, I had read in *John de Vigo*, in the Firſt Book of wounds in General the eight Chapter, that wounds made by weapons of fire did participate of Venenoſity, by reaſon of the Powder, and for their cure he commands to cauterize them with oyl of Elders ſcalding-hot, in which ſhould be mingled a little Treacle, and not to fail, before I would apply of the ſaid oyl knowing that ſuch a thing might bring to the patient great pain, I was willing to know firſt, before I applied it, how the other Surgeons did for the firſt dreſſing, which was to apply the ſaid oyl, the hotteſt that was poſſible, into the wouuds, with Tents and Setons; inſomuch that I took courage to do as they did. At laſt I wanted oyl, and was conſtrained in ſtead thereof, to apply a digeſtive of Yolks of Eggs, Oyl of Roſes, and Turpentine. In the night I could not ſleep in quiet, fearing ſome default in not cauterizing, that I ſhould find thoſe to whom I had not uſed the burning oyl, dead impoyſoned; which made me riſe very early to viſit them, where beyond my expectation, I found thoſe to whom I had applied my digeſtive medicin, to feel little pain, and their wounds without inflammation or tumor, having reſted reaſonable well that night: the other to whom was uſed the ſaid burning-oyl I found them feveriſh, with great pain and tumor about the edges of their wounds. And then I reſolved with my ſelf, never ſo cruelly to burn poor men wounded with gun-ſhot. Being at *Thurin*, I found a Surgeon, who had the fame above all others, for the curing of wounds of gun-ſhot, into whoſe favor I found means to inſinuate my ſelf, to have the Receit of his Balm, as he called it, wherewith he dreſſed wounds of that kind, and he held me off the ſpace of two years, before I could poſſible draw the Receit from him. In the end by gifts and preſents he gave it me, which was this, To boil young whelps new pupped, in oyl of Lillies, prepared Earth-worms, with Turpentine of *Venice*. Then was I joyful and my heart made glad, that I had underſtood his remedy, which was like to that which I had obtained by great chance. See then how I have learned to dreſs wounds made with gun-ſhot, not by Books. My Lord Marſhal of *Montain* remained Lieutenant-General for the King in *Piedmont*, having ten or twelve thouſand men in Garriſon through the Cities and Caſtles, who often combated with Swords and other weapons, as alſo with Muskets; and if there were four hurt, I had always three of them; and if there were queſtion of cutting off an arm or a leg, or to trepan, or to reduce a fracture or diſlocation, I brought it well to paſs. The ſaid Lord Marſhal ſent me one while this way, another while that way, for to dreſs the appointed Souldiers which were beaten as well in other Cities as that of *Thurin*, inſomuch that I was always in the Country

Exemplary puniſhment.

Counſel of *Vigo*.

Experience of a bold mans happy ſucceſs.

Receit of an excellent balm for wounds with Gun-ſhot.

Country one way or other. Mounſieur the Marſhal ſent for a Phyſician to *Milan*, who had no leſs reputation in the medicinal Art (then the diſeaſed Mounſieur *le Grand*) to take him in hand for an Hepatical flux, whereof at laſt he died. This Phyſician was a certain while at *Thurin* to deal with him, and was often called to viſit the hurt people, where he always found me, and I conſulted with him and ſome other Surgeons: and when we had reſolved to do any ſerious work of Surgery: 'twas *Ambroſe Parey* that put his hand thereto, where I did it promptly, and with dexterity, and with great aſſurance, in ſo much that the ſaid Phyſician admired me, to ſee me ſo ready in the operation of Surgery, ſeeing the ſmall age which I had. One day diſcourſing with the ſaid Lord Marſhal, he ſaid to him, *Signior tu, hai un Chirurgico giovane di anni, me egli veckio di ſapere e di eſperientia. Guarde lo bene, perche egli ti fara ſervicio & honore.* That is to ſay, Thou haſt a young Surgeon of age, but he is old in knowledge and experience; preſerve him well for he will do thee ſervice and honour. But the old man knew not that I had dwelt three years in the Hoſpital at *Paris*, there to dreſs the diſeaſed. In the end Mounſieur Marſhal died with his Hepatical Flux. Being dead, the King ſent Mounſieur the Marſhal of *Annebaut* to be in his place, who did me this honour to pray me to dwell with him, and he would uſe me as well or better than Mounſieur the Marſhal *Montain*; which I would not do for the grief I had for the loſs of my Maſter who loved me intimately, and I him in the like manner; and ſo I came back to *Paris*.

Witneſs of the dexterity of the Author.

The death of Marſhal *Montain*.

The Voyage of Marolle and of Low Britany, 1543.

The voyage of *Marolle* and of *Low Britany*, 1543.

I Went to the Camp of *Marolle*, with the diſeaſed Mounſieur *De Rohan*, where King *Francis* was in Priſon; and I was Surgeon of the Company of the ſaid Mounſieur *De Rohan*. Now the King was advertiſed by Mounſieur *De Eſtampes*, Governour of *Britany*, that the Engliſh had hoiſt ſail to land in *Low Britany*, and prayed him that he would ſend Mounſieur *De Rohan*, and Mounſieur *De Laval* for ſuccour, becauſe they were the Lords of that Countrey, and for their ſakes thoſe of that Countrey would beat back the Enemy and keep them from landing. Having received this advertiſement his Majeſty diſpatched to ſend the ſaid Lords for the relief of their Countrey, and to each was given as much power as to the Governour, in ſo much as they were all three the Kings Lieutenants: they took willingly this charge upon them, and ſpeedily they went away in Poſt: and led me with them to *Landreneau*, there where we found every one in arms, the Alarm-bells ſounding on every ſide, yea, five or ſix leagues about the *Harbours*, that is to ſay, *Breſt*, *Conquet*, *Crozon*, *Le Fou Dalac*, *Laudanac*, each of them well furniſhed with Artillery, as Cannons, Demi-cannons, Culverins, Sakers, Serpentines, Falcons, Harquebuſſes: in brief, there was nothing wanting in Artillery or Souldiers, as well *Britains* as *French*, to hinder that the Engliſh made no landing, as they had reſolved at their parting from *England*. The Enemies Army came unto the very mouth of the Cannon, and when we perceived them that they would land, they were ſaluted with Cannon-ſhot, and we diſcovered our Men of War, together with our Artillery; they fled to Sea again: where I was glad to ſee their Veſſels hoiſe ſail again, which was in a great number and in good order, and ſeemed like a Foreſt which marched upon the Sea. I ſaw a thing alſo whereat I marvelled much, which was, that the bullets of great pieces made great rebounds, and grazed upon the water as upon the ground. Now to make the matter ſhort, the Engliſh did us no harm, and returned whole and ſound into *England*, and left us in peace. We ſtaid in that Countrey in Garriſon, till we were aſſured that their Army was diſperſed. In the mean time our Horſemen exerciſed their feats of activity, as to run at the Ring, fight in Duel, and others; ſo that there was ſtill ſomething to imploy me withal. Mounſieur *De Eſtampes*, to make ſport and pleaſure to the ſaid Mounſieur *De Rohan* and *Laval*, and other Gentlemen, cauſed divers Countrey Wenches to come to the Feaſts, to ſing ſongs in *Low Britain* Tongue, where their harmony was like the croaking of Frogs, while they are in love. Moreover he made them dance the *Britany Triory*, without moving Feet or Buttocks; he made them hear and ſee much good. Otherwhiles they cauſed the Wraſtlers of the Cities and Towns, to come where there was a Prize for the beſt, and ſport was ſeldom ended, but that one or other had a leg or arm broken, or the ſhoulder or hip diſplaced: there was a little man of *Low Britany* of a ſquare body and well ſet, who held a long time the credit of the Field, and by his skill and ſtrength, threw five or ſix to the ground; there came to him a great Schoolmaſter, who was ſaid to be one of the beſt Wreſtlers of all *Britany*: he entered into the Liſts, having taken off his long Jacket, in Hoſe and Doublet, and being near the little man, he ſeemed as if he had been tied to his girdle. Notwithſtanding when each of them took hold of the Collar, they were a long time without doing any thing, and they thought they would remain equal in force and skill: but the little man caſt himſelf with an ambling leap under this great Pedant, and took him on his ſhoulder and caſt him on his kidnies ſpread abroad like a Frog, and then all the Company laught at the skill and ſtrength of the little Fellow. This great *Dativo* had a great ſpight, for being caſt by ſo little a man: he roſe again in choler, and would have his revenge. They took hold again of each others collar, and were again a good while at their hold without falling to the ground: in the end this great man let himſelf fall upon the little, and in falling, put his elbow upon the pitch of his ſtomach, and burſt his heart, and killed him ſtark dead. And knowing he had given him his deaths blow, took again his long Caſſock, and went away with his tail between his legs, and hid himſelf, ſeeing that the little man came not again to himſelf, either for Wine, Vinegar, or any other thing that was preſented unto him; I drew near to him, and felt his pulſe which did not beat at all, then I ſaid he was dead: then the *Britans* who aſſiſted the Wreſtling, ſaid aloud in their jabbering, *That is not in the ſport.* And ſome ſaid that the ſaid *Pedagogue* was accuſtomed to do ſo, and that but a year paſt he had done the like in a Wreſtling. I would needs open the body to know the cauſe of this ſudden death, where I found much bloud in the *Thorax*, and in the inferiour belly, and I ſtrived to find out any apertion in the place, from whence might iſſue ſo great a quantity of bloud, which I could not do for all the diligence I could make. Now I believe it was *per Diapedeſin*, or *Anaſtomoſin*, that is to ſay, by the apertion of the mouths of the veſſels, or by their poroſities: the poor little Wreſtler was buried. I took leave of *Meſſieurs de Rohan*,

Dances of the Countrey Wenches. Wreſtlers. Little *Britain* a good Wreſtler.

The little *Britain* killed.

The body opened by the Author.

Rohan, *de Laval*, and *Eſtamps*. Mounſieur *de Rohan* gave me a preſent of fifty double Duckets, and an ambling Horſe, and Mounſieur *de Laval* another for my Man, and Mounſieur *de Eſtamps*, a Diamond of thirty Crowns, and ſo I returned to my houſe at *Paris*.

The Voyage of Perpignan, 1543.

A Little while after Mounſieur *de Rohan* took me with him Poſt to the Camp of *Perpignan*; being there, the Enemy made a Sally forth, and came and incloſed three pieces of our Artillery, where they were beaten back to the Gates of the City: which was not done without hurting and killing many, and amongſt the reſt *de Briſſac*, (who was then chief Maſter of the Artillery) received a Musket ſhot upon the ſhoulders, returning to his Tent; all the others that were hurt followed him, hoping to be dreſt by the Surgeons that ought to dreſs them. Being come to his Tent and laid on his bed, the bullet was ſearched for by three or four the moſt expert Surgeons of the Army, who could not find it, but ſaid it was entered into his body.

In the end he called for me, to ſee if I were more skilful than they, becauſe he had known me before in *Piedmont*: by and by I made him riſe from his bed, and prayed him to put his body into that poſture as it was when he received his hurt; which he did, taking a Javelin between his hands as he held the Pike in the skirmiſh. I put my hand about the wound, and found the bullet in the fleſh, making a little tumor under the *Omoplate*: having found it, I ſhewed them the place where it was, and it was taken out by Maſter *Nicholas Lavernaut*, Surgeon to Mounſieur the *Dolphin*, who was the Kings Lieutenant in that Army, yet notwithſtanding the honour remained to me for finding it. Addreſs of the Author.

I ſaw one thing of great remark, which is this: That a Souldier in my preſence gave to one of his fellows a ſtroke with an Halbard upon the head, penetrating even to the left ventricle of the brain, without falling to the ground. He that ſtrook him ſaid, he had heard that he cheated at Dice, and that he had drawn a great ſum of money, and that it was his cuſtom to cheat. I was called to dreſs him, which I did as it were for the laſt, knowing well that he would quickly die: having dreſt him, he returned all alone to his Lodging, which was at leaſt two hundred paces diſtant: I bid one of his companions ſend for a Prieſt to diſpoſe of the affairs of his ſoul: he helped him to one who ſtaid with him to the laſt gaſp. The next day the Patient ſent for me by his She-friend in a Boys apparel to come to dreſs him, which I would not do, fearing he ſhould die under my hands; and to put it off, I ſaid I muſt not take off the dreſſing till the third day, by reaſon he would die though he were never touched. The third day he came ſtaggering, and found me in my Tent accompanied with the Wench, and prayed me moſt affectionately to dreſs him, and ſhewed me a Purſe wherein he had an hundred or ſix ſcore pieces of Gold, and that he would content me to my deſire; for all that, yet notwithſtanding I left not off to defer the taking off his dreſſing, fearing leſt he ſhould die at the ſame inſtant. Certain Gentlemen deſired me to go dreſs him, which I did at their requeſt, but in dreſſing him he died under my hands in a Convulſion. Now this Prieſt accompanied him until death, who ſeized upon the Purſe, leſt another ſhould take it, ſaying, he would ſay Maſſes for his ſoul. Moreover he furniſhed himſelf with his cloaths and with all the reſt of his things. I have recited this Hiſtory as a monſtrous thing that the Souldier fell not to ground when he had received this great ſtroke, and was in good ſenſes even till death. Soon after the Camp was broken for divers cauſes; the one becauſe we were advertiſed that four Companies of *Spaniards* were entered into *Perpignan*; the other, that the Plague begun much in our Camp, and it was told us by the People of the Country, that ſhortly there would be a great overflowing of the Sea, which might drown us all; and the preſage which they had, was a very great wind from Sea, which aroſe in ſuch manner that there remained not one Tent which was not broken and overthrown, for all the ſtrength and diligence could be given; and the Kitchins being all uncovered, the wind raiſed ſo the duſt and ſand, which ſalted and powdered our meat in ſuch ſort that we could not eat it, ſo that we were conſtrained to boil it in Pots and other veſſels well covered. An Hiſtory.

Now we did not uncamp our ſelves in ſo good time, but that there were many Carts and Carters, Mules and Mule-drivers drowned in the Sea, with great loſs of Baggage. The Camp broken, I returned to *Paris*.

The Voyage to Landreſy, 1544.

KIng *Francis* raiſed a great Army to victual *Landreſy*; on the other ſide, the Emperour had no leſs people, yea much more; that is to ſay, eight thouſand *Germans*, ten thouſand *Spaniards*, ſix thouſand *Walloons*, ten thouſand *Engliſh*, and about thirteen or fourteen thouſand Horſe. I ſaw the two Armies near one another, within Canon-ſhot, and it was thought they would never part without giving battel. There were ſome certain fooliſh Gentlemen who would approach the Enemies Camp; certain ſhot was made at them, and ſome died at the place, others had their legs or arms carried away. The King having done what he deſired, which was to victual *Landreſy*, retired himſelf with his Army to *Guiſe*, which was the day after *All-Saints*, One thouſand Five hundred Forty four, and from thence I returned to *Paris*.

The Voyage of Boulogn, 1545.

A Little while after we went to *Boulogn*, where the *Engliſh* ſeeing our Army, left the Forts which they had, that is to ſay, *Moulambert* the little Paradiſe, *Monplaiſir*, the Fort of *Shatillon*, the *Portet*, the Fort *Dardelot*. One day going through the Camp to dreſs my hurt people, the Enemies who were in the Tower of *Order*, ſhot off a piece of Ordnance, thinking to kill Horſemen which ſtaid to talk with one another. It happened that the bullet paſſed very near one of them, which threw him to the ground, and 'twas thought the ſaid bullet had toucht him, which it did not at all, but onely the wind of the ſaid bullet in the midſt of his coat, which went with ſuch a force that all the ontward part of the thigh became black and blue, and he had much ado to ſtand. I dreſt him, and made

made him divers ſcarifications to evacuate the contuſed bloud, which the wind of the ſaid bullet had made; and the rebounds that it made on the ground, killed four Souldiers which remained dead in the place. I was not far from this ſtroke, ſo that I felt ſomewhat the moved air, without doing me any more harm than a little fear which made me ſtoop my head very low, but the bullet was already paſſed far beyond me. The Souldiers mocked me to be affraid of a bullet already gone. (My little Maſter) I think if you had been there, that I had not been affraid alone, and that you would have had your ſhare of it. What ſhall I ſay more? Mounſieur the Duke of *Guiſe*, *Francis* of *Lorain*, was hurt before *Bullogne* with a ſtroke of a Lance, which above the right eye, declining towards the noſe, entered and paſſed quite through on the other between the *nucha* and the ear, with ſo great violence that the head of the Lance, with a great part of the wood was broken and remained within, in ſuch ſort that it could not be drawn out but with great force, yea with Smiths Pincers. Notwithſtanding all this violence which was not done without breaking of Bones, Nerves, and Arteries, and other parts; my ſaid Lord, by the help of God, was cured: the ſaid Lord went always with open face, which was the cauſe that the Lance went through on the other ſide.

The Voyage of Germany, 1552.

I Went the Voyage to *Germany* in the year 1552. with Mounſieur *de Rohan* Captain of fifty Horſes, where I was Surgeon of his Company, which I have ſaid already. In this Voyage Mounſieur the High Conſtable of *France* was General of the Army: Mounſieur *de Chaſtillon*, ſince Admiral, was chief Colonel of the Foot, having four Regiments of Lanſquenets, under the Conduct of theſe Captains, *Reerod* and *Ringrave*, having each of them two Regiments, each Regiment was of ten Enſigns, and each Enſign of five hundred men. And beſides theſe, was Captain *Chartel*, who conducted the Troops that the Proteſtant Princes had ſent to the King. This was a very great Company of Foot, accompanied with fifteen hundred Horſe, with the following of each one two Archers, which might make four thouſand and five huddred Horſe, beſides two thouſand Light-Horſe, and as many Muſketiers on Horſe-back, of whom *de Aumalle* was General, beſides the great number of Nobility who came for their pleaſure. Moreover the King was accompanied with two hundred Gentlemen of his houſe, and likewiſe with divers Princes; there was alſo for his Troop that ſerved him, the *French*, *Scottiſh*, and *Swiſſers* Guards, amounting to ſix hundred men on Foot, and the Companies of Mounſieur the *Dolphin*, *Meſſieres de Guiſe*, *de Aumalle*, and of the Marſhal of St. *Andrew*, which amounted to four hundred Lances, which was a marvellous thing to ſee ſuch a fair Company; and in this equipage the King entered into *Thou* and *Metz*. I will not omit to tell that it was ordained that the Companions of *Meſſieres de Rohan*, of the Count of *Sancerr*, of *Iarnac*, which was each of them of fifty Horſe, went by the Wings of the Camp; and God knows we had ſcarcity of Victuals; and I proteſt to God, that at three diverſe times I had thought I ſhould have been famiſhed, and it was not for want of money, for I had enough, and we could not have victuals but by force, by reaſon that the Peaſants withdrew it all into the Cities and Caſtles.

One of the Servants of a Captain of the Company of Mounſieur *de Rohan*, went with others thinking to enter into a Church where the Peaſants were retired, thinking to find Victuals by force or love: but amongſt the reſt this man was beaten, and returned with ſeven wounds with a Sword in the head, the leaſt of which penetrated the ſecond table of the ſcull; and he had four other upon the arms, and upon the right ſhoulder, which cut more than one half of the blade-bone, or *Omoplate*. He was brought back to his Maſters Lodging, who ſeeing of him ſo wounded, and they were to depart thence the morrow after at the break of day, and not thinking ever he could be cured, made him a Grave, and would have caſt him therein, ſaying, that or elſe the *Peaſants* would maſſacre and kill him; I moved with pity, told him that he might be cured if he were well dreſt: divers Gentlemen of the Company prayed him that he would cauſe him to be brought along with the Baggage, ſeeing I had the willingneſs to dreſs him; to which he agreed, and after that I had clothed him, he was put up in a Cart upon a Bed well covered and well accommodated, which one Horſe did draw. I did the office of a Phyſician, Apothecary, Surgeon, and Cook; I dreſt him even to the end of his cure, and God cured him, in ſo much that all theſe three Companies admired at this cure. The Horſe-men of the Company of Mounſieur *de Rohan*, the firſt Muſter that was made, gave me each one, one Crown, and the Archers half a Crown.

The Voyage of Danvilliers, 1552.

AT the return from the *German* Camp, King *Henry* beſieged *Danvilliers*; thoſe within would not render. They were well beaten, and our powder failed us; in the mean time they ſhot much at our people. There was a Culverin-ſhot paſſed a traverſe the Tent of Mounſieur *de Rohan*, which hit a Gentlemans leg, which was of his train; which I was fain to finiſh the cutting off, the which was done without applying hot irons.

Another Hiſtory.

The King ſent for Powder to *Sedan*, which being come, they began a greater battery than before, in ſuch ſort that they made a breach. *Meſſiers de Guiſe* and the High Conſtable being in the Kings Chamber, told him that they concluded the next day to make aſſault, and that they were aſſured they ſhould enter into it, and that they ſhould keep it ſecret, leſt the enemy were advertiſed. And all of them promiſed not to ſpeak of it to any one. Now there was a Groom of the Kings Chamber who lay under the Kings bed in the Camp to ſleep, underſtood that they reſolved the next day to give an aſſault; he preſently revealed it to a certain Captain, and told him that for certain, the day following aſſault ſhould be given, and that he had heard it of the King, and prayed the ſaid Captain that he would not ſpeak a word of it to any body, which he promiſed; but his promiſe was not kept; ſo at the ſame inſtant he went and declared it unto a Captain, and this Captain to another Captain, and from the Captains to ſome of the Souldiers, ſaying always, *ſay nothing*. It was ſo well hid that the next day early in the morning, there was ſeen the greateſt part of the Souldiers with their round

hoſe

hoſe and their breeches cut at the knee for the better mounting of the breach. The King was advertiſed of the rumor which run through the Camp, that the aſſault muſt be given, whereof he much marvelled, ſeeing there were but three of that advice, which had promiſed one to another not to tell it to any one. The King ſent for Monſieur *de Guiſe*, to know if he had not talked of this aſſault; he ſwore and affirmed to him he had not told it to any body, and Monſieur the Conſtable ſaid as much; who ſaid to the King, he muſt expreſly know who had declared this ſecret Counſel, ſeeing they were but three. Inquiſition was made from Captain to Captain, in the end the truth was found; for one ſaid it was ſuch an one told me, another ſaid as much, till at length they came to the firſt, who declared he had learned it of a Groom of the Kings Chamber, named *Guyard*, born at *Blois*, the ſon of the deceaſed King *Francis* his Barber. The King ſent for him into his Tent, in the preſence of Monſieur *de Guiſe*, and of Monſieur the Conſtable, to underſtand from him whence he had it, and who told him that this aſſault was to be given. The King told him, that if he did not tell the truth, that he would cauſe him to be hanged; and then he declared, he lay down under his bed thinking to ſleep, and ſo having heard it, he declared it to a Captain who was a friend of his, to the end he might prepare himſelf with his ſouldiers the firſt for the aſſault. After the King knew the truth, he told him he ſhould never ſerve him again, and that he deſerved to be hanged, and forbad him ever to come again to the Court. My Groom of the Chamber went away with this ſad news, and lay with one of the Kings Surgeons in Ordinary, named Maſter *Lewis*, and in the night gave himſelf ſix wounds with a knife, and cut his throat; yet the ſaid Surgeon perceived nothing till morning, till he ſaw the bed bloudy, and the dead body by him, he much marvelled at this ſpectacle upon his waking, and was afraid leſt they ſhould ſay, he was the cauſe of this murther; but was ſoon freed, knowing the cauſe to be from deſperation, having loſt the good amity which the King bore to him. The ſaid *Guyard* was buried. And thoſe of *Danvilliers* when they ſaw the breach large enough for them to enter in, and the Souldiers prepared for the aſſault, yielded themſelves to the mercy of the King. The chief of them were priſoners, and the Souldiers ſent away without arms. The Camp being broken up, I returned to *Paris* with my Gentleman whoſe leg I had cut off. I dreſſed him, and God cured him; I ſent him to his houſe merry with his wooden leg, and was content, ſaying that he had eſcaped good cheap, not to have been miſerably burnt, as you write in your book, my little Maſter.

What it is to reveal the ſecrets of Princes.

The Voyage of the Caſtle of Compt. 1552.

A Little while after, King *Henry* levied an Army of thirty thouſand men, to go make ſpoil about *Hedin*. The King of *Navarre* who was then called Monſieur *de Vendoſme*, was chief of the Army, and the Kings Lieutenant. Being at S. *Dennis* in *France*, ſtaying while the Companies paſſed by, he ſent for me to *Paris* to come ſpeak with him; being there, he prayed me, and his requeſt was a command, that I would follow him this Voyage; and I about to make my excuſe, told him my wife was ſick in her bed; he made me anſwer, That there were Phyſicians at *Paris* to cure her; and that he as well left his own, who was as well deſcended as mine; promiſing me that he would uſe me well, and forthwith gave command that I ſhould be lodged as one of his Train. Seeing this great affection, which he had to lead me with him, I durſt not refuſe him. I went and met with him at the Caſtle of *Compt*, within three or four leagues of *Hedin*, there where there was the Emperors Souldiers in garriſon with a number of Peaſants round about; he cauſed them to be ſummoned to render themſelves; and they made anſwer they ſhould never have them but by pieces, and let them do their worſt, and they would do their beſt to defend themſelves. They put confidence in their ditches full of water, and in two hours with a great number of Bavins, and certain empty Casks, way was made to paſs over the Foot, when they muſt go the aſſault, and were beaten with five pieces of Cannon, till a breach was made large enough to enter in, where they within received the aſſault very valiantly, and not without killing and hurting a great number of our people with muſket-ſhot, pikes, and ſtones. In the end when they ſaw themſelves conſtrained, they put fire to their powder and munition, which was the cauſe of burning many of our people, and theirs likewiſe, and they were all almoſt put to the ſword. Notwithſtanding ſome of our Souldiers had taken twenty or thirty, hoping to have ranſom for them. That was known, and ordered by the Council, that it ſhould be proclaimed by the Trumpet through the Camp, that all Souldiers who had any *Spaniards* priſoners, were to kill them, upon pain to be hanged and ſtrangled, which was done upon cold bloud. From thence we went and burnt divers Villages whoſe barns were full of all kind of Grain, to my grief. We went along even to *Tournahan*, where there was a very great Tower where the Enemies retired, but there was no man found in it, all was pillaged, and the Tower was made to leap by a Mine, and then with Gunpowder turned topſie-turvy. After that, the Camp was broken up, and I returned to *Paris*. I will not yet forget to write that the day after the Caſtle of *Compt* was taken, Monſieur *de Vendoſme* ſent a Gentleman to the King to make report to him of all which had had paſſed, and amongſt other things, told the King that I had greatly done my duty in dreſſing thoſe that were wounded, and that I had ſhewed him eighteen bullets which I had taken or drawn out of the hurt bodies, and that there were divers more which I could neither find, nor draw out, and told more good of me than there was by half. Then the King ſaid he would have me into his ſervice, and commanded Monſieur *de Gognier* his chief Phyſician to write me down as entertained one of his Surgeons in ordinary, and that I ſhould go meet with him at *Rheimes* within ten or twelve days, which I did, where he did me the honour to command me that I would dwell near him, and that he would do me good. Then I thankt him moſt humbly for the honour it pleaſed him to do me, in calling me to his ſervice.

The King of *Navarre* prayed the Author to follow him.

Hiſtory of deſperate people.

The taking of the Caſtle of *Compt*.

The Voyage of Mets. 1552.

THE Emperor having beſieged *Mets*, and in the hardeſt time of winter, as each one knows of freſh memory; and that there was in the City five or ſix thouſand men, and amongſt the

The names of the Princes who were at the ſiege of *Mets*.

reſt ſeven Princes; that is to ſay, Monſieur the Duke of *Guiſe* the Kings Lieutenant, *Meſſieurs d' Anguien*, *de Conde*, *de Montpenſier*, *de La Roch* upon *Yon*, Monſieur *de Nemours*, and divers others Gentlemen, with a number of old Captains of War, who often made ſallies forth upon the enemies, (as we ſhall ſpeak hereafter) which was not without ſlaying many, as well on the one ſide as the other. For the moſt part all our wounded people died, and it was thought the medicaments wherewith they were dreſſed were poiſoned; which cauſed Monſieur *de Guiſe* and other Princes to ſend to the King for me, and that he would ſend me, with Drugs to them, for they believed theirs were poiſoned, ſeeing that of their hurt people few eſcaped. I do not believe there was any poyſon, but the great ſtrokes of the Cutlaſſes, musket-ſhot, and the extremity of cold was the cauſe. The King cauſed one to write to Monſieur the Marſhal of S. *Andrew*, who was his Lieutenant at *Verdun*, that he found

Nota.

ſome means to make me enter into *Mets*. The ſaid Lord Marſhal of S. *Andrew*, and Monſieur the Marſhal of old *Ville*, got an *Italian* Captain, who promiſed them to make me enter in, which he did, and for which he had fifteen hundred Crowns: the King having heard of the promiſe which the *Italian* Captain had made, ſent for me, and commanded me to take of his Apothecary named *Daigue*, ſuch and as many Drugs as I ſhould think fit for the hurt who were beſieged, which I did, as much as a poſt horſe could carry. The King gave me charge to ſpeak to Monſieur *de Guiſe*, and to the Princes,

Commiſſion of the Author.

and Captains who were at *Mets*. Being arrived at *Verdun*, a few days after the Monſieur the Marſhal of S. *Andrew*, cauſed horſes to be given to me, and my man, and for the *Italian*, who ſpake very good high *Dutch*, *Spaniſh* and *Walloon*, with his own natural tongue. When we were within eight or ten Leagues of *Mets*, we went not but in the night, and being near the Camp, I ſaw a league and half off bright fires about the City, which ſeemed as if all the earth had been on fire, and I thought we could never paſs through thoſe fires without being diſcovered, and by conſequent be hanged and ſtrangled, or cut in pieces, or pay a great ranſom. To ſpeak truth, I wiſhed my ſelf at *Paris*, for the imminent danger which I foreſaw. God guided ſo well our affairs that we entred the City at midnight with a certain Token, which the Captain had with another Captain of the Company of Monſieur *de Guiſe*: which Lord I went to, and found him in bed, who received me with great thanks, being joyful of my coming. I did my meſſage to him of all that the King had commanded me to ſay to him: I told him I had a little letter to give to him, and that the next day I would not fail to deliver it him. That done, he commanded me a good lodging, and that I ſhould be well uſed, and bid me I ſhould not fail to be the next day upon the Breach, where I ſhould meet with all the Princes, and divers Captains; which I did; who received me with great joy, who did me the honour to embrace me, and tell me I was very welcome, adding withall they did not fear to die if they ſhould chance to be hurt. Monſieur *de la Roch* upon *Yon* was the firſt that feaſted me, and inquired of me what they ſaid at the Court concerning the City of *Mets*: I told him what I thought good. Then preſently he deſired me to go ſee one of his Gentlemen, named Moriſieur *de Magnane*, at this preſent Knight of the Kings Order, and Lieutenant of his Majeſties Guard, who had his leg broken by a Cannon-ſhot. I found him in his bed, his leg bended and crooked, without any dreſſing upon it; becauſe a Gentleman promiſed him

Hiſtory.

cure, having his name and his girdle, with certain words. The poor Gentleman wept and cried with pain which he felt, not ſleeping night nor day, in four days: then I mockt at this impoſture and falſe promiſe. Preſently I did ſo nimbly reſtore and dreſs his leg, that he was without pain, ſlept all night, and ſince (thanks be to God) was cured, and is yet at this preſent living, doing ſervice to the King. The ſaid Lord of the *Roch* upon *Yon* ſen me a tun of wine to my lodging, and bid tell me, when it was drunken, he would ſend me another. That done, Monſieur *de Guiſe* gave me a liſt of certain Captains and Lords, and commanded me to tell them what the King had given me in charge; which I did, which was to do his commendations and thankſgiving for the duty they had done and did in the keeping of the City of *Mets*, and that he would acknowledge it. I was more than eight days in acquitting my charge, becauſe they were many; firſt to the Princes and others, as the Duke of *Horace*, the Count of *Martiges*, and his brother Monſieur *de Bauge*, the Lords *Montmorancy* and *d' Anville*, the Marſhal of *France* Monſieur *de la Chapel*, *Bonnivet Carong* now Governour of *Rohan*, the *Vadaſme* of *Chartres*, the Cont of *Lude*, Monſieur *de Biron* now Marſhal of *France*, Monſieur *de Rondan* the *Rochfoucaut*, *Boxdalle d' Etrez* the younger, Monſieur *de S. John* in *Dolphiny*, and many others which it would be too long to recite; and chiefly to divers Captains who had very well done their duty in defence of their lives and City. I demanded afterwards of Monſieur *de Guiſe*, what pleaſed him I ſhould do with the Drugs which I had brought him; he bid me impart them to the Surgeons and Apothecaries, and chiefly to the poor hurt Souldiers in the Hoſpital which were in great number; which I did and can aſſure you, I could not do ſo much as go and ſee them, but they ſent for me to viſit and dreſs them. All the beſieged Lords prayed me carefully to ſolicite above all others Monſieur

The hurt of Monſieur *de Pienne* trepand and cured.

de Pienne who was hurt at the breach by a ſtone raiſed by a Cannon ſhot in the Temple with a fracture and depreſſion of the bone. They told me that preſently when he received the ſtroke, he fell to the earth as dead, and caſt blood out of his mouth, noſe and ears, with great vomitings, and was fourteen days without ſpeaking one word, or having any reaſon; there happened to him alſo ſtartings ſomewhat like Convulſions, and he had all his face ſwelled and livid. He was trepand on the ſide of the temporal muſcle upon the *Os Coronale*. I dreſt him with other Surgeons, and God cured him; and he is at this day living, God be thanked. The Emperor cauſed battery to be made with forty double Cannons, where they ſpared no powder night nor day. Preſently when Monſieur *de Guiſe* ſaw the Artillery ſeated to make a breach, he made the neareſt houſes be pulled down to make Ramparts, and the poſts and beams were ranged end to end, and between two clods of earth, beds and packs of wool, and then other poſts and beams were put again upon them as before. Now much wood of the houſes of the Suburbs, which had been put to the ground for fear leſt the enemy ſhould be lodged, cloſe covered, and that they ſhould not help themſelves with any wood, ſerved well to repair

Princes carried the Baskets.

the breach. Every one was buſied to carry earth to make the Ramparts night and day. *Meſſieres*, the Princes, Lords and Captains, Lieutenants, Enſigns, did all carry the Basket, to give example to

the

the Souldiers and Citizens to do the like, which they did: yea, both Ladies and Gentlewomen, and thoſe which had not Baskets, helped themſelves with Kettles, Panniers, Sacks, Sheets, and with what elſe they could to carry Earth; in ſo much that the Enemy had no ſooner beaten down the Wall, but he found behind it a Rampart more ſtrong. The Wall being fallen, our Souldiers cried to thoſe without, the Fox, the Fox, the Fox, and ſpake a thouſand injuries one to another. Monſieur *de Guiſe* commanded upon pain of death that no man ſhould ſpeak to them without for fear leſt there ſhould be ſome Traitor who would give them intelligence what was done in the City; the command made, they tied living Cats at the end of their Pikes, and put them upon the Wall, and cried with the Cats, *Miau, Miau.*

Truly the Imperialiſts were very much vexed to have been ſo long making a Breach, and at ſo great expence, which was the breach of fourſcore ſteps, to enter fifty men in front, where they found a Rampart more ſtrong than the Wall; they fell upon the poor Cats and ſhot at them with their Muskets, as they uſe to do at Birds. Our people did oftentimes make ſallies by the command of Mounſieur *de Guiſe*. The day before there was a great preſs to make themſelves enrolled, who muſt make the ſalley, chiefly of the young Nobility, led by well experimented Captains. In ſo much that it was a great favour to permit them to ſally forth and run upon the Enemy: and they ſallied forth always the number of one hundred or ſixſcore armed men with Cutlaſſes, Muskets, Piſtols, Pikes, Partiſans, and Halberts, which went even to their Trenches to awaken them. Where they preſently made an Alarm throughout all their Camp, and their Drums ſounded *plan, plan, ta, ti, ta, ta, ti, ta, ta, tou, touf, touf:* likewiſe their Trumpets and Cornets ſounded, *to the ſaddle, to the ſaddle, to the ſaddle, to horſe, to horſe, to horſe, to the ſaddle, to horſe.* And all their Souldiers cried, *Arm, arm, arm, to arms, to arms, to arms, arm, to arms, arm, to arms, arm, to arms,* like the cry after Wolves, and all divers Tongues, according to their Nations: and they were ſeen to go out from their Tents and little Lodgings, as thick as little Bees, when their Hive is diſcovered, to ſuccour their fellows who had their throats cut like Sheep, The Horſe-men likewiſe came from all parts a great gallop, *Patati, patata, patati, patata, ta, ta, patata, patata,* and tarried well, that they might not be in the throng, where ſtroaks were imparted to give and receive. And when our men ſaw they were forced, they returned into the City, ſtill firing, and thoſe who run after were beaten back with the Artillery which they had charged with Flint-ſtones, and four-ſquare pieces of Iron; and our Souldiers who were upon the ſaid Wall made a volly of ſhot, and ſhoured down their bullets upon them like hail, to ſend them back to their lodging, where divers remained in the place of the combat, and alſo our men did not all come off with whole skins, and there ſtill remained ſome for the Tithe, who were joyful to die in the Bed of Honour. And when there was a Horſe hurt, he was flayed, and eaten by the Souldiers in ſtead of Beef and Bacon, and it was fit I muſt run to dreſs our hurt men. A few days after other Sallies were made, which did much anger the Enemies, becauſe they did not let them ſleep but little in ſafety. Mounſieur *de Guiſe* made a War-like ſtratagem, which was, He ſent a Peſant who was none of the wiſeſt with two pair of Letters toward the King, to whom he gave ten crowns, and promiſed the King ſhould give him an hundred, provided he gave him the Letters. In the one he ſent word that the Enemy made no ſign of retiring himſelf, and by all force made a great breach, which he hoped to defend, yea to the loſing of his life, and of all thoſe that were within; and that the Enemy had ſo well placed his Artillery in a certain place which he named, that with great difficulty it was kept that they had not entered into it, ſeeing it was a place the moſt weak of all the City: but he hoped quickly to fill it up again in ſuch ſort, that they cannot be able to enter. One of theſe Letters was ſewed in the lining of his doublet, and he was bid to take heed that he told it not to any man. And there was alſo another given to him, wherein the ſaid Mounſieur *de Guiſe* ſent word to the King, that he and all the beſieged did hope well to keep the City, and other matters which I ceaſe to ſpeak of. They made the Peſant go forth in the night, and preſently after he was taken by one that ſtood Sentinel, and carried to the Duke of *Albe* to underſtand what was done in the City, and they asked him if he had any Letters, he ſaid yes, and gave them one; and having ſeen it, he was put to his Oath whether he had any other, and he ſwore, not; then they felt and ſearched him, and found that which was ſewed to his doublet, and the poor meſſenger was hanged.

The ſaid Letters were communicated to the Emperour, who cauſed his Council to be called there. Where it was reſolved, ſince they could do nothing at the firſt breach, that preſently the Artillery ſhould be drawn to the place which they thought the moſt weak, where they made great attempts to make another breach, and digged and undermined the Wall, and endeavoured to take the Tower of Hell, yet they durſt not come to the aſſault. The Duke of *Albe* declared to the Emperour that the Souldiers died daily, yet more than the number of two hundred, and that there was but little hope to enter into the City, ſeeing the Seaſon, and the great quantity of Souldiers that were there. The Emperour demanded what people they were that died, and if that they were Gentlemen of remark or quality; anſwer was made, that they were all poor Souldiers; then ſaid he it makes no matter if they die, comparing them to Caterpillars and Graſhoppers, which eat the buds of the Earth. And if they were of any faſhion, they would not be in the Camp for twelve ſhillings the Moneth; and therefore no great harm if they died. Moreover he ſaid, He would never part from before that City, till he had taken it by Force or Famine, although he ſhould loſe all his Army; by reaſon of the great number of Princes which were therein, with the moſt part of the Nobility of *France*. From whom he hoped to draw double his expence, and that he would go once again to *Paris*, to viſit the Pariſians, and make himſelf King of all the Kingdom of *France*. Mounſieur *de Guiſe*, with the Princes, Captains, and Souldiers, and generally all the Citizens of the City, having underſtood the intention of the Emperour, which was to extirpate us all, they adviſed of all they had to do: And ſince it was not permitted to the Souldiers nor Citizens, no nor to the Princes, nor Lords themſelves to eat either freſh Fiſh, or Veniſon, as likewiſe ſome Partridges.

Woodcocks, Larks, Plovers, for fear left they had gathered ſome peſtilential air which might give us any contagion; but that they ſhould content themſelves with the Ammunition Fare; that is to ſay, with Bisket, Beef, powdered Cows Lard, and Gammons of Bacon: Likewiſe Fiſh, as Green-fiſh, Salmon, Sturgeon, Anchovies, Pilchers, and Herrings; alſo Peaſe, Beans, Rice, Garlick, Onions, Prunes, Cheeſe, Butter, Oil, Salt, Pepper, Ginger, Nutmegs, and other Spiceries, to put into Pies, chiefly to Horſe-fleſh, which without that would have a very ill taſte; divers Citizens having Gardens in the City, ſowed therein great Radiſhes, Turnips, Carrets, and Leeks, which they kept well and full dear againſt the extremity of hunger. Now all theſe Ammunition Victuals were diſtributed by weight, meaſure, and juſtice, according to the quality of the perſon, becauſe we knew not how long the Siege would laſt. For having underſtood from the mouth of the Emperour, that he would never part from before *Mets* till he had taken it by Force or Famine; the victuals were leſſened, for that which was wont to be diſtributed to three, was now ſhared amongſt four, and defence made they ſhould not ſell what remained after their dinner, but 'twas permitted to give it to the Wenches that followed the Camp, and roſe always from Table with an appetite, for fear they ſhould be ſubject to take Phyſick. And before we would yield our ſelves to the mercy of our Enemies, had reſolved to eat our Aſſes, Mules, Horſes, Dogs, Cats, and Rats; yea, our Boots, and other Skins which we could ſoften and frie. All the beſieged did generally reſolve to defend themſelves with all ſorts of Inſtruments of War; that is to ſay, To rank and charge the Artillery, at the entry of the breach, with Bullets, Stones, Cart-nails, Bars and Chains of iron. Alſo all kinds and differences of artificial Fire, as Boerres, Bariquadoes, Granadoes, Ports, Lances, Torches, Squibs, burning-Faggots. Moreover, Scalding Water, melted Lead, Powder of unquencht Lime to blind their eyes. Alſo they were reſolved to have made holes through and through their houſes, there to lodge Muſquetiers, there to batter in the flank and haſten them to go, or elſe make them lie for altogether. Alſo there was order given to the Women to unpave the ſtreets, and to caſt out at their Windows, Billets, Tables, Treſſes, Forms, and Stools, which would have troubled their brains: Moreover, there was a little further a ſtrong Court of Guard, filled with Carts and Palliſadoes, Pipes and Hogſheads filled with earth for Barricadoes to ſerve to interlay with Faulcons, Faulconets, Field-pieces, Harquebuſſes, Muskets, and Piſtols, and Wild-fire, which would have broken legs and thighs, in ſo much that they had been beaten in head, in flank, and in tail; and when they had forced this Court of Guard, there was others at the croſſing of the ſtreets, each diſtant an hundred ſpaces, who had been as bad companions as the firſt, and would not have been without making a great many Widows and Orphans. And if Fortune would have been ſo much againſt us, as to have broken our Courts of Guard, there was ſeven great Baſtallions ordered in ſquare and triangle to combat altogether, each one accompanied with a Prince to give them boldneſs, and encourage them to fight, even till the laſt gaſp, and to die all together. Moreover it was reſolved, that each one ſhould carry his Treaſure, Rings, and Jewels, and their Houſhold-ſtuff of the beſt, to burn them in the great place, and to put them into aſhes rather then the Enemy ſhould prevail and make Trophies of their ſpoils; likewiſe there was people appointed to put fire to the Munition, and to beat out the heads of the Wine Casks, others to put the fire in each houſe, to burn our Enemies and us together: the Citizens had accorded it thus, rather then to ſee the bloudy Knife upon their Throat, and their Wives and Daughters violated, and to be taken by force by the cruel inhumane *Spaniards*. Now we had certain Priſoners which Mounſieur *de Guiſe* ſent away upon their Faith, to whom was ſecretly imparted our laſt reſolution, will and deſperate minds; who being arrived in their Camp, do not defer the publiſhing, which bridled the great impetuoſity and will of the Souldiers to enter any more into the City to cut our Throats, and to enrich themſelves of our pillages. The Emperour having underſtood this deliberation of the great Warriour the Duke of *Guiſe*, put Water in his Wine, and reſtrained his great choler and fury; ſaying, He could not enter into the City without making a great ſlaughter and butchery, and ſpill much bloud, as well of the Defendants as of the Aſſailants, and that they ſhould be dead together, and in the end could have nothing elſe but a few aſhes, and that afterward it might be ſpoken of that, as of the deſtruction of *Jeruſalem* already made by *Titus* and *Veſpaſian*. The Emperour then having underſtood our laſt reſolution, and ſeeing their little prevailing by their battery and undermining, and the great Plague which was in his whole Army, and the indiſpoſition of the Time, and the want of Victuals and Money, and that his Souldiers forſook him, and went away in great companies; concluded in the end to retire themſelves, accompanied with the Cavalry of the Van-guard, with the greateſt part of his Artillery, and the Battalia. The Marqueſs of *Brandenburg* was the laſt which decamped, maintained by certain Bands of *Spaniards*, *Bohemians*, and his *German* Companies, and there remained one day and a half after, to the great grief of Mounſieur *de Guiſe*, who cauſed four pieces of Artillery to be brought out of the City, which he cauſed to be diſcharged at him on one ſide, and the other to haſten them to be gone, which he did full quickly, with all his Troops. He being a quarter of a league from *Mets*, was taken with a fear left our Cavalry ſhould fall upon him in the Rere, which cauſed him to put fire to his Munition Powder, and leave certain pieces of Artillery, and much Baggage, which he could not carry, becauſe the Van-guard, and the Battalia, and great Cannons, had too much broken the way. Our Horſe-men would by all means have gone out of the City to have fallen upon their breech, but Mounſieur *de Guiſe* would never permit them, but on the contrary we ſhould rather make plain their way, and make them Bridges of Gold and Silver, and let them go, being like to a good Shepherd, who will not loſe one of his Sheep. See now how our well-beloved Imperialiſts went away from before the City of *Mets*, which was the day after *Chriſtmas* day, to the great contentment of the beſieged, and honour of Princes, Captains, and Souldiers, who had endured the travels of this Siege the ſpace of two moneths. Notwithſtanding they did not all go; there wanted twenty thouſand who were dead, as well by Artillery, as by the Sword, as alſo by the Plague, Cold, and Hunger.

hunger, and for ſpite they could not enter into the City to cut our throats, and have the pillage: and alſo a great number of their Horſes died, of which they had eaten a great part in ſtead of Beef and Bacon. They went where they had been encamped, where they found divers dead bodies not yet buried, and earth all digged like St. *Innocents* Church-yard in the time of the Plague. They did likewiſe leave in their Lodgings, Pavillions and Tents, divers ſick people; alſo Bullets, Arms, Carts, Waggons, and other Baggage, with a great many of Munition Loaves, ſpoiled and rotten by the rain and ſnow, yet the Souldiers had it but by weight and meaſure; and likewiſe they left great proviſion of Wood, of the remainders of the Houſes of the Villages which they had pluckt down two or three miles compaſs; likewiſe divers other Houſes of Pleaſure belonging to the Citizens, accompanied with fair Gardens, and Graſs-plats filled with Fruit-trees, for without that they had been ſtarved with cold, and had been conſtrained to have raiſed the Siege ſooner. The ſaid Mounſieur *de Guiſe* cauſed the dead to be buried, and dreſs their ſick people; likewiſe the Enemies left in the Abby of St. *Arnoul* divers of their hurt Souldiers which they could not lead with them; the ſaid Mounſieur *de Guiſe* ſent them all victuals enough, and commanded me and other Surgeons to go dreſs them and give them Medicins; which we willingly did, and think they would not have done the like toward others (becauſe the *Spaniard* is moſt cruel, perfidious, and inhumane, and therefore Enemy to all Nations) which is proved by *Lopez* a *Spaniard*, and *Benzo* of *Milan*, and others who have written the Hiſtory of *America*, and the *Weſt-Indies*, who have been conſtrained to confeſs that the cruelty, avarice, blaſphemy, and wickedneſs of the *Spaniards*, have altogether alienated the poor *Indians* from the Religion which the ſaid *Spaniards* are ſaid to hold. And all write, they are leſs worth than the idolatrous *Indians*, by the cruel uſage done to the ſaid *Indians*.

And after a few days we ſent a Trumpet to *Thionville* toward the Enemy, that they ſhould ſend back for their wounded men in ſafety, which they did with Carts and Waggons, but not enough. Mounſieur *de Guiſe* cauſed them to have Carts and Carters to help to carry them to the ſaid *Thionville*. Our ſaid Carters being returned back, brought us word that the way was paved with dead bodies, and that they never led back the half, for they died in their Carts, and the *Spaniards* ſeeing them at the point of death, before they had caſt out their laſt gaſp, caſt them out of their Carts, and buried them in the Mud and Mire, ſaying, they had no order to bring back the dead. Moreover our Carters ſaid, they met by the way divers Carts loaden with Baggage ſticking in the Mire, which they durſt not ſend for back, for fear leſt thoſe of *Mets* ſhould fall upon them. I will again return to the cauſe of their mortality, which was principally through Hunger, Plague, and Cold; for the Snow was two foot thick upon the earth, and they were lodged in the caves of the earth, onely covered with a little ſtraw. Notwithſtanding each Souldier had his Field-bed, and a covering ſtrewed with glittering Stars, more bright than fine gold, and every day had white ſheets, and lodged at the ſign of the Moon, and made good chear when they had it, and paid their Hoſt ſo well overnight, that in the morning they went away quite, ſhaking their ears, and they needed no Comb to take away the down out of their hairs either of head or beard, and found always a white Table-cloth, loſing good Meals for want of Victuals. Alſo the greateſt part of them had neither Boots nor Buskins, Slippers, Hoſe, or Shoes, and divers had rather have none than have them, becauſe they were always in mud, half way of the leg; and becauſe they went bare-legged, we called them the Emperours Apoſtles. After the Camp was wholly broken, I diſtributed my Patients into the hands of the Surgeons of the City, to finiſh their Cure: then I took leave of Mounſieur *de Guiſe*, who came back toward the King, who received me with a loving countenance, and demanded of me how I did enter into the City of *Mets*. I recounted to him all that I had done, he cauſed two hundred Crowns to be given me, and one hundred I had at my going out, and told me he would not leave me poor; then I thanked him moſt humbly for the good and the honour which he pleaſed to do me.

The Voyage of Hedin, 1553.

CHarles the Emperour cauſed the City of *Therouenne* to be beſieged, where Mounſieur the Duke of *Savoy* was General of the whole Army: it was taken by aſſault where there was a great number of our men ſlain and priſoners. The King willing to prevent that the Enemy ſhould not alſo come to beſiege the City and Caſtle of *Hedin*, ſent Meſſiers the Duke of *Bouillon*, the Duke *Horace*, the Marqueſs of *Villars*, a number of Captains, and about eight hundred Souldiers, and during the ſiege of *Therouenne*, the ſaid Lords fortified the ſaid Caſtle of *Hedin*, in ſuch ſort that it ſeemed impregnable. The King ſent me to the ſaid Lord to help them with my Art, if there were any need. Now ſoon after the taking of *Therouenne*, we were beſieged with the Army: there was a quick clear Fountain of Spring, within Cannon-ſhot, where there was about fourſcore Whores and Wenches of the Enemies, who were round about it to draw Water. I was upon a Rampart beholding the Camp, and ſeeing ſo many idlers about the ſaid Fountain, I prayed Mounſieur *de Pont* Commiſſary of the Artillery, to make one Cannon-ſhot at that roguiſh Company; he made me much denial, anſwering me that ſuch kind of people were not worth the Powder they ſhould waſte. Again I prayed him to level the Cannon, telling him, *the more dead the fewer Enemies*; which he did through my requeſt, and at that ſhot fifteen or ſixteen were killed, and many hurt. Our Souldiers ſallied forth upon the Enemies, where there was many killed and ſlain with Musket-ſhot and Swords, as well on the one ſide as of the other, and our Souldiers did often make ſallies forth upon the Enemies before their Trenches were made; where I had much work cut out, ſo that I had no reſt night nor day for dreſſing the wounded. And I will tell this by the way, that we had put many of them in a great Tower, laid upon a little ſtraw, and their Pillows were ſtones, their Coverlets were their Cloaks, of thoſe that had any. Whileſt the battery was making, as many ſhot as the Cannons made, the Patients ſaid they felt pain in their wounds, as if one had given them blows with a ſtaff; the one cried his head, the other his arm, and ſo of other parts; divers of their wounds bled afreſh, yea in greater quantity than firſt when they were wounded, and then it was I muſt run to ſtay their bleeding.

My little Maſter, if you had been there, you had been much troubled with your hot irons, you had need to have had much Charcoal to make them red hot, and believe they would have ſlain you like a Calf for this cruelty. Now through this Diabolical tempeſt of the Eccho from theſe thundering Inſtruments, and by the great and vehement agitation of the colliſion of the air reſounding and reverberating in the wounds of the hurt people, divers died, and others becauſe they could not reſt by reaſon of the groans and cries that they made night and day, and alſo for want of good nouriſhment, and other good uſage neceſſary to wounded people. Now my little Maſter, if you had been there, you would hardly have given them Gelly, Reſtauratives, Culliſes, Preſſures, Panado, cleanſed Barley, White Meats, Almond-milk, Prunes, Raiſins, and other proper meats for ſick people: your ordinance would onely have been accompliſhed in paper, but in effect they could have had nothing but old Cow-beef, which was taken about *Hedin* for our Munition, ſalted and half boiled, in ſo much that who would have eat it, he muſt pull it with the force of his teeth, as Birds of Prey do Carrion. I will not forget their Linen wherewith they were dreſt, which was onely rewaſhed every day, and dried at the fire, and therefore drie and ſtubborn like Parchment. I leave you to think how their wounds could heal well. There were four luſty Whores to whom charge was given to waſh their Linen, who diſcharged their duty under penalty of the Battoon, and alſo they wanted both Sope and Water. See then how the ſick People died for want of nouriſhment, and other neceſſary things. One day our Enemies feigned to give us a general Aſſault, to draw our Souldiers upon the breach, to the end to know our countenance and behaviour: every one ran thiter; we had made great proviſion of artificial Fire to defend the breach: a Prieſt belonging to Mounſieur *Du Bouillon* took a Granado, thinking to throw it on the Enemies, and ſet it on fire ſooner than it ought to have done; it brake aſunder, and the fire fell amongſt our Fireworks, which were put into a houſe near the breach, which was to us a marvellous diſaſter, becauſe it burned many poor Souldiers: it alſo took hold on the houſe it ſelf, and we had been all burned, had not great help been uſed for to quench it; there was but one Well there wherein was Water in our Caſtle, which was almoſt quite dried up, and in ſtead of Water we took Beer and quenched it: then afterwards we had great ſcarcity of Water, and to drink the reſt that remained, which we muſt ſtrain through Napkins.

Now the Enemy ſeeing this ſmoke and tempeſt of the Fire-works, which caſt a very great flame or claſhing noiſe, they believed we had put the fire on purpoſe for the defence of our breach, to burn them, and that we had great ſtore of others. That made them to be of another opinion than to take us by aſſault; they did undermine, and dig under the greateſt part of our Walls, ſo that it was the way to overthrow wholly the Caſtle topſie-turvy, and when the Mines were finiſhed, and that their Artillery ſhot, the whole Caſtle did ſhake under us like an Earthquake, which did much aſtoniſh us. Moreover he had levelled five pieces of Artillery which they had ſeated upon a little hill, to play upon our backs when we would go to defend the breach.

The Duke *Horace* had a Cannon-ſhot upon one ſhoulder, which carried away his arm on one ſide, and the body on the other, without being able to ſpeak one onely word. His death was to us a great diſaſter for the rank which he held in his place.

Likewiſe Mounſieur *De Martigues* had a ſtroke with a bullet which pierced through his Lungs; I dreſſed him, as I will declare hereafter. Then we demanded Parl, and a Trumpet was ſent toward the Prince of *Piedmont*, to know what compoſition it pleaſed him to make us: His anſwer was, that all the Chief, as Gentlemen, Captains, Lieutenants, and Enſigns, ſhould be taken for ranſom, and the Souldiers ſhould go out without Arms; and if they refuſed this fair and honeſt proffer, the next day we ought to be aſſured they would have us by aſſault, or otherwiſe. Council was held, where I was called to know if I would ſign, as divers Captains, Gentlemen, and others, that the place ſhould be rendred up. I made anſwer it was not poſſible to be held, and that I would ſign it with my proper bloud, for the little hope that I had that we could reſiſt the Enemies force, and alſo for the great deſire which I had to be out of this Torment and Hell; for I ſlept not either night or day, by reaſon of the great number of hurt people, which were about two hundred. The dead bodies yielded a great putrefaction, being heaped one upon another like Fagots, and not being covered with earth, becauſe we had it not; and when I entered into one lodging, Souldiers attended me at the door to go and dreſs others at another; when I went forth, there was ſtriving who ſhould have me, and they carried me like a Holy body, not touching the ground with my foot, in ſpite one of another; nor could I ſatisfie ſo great a number of hurt people. Moreover I had not what was neceſſary to dreſs them withall; for it is not ſufficient that the Surgeon do his duty towards the Patients, but the Patient muſt alſo do his, and the aſſiſtants and all exteriour things, witneſs *Hippocrates* in his firſt Aphoriſm. Now having underſtood the reſolution of the yielding up of our place, I knew our affairs went not well; and for fear of being known, I gave a Velvet Coat, a Satin Doublet, a very fine Cloth Cloak lined with Velvet, to a Souldier, who gave me a ſcurvy old torn doublet cut and ſlaſht with uſing, and a leather Jerkin well examined, and an ill-favoured Hat, and a little Cloak; I ſmucht the collar of my Shirt with water in which I had mingled a little Soot; likewiſe I wore out my ſtockings with a ſtone at the knees and at the heels as if they had been wore a long time, and I did as much to my ſhoes, in ſo much that they would rather take me for a Chimney-Sweeper than a Kings Surgeon. I went in this Equipage towards Mounſieur *De Martigues*, where I prayed him that he would take order that I might remain near him to dreſs him, which he agreed to moſt willingly, and had as much deſire I ſhould remain with him as my ſelf. Soon after the Commiſſioners, who had charge to elect the Priſoners, entered into the Caſtle the ſeventeenth day of *July*, One thouſand Five hundred Fifty three, where they made *Meſſieures* the Duke of *Bouillon*, the Marqueſs of *Villars*, the Baron of *Culan*, Mounſieur *Du Pont* Commiſſary of the Artillery, and Mounſieur *De Martigues* and I to be taken through the requeſt that he made to them; and all other Gentlemen which they could perceive were able to

pay

pay any ranſom, and the moſt part of the Souldiers and the chief of Companies, having ſuch and ſo many Priſoners as they would.

Afterward the *Spaniſh* Souldiers entered by the breach without any reſiſtance, for ours eſteemed they would hold their Faith and Compoſition that they ſhould have their lives ſaved. They entered in with a great fury to kill, pillage, and to rifle all they retained: ſome hoping to have ranſom, they tied their Stones with Arquebus-cords, which was caſt over a Pike which two held upon their ſhoulders, then pulled the ſaid cord with a great violence and deriſion, as if they would ring a Bell, telling them that they muſt put themſelves to the ranſom, and tell of what Houſes they were; and if they ſaw they could have no profit, made them cruelly die between their hands, or preſently after their genital parts would have fallen into a Gangrene and total Mortification; but they killed them all with their Daggers, and cut their Throats. See now their great cruelty and perfidiouſneſs, let him truſt to it that will. Now to return to my purpoſe; Being led from the Caſtle to the City with Mounſieur *De Martigues*, there was a Gentleman of the Duke of *Savoys*, who asked me if Mounſieur *De Martigues* wound were curable, I anſwered not; who preſently went and told the Duke of *Savoy*; now I thought he would ſend Phyſicians and Surgeons to viſit and dreſs my ſaid Mounſieur *De Martigues:* in the mean time I thought with my ſelf whether I ought to make it nice, and not to acknowledge my ſelf a Surgeon, for fear leſt they ſhould retain me to dreſs their wounded, and in the end they would know I was the Kings Surgeon, and that they would make me pay a great ranſom. On the other ſide I feared, if I ſhould not make my ſelf known to be a Surgeon, and to have carefully dreſſed Mounſieur *De Martigues*, they would cut my Throat, ſo that I took a reſolution to make it appear to them he would not die for want of good dreſſing and looking to. Soon after, ſee, there were divers Gentlemen accompanied with the Phyſician and Surgeon of the Emperour, and thoſe of the ſaid Duke of *Savoy*, with ſix other Surgeons following the Army, to ſee the hurt of the ſaid Lord of *Martigues*, and to know of me how I had dreſſed him, and with what Medicins. The Emperours Phyſician bid me declare the eſſence of the wound, and how I had dreſt it. Now all the aſſiſtants had a very attentive ear to know if the wound were mortal or not; I began to make a diſcourſe that Mounſieur *De Martigues* looking over the Wall to perceive them that did undermine it, received a ſhot from an Arquebus quite through the body; preſently I was called to dreſs him, I ſaw he caſt out bloud out of his mouth and his wounds. Moreover he had a great difficulty of breathing, and caſt out wind by the ſaid wounds with a whiſtling, in ſo much that it would blow out a candle; and he ſaid he had a moſt ſharp pricking pain at the entrance of the bullet. I do believe and think it might be ſome little pieces of bones which prickt the Lungs. When they made their Syſtole and Diaſtole, I put my finger into him, where I found the entrance of the bullet to have broken the fourth rib in the middle, and ſcales of bones, which the ſaid bullet had thruſt in, and the out-going of it had likewiſe broken the fifth rib with pieces of bones which had been driven from within outward; I drew out ſome, but not all, becauſe they were very deep and adherent. I put in each wound a Tent, having the head very large, tied with a thred, leſt by the inſpiration it might be drawn into the capacity of the *Thorax*, which hath been known by experience to the detriment of the poor wounded; for being fallen in, it cannot be taken out, which is the cauſe that engenders putrefaction, a thing contrary to Nature. The ſaid Tents were anointed with a Medicin compoſed of Yolks of Eggs, Venice Turpentine, with a little Oil of Roſes. My intention for putting the Tents was to ſtay the flux of bloud, and to hinder that the outward air did not enter into the breſt, which might have cooled the lungs, and by conſequent the heart. The ſaid Tents were alſo put, to the end that iſſue might be given for the bloud that was ſpilt within the *Thorax*. I put upon the wound great Emplaſters of *Diacalcitheos*, in which I had relented Oil of Roſes and Vinegar to the avoiding of the inflammation; then I put great ſtupes of *Oxycrate*, and bound him up, but not too hard, to the end he might have eaſie reſpiration; that done I drew from him five porringers of bloud from the Baſilick vein of the right arm, to the end to make revulſion of the bloud which runs from the wounds into the *Thorax*, having firſt taken indication from the wounded part, and chiefly his forces, conſidering his youth and ſanguin temper; He preſently after went to ſtool, and by his Urin and Siege caſt great quantity of bloud. And as for the pain which he ſaid he felt at the entrance of the bullet, which was as if he had been pricked with a bodkin, that was becauſe the Lungs by their motion beat againſt the ſplinters of the broken rib. Now the Lungs are covered with a coat coming from the membrane called *Pleura*, interweaved with Nerves of the ſixth Conjugation from the brain, which was cauſe of the extreme pain he felt; likewiſe he had great difficulty of breathing, which proceeded from the bloud which was ſpilt in the capacity of the *Thorax*, and upon the Diaphragm, the principal inſtrument of reſpiration, and from the dilaceration of the muſcles which are between each rib, which help alſo to make the expiration and the inſpiration; and likewiſe becauſe the Lungs were torn and wounded by the bullet, which hath cauſed him ever ſince to ſpit black and putrid bloud in coughing. The Fever ſeized him ſoon after he was hurt, with faintings and ſwoonings. It ſeemed to me that the ſaid Fever proceeded from the putredinous vapours ariſing from the bloud which is out of his proper veſſels, which hath fallen down, and will yet flow down. The wound of the Lungs is grown great, and will grow more great, becauſe it is in perpetual motion both ſleeping and waking, and is dilated and compreſt to let the air to the heart, and caſt fuliginous vapours out: by the unnatural heat is made inflammation, then the expulſive virtue is conſtrained to caſt out by cough whatſoever is obnoxious unto it: for the Lungs cannot be purged but by coughing, and by coughing the wound is dilated, and grows greater, from whence the bloud iſſues out with great abundance, which bloud is drawn from the heart by the Vein Arterial to give them nouriſhment, and to the heart by the *Vena cava*; his meat was Barley-broth, Stewed Prunes, ſometimes Panado; his drink was Ptiſan: He could not lye but upon his back, which ſhewed he had a great quantity of bloud

ſpilt

ſpilt within the capacity of the *Thorax*; and being ſpread or ſpilled along the ſpondyls, doth not ſo much preſs the Lungs as it doth being laid on the ſides or ſitting.

What ſhall I ſay more, but that the ſaid Lord *Martigues* ſince the time he was hurt hath not repoſed one hour onely, and hath always caſt out bloudy Urines and Stools. Theſe things then *Meſſiers* conſidered, one can make no other prognoſtick but that he will die in a few days, which is to my great grief. Having ended my diſcourſe, I dreſt him as I was wont; having diſcovered his wounds, the Phyſicians and other aſſiſtants preſently knew the truth of what I had ſaid.

The ſaid Phyſicians having felt his pulſe and known his forces to be almoſt ſpent and aboliſhed, they concluded with me, that in a few days he would die; and at the ſame inſtant went all toward the Lord of *Savoy*, where they all ſaid that the ſaid Lord *Martigues* would die in a ſhort time; he anſwered, it were poſſible if he were well dreſt, he might eſcape: Then they all with one voice ſaid, he had been very well dreſt, and ſollicited with all things neceſſary for the curing of his wounds, and could not be better, and that it was impoſſible to cure him, and that his wound was mortal of neceſſity. The Mounſieur *De Savoy* ſhewed himſelf to be very much diſcontented and wept, and asked them again if for certain they all held him deplored and remedileſs; they anſwered, Yes. Then a certain *Spaniſh* Impoſtor offered himſelf, who promiſed on his life that he would cure him, and if he failed to cure him, they ſhould cut him in an hundred pieces: but he would not have any Phyſicians, Surgeons, or Apothecaries with him. And at the ſame inſtant the ſaid Lord of *Savoy* told the Phyſicians and Surgeons they ſhould not in any wiſe go any more to ſee the ſaid Lord of *Martigues*. And he ſent a Gentleman to me to forbid me upon pain of life not to touch any more the ſaid Lord of *Martigues*, which I promiſed not to do; wherefore I was very glad, ſeeing he ſhould not die in my hands, and commanded the ſaid Impoſtor to dreſs the ſaid Lord of *Martigues*, and that he ſhould have no other Phyſicians nor Surgeons but him; he came preſently to the ſaid Lord of *Martigues*, who told him:

Senor Cavallero el ſenor Duge me ha mandado que veniaſſe a curar vaſtra herida, yo os juro a Dios que antes de achio dias yo os hag a ſubir a Cavello con la lanſa en puno contaſque no ago qué yo quos togne, Comeris y biberis todis comedas que ſueren de vaſtro guſto y yo hare la dieta pro V. M. y deſto os de veu aſeguirar ſobre de mi, yo he ſanado mun hos que tenian magores heridas que la vaſtra. That is to ſay, Lord Cavallier, Mounſieur the Duke of *Savoy* hath commanded me to come dreſs thy wound; I ſwear to thee by God, that before eight days I will make thee mount on Horſe-back with thy Lance in thy hand, provided that no man may touch thee but my ſelf; thou ſhalt eat and drink any thing that thou haſt a mind to, I will perform thy diet for thee, and of this thou mayeſt be aſſured upon my promiſe. I have cured divers who have had greater wounds than thine: and the Lord replied, *God give you Grace to do it.*

He demanded of the ſaid Lord a Shirt, and tore it in little rags, which he put acroſs, muttering and murmuring certain words over the wounds; and having dreſt him, permitted him to eat and drink what he would, telling him he would obſerve a diet for him, which he did, eating but ſix Prunes and ſix bits of bread at a meal, and drinking but Beer. Notwithſtanding two days after, the ſaid Lord of *Martigues* died; and my *Spaniard*, ſeeing of him in the Agony, eclipſed himſelf, and got away without bidding farewel to any body; and I believe if he had been taken, he had been hanged for his falſe promiſes, which he had made to Mounſieur the Duke of *Savoy*, and to divers other Gentlemen.

He died about ten of the Clock in the morning, and after Dinner the ſaid Lord of *Savoy* ſent Phyſicians and Surgeons, and his Apothecary, with a great quantity of Drugs to embalm him; they came accompanied with divers Gentlemen and Captains of the Army.

The Emperours Surgeon came near to me, and prayed me kindly to open the Body; which I refuſed, telling him I was not worthy to carry his Plaſter-Box after him. He prayed me again; which then I did for his ſake, if it ſo liked him. I would yet again have excuſed my ſelf, that ſeeing he was not willing to embalm him, that he would give this charge to another Surgeon of the Company; he made me yet anſwer, that he would it ſhould be I; and if I would not do it, I might hereafter repent it. Knowing this his affection, for fear he ſhould do me any diſpleaſure, I took the Razor and preſented it to all in particular, telling them I was not well practiſed to do ſuch Operations, which they all refuſed.

The Body being placed upon a Table, truly I purpoſed to ſhew them that I was an Anatomiſt, declaring to them divers things ſhould be here too long to recite. I began to tell all the Company that I was ſure the bullet had broken two Ribs, and that it had paſſed through the Lungs, and that they ſhould find the wound much enlarged, becauſe they are in perpetual motion, ſleeping or waking, and by this motion the wound was the more dilacerated. Alſo that there was great quantity of bloud ſpilt in the capacity of the breſt, and upon the midriff, and ſplinters of the broken ribs which were beaten in at the entrance of the bullet, and the iſſuing forth of it had carried out. Indeed all which I had told them was found true in the dead body.

One of the Phyſicians asked me, which way the bloud might paſs to be caſt out by Urine, being contained in the *Thorax*. I anſwered him that there was a manifeſt Conduit, which is the *Vena Azygos*, which having nouriſhed the ribs, the reſt of the bloud deſcends under the Diaphragm, and on the left ſide is conjoined to the emulgent Vein, which is the way by which the matter in Pleuriſies and in *Empuema*, do manifeſtly empty themſelves by Urin and Stool. As it is likewiſe ſeen the pure milk of the breſts of Women newly brought to bed, to deſcend by the Mammillary veins and to be evacuated downwards by the neck of the womb without being mixt with the bloud. And ſuch a thing is done (as it were by a miracle of Nature) by her expulſive and ſequeſtring virtue, which is ſeen by experience of two glaſs veſſels called Mount-wine; let the one be filled with Water, and the other with Claret-wine, and let them be put the one upon the other, that is to ſay, that which ſhall be filled with Water upon that which ſhall be filled with Wine, and you ſhall apparently ſee the Wine

mount

mount up to the top of the veſſel quite through the water, and the water deſcend atraverſe the wine, and go to the bottom of the veſſel without mixture of both; and if ſuch a thing be done ſo exteriorly and openly to the ſenſe of our eye, by things without life, you muſt believe the ſame in our underſtanding; That nature can make matter and bloud to paſs, having been out of their veſſels, yea, through the bones, without being mingled with the good bloud.

Our diſcourſe ended, I embalmed the body, and put it into a Coffin; after that the Emperors Surgeon took me apart, and told me if I would remain with him, that he would uſe me very well, and that he would cloath me a new, alſo that I ſhould ride on Horſe-back. I thanked him very kindly for the honour he did me, and told him that I had no deſire to do ſervice to Strangers and Enemies to my Countrey: then he told me I was a Fool, and if he were Priſoner as I, he would ſerve the Devil to get his liberty. In the end I told him flat that I would not dwell at all with him.

The Emperours Phyſician returned towards the ſaid Lord of *Savoy*, where he declared the cauſe of the death of the ſaid Lord of *Martignes*, and told him that it was impoſſible for all the men in the World to have cured him; and confirmed again, that I had done what was neceſſary to be done, and prayed him to win me to his ſervice, and ſpake better of me than I deſerved.

Having been perſuaded to take me to his ſervice, he gave charge to one of his Stewards named Mounſieur *de Bouches*, to tell me if I would dwell in his ſervice, that he would uſe me kindly: I anſwered him that I thanked him moſt humbly, and that I had reſolved not to dwell with any Stranger. This my anſwer being heard by the Duke of *Savoy*, he was ſomewhat in choler, and ſaid, He would ſend me to the Gallies.

Mounſieur *de Vandeville* Governor of *Gravelin*, and Colonel of the ſeventeen Enſigns of Foot, prayed him to give me to him, to dreſs him of an ulcer which he had in his leg this ſix or ſeven years; Mounſieur *de Savoy* told him, becauſe I was of worth, that he was content, and if I rankled his leg, it would be well done; he anſwered, that if he perceived any thing, he would cauſe my Throat to be cut.

Soon after the ſaid Lord of *Vandeville* ſent for me by four *German* Halbertiers, which affrighted me much, not knowing whither they led me, they ſpake no more French than I High Dutch: being arrived at his Lodging, he told me I was welcome, and that I was his; and as ſoon as I ſhould have cured him of that ulcer in his leg, that he would give me leave to be gone without taking any ranſom of me. I told him that I was not able to pay any ranſome.

Then he made his Phyſician and Surgeon in Ordinary to ſhew me his ulcerated leg; having ſeen and conſidered it, we went apart into a Chamber, where I began to tell them that the ſaid Ulcer was annual, not being ſimple but complicated: that is of a round figure and ſcaly, having the lips hard and callous, hollow and ſordid, accompanied with a great varicous vein which did perpetually feed it; beſides a great tumour, and a phlegmonous diſtemper very painful through the whole leg, in a body of cholerick complexion, as the hair of his face and beard demonſtrated. The method to cure it (if cured it could be) was to begin with univerſal things, that is, with Purgation and Bleeding, and with this order of Diet, that he ſhould not uſe any Wine at all, nor any ſalt Meats or of great nouriſhment, chiefly thoſe which did heat the bloud: afterward the Cure muſt begin with divers ſcarifications about the Ulcer, and totally cutting away the callous edges or lips, and giving a long or a triangular figure; for the round will very hardly cure, as the Ancients have left it in writing, which is ſeen by experience. That done the filth muſt be mundified, as alſo the corrupt fleſh, which ſhould be done with *Unguentum Ægyptiacum*, and upon it a bolſter dipt in juice of Plantain and Nightſhade and *Oxycrate*, and rowl the leg, beginning at the foot, and finiſhing at the knee, not forgetting a little bolſter upon the varicous Vein, to the end no ſuperfluities ſhould flow to the Ulcer. Moreover that he ſhould take reſt in his bed, which is commanded by *Hippocrates*, who ſaith, that thoſe who have ſore legs ſhould not uſe much ſtanding or ſitting, but lying along. And after thoſe things be done, and the Ulcer well mundified, a plate of Lead rubbed with Quickſilver ſhould be applied. See then the means by which the ſaid Lord *Vandeville* might be cured of the ſaid Ulcer; all which they found good. Then the Phyſician left me with the Surgeon, and went to the Lord *Vandeville*, to tell him that he did aſſure him I would cure him, and told him what I was reſolved to do for the cure of his Ulcer, wherefore he was very joyful. He made me to be called to him, and asked me if I was of the opinion that this Ulcer could be cured, and I told him, yes, provided he would be obedient to what he ought. He made me a promiſe he would perform all things which I would appoint; and as ſoon as his Ulcer ſhould be cured, he would give me liberty to return without paying any ranſom. Then I beſeeched him to come to a better compoſition with me, telling him that the time would be too long to be out of liberty, if I ſtaid till he was perfectly well; and that I hoped within fifteen days the Ulcer ſhould be diminiſhed more than one half, and it ſhould be without pain, and that his Phyſicians and Surgeons would finiſh the reſt of the cure very eaſily. To which he agreed, and then I took a piece of Paper, and cut it the largeneſs of the Ulcer, which I gave him, and kept as much my ſelf. I prayed him to keep promiſe, when he ſhould find his buſineſs done: He ſwore by the faith of a Gentleman he would do it. Then I reſolved to dreſs him well, according to the method of *Galen*, which was, that after all ſtrange things were taken out of the Ulcer, and that there wanted nothing but filling up with fleſh, I dreſt him but once a day, and he found that very ſtrange. And likewiſe his Phyſician, which was but a Freſh-man in thoſe affairs, who would perſuade me with the Patient, to dreſs him two or three times a day, I prayed him to let me do what I thought good; and that it was not to prolong the cure, but on the contrary to haſten it, for the great deſire I had to be in liberty. And that he would look in *Galen* in the fourth Book of the Compoſition of Medicaments *ſecundum genera*, who ſaith, that if a Medicin do not remain long upon the part it profits not ſo much as when it doth continue long; a thing which many Phyſicians have been ignorant of, and have thought it hath been better to change the Plaſter often. And this ill cuſtom is ſo inveterate and rooted, that the Patients themſelves accuſe often-times the Surgeons of negligence, becauſe they do not oftner

remove

remove their Emplaſters; but they are deceived. For as you have read in my Works in divers places, the qualities of all bodies which mutually touch, operate one againſt another, and both of them ſuffer ſomething, where one of them is much ſtronger than the other, by means whereof the ſaid qualities are united; they familiarize with the time, although they are much differing from the manner, that the quality of the Medicament doth unite, and ſometimes becomes like to that of the body, which is a very profitable thing. Therefore they ſay he is to be praiſed much who firſt invented not to change the Plaſter ſo often, becauſe it is known by experience this is a good invention.

Moreover it is ſaid, great fault is committed to dreſs Ulcers often in wiping of them hard; for one takes not away onely the unprofitable excrement, which is the *pus* or *ſanies* of the ulcer, but the matter whereof the fleſh is engendered; wherefore for the reaſons aforeſaid it is not needful to dreſs Ulcers ſo often.

The ſaid Lord *Vandeville* would ſee whether that which I alledged out of *Galen* were true and commanded the ſaid Phyſician to look there, for that he would know it; he cauſed the Book to be brought upon the Table, where my ſaying was found true, and then the Phyſician was aſhamed, and I very joyful. So that the ſaid Lord of *Vandeville* deſired not to be dreſſed but once a day, in ſo much that within fifteen days the Ulcer was almoſt cicatrized; the compoſition being made between us, I began to be merry. He made me eat and drink at his Table, when there were not men of more great rank with him.

He gave me a great red Scarf, which he commanded me to wear. I may ſay I was as glad of it as a Dog that hath a clog, for fear he ſhould go into the Vineyard and eat the Grapes. The Phyſician and Surgeon led me through the Camp, to viſit their hurt people, where I took notice what our Enemies did: I perceived they had no more pieces of Cannon, but twenty five or thirty pieces for the Field.

Mounſieur *de Vandeville* held Mounſieur *de Bauge* Priſoner, the Brother of Mounſieur *de Martignes* who died at *Hedin*. The ſaid Lord of *Bauge* was Priſoner in the Caſtle of the *Heap of Wood*, belonging to the Emperour, who had been taken at *Therouenne* by two *Spaniſh* Souldiers. Now the ſaid Lord of *Vandeville* having looked well upon him, conceived he muſt be a Gentleman of ſome good Houſe; and to be the better aſſured, he aauſed him to have his Stockings pulled off, and ſeeing his Stockings and his Feet clean and neat, together with his fine white ſocks, it confirmed him the better in his opinion, that it was a man was able to pay ſome good ranſom. He demands of the Souldiers if they would take thirty Crowns for their Priſoner, and that he would give it to them preſently, to which they agreed willingly, becauſe they had neither means to keep him, nor feed him: beſides they knew not his worth, therefore they delivered their Priſoner into the hands of the ſaid Lord of *Vandeville*, who preſently ſent him to the Caſtle of the *Heap of Wood* with a Guard of four Souldiers, with other Gentlemen Priſoners of ours. The ſaid Lord *Bauge* would not diſcover himſelf, who he was, and endured very much, being kept but with bread and water, and lay upon a little ſtraw. The ſaid Lord of *Vandeville* after taking of *Hedin*, ſent word to the ſaid Lord *Bauge* and other priſoners, that the place of *Hedin* was taken, and the liſt of thoſe that had been ſlain, and amongſt the reſt, Mounſieur *de Martignes:* and when the ſaid Lord of *Bauge* heard the ſound of the death of his brother the Lord *Martignes*, he began much to weep and lament; his Keeper demanded of him, why he made ſo many and ſo great lamentations? He declared unto them that it was for Mounſieur *de Martignes* his brothers ſake. Having underſtood that, the Captain of the Caſtle diſpatched a man away quickly, to tell it to Mounſieur *de Vandeville* that that he had a good priſoner; who having received this good news rejoiced greatly, and the next day ſent me with his Phyſicians and four Souldiers to the Wood-Caſtle to know if this priſoner would give him fifteen thouſand Crowns for a ranſom, ſo he would ſend him free to his own houſe; and for the preſent he deſired but the ſecurity of two Merchants of *Antwerp*, that he would name. The ſaid Lord *Vandeville* perſuaded me that I would make his agreement with his priſoner. See then why he ſent me to the Wooden Caſtle, and commanded the Captain of the Caſtle to uſe him well, and to put him into a Chamber hung with Tapeſtry, and that they ſhould make the Guard more ſtrong, and from that time they made him good chear at his expence.

The anſwer of the ſaid Lord of *Bauge* was, that to put himſelf to ranſom he was not able; and that, that depended upon Mounſieur *de Eſtamps* his Uncle, and of Miſtreſs *de Breſſeure* his Aunt, and he had not any means to pay ſuch a ranſom. I returned with my Keepers to the ſaid Lord *Vandeville*, and told him the anſwer of his ſaid Priſoner, who told me perhaps he ſhould not get out at ſo good a rate; which was true, for he was diſcovered. And forthwith the Queen of *Hungary* and the Duke of *Savoy* ſent word to the Lord *Vandeville*, that this morſel was too great for him, and that he muſt ſend him to them, (which he did) and that he had enough Priſoners beſides him. He was put to forty thouſand Crowns ranſom, beſides other expences.

Returning toward the ſaid Lord *Vandeville* I paſſed by St. *Omer*, where I ſaw their great pieces of Battery, whereof the greateſt part was flawed and broken. I came alſo by *Therouenne*, where I did not ſee ſo much as ſtone upon ſtone, unleſs the mark of a great Church. For the Emperor gave commandment to the Country people within five or ſix leagues about, that they ſhould empty and carry away the ſtones; in ſo much, that now one may drive a Cart over the City as is likewiſe done at *Hedin*, without any appearance of Caſtle or Fortreſs. See then the miſchief which comes by the Wars.

And to return to my purpoſe, preſently after my ſaid Lord *Vandeville* was very well of his Ulcer, and little wanted of the entire cure, which was the cauſe he gave me my leave, and made me be conducted with a Paſs-port by a Trumpet to *Abbeville*, where I took Poſt, and went and found King *Henry* my Maſter at *Auſimon*, who received me with joy, and a good countenance.

He ſent for the Duke of G[illegible] the High Conſtable of *France*, and Mounſieur *d' Eſtres*, to underſtand by me what had paſſ[illegible] the taking of *Hedin*; and I made him a faithful report, and aſſured them I had ſeen the great Pieces of Battery, which they had carried to St. *Omer*. Whereof

the

the King was very joyful, becauſe he feared leſt the enemy ſhould come further into *France*. He gave me two hundred Crowns to retire my ſelf to my own houſe, and I was very glad to be in liberty, and out of this great torment and noiſe of thunder from the Diabolick artillery, and far from the Souldiers, blaſphemers and deniers of God. I will not omit to tell here that after the taking of *Hedin*, the King was advertiſed that I was not ſlain, but that I was a priſoner, which his Majeſty cauſed to be written to my wife by Monſieur *de Goguier* his chief Phyſician, and that ſhe ſhould not be in any trouble of mind for me, for that I was ſafe and well, and that he would pay my ranſom.

The Battle of S. Quintin, 1557.

AFter the Battel of S. *Quintin*, the King ſent for me to the Fere in *Tartenis* toward Monſieur the Marſhal of *Bourdillon*, to have a paſs-port by the Duke of *Savoy* to go to dreſs Monſieur the Conſtable, who was grievouſly hurt with a Piſtol-ſhot in the back, whereof he was like to die, and remained a priſoner in his enemies hands. But the Duke of *Savoy* would not give conſent that I ſhould go to the ſaid Lord Conſtable, ſaying, he would not remain without a Surgeon, and that he doubted I was not ſent only to dreſs him, but to give him ſome advertiſement, and that he knew I underſtood ſomething elſe beſide Surgery, and that he knew me to have been his priſoner at *Hedin*. Monſieur the Marſhal of *Bourdillon* advertiſed the King of the Dukes denial, by which means the King writ to the ſaid Lord of *Bourdillon*, that if my Lady, the Lord high Conſtables wife, did ſend any body of her houſe, which was an able man, that I ſhould give him a letter, and that I ſhould alſo have told him by word of mouth, what the King and Monſieur the Cardinal of *Lorrain* had given me in charge. Two days after there arrives a ſervant of the Lord Conſtables Chamber, who brought him ſhirts and other linnen, for which the ſaid Lord Marſhal gave paſs-port, to go to the ſaid Lord Conſtable; I was very glad thereof, and gave him my letter, and gave him his leſſon, of that which his Maſter ſhould do being priſoner. I had thought being diſcharged of my embaſſage to return toward the King. But the ſaid Lord of *Bourdillon* prayed me to ſtay with him at the Fere to dreſs a great number of people who were hurt, and were thither retired after the battle; and that he would ſend word to the King the cauſe of my ſtay; which I did. The wounds of the hurt people were greatly ſtinking, and full of worms with gangrene and putrefaction; ſo that I was conſtrained to come with my knife to amputate that which was ſpoiled, which was not without cutting off arms and legs, as alſo to trepan divers. Now there were not any medicines to be had at the Fere, becauſe the Surgeons of our Camp had carried all with them; I found out that the Chariot of the Artillery tarried behind at the Fere, nor had it yet been touched. I prayed the Lord Marſhal that he would cauſe ſome of the drugs to be delivered to me that were in it; which he did, and there was given to me one half at a time: five or ſix days after I was conſtrained to take the reſt, neither was there half enough to dreſs ſo great a number of people, and to contract and ſtay the putrefaction, and to kill the worms that were entred into their wounds, I waſhed them with *Ægyptiacum* diſſolved in wine and *Aqua vitæ*, and did for them all which I could poſſible, yet notwithſtanding all my diligence, very many of them died.

There were Gentlemen at the Fere who had charge to find out the dead body of Monſier *de Bois-Dolphin* the Elder, who had been ſlain in the battle; they prayed me to accompany them to the Camp to find him out amongſt the dead, if it were poſſible, which indeed was impoſſible; ſeeing that the bodies were all diſfavoured and overwhelmed with putrefaction. We ſaw more than half a league about us the earth covered with dead bodies, neither could we abide long there, for the cadaverous ſents which did ariſe from the dead bodies, as well of men as of Horſes. And I think we were the cauſe, that ſo great a number of flies roſe from the dead bodies, which were procreated by their humidity and the heat of the Sun, having their tails green and blew, that being up in the air made a ſhadow in the Sun. We heard them buz, or hum, which was much marvel to us. And I think it was enough to cauſe the Plague where they alighted. (My little Maſter) I would you had been there as I was, to diſtinguiſh the ordures, and alſo to make report to them which were never there. Now being cloyed and annoyed in that Country, I prayed Monſieur the Lord Marſhal, to give me my leave to be gone, and that I was afraid I ſhould be ſick by reaſon of my too great pains, and the ſtinks which did ariſe from the wounded, which did almoſt all die, for what diligence ſoever could be uſed unto them. He made other Surgeons come finiſh the dreſſing of the ſaid hurt people, and I went away with his good grace and favour. He wrote a letter to the King, of the pains he had taken of the poor wounded. Then I returned to *Paris*, where I found yet many Gentlemen that had been hurt, and were there retired after the battle.

The Voyage of the Camp of Amiens, 1558.

THE King ſent me to *Dourlan*, and made me be conducted by a Captain *Govaſt*, with fifty men in Arms, for fear I ſhould be taken by the enemies. And ſeeing that in the way we were always in alarums, I cauſed my man to alight, making him to be my maſter for that time, and I got upon his horſe, which carried my mail, and took his cloak and hat, and gave him my ambling Mare. My man being put upon her back, one would have taken him for the maſter, and I for the ſervant. Thoſe of *Dourlan* ſeeing us far off, thought we were enemies, and let flie their Cannon-ſhot at us. Captain *Gaveſt* my conductor, made a ſign with his hat, that we were not enemies, ſo that they left ſhooting, and we entred into *Dourlan*, with great joy. Thoſe of *Dourlan* made a ſally forth upon the enemies five or ſix days before; who killed and hurt divers of our Captains, and good Souldiers; and amongſt the reſt Captain S. *Aubin* valiant at the ſword, whom Monſieur *de Guiſe* loved very well, and for whom chiefly the King ſent me thither, who being in the fit of a quartan fever, would needs go out to command the greateſt part of his Company: a *Spaniard* ſeeing him that he commanded, perceived he was a Captain, and ſhot a muſket-bullet quite through his neck; my Captain S. *Aubin* thought with this ſtroke he was dead,

and

and with the fear (I proteſt to God) he loſt his quartan ague, and was altogether freed from it. I dreſſed him with *Anthony Portal* Surgeon in ordinary to the King, and divers other ſouldiers: ſome died, others eſcaped quite with the loſs of a leg, or an arm, or the loſs of an eye, and they ſaid they eſcaped good cheap, eſcape that can. When the enemy had broken their Camp, I returned to *Paris*. Here I hold my peace of my little Maſter, who was more at eaſe in his houſe, than I at the Wars.

The Voyage of Harbor *of Grace*, 1563.

YEt I will not omit to ſpeak of the Voyage of the *Harbor* of Grace; then when they made the approaches to plant the Artillery, the Engliſh who were within it killed ſome of our Souldiers, and divers Pioneers, who undermined, who when they were ſeen to be ſo hurt that there was no hope of curing, their fellows ſtript them and put them yet alive into the Mines, which ſerved them for ſo much filling earth. The Engliſh ſeeing they could not withſtand an aſſault, becauſe they were very much attainted with diſeaſes, and chiefly with the Plague, they vielded, their lives and jewels ſaved. The King cauſed them to have ſhips to return to *England*, being glad to be out of this place infected with the Plague: the greateſt part died, and carried the Plague into *England*, and ſince have not yet been exempted. Captain *Sarlabous* maſter of the Camp, was left there in Garriſon, with ſix Enſigns on foot, who had no fear of the plague, and were very joyful to enter therein, hoping there to make to make good cheer. My little Maſter had you been there, you had done as they.

The Voyage of Rowen, 1562.

NOw for the taking of *Rowen*, they killed divers of ours before the aſſault, and at the aſſault: the day after they entred into the City, I trepaned eight or nine, who were hurt at the breach with the ſtrokes of ſtones. There was ſo malignant an air, that divers died, yea of very ſmall hurts, inſomuch that ſome thought they had poiſoned their bullets: thoſe within ſaid the like by us, for although they were well treated in their neceſſities within the City, yet they died alſo as well as thoſe without. The King of *Navor* was hurt in the ſhoulder with a bullet ſome few days before the aſſault; I viſited and helpt to dreſs him, with his own Surgeon, named M. *Gilbert* one of the chief of *Montpelier*, and others. They could not find the bullet, I ſearched for it very exactly; I perceived by conjecture, that it was entred by the head of the *Adjutorium*, and that it had run into the cavity of the ſaid bone, which was the cauſe we could not find it. The moſt part of them ſaid it was entred and loſt within the cavity of the body. Monſieur the Prince of the *Roch upon Yon*, who intimately loved the King of *Navar*, drew me to one ſide, and askt me if the wound was mortal. I told him yea, becauſe all wounds made in great joints, and principally contuſed wounds, were mortal according to all Authors who had written of them. He inquired of the others what they thought, and chiefly of the ſaid *Gilbert*, who told him that he had great hope that the King his Maſter would be cured, and the ſaid Prince was very joyful. Four days after the King and Queen-Mother, Monſieur the Cardinal of *Bourbon* his brother, Monſieur the Prince of *Roch upon Yon*, Monſieur *de Guiſe*, and other great perſonages, after we had dreſſed the King of *Navar*, cauſed a conſultation to be made in their preſences, where there were divers Phyſicians and Surgeons: each man ſaid what ſeemed good unto him, and there was not one of them, who had not good hope of him, ſaying that the King would be cured, and I perſiſted always on the contrary.

Monſieur the Prince of the *Roch upon Yon* who loved me, withdrew me aſide, and ſaid I was only againſt the opinion of all the reſt, and prayed me not to be obſtinate againſt ſo many worthy men. I anſwered him, that when I ſaw any good ſigns of cure, I would change my advice. Divers conſultations were made, where I never changed my word, and prognoſtick, ſuch as I had made at the firſt dreſſing, and always ſaid that the arm would fall into a Gangrene, which it did, what diligence ſoever could be had to the contrary; and he gave up his ſoul to God the eighteenth day of his hurt, Monſieur the Prince *upon Yon*, having heard the death of the ſaid King, ſent his Phyſician and Surgeon toward me, named *Feure* now in ordinary to the King, and the Queen-Mother, to tell me, that he would have the bullet taken out, and that it ſhould be lookt for in what place ſoever it could be found: then I was very joyful, and told them that I was well aſſured to find it quickly, which I did in their preſences and divers Gentlemen. It was lodged in the very midſt of the cavity of the Adjutory bone. My ſaid Prince having it, ſhewed it to the King and Queen, who all ſaid my prognoſtick was found true. The body was laid to reſt in the Caſtle-Galliard, and I returned to *Paris*, where I found divers hurt men who were hurt at the breach of *Rowen*, and chiefly *Italians*, who deſired me very much to dreſs them, which I did willingly; there were divers that recovered, and others died. I believe (my little Maſter) you were called to dreſs ſome of them, for the great number there was of them.

The Voyage of the Battel of Dreux, 1592.

THe day after the battel was given at *Dreux*, the King commanded me, to go dreſs Monſieur the Count of *Eu*, who had been hurt with a Piſtol-ſhot in the right thigh, neer the joint of the hip; which fractured and broke the *Os femoris* in divers places, from whence divers accidents did ariſe, and then death, which was to my great grief. The day after my arrival I would go to the field, where the battel was given, to ſee the dead bodies: I ſaw a league about: all the earth covered, where there was by eſtimation five and twenty thouſand men and more. All which were diſpatched in the ſpace of two hours. I would (my little Maſter) for the love I bear you, that you had been there to recount it to your ſcholers, and to your children. Now in the mean time while I was at *Dreux* I viſited and dreſt a great number of Gentlemen and poor ſouldiers, and amongſt the reſt many *Swiſſer* Captains; I dreſſed fourteen in one chamber only, all hurt with Piſtol-ſhot and other inſtruments of diabolical fire, and not one of the fourteen died. Monſieur the Count of *Eu* being dead, I made no long tarrying at *Dreux*: there came Surgeons from *Paris* who perform-

ed

med well their duty towards the hurt people, as *Pigray*, *Cointeret*, *Hubert*, and others; and I returned to *Paris*, where I found divers Gentlemen wounded, who had retired themſelves thither after the Battle to be dreſſed of their hurts.

The Voyage of the Battle of Moncontour, 1596.

DUring the Battle of *Moncontour*, King *Charles* was at *Pleſſis* the *Tours*, where he heard they had won it; a great number of hurt Gentlemen and Souldiers withdrew themſelves into the City and Suburbs of *Tours*, to be dreſſed and helped, where the King and Queen-Mother commanded me to ſhew my duty with the other Surgeons, who were then in quarter, as *Pigray*, *du Blois*, *Portail*, and one named *Siret*, a Surgeon of *Tours*, a man very skilful in Surgery, and at that time Surgeon to the Kings Brother; and for the multitude of the wounded we were but little in repoſe, nor the Phyſicians likewiſe. Count *Mansfield* Governour of the Duchy of *Luxemburg*, Knight of the King of *Spains* Order, was greatly hurt in the battle, in the left arm, with a Piſtol-ſhot, which broke a great part of the joint of the elbow, and had retired himſelf to *Bourgueille* near *Towers*; being there, he ſent a Gentleman to the King, affectionately to beſeech him to ſend one of his Surgeons to help him in his hurt. Council was held what Surgeon ſhould be ſent. Mounſieur the Marſhal of *Montmorency* told the King and Queen, that it were beſt to ſend his chief Surgeon, and declared to him that the ſaid Lord *Mansfield* was one part of the cauſe of winning the Battle. The King ſaid flat he would not that I ſhould go, but would have me remain cloſe to him. Then the Queen-Mother ſaid, I ſhould but go and come, and that he muſt conſider it was a ſtrange Lord, who was come from the King of *Spains* ſide, to help and ſuccour him. And upon this he permitted me to go, provided that I ſhould return quickly. After this reſolution he ſent for me, and likewiſe the Queen-Mother, and commanded me to go find the ſaid Lord *Mansfield* in the place, where I was to ſerve him in all I could, for the cure of his hurt; I went and found him, having with me a Letter from their Majeſties: having ſeen it, he received me with a good will, and from thenceforth diſcharged three other Surgeons that dreſt him; which was to my great grief, becauſe his hurt ſeemed to me uncurable. Now at *Bourgueil* there were retired divers Gentlemen, who had been hurt at the ſaid Battle, knowing that Mounſieur *de Guiſe* was there, who had been alſo very much hurt with a Piſtol-ſhot through one leg, well aſſured that he would have good Surgeons to dreſs him, and alſo that he, being kind and liberal, would aſſiſt them with a great part of their neceſſaries. And for my part, I did help and aid them with all my Art, as much as it was poſſible; ſome died, ſome recovered, according to their hurts. The Count *Rhingrave* died, who had ſuch a ſhot into the ſhoulder, as the King of *Navar* before *Rouen*. Mounſieur *de Baſſompiere* Colonel of twelve hundred Horſe, was hurt alſo in ſuch a like place as Count *Mansfield*, whom I dreſt and God cured. God ſo bleſſed my work that within three Weeks I led him back to *Paris*, where I muſt as yet make ſome inciſions in the arm of the ſaid Lord *Mansfield*, to draw out the bones which were greatly broken and carieſed: he was cured by the grace of God, and gave me an honeſt reward, ſo that I was well contented with him, and he with me, as he hath ſince made it appear: He writ a Letter to the Duke of *Aſcot* how that he was cured of his hurt, and alſo Mounſieur *de Baſſompiere* of his, and divers others, which I had dreſt after the Battle of *Moncontour*, and counſelled him to beſeech the King of *France*, my good Maſter, to give me leave to go ſee Mounſieur the Marqueſs of *Auret* his Brother.

The Voyage of Flanders.

MOunſieur the Duke of *Aſcot* did not fail to ſend a Gentleman to the King with a Letter, humbly to beſeech him to do him ſo much good and honour, as to permit and command his chief Surgeon to come to ſee the Marqueſs of *Auret* his Brother, who had received a Muſket-ſhot near the Knee, with fracture of the bone, about ſeven moneths ſince, which the Phyſicians and Surgeons in theſe parts were much troubled to cure. The King ſent for me, and commanded me to go ſee the ſaid Lord *Auret*, and to help him in all that I could for the cure of his hurt; I told him I would imploy all that little knowledge which it hath pleaſed God to give me. I went then conducted by two Gentlemen of the Caſtle of *Auret*, which is a league and a half from *Mons* in *Hainault*, where the ſaid Marqueſs was: as ſoon as I arrived I viſited him, and told him the King had commanded me to come and ſee him, and to dreſs him of his hurt; he told me he was glad of my coming, and was much bound to the King to have done him the honour to have ſent me to him. I found him in a great Fever, his eyes very much ſunk, with a countenance gaſtly and yellow, his tongue drie and rough, and all the body emaciated and lean, his ſpeech low like that of a dying man: then I found his thigh much ſwelled, apoſtemated, ulcerated, and caſting out a green ſtinking matter; I ſearched it with a Probe, and by the ſame I found a cavity near the groin, ending in the middle of the thigh, and others about the knee, ſanious and cuniculous; alſo certain ſcales of bones, ſome ſeparated, others not. The legs were much tumified, and ſoked with a pituitous humour, cold, moiſt, and flatulent; in ſo much that the natural heat was in the way to be ſuffocated and extinguiſhed, and the ſaid leg crooked and extracted toward the buttocks, his rump ulcerated the bredth of the palm of an hand, and he ſaid he felt there a great pain and ſmarting, and likewiſe in his reins, in ſo much that he could not take any reſt night or day; neither had he any appetite to eat, but to drink enough: it was told me that he fell often into faintings and ſwoonings, and ſometimes as it were by an Epilepſie, and had oftentimes deſired to vomit, with ſuch a trembling that he could not carry his hands to his mouth. Seeing and conſidering all theſe great accidents, and the forces much abated; truly I was much grieved to have gone to him, becauſe me thought there was little appearance that he could eſcape. Notwithſtanding to give him good courage and good hope, I told him that I would quickly ſet him on foot by the grace of God, and the Phyſicians and Surgeons help. Having ſeen him, I went

a walking into a Garden, where I prayed to God that he would give me the grace to cure him, and that he would give a bleſſing to our Hands and Medicaments, to combat againſt ſo many complicated Maladies. I bethought in my mind the ways I muſt keep to do it. They called me to dinner, I entered into the Kitchin where I ſaw taken out of a great Pot, half a Mutton, a quarter of Veal, three great pieces of Beef, and two Pullets, and a great piece of Bacon, with great ſtore of good Herbs. Then I ſaid to my ſelf, this Broth was full of juice, and of good nouriſhment. After Dinner all the Phyſicians and Surgeons aſſembled, we entered into conference in the preſence of Mounſieur the Duke of *Aſcot*, and ſome Gentlemen that did accompany him; I began to tell the Surgeons that I marvelled much they had made no apertions in the Marqueſſes thigh, which was all apoſtumated, and the matter that iſſued out was foul and ſtinking, which ſhewed it had a long time lurked there, and that I found with my Probe a *Caries* in the bone, and ſmall ſcales which were already ſeparated; they made me anſwer, He would never give conſent, and likewiſe it was almoſt two Moneths ſince they could win him to put on clean Sheets on his bed, neither durſt any one ſcarce touch the Coverlet, he felt ſo great pain. Then ſaid I, for to cure him, we muſt touch other things than the Coverlet of the Bed. Each one ſaid what he thought beſt for the Lords grief, and for concluſion held it altogether deplorable. I told them there was yet ſome hope, becauſe of his youth, and that God and Nature do ſometime ſuch things which ſeem to Phyſicians and Chirurgeons impoſſible. My conſultation was, that all thoſe accidents were come by reaſon of the bullet hitting near the joint of the Knee, which had broken the ligaments, tendons, and *aponeuroſes* of the muſcles which tied the ſaid joint together with the *Os femoris*; alſo Nerves, Veins, and Arteries, from whence had followed pain, inflammation, apoſtume, and ulcer: and that we muſt begin the cure by the diſeaſe, which was the cauſe of all the ſaid accidents, that is to ſay, to make apertions, to give iſſue to the matter retained in the interſpaces of the Muſcles, and in the ſubſtance of them: Likewiſe to the bones which cauſed a great corruption in the whole thigh, from whence the vapours did ariſe and were carried to the heart, which cauſed the Syncope and the Fever, and the Fever an univerſal heat through the whole body; and by conſequent, depravation of the whole *Oeconomy*; Likewiſe that the ſaid vapours were communicated to the brain, which cauſed the Epilepſie and trembling, and to the Stomach diſdain and loathing, and hindered it from doing its functions, which are chiefly to concoct and digeſt the meat, and to convert it into *Chylus*; which not being concocted, they ingender crudities and obſtructions, which makes that the parts are not nouriſhed, and by conſequent the body dries, and grows lean, and becauſe alſo it did not do any exerciſe; for every part which hath not his motion remaineth languid and *atrophiated*, becauſe the heat and ſpirits are not ſent or drawn thither, from whence follows mortification. And to nouriſh and fatten the body, Frictions muſt be made univerſally through the whole body with warm linnen cloths above, below, and on the right ſide, and left, and round about; to the end to draw the bloud and ſpirits from within outward, and to reſolve any fuliginous vapours retained between the skin and the fleſh; thereby the parts ſhall be nouriſhed and reſtored, (as I have heretofore ſaid, in the Tenth Book treating of the Wounds of Gunſhot) and we muſt then ceaſe when we ſee heat and redneſs in the skin, for fear of reſolving that we have already drawn, and by conſequent make it become more lean. As for the ulcer which he hath upon his rump, which came through his too long lying upon it without being removed, which was the cauſe that the ſpirits could not flouriſh or ſhine in it, by the means of which there ſhould be inflammation, apoſteme, and then ulcer, yea with loſs of ſubſtance of the ſubject fleſh, with a very great pain, becauſe of the Nerves which are diſſeminated in this part: That we muſt likewiſe put him in another ſoft bed, and give him a clean Shirt and Sheets; otherwiſe all that we could do would ſerve for nothing, becauſe that thoſe excrements and vapours of the matter retained ſo long in his bed, are drawn in by the *Syſtole* and *Diaſtole* of the Arteries which are diſſeminated through the skin, and cauſe the ſpirits to change and acquire an ill quality and corruption which is ſeen in ſome that lie in a bed where one hath ſwet for the Pox, who will get the Pox by the putrid vapours which ſhall remain ſoaking in the Sheets and Coverlets. Now the cauſe why he could in no wiſe ſleep, and was as it were in a Conſumption, 'twas becauſe he ate little, and did not do any exerciſe, and becauſe he was grieved with extreme pain. For there is nothing that abateth ſo much the ſtrength as pain. The cauſe why his tongue was dry and foul, was through the vehemency of the heat of the Fever, by the vapors which aſcended through the whole body to the mouth. For as we ſay in a common Proverb, *When the Oven is well heat, the Throat feels it.* Having diſcourſed of the Cauſes and Accidents, I ſaid they muſt be cured by their Contraries, and firſt we muſt appeaſe the pain, making apertions in the thigh to evacuate the matter retained, not evacuating all at a time, for fear leſt by a ſudden great evacuation, there might happen a great decay of ſpirits which might much weaken the Patient and ſhorten his days. Secondly, to look to the great ſwelling and cold of his leg, fearing leſt it ſhould fall into a Gangrene and that actual heat muſt be applied unto him, becauſe the potential could not reduce the intemperature *De Potentia ad Actum*; for this cauſe hot Bricks muſt be applied round about, on which ſhould be caſt a decoction of Nerval Herbs boiled in Wine and Vinegar, then wrapt up in ſome Napkin, and to the feet an earthen Bottle filled with the ſaid decoction, ſtopt and wrapped up with ſome linen cloths; alſo that fomentations muſt be made upon the thigh, and the whole leg, of a decoction made of Sage, Roſemary, Tyme, Lavender, Flowers of Cammomile, Melilot, and Red Roſes boiled in White Wine, and a *Lixivium* made with Oak-aſhes, with a little Vinegar, and half an handful of Salt. This Decoction hath vertue to attenuate, inciſe, reſolve and drie the groſs viſcous humour. The ſaid Fomentations muſt be uſed a long while, to the end there may be a great reſolution; for being ſo done a long time together, more is reſolved than attracted, becauſe the humour contained in the part is liquified, the skin and the fleſh of the muſcles is rarified. Thirdly, that there muſt be applied upon the rump a great Plaſter made of the red deſic-

cative,

cative and *Unguentum Comitiſſæ*, of each equal parts incorporated together, to the end to appeaſe his pain, and drie up the ulcer, alſo to make him a little down-pillow which might bear his rump aloft without leaning upon it. Fourthly, to refreſh the heat of his Kidnies, one ſhould apply the Unguent called *Refrigerans Galeni* freſhly made, and upon the leaves of Water-Lillies. Then a Napkin dipt in *Oxycrate*, wrung and often renewed, and for the corroboration and ſtrengthening of his heart a refreſhing Medicin ſhould be applied, made with Oil of *Nenuphar*, and unguent of Roſes, and a little Saffron diſtilled in Roſe-Vinegar, and Treacle ſpread upon a piece of Scarlet, for the *Syncope* which proceeded from the debilitation of the natural ſtrength troubling the brain. Alſo he muſt uſe good nouriſhment full of juice, as Rere Eggs, Damask Prunes ſtewed in Wine and Sugar, alſo Panado made of the broth of the great Pot (of which I have already ſpoken) with the white fleſhy parts of Capons, and Partridge wings minced ſmall, and other roaſt-meat eaſie of digeſtion, as Veal, Goat, Pigeon, Partridge, and the like. The Sauce ſhould be Oranges, Verjuice, Sorrel, ſharp Pomgranats; and that he ſhould likewiſe eat of them boiled with good herbs, as Sorrel, Lettuce, Purſlain, Succory, Bugloſs, Marigolds, and other the like. At night he might uſe cleanſed Barley with the juice of Nenuphar and Sorrel, of each two ounces, with five or ſix grains of Opium, and of the Four cold Seeds bruiſed, of each half an ounce, which is a remedy nouriſhing and medicinal, which will provoke him to ſleep: that his bread ſhould be of Meſlin, neither too new nor too ſtale; and for the great pain of his head, his hair muſt be cut, and rub his head with *Oxyrrhodinum* luke-warm, and leave a double cloth wet therein upon it; likewiſe ſhould be made for him a frontal of Oil of Roſes, Nenuphar, Poppies, and a little Opium and Roſe Vinegar, and a little Camphire and to renew it ſometimes. Moreover one ſhould cauſe him to ſmell to the flowers of Henbane and Nenuphar bruiſed with Vinegar, Roſe Water, and a little Camphire wrapped in a Handkerchief, which ſhall be often and a long time held to his noſe, to the end that the ſmell may be communicated to the brain, and theſe things to be continued till that the great inflammation and pain be paſt, for fear of cooling the brain too much. Beſides, one may cauſe it to rain artificially, in pouring down from ſome high place into a Kettle, and that it may make ſuch a noiſe that the Patient may hear it; by theſe means ſleep ſhall be provoked on him. And as for the retraction of his leg that there was hope to dreſs it, when evacuation was made of the matter, and other humours contained in the thigh, which by their extention (made by repletion) have drawn back the leg, which might be remedied in rubbing the whole joint of the Knee with *Unguentum Dialthææ* and Oil of Lillies, and a little *Aquæ vitæ*, and upon it to be laid black Wool with the greaſe thereof. Likewiſe putting in the Ham a Feather pillow folded in double, and by little and little to make his leg to ſtretch out. All which my diſcourſe was approved of by the Phyſicians and Chirurgeons. The conſultation ended, we went to the ſick Patient, and I made him three apertions in his thigh, from whence iſſued out great quantity of matter and ſanies; and at the ſame time I drew out ſome ſcales of bones; nor would I let out too much abundance of the ſaid matter, for fear of too much decaying his ſtrength: Then two or three hours I cauſed a Bed to be made near his own, where there were clean white ſheets, then a ſtrong man lifted him into it, and he rejoiced much in that he was taken out of his foul ſtinking Bed. Soon after he demanded to ſleep, which he did almoſt four hours, where all the people of the houſe began to rejoice, chiefly Mounſieur the Duke of *Aſcot* his Brother.

The days following I made injections into the bottom of the cavities of the Ulcer, made with *Ægyptiacum* diſſolved ſometimes in *aquæ vitæ*, and ſometimes in Wine. I applied to mundifie and drie the ſpongy and looſe fleſh, bolſters; at the bottom of the ſinuoſities, hollow tents of lead, that the ſanies might have paſſage out; and upon it a great Emplaſter of *Diacalcitheos* diſſolved in Wine: likewiſe I did rowl it with ſuch dexterity, that he had no pain, which being appeaſed, the Fever began much to diminiſh. Then I made him drink Wine moderately allayed with Water, knowing that it reſtores and quickens the ſpirits: and all the things which were reſted on in the conſultation were accompliſhed, according to time and order; and his Pains and Fever ceaſed, he began to grow better, and diſcharged two of his Surgeons and one of his Phyſicians, ſo that we were but three with him. Now I remained there about two moneths, which was not without ſeeing divers ſick people, as well rich as poor, which came to me about three or four leagues about. They gave meat and drink to the needy, all which he recommended to me, and prayed me alſo for his ſake to help them. I proteſt I did not refuſe any one, and did to them what I poſſibly could, wherefore he was joyful. Then when I ſaw he began to mend, I told him he muſt have a Conſort of Violins and a Jeſter to make him merry, which he did: in one moneth we ſo wrought, that he could hold himſelf up in a Chair, and made himſelf to be carried and walk in his Garden, and at the Gate of his Caſtle to ſee the people paſs by. The Country people of two or three leagues about, knowing they could ſee him, came the Feaſt-day Male and Female, to ſing and dance pell mell, in joy of his amendment, all being very glad to ſee him, which was not done without good laughing and drinking. He cauſed ſtill a barrel of Beer to be given them, and they drank all merrily to his good health. And the Citizens of *Mons Hainault*, and other Gentlemen neighbors, came to ſee him in admiration, as a man coming from the Tomb. And as ſoon as he began to mend, he was not without company, and as one went out another came in to viſit him: his Table was always well covered. He was greatly loved of the Nobility and of the Common People, as well for his liberality, as for his beauty and honeſty, having a pleaſant look and a gracious ſpeech, in ſo much that thoſe that beheld his face were conſtrained to love him. The chief of the City of *Mons* came on Saturday to beſeech him to permit me to go to *Mons*, where they had a great deſire to feaſt and make me good cheer for his ſake. He told them he would pray me to go there, which he did. But I made him anſwer that they ſhould not do me ſuch honour, as alſo that they could not give me better cheer than I had with him. And he prayed me again affectionately to go thither, and that I ſhould do that for his ſake, to which I agreed. The day

after they fetcht me with two Coaches, and being arrived at *Mons* we found the dinner ready, and the chief of the City with their Wives, ſtaid for me with a good will. We went to the Table, and they placed me at the upper end, and drank all to me, and to the health of Mounſieur *D' Auret*, ſaying that he was very happy, and they likewiſe, to have obtained me to take him in hand, for that they knew that in this company he was greatly honoured and loved. After Dinner they led me back to the Caſtle of *Auret*, where Mounſieur the Marqueſs ſtaid for me with great expectation to recount unto him, what we had done in our Banquet. I told him that all the company had drank divers times to his health. In ſix weeks he began to uphold himſelf a little with Crutches, and grow very fat, and to get a lively natural colour. Now he had a deſire to go to *Beaumont*, which is the dwelling place of Mounſieur the Duke of *Aſcot*, and made himſelf be carried in a great chair with eight men by turns, and the Country-folks where we paſſed along, knowing 'twas Mounſieur the Marqueſs, fought and ſtrove together who ſhould carry him, and conſtrained us to drink, but it was but Beer, but I believe had it been Wine or Hippocras, they would have given it us with a very good will, ſo much did they ſhew themſelves joyful to ſee the ſaid Marqueſs, and prayed all to God for him. Being arrived at *Beaumont*, all the people came before us to do him reverence, and prayed God to bleſs him, and keep him in good health. We entered into the Caſtle, where there was more than fifty Gentlemen which the Duke of *Aſcot* had ſent for to come make good cheer with his Brother, who kept his Table furniſhed three days together: And after Dinner the Gentlemen ran at the Ring, played at Foils, and rejoiced to ſee Mounſieur *Auret*, becauſe they heard he would never come out of his Bed again, or be cured of his hurt. I was always at the upper end of the Table, where every one drank carouſes to him and me, thinking to make me foxt, which they could not do, for I drank but according to my old cuſtom. A few days after we returned back and took leave of Madam the Dutcheſs of *Aſcot*, who took a Diamond Ring from her finger, which ſhe gave me, acknowledging I had very well dreſt her Brother; which Diamond was better worth than fifty Crowns. Mounſieur *Auret* grew better and better, and walked all alone round about his Garden with Crutches. I begged leave of him divers times to come away to *Paris*, declaring that his Phyſician and Surgeon would well do the reſt that remained for the cure of his grief. And now to begin a little to eſtrange my ſelf from him, I prayed him to give me leave to go ſee the City of *Antwerp*, which he willingly accorded to: and commanded his Steward to conduct me thither accompanied with two Pages: we paſſed through *Malines* and *Bruxels*, where the chief of the City prayed the ſaid Steward that at our return they might hear of it, and they had a great deſire to feaſt me, as they of *Mons* had done. I thanked them moſt kindly, and told them that I was not worthy of ſuch honour. I was not two days and a half to ſee the City of *Antwerp*, where ſome Merchants knowing the Steward, prayed him to do them the honour, that they might beſtow a Dinner or Supper upon us. There was ſtriving who ſhould have us, and they were all very joyful to hear of the good health of the Marqueſs of *Auret*, doing me more honour than I expected. To conclude, we came back to the Marqueſs making good cheer, and within five or ſix days I asked my leave of him, which he granted with great grief, and gave me an honeſt Preſent, and of great value, and made me be conducted by the ſaid Maſter of his Houſe and two Pages, even to my houſe at *Paris*.

I have forgot to tell you that the *Spaniards* have ſince ruined and demoliſhed his Caſtle of *Auret*, ſackt, pillaged, rifled and burnt all the Houſes and Villages belonging unto him, becauſe he would not be of their ſide, in the ſlaughters and ruines of the Low-Countries.

The Voyage of Bourges, 1562.

THe King with his Camp remained not long at *Bourges*, but thoſe within yielded it up, and went out with their Jewels ſaved. I know nothing worthy of memory, but that a Boy of the Kings Privy Kitchin, who being near the Walls of the City before the Compoſition was made, cried with a loud voice, *Hugonot*, *Hugonot*, Shoot here, Shoot here, having his arms lifted up, and his hand ſtretched out, a Souldier ſhot his hand quite through with a bullet: having received his ſtroke, he came and found me out to dreſs him. My Lord High-Conſtable ſeeing the Boy to have his hand all bloudy, and all rent and torn, demanded of him who had hurt him. Then there was a Gentleman who ſaw the ſhot made, ſaid it was well beſtowed, becauſe he cried *Hugonot*, ſhoot here, ſhoot here. Then the ſaid Lord Conſtable ſaid, this *Hugonot* was a good Musketeer, and bare a pitiful mind; for it was very likely if he would have ſhot at his head, he might have done it more eaſily than in the hand. I dreſſed the ſaid Cook who was very ſick, but at length was cured, but with lameneſs of his hand, and ever after his Companions called him *Hugonot*.

The Battle of St. Dennis, 1567.

ANd as for the battle of Saint *Denis* there were divers ſlain as well on one ſide, as on the other: ours being hurt, went back to *Paris* to be dreſſed together with the Priſoners who were taken, whereof I dreſſed a great part. The King commanded me, by the requeſt of the Lady High-Conſtable, to go to her houſe to dreſs my Lord, who had received a Piſtol-ſhot in the middle of the ſpondyls of his back, whereby he preſently loſt all ſenſe and motion of thighs and legs, with retention of excrements, not being able to caſt out his Urin, nor any thing by the fundament, becauſe that the Spinal marrow, (from whence proceed the ſinews to give ſenſe and motion to the inferiour parts) was bruiſed, broken, and torn by the vehemence of the bullet. He likewiſe loſt his Reaſon and Underſtanding, and in a few days he died. The Surgeons of *Paris* were a long time troubled to dreſs the ſaid wounded people. I believe (my little Maſter) that you ſaw ſome of them. I beſeech the great God of Victories, that we may never be imploied in ſuch evil encounters and diſaſters.

The

The Voyage of Bayonne, 1564.

NOw I ſay moreover, what I did in the Voyage with the King to *Bayonne*, where we have been two years and more, to compaſs all this Kingdom, where in divers Cities and Villages I have been called into conſultations for divers diſeaſes with the deceaſed Mounſieur *Chaplain*, chief Phyſician to the King, and Mounſieur *Chaſtellon* chief to the Queen-Mother, a man of great honour and knowledge in Phyſick and Surgery: making this Voyage, I was always inquiſitive of the Surgeons if they had marked any rare thing of remark in their practice, to the end to learn ſome new thing. Being at *Bayonne*, there happened two things of remark for the young Chirurgeons: The firſt was, that I dreſt a *Spaniſh* Gentleman, who had a grievous great Impoſtume in his Throat: he came to have been touched by the deceaſed King *Charles* for the Evil. I made inciſion in his Apoſteme, where there was found great quantity of creeping Worms as big as the point of a Spindle, having a black head; and there was great quantity of rotten fleſh. Moreover there was under his Tongue an Impoſtume called *Ranula*, which hindered him to utter forth his words, and to eat and ſwallow his meat: he prayed me with his held up hands to open it for him, if it could be done without peril of his perſon; which I immediately did, and found under my Lancet a ſolid body, which was five ſtones, like thoſe which are drawn from the bladder. The greateſt was as big as an Almond and the other like little long Beans, which were five in number; in this apoſteme was contained a ſlimy humour of a yellow colour, which was more than four ſpoonfuls; I left him in the hands of a Surgeon of the City to finiſh his cure.

Mounſieur *de Fontain* Knight of the Kings Order, had a great continual peſtilent Fever accompanied with divers Carbuncles in divers parts of his body, who was two days without ceaſing to bleed at the noſe, nor could it be ſtanched; and by that means the Fever ceaſed with a very great ſweat, and ſoon after the Carbuncles ripened and were by me dreſſed, and by the grace of God, cured.

I have publiſhed this Apology to the end that each man may know with what foot I have always marched, and I think there is not any man ſo tickliſh, which taketh not in good part what I have ſaid, ſeeing my Diſcourſe is true, and that the effect ſheweth the thing to the eye, Reaſon being my Warrant againſt all Calumnies.

The End of the Apology and Voyages.

FINIS.

ΑΓΓΕΙΟΛΟΓΙΑ:
OR,
A DESCRIPTION OF THE VESSELS In the BODY of MAN:

Of the THREE KINDS; *i. e.*

OF THE

Veins, Arteries, and Nerves:

Especially of those in the LIMBS and HABIT of the *Body*.

Whereof there are also given

ANATOMICAL FIGURES,

The largest and fairest that ever were published with any *English* Book.

IN THREE TRACTATES.

Translated out of the ANATOMY of *ADRIANUS SPIGELIUS*, by whom these Parts are more largely and accurately described than by other Authors: the more full tractation whereof, being a part of *Anatomy* so useful in order to *Chirurgical Operations*, hath been judged very worthy to be annexed unto this present WORK.

LONDON,

Printed by *M. Clark* for *John Clark*, and are to be sold at *Mercers Chappel* at the Lower End of *Cheapside*. MDCLXXVIII.

THE
PREFACE.

OF how great consequence a more perfect knowledge of ANATOMY is to the Art of PHYSICK and CHIRURGERY, hath been frequently and abundantly made out by Anatomists, Physicians, and Chirurgeons, upon occasion, in their several Writings; though the thing it self speak so plainly in its own behalf, that much need not be said in this kind. The case is plain, that with the like facility and success may a Mariner, making out some Unknown Land, steer his course through the Main Ocean, where nothing but Sea and Skie appears, without the help of his Card and Compass, as a Physician judge of the Natural Action, or Preternatural Affect of any part of the Body: or a Chirurgeon institute any Operation about the same, without the Anatomical knowledge thereof: and therefore no more shall be said to this effect.

Anatomy may be very commodiously reduced to four distinct Kinds, or distinguished according to so many Principal Parts.

1. Σπλαγχνολογία, Splanchnologie, that is, the description of the Bowels contained in the three Cavities or Bellies of the Body, the lower, middle, and supreme.

2. Ὀστεολογία, Osteologie, which is the description of all the Bones of the Body.

3. Μυολογία, Myologie, being the Anatomical History of all the Muscles.

4. Ἀγγειολογία, Angeiologie, describing all the Vessels of the Body, i. e. the Veins, Arteries, and Nerves: these last though having no sensible Cavities, being reputed Vessels in the account of Anatomists.

Now though all these parts or kinds of Anatomy are needful both to Physick and Chirurgery, yet are they not all of a like necessity to both: but the first of more absolute necessity to the Art of Physick; the other three to Chirurgery. And therefore, though all four have been treated on by the learned Author of this Volume, yet in reason it could not but be advantagious and acceptable to Chirurgeons to have some further helps in our English Tongue, for improvement in the three latter kinds before-mentioned, or in some of them at least. Now for Osteologie, the parts themselves, or the dry bones are and may be kept at hand, for frequent view and contemplation upon them; whereby their several Figures, Articulations, and all other particulars observable about them, may be rendred familiar, in order to practice about Fractures and Luxations: and without such Autopsie, much cannot be acquired by the reading of Descriptions, or sight of Delineations. Toward Myologie there hath been a peculiar Tractate of late published in English, which may be useful in that respect to those who cannot peruse Latin Authors. So that the greatest want seemed to be in that kind or part of Anatomy, which is the last in the Enumeration, i. e. Angeiologie, or the Description of the Vessels; the more exact or particular knowledge whereof, especially of those in the habit of the body,

body, will appear, upon a true accompt, more neceſſary to the exerciſe of Chirurgical Operations, at greater certainty, and with more ſecurity, than the knowledge of the Muſcles. Upon theſe conſiderations, being conſulted by the Publiſher of this Work, what Piece or Tractate in any kind, of Chirurgery or Anatomy, I thought might to good purpoſe be added thereunto; I reſolved him that I could think of nothing more advantageous in this kind, than a fuller and more Anatomical Deſcription of the Veins, Arteries, *and* Nerves, *in the Body of Man, Tranſlated out of the* Anatomy *of* Spigelius; *adding alſo the moſt uſeful* Anatomical Figures *relating to the ſaid Deſcriptions, of the ſame largeneſs as they are in the Editions of the ſaid Author in* Folio; *which were firſt taken out of* Veſalius, *and are the largeſt and faireſt that are extant: the caſe being here, as in Mathematical Inſtruments, in which, how much the largeneſs conduceth to certainty in uſe, is well known. Accordingly he hath not ſpared for care and coſt, in procuring a Scholar every way competent to Tranſlate the Deſcriptions of theſe Parts out of the forementioned Author, and an able Artificer to Cut the Figures. And as the Work is now accompliſhed, I doubt not but good improvement may be made thereof by ſuch Chirurgeons, as being not able to make uſe of the Original, ſtand in need of ſuch helps, if they will not be wanting to themſelves for induſtry in the uſe hereof.*

J. G.

TRACT.

TRACT. I.
CONCERNING THE VEINS.

CHAP. I.

Reckons up the Branches or Propagations of the Vena Portæ *or the Gate-Vein, and explains an Aphoriſm of* Hippocrates, *that makes very much to the purpoſe.*

Note that the Letters, which are incloſed thus [ ] refer to the particular Tables at the end of that Treatiſe wherein they are ſet.

LEt us come now to the Hiſtory of the Veins, in which we will begin with the *Vena Portæ* or Gate-vein, as that which ſpreads not ſo wide and far as the *Cava* or hollow one. For it is wont to be diſtributed onely through the loweſt belly, and not at all to propagate it ſelf out of it; nor does it branch through all parts of that, but ſuch onely as are appropriated to the nutritive faculty, namely the Liver, the bladder of Gall, the Stomach, the Spleen, the Sweet-bread, Kall, Guts, and Meſentery; for the Hollow-vein ſends its propagations to the reſt, as the Reins, Bladder and thoſe parts which ſerve for generation. But that the manner of this diſtribution may be more eaſily underſtood, for our better method in Teaching, likening the whole Vein to a Tree, we will divide it into four parts, one of which we will call the *Roots*, as that part which is in the Liver; another the *Trunk*, which continues it ſelf on, and is not divided; a third the *Branches*, into which the Trunk is divided; a fourth, *Twigs* or *Surcles*, ſuch ſmall Veins as the Trunk ſhoots out at its ſides; before it be divided into its branches. Which terms ought diligently to be obſerved, becauſe we have endeavoured by the propriety of theſe words to give light to this obſcure Treatiſe concerning the Veins. But that they may more eaſily be committed to memory, and all that concerns this buſineſs be written with more brevity, following ſome very learned later Authors, we will give every part its name from the place of its inſertion.

Through what parts the Gate-vein is diſperſed.

The diviſion of the Gate-vein into the Roots, Trunks, Branches and Twigs.

From the outſide then of the Liver ſome very little hairy Veins are prolonged towards its inner Region, and by little and little meet together into greater branches, ſo that at length they become five, which again gathered together like roots about the middle of the hollow ſide of the Liver, but ſomewhat hinderly near to the back, make a notable ſtock or Trunk, which at length iſſuing forth near to thoſe eminencies of the Liver, which by the Greeks are termed Πύλαι Gates, is called the Gate-vein, and now deſerves the name of a Trunk.

The Roots.

This Trunk parting now from the Liver deſcends ſomewhat obliquely towards the left ſide, under the Gut called *Duodenum*, where above the Rack-bones it gets a firm ſeat; but before it be divided into branches, two twigs ſprout from it; the firſt of which being very ſmall, ariſing out of the uppermoſt and forepart of the Trunk, as ſoon as it is come forth from the Liver, is ſcattered into the neck and body of the bladder of Gall, or into its outer coat, with a numerous ſucceſſion of very little branches, ſuch as we have ſaid above are called hairy Veins. This twig is called in Greek Κυστικὸς, in Latin you may render it *Veſicalis*, the Vein of the bladder of Gall. *Veſalius* ſays there are two branches, which run through the bladder of Gall, whence they are called by ſome *Cyſticæ gemellæ*, the twin-veins of the Gall, but this makes no great matter. The ſecond twig being greater than the former, but lower, ariſing from the ſame fore-part, and more to the right, is inſerted into *Pylorus* or the lower mouth of the ſtomach, into whoſe hinder part which looks towards the back, it ſcatters many ſmall branches, from whence it is commonly called *Gaſtricus*, the ſtomach-branch, but perhaps for memories ſake it may be better termed *Pyloricus*, or branch of the lower mouth of the ſtomach, becauſe there are others alſo which are called Stomach-branches.

The Trunk.

The Twigs that grow out before the diviſion of the Trunk.

Cyſticus.

Gaſtricus.

Theſe two twigs being thus propagated, the Trunk runs downwards, and inclining all the way ſomewhat to the left, is divided into two notable branches, a right and a left one: the left is ſomething higher than the right, but leſſer; the right lower, but greater: the *left* ſpreads it ſelf through the Stomach, the Kall, one part of the *Colon* or Colick gut, and the Spleen; the *right* through the Guts and Meſentery; that is called *Splenica* or Spleen-vein, or the linear one; this the Meſenterick.

The two branches.

Splenica.

Now the Spleen-vein, after it is thus come forth from the Trunk, is carried athwart, being underpropt by the membrane of the Kall toward the Spleen, into which before it be conſumed, it ſhoots forth certain twigs, both from its upper part, and from its lower; from its upper part one, that aſcending obliquely to the left ſide of the Stomach that looks towards the back, is divided into three propagations, of which the outermoſt on either ſide are conveyed into the Stomach, and preſently ſcatter into more twigs; but the middle one aſcending through the ſame hinder part ſpreads it ſelf through the upper region of the Stomach, and compaſſes the left orifice or mouth round about like a crown, from whence it is called Στεφανικία or *Coronaria*, the Crown-vein of the Stomach. This again ſends forth continually ſome ſmall branches upwards to the end of the Gullet, and others downwards through the Stomach. All this branch is called *Gaſtricus*, the Stomach-branch, becauſe it is the greateſt, and moſt capacious of all thoſe, which come to the Stomach. From the lower part of the Spleen-branch ariſe two twigs; one, which is ſmall, ſending forth other little ſprigs to the right ſide of the lower membrane of the Kall, and the Colick Gut annexed thereunto, is commonly called *Epiploïs Dextra*, you may Latin it *Omentalis*, the right Kall-vein. Another anſwering to that branch, which ariſes from the higher part of the Spleen-vein, and begets the Crown-vein, is inſerted in the lower membrane of the Kall, and preſently after its riſe is divided into two branches, which parting one from another a great diſtance beget many

Circles riſing from the upper part of the Splenick-branch.

Coronaria.

Circles riſing from the lower part of the Splenick-branch.

Epiploïs dextra.

other

other twigs, which are ſpent upon the lower membrane of the Kall, which like a Meſentery ties the Colick Gut to the back, as alſo upon that part of the Colick Gut, which is ſo tied. It is cal-

Epiploïs poſtica. called *Epiploïs*, or *Omentalis poſtica*, the hinder Kall-vein. After the Spleen-branch has thus ſcat-

The diviſion of the Splenick branch. tered many twigs, now drawing near to the Spleen, it is cleft into two branches, an upper and a lower one; which are broken into others in the very *Parenchyma* or fleſh of the Spleen. From the upper, ſometimes before it enters the Spleen, ſometimes when it is already entered, there ſprouts

A propagation of the upper branch. forth a double or three-fold twig, very famous among the Writers of Phyſick, which they commonly call *Vas breve*, the ſhort Veſſel, but we the Venal, to diſtinguiſh it from the Arterial Veſſel that anſwers to it: this is inſerted into the left ſide of the bottom of the Stomach, ſometimes alſo higher and about the left orifice or mouth. Which is the cauſe why ſome Phyſicians, and commonly Anatomiſts too, have fooliſhly thought that the Melancholick humour is returned from the Spleen through this Veſſel back into the Stomach, to provoke appetite. But you may

A propagation of the lower branch. often find Bodies, in which it is altogether wanting. From the lower branch, which goes to the nether part of the Spleen, one propagation ariſes, which being pretty big, and notable, is reflected toward the right hand, like the fore-going, and compaſſes the bottom of the Stomach to the left ſide, and alſo ſends many little branches to the higher membrane of the Kall on the

Gaſtro-epiplois ſiniſtra. left ſide; it is called *Gaſtro-epiplois ſiniſtra*, the left Stomach and Kall-vein.

There is alſo another notable Branch, which is found in moſt to ariſe from the lower Spleen-branch, very ſeldom from the Spleen it ſelf. This is carried downwards, and ſcattering twigs over all the left ſide of the Colick Gut, goes on further by the whole length of the ſtrait Gut, and at length determines in the membranous ſubſtance thereof, and in the fundament with many little

Hæmorrhoidalis interna. twigs. Phyſicians make mention of this very often, and call it *Hæmorrhoidalis interna*, the inner Emroid Vein, to diſtinguiſh it from the outer, which is derived from the hollow Vein. It is truly and properly called the Emroid Vein; I ſay, properly and truly, becauſe ſometimes they call by that name the Veins of the Noſtrils, Gums, and Mouth, that caſt forth bloud, and without pain. In this large ſenſe the Philoſopher took it, 3. *De Part. Animal.* where he makes Menſtruous purgations

1. alſo a ſpecies of the Emroids. But the Emroids properly ſo called by Phyſicians, are dilatations of this Vein in the fundament, cauſed as well by black and yellow choler, as alſo by a ſalt flegm, as by the melancholick humour. And theſe are of two kinds; *Cæcæ*, blind Piles which caſt out no bloud,

2. but ſwell out like the ſtone of a Grape into the fundament, or out of it: Others *Apertæ*, open, which caſt out the bloud which they contain. The learned *Hippocrates* hath left us a peculiar Book, a golden one indeed, concerning the cure of theſe. The remaining part of the Spleen-branch is ſpent upon the whole Spleen, and therein is ſcattered into divers and very ſmall propagations, entering the very fleſh of it about the hollow and middle line. And theſe are the ſprigs which grow out of the Spleen-branch.

The Meſenterick Vein, or right branch of the Gate Vein is joined to the Meſentery, as ſoon as it comes from the back, and is divided into two chief branches, which paſſing through the Meſentery betwixt its two coats, are each of them cleft into an infinit number of ſmall branches, and they again into leſs twigs, which going to the Guts make up thoſe Veins ſo famous among Phy-

The right Meſenterick branch. ſicians, that are called the Meſaraick Veins. The firſt of theſe branches is called the right Meſenterick Vein from the right ſide, wherein it is placed, and is likewiſe two-fold; whence it came to paſs that *Veſalius*, and almoſt all others who follow him, reckon three Meſenterick Veins. This branch is inſerted into the *Jejunum* or empty Gut, the *Ileum* or Circle Gut, the *Cæcum* or blind Gut, and the right ſide of the Colick Gut, where it lies next to the Reins and Liver: and although both its branches ſhoot forth many propagations from themſelves, ſo that it is very hard to expreſs any number of them, as well becauſe they vary much by reaſon of their ſubjects, as alſo becauſe they do not obſerve the very ſame order and courſe, yet it hath been obſerved, that for the moſt part there are fourteen, which afterwards are ſcattered into an infinite company of other twigs. Theſe when they are come to the Guts, onely gape with their little mouths into their Coat, and enter not the cavity it ſelf, that being compaſſed about within with a certain cruſt. But as in moſt parts of our body, the divarications or diviſions of the Veſſels are attended with certain glandules, partly that they may make the ſafer progreſs, partly leſt they ſhould ſink down, and withall the flow and ebb of the bloud ſo very neceſſary be hindered; ſo here alſo the diviſions of the Veſſels, which are ſcattered through the Meſentery, are bolſtered up with certain glandules, which with their propagations obſerve ſuch an exact propagation, that the greater glandules do ſuſtain the greater branches, and the leſs the leſſer. When theſe Glandules ſwell with a *Scirrhus*, the Veſſels being preſt cloſe together, and the diſtribution of the *Chylus* through the Veins, and conſequently of the bloud through the body being hindered, there follows a Conſumption, and pining of the whole

The left Meſenterick. body. The left Meſenterick Vein is diſtributed into the middle part of the Meſentery, and alſo that part of the Colick Gut which runs from the left region of the Stomach as far as to the ſtrait Gut. The *Hæmorrhoidalis interna*, or inner Emroid Vein, of which we ſpake a little before, ſometimes ariſes from this Vein, as *Veſalius* hath obſerved, which affording ſome ſprigs to the Colick Gut, at laſt running forward through the whole length of the ſtrait Gut, determines in the fundament. But before the Meſenterick Trunk be divided into theſe two branches, it firſt ſends forth two

Propagations that ariſe before the diviſion of the Meſenterick. propagations, one of which is called *Gaſtro-epiplois dextra*, or the right Stomach and Kall Vein, which creeps through the right bottom of the Stomach, before and behind, as alſo through the upper membrane of the Kall: the other called by others *Inteſtinalis*, or the Gut Vein, by us the *Duodena*, reaches

Gaſtro-epiplois Dextra Inteſtinalis. to the middle of the Gut *Duodenum*, and the beginning of the Empty Gut or *Jejunum*, and deſcends all along through them.

The firſt uſe of the Gate Vein. The chief uſe of the Gate Vein is to nouriſh thoſe parts which are ſeated in the loweſt belly, and need a thicker and more fæculent bloud, ſuch as are all thoſe parts which ſerve for nutrition. For their bloud ought to be thicker, that it might be hotter, when heat is always more

powerful

powerful in a thicker body: ſo then the Roots of the Gate-vein nouriſh the Liver, the Trunk nouriſhes the *Pancreas* or Sweet-bread; of the Twigs, the *Cyſticus*, or Gall-twig nouriſhes the bladder of the Gall; the Spleen-branch, all the entrails which ſerve for nutrition, except the Meſentery, and the Guts; the Twig *Pyloricus*, or of the lower mouth of the Stomach, the *Gaſtricus* or Stomach-branch, both the Stomach and Kall-veins, and the ſhort veſſel nouriſh the Stomach. For I do not think that the ſhort veſſel was made by nature for the carrying back of melancholick humors to the Stomach, but chiefly for its nouriſhments ſake; when that blood which is generated in the Spleen, is not a melancholy and excrementitious humor, but rather the beſt, although ſomewhat thicker than other blood, and that becauſe the parts that are to be nouriſhed by the Spleen branch, needed a thicker bloud, then they which are to be nouriſhed by the Meſenterick. Both the Stomach and Kall-veins nouriſh the upper membrane of the Kall; the right and the hinder *Epiploïs*, or the Kall-veins, the lower. The Spleen is nouriſhed by thoſe two branches, into which the Spleen-vein is cleft, and which enter its *parenchyma*, or fleſh through its middle line: the Meſentery, and almoſt all the Guts by the two Meſenterick branches; the Gut *Duodenum* by the propagation called *Duodena*; but the empty Gut, the *Ileum* or circle Gut, the blind Gut, and the right ſide of the Colick or *Colon* by the right Meſenterick-branch. The left ſide of the Colick and all the ſtrait-Gut by the hæmorrhoidal vein; but the middle part which lies under the Stomach, by the hinder Kall-vein. The ſecond uſe is to attract the *Chylus*, and carry it to the Liver; whoſe veins are moſt famous for the making of bloud. But the ſame veins which nouriſh the Meſentery branch, do alſo attract the *Chylus*, as we ſhall ſhew you hereafter, when we ſhall inſiſt upon the Hiſtory of it. The third uſe is to empty out the excrements from the body through the Guts. Thus we ſee that the cholerick humour is ſometimes poured forth out of the Liver through the Meſenterick-branch in the bloody flux, and cholerick looſneſs, and the melancholick dregs through the Emroid-vein. The fourth uſe is to help the concoction of the Liver. Thus we ſee that the thicker part of the *Chylus*, which is called melancholy, is attracted by the ſplenick branch, not that the ſeat of melancholy is in the Spleen, but that it may be more attenuated, and better concocted by the benefit of the Arteries, which are moſt abounding in the Spleen, and ſo not diſturb, or hinder the concoction which is famed to be in the veins of the Liver, as it uſually happens, that whenſoever the Spleen is troubled with any diſeaſe, the work of making bloud is preſently harmed.

The ſecond uſe.

The third uſe.

The fourth.

But becauſe there has been mention made here of the Emroid veins, it ſeemed that it would not be unreaſonable if I did refer to this place the explanation of a moſt excellent Aphoriſm, which is the twelfth of the ſixth Section, when it cannot be underſtood without the Hiſtory of Anatomy, and is not ſo faithfully explained by others, as was neceſſary. *Hippocrates* writes in it, αἱμορῤῥοΐδας ἰσθέντι χρονίας ἢν μή μία φυλαχθῇ κίνδυνος ὕδρωπα ἐπιγενέσθαι ἢ φθίσιν, that is, he that is cured of old Emroids, unleſs one of them be preſerved, is in danger of falling into a Dropſie, or Conſumption. In explanation hereof we will firſt doubt of the Aphoriſm, then we will diſpute of the manner whereby a Dropſie, or Conſumption follows upon the Cure of old Emroids. But we may not without cauſe doubt of the truth of it, becauſe the ſame *Hippocrates* in a Book concerning the Emroids, which I think to be very much his own, whatſoever *Mercurialis* ſay, though otherwiſe a moſt learned man, bids us to burn the Emroids, and forbids us to leave any unburnt, but to burn them all. And truly *Aetius* in his 14. Book, deſirous to reconcile theſe two places, at thoſe words ἢν μὴ μία φυλαχθῇ, that is, unleſs one be preſerved, being overcome, thinks that a manner of diet is to be underſtood, not an Emroid, as if *Hippocrates* ſhould ſay: Thou ſhalt not cure one that hath long had the Emroids, unleſs the patient will diligenly obſerve a convenient manner of diet preſcribed by thee; for otherwiſe there is danger of his falling into a Dropſie or Conſumption. But *Galen* in his Comment upon that Aphoriſm writes expreſly, that *Hippocrates* ſays, that unleſs one Emroid be preſerved, ſuch danger will enſue, and makes no mention at all of diet. And what is more, daily experience ſufficiently witneſſes, that ſuch miſchiefs do enſue, though never ſo exact a diet be kept, and the reaſon taken from the manner, wherein they happen, and which we ſhall preſently explain, does abundantly manifeſt it. Whence it is evident, that theſe two places of *Hippocrates* are left ſtill in controverſie and contradicting one another from this anſwer of *Aetius*. But the right anſwer will be, if we ſay, that *Hippocrates* when he writes in his Book of the Emroids, that for a perfect cure they muſt all be burnt, ſpeaks not of old Emroids, but of ſuch only as are lately come, or when nature has already endeavoured to expel the humour, which was otherwiſe purged out of the Emroids ſome other way, whether it be by iſſues, or by a Fiſtula, or ſome ulcer in the Leg. For ſuch may be very well cured and without danger of Conſumption, or Dropſie, the rather, if the entrails be yet whole and ſound, and eſpecially if a good rule of diet follow. Nor does the cure of all old Emroids neceſſarily bring on a Dropſie or Conſumption, but only for the moſt part they threaten a danger of theſe diſeaſes to enſue; for ſometimes the melancholick matter being hurried up into the brains, there follows madneſs, as it happened to *Alcippus*, in *Hippocrates* 4. *Epidem.* For, ſays he, this *Alcippus* having the Emroids was forbidden to be cured, for after the cure he fell mad, but an acute Feaver following it, he was recovered. For explanation of the ſecond doubt, firſt let us hear *Galen*, for he in his Commentary upon the Aphoriſm, ſays, "That the Emroids came by reaſon of fæculent and melancholick bloud, which the Liver drives "down to the mouths of certain veins, and ſo this way being ſtopt, an abundance of groſs humors "burdens the Liver, and ſtifles the natural heat, which being extinguiſht, no more bloud is ge- "nerated, but onely water, which nature afterwards driving it into the *Abdomen*, or paunch, "makes a Dropſie. But if the Liver ſend that abundance of melancholick humour to the Lungs, "ſome veſſel being broken, there follows a Conſumption. This interpretation of *Galen*, beſides that it ſeems very obſcure to us, is not altogether agreeable to truth. For firſt, it is falſe in my judgment, which *Galen* ſets down in his Comment, that it is impoſſible, that the Emroids ſhould be

The explanation of a certain Aphoriſm of *Hippocrates*.

cauſed without an abundance of fæculent and thick blood; when it may be proved both by reaſons and authority, that they come alſo from choler and phlegm. By the Authority of *Hippocrates*, who in the beginning of his Book concerning the Emroids, witneſſes that this diſeaſe is cauſed in this manner; to wit, when choler, or phlegm falling down into the veins of the Strait-Gut, heats the blood, which is in the veins. For theſe veins being heated attract the blood out of the little veins that are near, and when they are filled, the inward part of the Seat ſwells, and the heads of the veins appear out of it. But by reaſon it is proved thus; when madneſſes are cauſed by phlegm, or choler, as *Hippocrates* witneſſeth in his Book *De Morbo Sacro*, the ſame Author in the 6. Aphoriſm, 21. profeſſes that that madneſs is taken away, if there follow ſwellings of the veins, or Emroids in thoſe that are ſo mad. Now the madneſs would not be taken away, if melancholick humors did only come forth by the Emroids; for then the cauſe of the diſeaſe would not be purged out. But I my ſelf alſo have ſeen formerly in *Germany* ſome Noblemen, that were troubled with ſalt catarrhs, afterwards recovered by a great flux of the Emroids; that I am of opinion, that not only melancholy, but alſo ſalt phlegm and choler are wont to be purged out by the Emroids. Wherefore if it happen, that one, who has been long troubled with the Emroids, be cured afterwards, that choler and phlegm, either breed obſtructions in the Liver, or Spleen, or being gathered together in ſome plenty by ſtretching the veſſels contained in the *Abdomen*, or paunch, breaks through them, or by their quality corrodes and eats their way out, and makes a Dropſie in the *Abdomen*; or elſe by raiſing obſtructions in the Liver, and extinguiſhing the natural heat, generates much water, and ſerous humour in ſtead of bloud, which paſſing through the veins, make a *ſpecies* of the Dropſie called *Leucophlegmatia*; but if the humor go back to the Breaſt, or Lungs, it breaks through, or eats out their veſſels, and hence follows a ſpitting firſt of blood, then of corrupt matter, and from thence at laſt a Conſumption, as *Hippocrates* teaches in his Aphoriſm. But in this place it is firſt of all to be obſerved, that there are two ſorts of propagations of veins, which make the Emroids: for there are ſome propagations of the Gate-vein, of which we have already treated; but there are others of the Hollow-vein, which ariſe from the Iliacal branches, of which we are to ſpeak hereafter. Now if the forementioned humors, whether melancholick, or cholerick, or phlegmatick and ſalt, flow through the propagations of the Gate-vein, the internal Emroids are cauſed, which being cured, the matters flow back into the branches of the Gate-vein, that are ſcattered through the lower Belly into which the veins being loden with theſe humors unburden themſelves, and make a *ſpecies* of the Dropſie called *Aſcites*. But if they flow through the Branches of the Hollow-vein, they cauſe the external Emroids, and theſe being cured againſt the Precept of *Hippocrates*, there is danger of a Conſumption to enſue, becauſe from hence there is an eaſie paſſage of the peccant matter through the Hollow-vein to the Lungs, nigh to the Heart. And this is that which we have of a good while obſerved, that many, who have been long troubled with Fiſtula's of the Fundament; and afterwards cured, through the ignorance of Phyſicians, have fallen into a ſpitting of blood, and then into a Conſumption. Nay, we remember, that a Maid was once cured by us in *Germany*, which had a Fiſtula in the middle of her Hip, and for three years had ſought help from many in vain, but being cured ſhe fell at length after three or four months into a ſpitting of much blood. Although ſhe was ſcarce ten years old, I let her bloud preſently in the foot on that ſide on which ſhe had been troubled with the Fiſtula, and purging her body, and laying on a cautery near the place, in which the Fiſtula had been, I eaſily freed her in this manner from imminent danger of a Conſumption. This ſpitting of blood happened from no other cauſe, but that ſharp and cholerick matter, which when it could no longer find a way out by the Fiſtula, got up afterwards to the Lungs through the branches of the Hollow-vein. But *Hippocrates* ſays expreſly that there is danger of a Dropſie, or Conſumption to follow, becauſe it ſometimes falls out, that neither of theſe happen, but rather ſome other diſeaſe inſues, as it happened to *Alcippus*, who fell into a madneſs, and from that into an acute Feaver: ſometimes alſo the bloudy flux follows, and others miſchiefs. Sometimes alſo it happens, that they who are ſo cured, are preſerved ſtill in health, by abundance of urine, ſweatings, remedies, and a good rule of diet.

CHAP. II.

Treats of the ſuperiour, or aſcendent Trunk of the Vena Cava, *or Hollow vein, and the branches which it ſcatters through the Head.*

The uſe of the Hollow-vein.

WE are now to conſider the other vein, which as we told you is called *Cava*, the Hollow one [a], which ſpreads it ſelf much wider than the Gate-vein, as being diſtributed throughout the whole body. For its office is to nouriſh all thoſe parts of our body, which conduce not to the concoction of the food, and thoſe parts being ſpread far and wide, it is neceſſary, that the Hollow vein alſo be very large, and extended to a great length: and becauſe they ought to be nouriſht with a thinner, and more elaborate blood, and not ſo thick and fæculent, as that wherewith the Stomack, Spleen, and Gall are nouriſht; therefore the bloud which the Hollow-vein makes, and carries, is alſo more pure, thin and ſincere.

The method to be obſerved in the Hiſtory of this vein.

In delivering the Hiſtory of this vein, although we are not of their opinion, who derive its beginning either from the liver, or heart, yet becauſe we muſt begin our Treatiſe of it ſomewhere, we thought fit to follow the received Cuſtom of Anatomiſts, and ſo for perſpicuities ſake, we ſhall always ſpeak of it, as if it took its birth from the Liver. It may be added, that it ſpreads certain roots as it were in the Liver, juſt like the Gate-vein, in the Hiſtory of which when for that reaſon we took our riſe from thoſe roots, we may not without cauſe begin thence alſo with the Hollow one. But this vein although it runs directly through the whole

whole Trunk of the body, and make one very notable ſtock [D] that is drawn out through the middle, and loweſt belly, like one ſtrait line continued, or rather in manner of a channel, or conduit pipe, is notwithſtanding wont to be divided into two by reaſon of the Liver, and ſoone to be called the Aſcendent Trunk, the other the Deſcendent. For indeed that is not true, to which many perſwade themſelves, that the Hollow-vein in its going forth from the Liver, like the great Artery, when it comes out of the Heart, is cleft into two Trunks; but if hereafter, they be called Trunks by me, you muſt believe, that I do it only for orders ſake in teaching. The Aſcendent therefore or upper Trunk [A D] is that which ſtands about the Liver, and is terminated about the *Jugulum*, or Hollow of the Neck; but that is called the Deſcendent, one [TV] which is beneath the Liver, and reaches down as far as the Legs. For both of them are afterwrds divided into two branches, of which they of the Aſcendent [m and q] are carried upwards to the head, as the Jugular or Neck-branches; or to the Arms, as the *Brachiales* [G and I] or Arm-veins; theſe of the Deſcendent Trunk to the Legs, and are called the Crural branches [T]. We will ſpeak therefore of all theſe in order, ſo that we firſt deliver the Hiſtory of the Aſcendent Trunk, then of its branches, that grows up partly to the Head, partly to the Arms, after that we will come to the deſcendent Trunk, and its branches, that are digeſted into the Legs.

The Aſcendent Trunk.

As therefore we have ſaid, that many little Veins like roots grow out of the Hollow ſide of the Liver, which always by degrees inſerted into the greater veins, and all of them at length meeting together about the middle of it did make a Trunk; ſo in the ſame manner out of the circuit of the Convex ſide of the Liver a numerous propagation of veins iſſues forth, which afterwards meet together in one Trunk. This Trunk makes its way through the nervous part of the midriff on its right ſide, and paſſing through it goes undivided to the *Jugulum*, or Hollow of the Neck, and becauſe it climbs upwards, it is commonly called the Aſcendent Trunk by them who conceive that the Hollow-vein riſes out of the Liver. It is much leſſer than the Deſcendent, becauſe the upper parts are nouriſhed by it alone; but almoſt all the inferiour parts, that are contained in the loweſt Belly, by the Gate-vein. But although it be not parted into any branches, until it come to the *Jugulum*; yet before that it ſpreads ſome propagations at its ſides, and of thoſe, three notable ones. The firſt [ee] is that which is called *Phrenica*, or the vein of the Midriff, on either ſide one, and is diſtributed throughout the whole Midriff, which is called φρένες, with a numerous iſſue, ſending little branches to the neighbouring *Pericardium*, or purſe of the Heart, and the *mediaſtinum*, or partition of the Cheſt; which when it has now got above, and entred the Cheſt, it inclines a little to the left hand, and enters the *Pericardium*, and being hidden very cloſe over againſt the eighth Rack-bone of the Cheſt, is very ſtrongly infixt into the right ventricle [C] of the heart; that *Ariſtotle* did not without cauſe gheſs, that it ſprung from hence. But before it be ſo infixed, it ſends out another propagation [bb] which is a notable one, and extends it ſelf by the hinder part of the Heart, and the left ſide of it, towards the forepart, compaſſing the *baſis* of the Heart like a Crown, from whence it is called *Coronaria*, or the Crown-vein of the Heart. This ſcatters many branches through all the outer ſurface of the Heart, but eſpecially through the left ſide, as that which needed a more copious aliment than the right ſide, becauſe of the continual, and greater motion there. But becauſe the fleſh of the Heart is hard, and ſolid, it ought therefore to be nouriſht with a thicker blood, from whence it is, that this branch grows out of the vein, before it enters the Heart, to wit, when the blood is ſomewhat thicker, and not yet attenuated in the cavities of the Heart. Near to the original of this there is a little valve, or floud-gate, which hinders the blood from flowing back to the Hollow-vein, as it might eaſily do by reaſon of the continual motion of the Heart. When the Hollow-vein has now gotten above the Heart, it becomes leſſer, and perforates again the *Pericardium*, and forſakes the Rack-bones of the Back, and being got above the Gullet, the rough Artery, and the *Aorta*, or great Artery, (which lean ſo upon one another, that the Gullet takes hold of the bodies of the Rack-bones, the rough Artery lies upon that, and the *Aorta* again upon this) it climbs upwards through the midſt of the diviſion of the Lungs, where the right part is ſeparated from the left. But becauſe by this means it could not get to the back, and the little branches, if it ſhould have ſent forth any ſuch, had been very liable to danger of breaking, being ſo hanged up; therefore it ſends forth a third propagation [cc] as ſoon as it is got out of the *Pericardium* or purſe of the Heart. The Greeks call this vein ἄζυγος, the Latins *ſine pari*, or *carens conjuge*, without a companion, or wanting a mate, becauſe in a man there is but one, and it has no companion, or mate on the left ſide, as other veins have; though in creatures that chew the cud, it is double, and plainly to be perceived on both ſides. But it iſſues forth about the fifth Rack-bone of the Cheſt out of the hinder part of the Hollow-vein, and the right ſide, and goes downwards, not directly, but inclining a little toward the right hand, is as it were reflected baekwards to the Back-bone: but as ſoon as it reaches the eighth, or ninth rib, it is cleft above the Spine of the Back into two branches, which running downwards paſs through the diviſion of the midriff, which is betwixt its two productions, and ſo are ſpread abroad into the loweſt Belly: Of theſe the left, which is ſometimes the greater, hiding it ſelf about the tranſverſe Proceſſes of the Rack-bones, and under the left production of the midriff and the original of the firſt bending Muſcle of the thigh, is inſerted into the left Emulgent, either near to its beginning, or (as it oft happens) into the middle of it. But the right, running on likewiſe under the membranes about the tranſverſe proceſſes of the right ſide, and the right production of the *Septum* or Midriff, and the beginning of the ſame firſt bender of the thigh, which keeps the right ſide, is implanted ſometimes into the very Trunk of the Hollow-vein, ſometimes into the firſt vein of the Loins. And we are indebted for this obſervation to the learned *Faliopius*, who would have the matter that is gathered together in the Cheſt, whether it be watery, or purulent and corrupt, or ſanguinous, to be evacuated by the benefit of the left branch

Propagations of the Aſcendent Trunk.

Phrenica.

Coronaria.

Ἄζυγος.

of this vein; of which notwithſtanding we will ſay ſomething briefly in the following Book. But this vein in its journey downwards ſhoots forth twigs on both ſides, as well right, as left, of which the right are more notable, and larger, of which there are numbred almoſt always ten; which run out to as many diſtances of the lower ribs, and make the inferiour intercoſtal veins. But I ſay they are almoſt always ten, becauſe it happens very ſeldom, that all the diſtances of the ribs receive branches from this vein, the two uppermoſt, to wit, the firſt and ſecond diſtance getting their ſurcles or twigs from the fourth branch, that is preſently to be mentioned. But theſe twigs run ſtraight forwards near to the lower ſide of the ribs, where there are cavities cut out for them, as we have taught in the ſecond Book. And truly this place is diligently to be taken notice of by Students in Chirurgery, becauſe of the opening of the Cheſt in the diſeaſe called *Empyema*, that they may know that inciſion is to be made in the uppermoſt place of the rib, becauſe in the lower the veſſels would be harmed to the great indangering of life. But theſe veins do not run through the whole length of the true ribs, but are terminated together with the bony part. But the propagations of the Mammary vein nouriſh the ſix diſtances betwen the griſtles of the ſeven true ribs, as we ſhall tell you by and by. Yet in the baſtard ribs they run even beyond the Griſtles towards the *Abdomen* or Paunch, into whoſe Muſcles they inſinuate themſelves. But there are certain other little branches propagated from the ſame vein, by which nouriſhment is derived to the marrow of the Rack-bones, and the Muſcles, to wit, thoſe about which they are carried: ſome alſo are implanted into the *Mediaſtinum* near to the back. This vein *ſine pari* without a companion, being thus conſtituted, the Hollow vein aſcends to the *Jugulum*, or Hollow of the Neck [D] being ſupported by the *Mediaſtinum*, and a certain ſoft and glandulous body, which the Greeks call θυμὸς, and is placed in the higheſt part of the Cheſt, to defend the divarications of the veins there hanging up from all danger of breaking.

The diviſion of the Hollow vein into the two Subclavian branches.

And here the Hollow-vein is firſt divided into two notable branches [EE] from which all thoſe veins ariſe, that run as well to the Head, as to the Arms, or to certain Muſcles of the *Abdomen*. Of theſe one goes to the right ſide, and the other to the left, which as long as they yet are in the Cheſt, are called *Subclavii*, Subclavian branches, becauſe they go under the *Claviculæ*, or Collar-bones; but as ſoon as they have gotten out of the Cheſt, and attain to the Arm-hole, they are named *Axillares*, the Axillary-veins [F]. From both of them very many propagations iſſue forth, ſome of which ariſe from their upper part, and ſome from their lower. In our reccital of them we will obſerve this order, that they which are neareſt to the Trunk, ſhall be firſt mentioned by us; and they laſt, which are fartheſt from it.

Propagations from the lower part of the Subclavian branches.

Intercoſtalis ſuperior.

The firſt propagation then iſſues out near the very root of the divarication or diviſion of the Trunk, and is called *Intercoſtalis ſuperior*, the upper intercoſtal-vein; [e] there is on either ſide one, which being very little, and deſcending along by the roots of the ribs, as far as to the third rib, ſends two twigs [ff] overthwart, like the *vena ſine pari*, to the two diſtances of the upper ribs. But if the *vena ſine pari* ſend its propagations to all the diſtances (as it ſometimes happens) then it is wanting not without cauſe. Sometimes the ſame vein ariſes from the Trunk of the Hollow-vein, before its diviſion into the Subclavian branches.

Mammaria.

Another vein [g] ſometimes ariſes from the forepart of the Bifurcation; ſometimes from the root of the Subclavian-branch, and is double, on either ſide one: ſometimes alſo only one grows out of the middle of the Trunk, before it be divided; which at length, when it has attained unto the Breaſt-bone, is parted into a right, and a left branch. For Nature is wont to ſport, as ſometimes in its other works, ſo eſpecially in the riſe of veins, ſo that they are not ſpread in all bodies after the ſame manner. But this is called *Mammaria*, the Mammary-vein, which, whenſoever it ariſes, going toward the fore-part; ſtrives to get up to the higher part of the Breſt-bone, and deſcends by the ſide of it, and when it comes to the Breaſt-blade, about its ſides goes out of the Cheſt, and runs on directly under the right Muſcles of the *Abdomen*, even to the Navil, near to which it is joined by Anaſtomoſis, or Inoculation [10] with an Epigaſtrick-vein [9] that aſcends and meets it; by the benefit whereof ariſes that notable ſympathy betwixt the womb and Breaſts of women, of which we ſhall ſpeak more hereafter in the eighth Chapter, when we ſhall inſiſt on that Hiſtory of the Epigaſtrick-vein. But before it leave the Cheſt, in its deſcent, it diſtributes one branch apiece to the ſix diſtances betwixt the Griſtles of the ſeven upper true ribs, of either ſide, which are terminated with the Griſtles near to the end of the bony part of the ribs, in which place we told you that the branches of vein *ſine pari*, (with the extremities of which theſe are joined) were ended. From theſe veins, which are diſtributed in this manner to the diſtances of the Griſtles, ſome others very worthy of our notice do ariſe, which are diſſeminated both in the Muſcles that lie upon the Breaſt, and into the Paps. Near to theſe a third [h] ariſes, and ſometimes alſo grows out of the Trunk, which is called *Mediaſtina*, becauſe it ſpreads it ſelf into the *Mediaſtinum*, or membrane that cloſes up the cavity of the Cheſt, being extended all along by it, with the left Nerve of the Midriff. The fourth [i] commonly called *Cervicalis*, ot the Neck-vein, is a large vein on both ſides, which running obliquely, upward, and backward, to the Tranſverſe Proceſſes of the Rack-bones of the Neck, and climbing up through their holes, (from whence perhaps it might be better named *Vertebralis*) affords ſprigs to the Muſcles that lie next upon the Rack-bones. When this vein has got above the Tranſverſe Proceſs of the ſeven Rack-bones, it derives a Notable branch to the *Sinus* or *Canale*; in the Neck, through the hole that is made for the outlet of the Nerves; and then another, when it comes above the Proceſs of the ſixth ſpondyl, or Rack-bone, and again another, when it has left the fifth Spondyl until at laſt it comes to the Proceſs of the firſt Rack-bone, which notwithſtanding it does not touch, much leſs does it paſs into the Skull, (as *Veſalius* would have it) near which it goes partly to the ſame *ſinus* or *canale*, partly it is diſtributed into the hinder part of the Neck. For there are two long *ſinus* filled with blood, which are made out of the hard membrane of the Brain, one on each ſide, being

Mediaſtina.

Cervicalis.

be ing placed at the ſides of the marrow of the Neck. From theſe little branches are diſtributed, which nouriſh the marrow of the Back-bone, and the neighbouring parts; they being about the Juncture of the head with the firſt Rack-bone, and end near to the ſeventh Rack-bone of the Neck. Theſe two *ſinus*, of which one is of the right, another on the left ſide, have ſome communion betwixt themſelves by a little pipe, and that a ſhort one, which is derived overthwart from the one to the other, for the moſt part about that region of the Neck, which is betwixt the ſecond and third Rack-bones. At laſt there is a fifth vein [l] which ariſes from the hinder part, called *Muſcula inferior*, or the lower Muſcle-vein, which is diſtributed in many branches to the Muſcles in the lower part of the Neck, (and ſo extending the Head and Neck, from whence the vein might be rightlier called *Cervicalis*, or the Neck-vein) and alſo to thoſe in the higher part of the Cheſt near to the Rack-bones.

Propagations that ariſe from the upper part of the Subclavian branches.

For the upper part of the Subclavian branches, whilſt the Hollow-vein is yet in the Cheſt, three propagations iſſue forth; two of which do very well deſerve to be noted, which take their way upward, under the Muſcles that bend the Head. The former of the two looks more inward, and is called *Jugularis interna*, the inner Jugular-vein: the other inclines to the outer parts, and is commonly called *Jugularis externa*, the outer Jugular-vein. For both of them ariſe near to the *Jugulum*, or Hollow of the Neck, and aſcend by that to the Head. The inner is greater, and the outer is leſs in a man, but in brutes it is contrary. But when almoſt all Appellations are derived, and that beſt, not from the place, through which the veins paſs, but from their inſertion, perhaps they might be rightlier named *Cephalicæ* or *Capitales*, Head-veins. The inner Jugular-vein [m] takes its original near to the joint, by which the Clavicles or Patel-bones are tied to the Cheſt, and as ſoon as it ariſes, it is joined with the *arteria Carotis*, or ſleepy Artery, and a Nerve of the ſixth pair, as companions in its journey, at the ſide of the rough Artery, and climbing to the Chops, about the middle of the way is parted into two branches, of which one is called the outer, the other the inner branch. The outer is ſo called, becauſe it comes not into the inner parts of the Head, but being divided into two at the corner of the lower Jaw, diſtributes one branch to the Chops, and the other near to the Ears and Face. The inner branch, all the way is joined to the *Arteria Carotis*, or ſleepy Artery, even to the baſis of the Skull, whither when it is arrived on the backſide, it is likewiſe cleft into two branches, but of unequal bigneſs. For the firſt [n] is greater and more hinderly, being carried backward obliquely, which having propagated ſome twigs to the Muſcles under the Gullet, and in the forepart of the Rack-bones of the Neck, through the ſecond hole of the *Occipitium* or Nowl-bone enters the Skull with the leſſer branch of the *Arteria Carotis*, through which ſaid hole the ſixth pair of the Nerves deſcends: and thus this branch enters the firſt [1] and ſecond [2] *ſinus* of the thick membrane. The ſecond branch [p] being ſmaller, and more to the forepart, quite forſaking the *Arteria Carotis*, or ſleepy Artery, goes to the forepart of the Head, and after that by the way it has beſtowed a Surcle not very notable upon the Organ of hearing, it enters the Skull through the ſeventh hole of the Wedg-bone, or *Os cuneiforme*. This is diſperſed through the *baſis*, and ſides of the thick membrane, with a numerous iſſue of branches, the prints whereof are obſerved in the inner ſurface of the bones of the forepart of the Head, as we have ſaid above in the ſecond Book. We will call theſe two branches, becauſe they go to the brain, *Encephalici*, as if you ſhould ſay *Cerebrales*, of the Brain, and that ſhall be the greater *Encephalicus*, this the leſſer. The external Jugular-vein [q] aſcending under the skin, and the *Muſculus Quadratus*, or ſquare Muſcle, that draws down the Cheeks, by the ſides of the Neck, when it comes to the Ear, is cleft into two branches [r] one of which I call *Profundus*, the deep one, becauſe it enters the Muſcles, and retires into the more inward parts, the other *Cutaneus* the skin-branch. The deep or inner one [s] in its firſt divarications meets with Glandules about the Chops, and ſends forth propagations worthy of our notice to the *Larynx* or Throttle, and the Glandules that grow to it, as alſo to the Muſcles of the Chops, and of the bones called *hyoides*, among that which creeps all along under the tongue, is a notable one, and is ſcattered into many little branches, which are ſeen, if the tongue be liſt up, even before diſſection. From this deep branch three other ariſe, which enter into the inner parts of the Head and the Skull. The firſt, after it has ſpread little branches into the Chops, and Mouth, and enters the Skull, through the firſt hole of the Temple-bone. The next [c] paſſes out of the fore part of the eye through the ſecond hole of the Wedg-bone, at which the ſecond pair of Nerves get out, and runs with ſome Surcles through the thicker Membrane upwards. The third is ſcattered out of the bredth of the Noſtrils through the hole of the *Os cribroſum*, or ſive-bone into the ſame Membrane. Theſe two nouriſh this forepart, to which the third *ſinus* reaches not, but ends near to the partition of the Mamillary Proceſſes. But the outer or Skin-branch [u] creeping by the skin of the Head, and ſtayed up with the Glandules under the Ear, which they call *Parotides*, is divided into two branches; of which the Anteriour [x] is carried upward obliquely through the Cheeks to the inner corner of the Eye, diſtributing little branches by the way to the Noſe; and going on to the Eye-brow, is joined with the remainder of the branch of the other ſide, and makes the ſtrait vein, which they call *vena frontis*, the Fore-head vein, [y] and which in madneſs is opened to very great advantage. To this the *Satyriſt* alludes, when ſpeaking of a certain fooliſh fellow, he ſays, — *Mediam pertundite venam.*

Jugularis Externa. *Profundus.* *Cutanea.*

Three branches entring the skull.

The other or Poſteriour branch is carried behind, and ſends branches to the Temples [z] and skin of the Back-part [α] of the Head. A third vein which ariſes out of the upper part of the Subclavian branches, is commonly called *Muſcula ſuperior*, the upper Muſcle-vein, in relation to another of the ſame name ariſing out of the lower part. It iſſues out near to the external Jugular-vein, and is diſperſed into the Muſcles, and skin of the back-ſide of the Neck, in regard whereof we ſhall not do amiſs to call it *Cervicalis ſuperior*, or the higher Neck-vein [6]. But now let us return to the diſtribution of the Subcla-

Muſcula ſuperior.

vian vein, from which we have digreſt. This vein, as ſoon as it gets out of the cavity of the Cheſt is called *Axillaris* [F], and when it comes to the Arm-pit, is divided into two notable branches, called *Cephalica* or Head-vein [G] and *Baſilica* [I], which are afterward diſſeminated throughout the whole Arm. But before the Axillary-vein be thus divided, it ſends forth two twigs: the firſt [γ] is called *Scapularis interna* the inner Blade-vein, and is diſtributed through the Muſcles on the inſide of the Shoulder-blade: the other [δ] is named *Scapularis externa*, or the outer blade-vein, it is a pretty big one, and is implanted into the muſcles of the outer, and gibbous part of the ſame Shoulder-blade. But the vein *Baſilica* alſo, before it enters the Arm, ſhoots out two propagations; one called *Thoracica ſuperior*, or the upper Cheſt-vein [ε] becauſe it ariſes out of a higher part than the following, it is a very notable one, and runs through the inſide of the pectoral Muſcle that brings the Arm forward to the Breſt; it diſtributes branches alſo to the other Muſcles of the Breſt, as alſo to the skin of the Dugs in women. The other is called *Thoracica inferior*, the lower Cheſt-vein [ζ], a great and notable one likewiſe, which deſcending along the ſide of the ſide of the Cheſt is diſtributed eſpe- through the third broad Muſcle or *Latiſſimus* that moves the Arm backward ſcattering many little branches from it ſelf, which afterwards are joined by *Anaſtomoſis* or inoculation, with the branches of the vein *ſine pari*, that fall out of the Cheſt. And this vein ſometimes grows out of the former, or the upper Cheſt-vein. Theſe branches being thus diſtributed, the Axillary-vein reaches into the Arm.

The Diviſion of the Axillary vein into two branches.

CHAP. III.

Shews how the Axillary-vein is diſtributed through the Arm.

THE Axillary-vein [F] therefore is cleft into two branches, as ſoon as it comes near to the Arm, but thoſe branches are of different bigneſs. For the upper [G] which they call *Cephalicus*, the Head-branch, is ſmaller; but the lower vein [I] called *Baſilica*, is almoſt thrice greater, The Cephalick alſo is as it were wholly juſt under the skin, and ſinks not with above one branch into the deeper retreats of the Muſcles; wherefore it has neither Artery, nor nerves for its companions, they being addicted to the more inward rooms of the body. But the Baſilick vein partly creeps on under the skin, partly hides it ſelf under the Muſcles, and therefore it ought with good reaſon to exceed the other in bigneſs, as being deſtined for the nouriſhment of more parts. It hath both Nerves and Arteries as companions in its journey, which is the cauſe why upon the cutting of this vein the blood ſpins out with a force; but of the contrary, the Cephalica being cut, it comes forth ſoftly: which we ſee ſome Phyſicians unskilful in diſſections, ſtanding by whilſt the vein is opened, fooliſhly refer to the ſtrength, or weakneſs of the mind or body. We are now to ſpeak briefly of the manner of the diſtribution of both theſe veins through the Arm, beginning from the upper, as the leſſer branch.

The diviſion of the Axillary vein.

The *Cephalica* [G] therefore is called by *Vſalius Humeraria*, or the vein of the Arm, becauſe by the Arm it deſcends into the Hand; by others *Cubiti exterior*, the outer vein of the cubit, from its ſituation, becauſe it runs on the outſide of the Cubit, as the *Baſilica* contrariwiſe doth on the inſide. By ſome later writers it is commonly called *Cephalica*, the Head-vein, becauſe it is wont to be opened in diſeaſes of the Head, through the error of the Antients, who thought ignorantly that it ariſes from the external Jugular vein, and therefore empties the blood immediately immediately out of the Head. But it ariſes from the upper part of the Axillary vein, and climbing over the Tendon of the *Serratus minor*, or leſſer Saw-Muſcle, that bends the ſhoulder blade forward to the Breſt, it runs betwixt the Muſcle called *Deltoides*, which lifts up the Arm, and the beginning of the Pectoral Muſcle, which brings it forward to the Breaſt, where it ariſes from the Clavicle or Collar-bone, and ſo it runs down by the Arm to the outſide of the firſt Muſcle that bends to the Cubit, which they call *Biceps*, or the double-headed Muſcle; by reaſon whereof the more learned Chirurgeons have wiſely uſed to make iſſues betwixt the Muſcles *Biceps* and *Deltoides*; for iſſues ought always to be made at the ſeat of ſome notable vein, that the matter may more eaſily be voided out. But although this vein be not divided into branches, whilſt it is thus carried down by the upper part of the Arm, yet it ſcatters ſome twigs [u and e] of both ſides into the aforeſaid Muſcles, and the skin. At length when it is come to the Cubit, it runs under the fleſhy membrane, as a vein under the skin ſhould, and preſents it ſelf to the ſigt without diſſection. But about the very joint of the Cubit at the exernal protuberation of the Arm, *it* is wont to be divided [H] for the moſt part into three branches, an outer, an inner and a middle one. The two former run under the skin, the third deeper. The firſt or middle one, [i] which is often wanting, is very little, and deeper, and penetrates into into the ſubſtance of the Muſcles, eſpecially of thoſe two that bend the ſecond, and third joint of the finger, as alſo of the long *ſupinator* of the *Radius*, or wand of the Arm. The ſecond [x] and inner, and chief of the three branches is carried down obliquely under the skin, and joins with the inner branch of the *Baſilica*, three fingers below the joint of the Cubit, with which it makes up the vein that Phyſicians call *Mediana*, the middle vein [ʌ]. This running down obliquely by the middle Region of the Cubit, diſtributes many Surcles to the *Radius* or wand, and at length it ſelf is divided into two leſſer branches; of which the outer [ρ] goes to the inſide of the wriſt, toward the thumb: the other and inner [o] runs to the fore, and middle fingers. The outer of theſe is called by ſome *Cephalica manus*, and is opened to very good purpoſe in the diſeaſes of the Head or Teeth. Now the third branch [ ] or outer Cephalick-vein climbs up to the Muſcle called the long *ſupinator* Cubit, and in that ſame place is joined with a little branch [τ] of the Baſilick-vein; being united thereto it goes on to the outſide of the wriſt; and diſtributes veins to that part of the Hand, which of the *Radius*, or wand, diſperſing divers little veins into the skin, and ſo is carried obliquely [ ] through the *Radius*, or wand, and having attained to the middle of its length enters the outſide of the lies before the little, and Ring-fingers, as alſo to the fingers themſelves. This vein, eſpecially that which

Three branches of the Cephalick-vein.

Salvatella.

which reſpects the little finger, is commonly called *Salvatella*, and the Secti on of it is much commended by Practitioners in Phyſick in melancholy diſeaſes. Which being ſometime s called in queſtion, and I having obſerved that experience does favour thoſe Practitioners, endeavoured to find out the cauſe, and found that there are many inoculations here of this vein with the Arteries, as the inoculations are uſually more frequent about the extreme parts, as being more removed from the fountain of heat, and therefore wanting a hotter and more ſpirited blood. This vein therefore being cut, becauſe the inoculations are ſo near, it cannot be but that the blood of the Arteries ſhould be alſo let out, which cannot be ſo well done by opening the veins of the Cubit, becauſe the *Anaſtomoſes* or Inoculations are ſomewhat more diſtant from the place, in which the vein is opened. And hence it is, that the blood which is emptied out of the Hand, is much fairer and redder than that out of the Arm, becauſe the Arterious blood there always runs out together with that of the veins. But there being ſix times more Arteries then there are veins in the Spleen, it is neceſſary, that its diſeaſes be much helped, when the peccant blood is drawn out of thoſe veſſels wherein it was.

The baſilick vein.

The other branch of the Axillary-vein, that is the inner, and greater, is the *Baſilica* [I] which according to its ſituation in different arms hath found different names among writers practiſed in Phyſick. For in the right arm it is called *Hepatica* or the liver-vein; but in the left *Splenica*, or the ſpleen-vein. They chooſe that to be opened in diſeaſes of the liver, this in diſeaſes of the ſpleen. But it iſſues forth under the armpit, and diſperſing many propagations of the Glandules, that are frequent thereabout, it is carried down by the upper part of the Arm to the ſide of the double headed Muſcle, or *Biceps*, between the Muſcles that bend and ſtretch out the Cubit, and not far from its egreſs out of the Cheſt, is divided [K] into two notable branches, of which one is called *Profundus* or deep, the other *Subcutaneus*, or branch under the skin, from their ſite and progreſs. The deep one or *Profundus* [L], which for the moſt part is the thicker, all the way it goes, penetrates into the more inward parts of the Arm; having the Axillary Artery, that runs into the Arm every where for its companion, as alſo the fourth branch of the third Nerve of the Arm. But it is carried betwixt the two Muſcles, which bend the Cubit, and having paſt its joint, is cleft [M] into two branches; of which the outer [N] near to the *radius* or wand, (from whence it might be called *Radicus*) goes down to the Hand, and ſcatters little branches toward the Thumb or Fore-finger, as alſo the middle one; but the inner branch [O] paſſing near to the bone of the Cubit, (from whence it deſerves the name of *Cubitens*) diſtributes ſmall branches to the middle, and little fingers; but as the outer ſends its propagations to the Muſcles on the outſide of the Hand; ſo the inner to thoſe on the inſide. The other is the branch *Subcutaneus*, or under the skin [P] which is carried down by the inſide of the Arm, ſcattering divers iittle branches to the skin, and parts adjacent, but when it is come to the inner protuberation of the Arm, it is divided [Q] into an outer, and inner branch, like as the Cephalick is. The inner [R] is carried down obliquely; beneath the bow of the Arm, and being united with the inner branch [ϰ] of the Cephalick, makes the vein called *Mediana*, [λ] of which we ſpake before. But the outer [S] near to the inner protuberation of the Arm being divided into two branches, is carried by the greater along the Region of the *ulna* or ell downward to the wriſt, and ſcatters it ſelf into the little Finger, but by the other it is derived to the inſide of the Hand.

The branches of the baſilick vein.

Profundus.

Subcutaneus.

Its diviſion into an outer and an inner branch.

But in this place it is worth our pains to advertiſe with other the moſt learned Anatomiſts; that it ought not to be believed, that the ſame order and courſe of veins i s to be found in all men; when the diſſection of the bodies does demonſtrate, that ſcarce two in a thouſand do accurately obſerve the ſame diſtribution of the veins. Wherefore we ought not to be ſo ſcrupulous in chooſing out places for the opening of the veins, as ſome that are unexperienced, are wont; but to chooſe that vein eſpecially, which may be moſt ſafely opened becauſe it is beſt ſeen. For ſometimes the Cephalick or Head-vein is ſo ſmall, that it can hardly be diſcerned; and ſometimes on the contrary the Baſilick is ſo. Wherefore he ſhall do beſt, who will rather follow wiſe counſel, than the ſcrupulous opinion of unskilful men.

CHAP. IV.

Explains the lower, or deſcendent Trunk of the Hollow-vein.

The inferiour Trunk of the Hollow vein.

WE have done with the upper Trunk, and branches of the Hollow-vein; it remains now that we treat alſo of the lower. Nevertheleſs (as we have above alſo admoniſht) they are not indeed two Trunks, as *Galen* would have them, but one only, which reaches in one continued line from its diviſion about the fifth Back-bone of the Loins [V] as far as to the *Jugulum*, or hollow of the Neck [D]: but, for methods ſake in teaching, we thus divide it by reaſon of the Liver, which ſtanding as it were in the middle of it, ſeems to part it into an upper and a lower Trunk. As therefore that is the upper one [AD] which runs up from the Liver to the Hollow of the Neck; ſo that is the lower [TV] which beginning at the ſame Liver, is terminated at the *Os ſacrum*, or Holy-bone. And as the upper did run on undivided through the Cheſt, ſcattering only ſome propagations at its ſides; ſo the lower alſo ſlides down, intire through the whole *Abdomen*, or paunch, only ſome twigs ſprouting from it. But when it has attained to the fifth Back-bone of the Loins, it is cleft into thoſe two notable branches called *Iliaci* [XX] as the upper is into the Subclavian, which Iliacal branches afterward reaching into the Legs make the Crural-veins; as the Subclavian carried into the Arms make the *Brachiales*, or Arm-veins. Let us ſpeak therefore in this Chapter of the Trunk, and its propagations, as long as it yet is in the lower belly. Then let us come to the crural branches.

Four propagations ariſing from the Trunk before its diviſion.

For the deſcendent Trunk then [TV] before it part into the branches, ariſe four veins. For as ſoon as it is come forth from the hinder part of the Liver, it declines to the right ſide of the Back, and

Adipoſa.

and ſends forth a propagation from its own left ſide which they call *Adipoſa ſiniſtra*, the left fatty vein [on the left ſide] becauſe it paſſes to the fat and outer membrane of the Kidneys, which ariſes from the *Peritoneum* or Rim of the Belly, as alſo to the Glandule that grows above the Kidneys. There is another [♃ on the right ſide] anſwering to this on the left ſide, but which does very ſeldom grow out of the Trunk, but rather from the upper ſide of the middle part of the Emulgent vein; and becauſe it is diſtributed in the ſame manner as the left is, it is called *Adipoſa dextra*, the right Fatty vein. Yet ſometimes you may ſee the contrary alſo to happen, and this right vein to come forth of the Trunk, and the left out of the Emulgent. For there are divers ſportings of nature to be ſeen in the veins; and you cannot eaſily meet with a dead body in which you may not find ſomething new, and differing from others. After this the Hollow-vein paſſing on, when it comes beyond the middle of the back, about the firſt Rack-bone of the Loins, it brings forth a ſecond pair of veins, [♀] very notable, which haſtens directly to the Kidneys, upon whoſe ſubſtance it is wholly ſpent. And hence it is called *Renale*, the pair of Kidney-veins from its inſertion; but from its uſe *Emulgentis.* *Emulgens*, becauſe the Kidneys ſeem by this pair to milk out the whey or ſerous moiſture in the blood, and to draw it to themſelves. It is therefore very thick, but yet ſhort, and not of equal length, nor riſing directly oppoſite each to his fellow. It is ſhort, becauſe it did not need length, which for the moſt part is given by nature to veſſels for ſome previous preparation. It is unequal, becauſe it was fitting the left ſhould be longer than the right, by reaſon that it was neceſſary to bring the ſpermatical vein out of it. But the beginning of both anſwers not directly one to another, leſt one ſhould be hindered by the action of the other. And the left is higher than the right, becauſe the left Kidney is alſo ſeated higher than the right. But the Emulgent branches, as ſoon as they ariſe out of the Trunk, do not preſently go to the cavity of the Kidneys, but are firſt divided into two greater branches, and ſo accompanied with Arteries, enter the concavous ſide of the Kidneys, and afterward being broken into leſſer branches are ſcattered quite through the whole ſubſtance of the Kidneys, and at laſt determine with their ſmall hairy ends in certain fleſhy proceſſes, which they call *Mammillares*. Theſe veins do ſerve not only for the bringing of nouriſhment to the Kidneys, but alſo for the carrying down of the ſerous moiſture to thoſe fleſhy Proceſſes called *Mammillares*, through which it is ſtrained into the Pipes of the Ureters, and then gathered together into that cavity of theirs called the *Pelvis*, and ſo drops down by little into the bladder, as we ſhall ſhew, when we open the hiſtory of the Kidneys. And here the place is to be noted, in which the

The place in which the ſtones of the Kidneys are bred.

ſtones of the Kidneys are wont to be generated, which is not in the Emulgent veſſels, I mean veins, or Artery; but rather in the very cavity of the Kidneys, or in the *Pelvis* and pipes of the Ureters. For in theſe if a viſcous matter be at any time received, either it is hardened there by reaſon of a notable heat, or elſe through cold is congealed into gravel or ſtone. For this matter is not only a crude and uncocted kind of blood, which like a mucous matter ſometimes is wont to abound in the maſs of bloud, but oftentimes alſo that excrementitious phlegm which falls down from the head, through the veins and Arteries, both into the Hollow-vein and the great Artery, and ſometimes into the Stomach and Guts. Of which this ſeems to be a manifeſt ſign, that they who are ſubject to diſeaſes of the Stome, are very often troubled with reums and pains of the Colick; of which whilſt ſome perſwade themſelves that it is cauſed by wind, daily experience hath taught me, that it comes from phlegm; becauſe I have obſerved, that they who are troubled with the ſtone in the Kidneys, had their *Colon* or Colick-gut always ſtuft with plenty of this phlegm, and that this being taken away, the Stone has been no longer bred. And therefore oft times I give ſcouring Clyſters, and ſuch as gently purge phlegm, not only to ſuch as have the Stone already, but alſo to ſuch as are threatned with the breeding of it, with a great deal of benefit to the Patients. but all thoſe things are perpetually to be avoided, which drive out the ſtones, as well becauſe moſt of that nature are hot, as alſo becauſe they are able to drive down the crude matter plentifully to the Kidneys. We thought fit therefore to inſiſt upon this, that we may accommodate the ſtudy of Anatomy to the very practice of Phyſick; eſpecially ſeeing that the place wherein the ſtone is bred, is not commonly known, becauſe the moſt famed *Fernelius*, whom the greateſt number of Phyſicians does for the moſt part follow, *Lib. 6. Pathолog. c.* 12, thinks that ſmall gravel is bred in the proper ſubſtance of the Kidneys, and waſhed from thence by the flowing of the Urine and carried into the cavity, and ſo the Urine full of gravel ſlides down through the Ureters into the Bladder. But if

Why the left Kidney is more ſubject to the ſtone, than the right.

any one enquire alſo the cauſe, why the left Kidney is more ſubject to the Stone than the right; we muſt conclude that this happens, becauſe the Colick-gut lies more upon the left Kidney, in whoſe cells this phlegm, of which we ſpake, abounding, either it ſweats through the pores, and is ſuckt into the Kidneys, or elſe by reaſon of its nearneſs, the Kidneys are exceedingly cooled; experience having often taught us, that this kind of phlegmatick matter is indeed actually exceeding cold in the as they have ſufficiently perceived, who have voided it in great plenty by ſtool. After this there

Spermatica.

follows a third part [♈ and ♄] called *ſpermaticæ*, or *ſeminales*, the ſpermatical, or ſeed veins, becauſe they carry down matter for making of the ſeed. Theſe differ in their original. For the left [♄] ariſes from the inſide, and middle part of the Emulgent, and communicating ſome ſurcles to that part of the *Peritoneum*, or rim of the belly, which covers the Muſcles that lie in the Loins, it goes faſt by the ſaid *Peritoneum*, and deſcends obliquely; but when it has attained to the *Os pubis*, or the Share-bone, riding over it, it paſſes through the *Peritoneum*, and holes of the oblique and tranſverſe Muſcles of the *Abdomen*, with whoſe proceſſes being ſuſtained it is contorted into certain varicous circlings which are joined with the ſpermatical Artery by *Anaſtomoſes* or Inoculations, and at length it ends in the Teſticle of its own ſide. But the right ſpermatical vein [♈] ariſes not out of the Emulgent, but the Trunk it ſelf, and the forepart of it, a little beneath the Emulgent-vein, and afterwards obſerves a like courſe with the former. And thus they are in males, though we may obſerve nature oftentimes varying in them: but in Women, although they ariſe in the ſame manner, and obſerve the ſame courſe with thoſe in Men, as far as the Holy-bone; yet they fall not out of the *Peritoneum*,

nor

nor reach into the ſhare-bones, but before they come to the Teſticles, are cleft into two unequal branches; the leſſer of which is ſcattered into the ſides of the womb, toward the bottom of it; the greater being joined to the ſpermatical Artery, and inoculated with it, enters into the Teſticle on its own ſide. Laſt of all the fourth pair is called [X] *Lumbares*, the Loin veins [4 4 4] two, or three which the Hollow-vein ſends forth from its back-ſide, which looks towards the bodies of the Rack-bones of the Loins; and therefore they are not to be ſeen, unleſs the Trunk of the Hollow-vein be lifted up. Theſe veins go in through the holes of the Rack-bones, through which the Nerves go out, and ſo carry nouriſhment to the ſpinal Marrow. From them two other veins, tyed on both ſides to the ſide of the Marrow, aſcend toward the brain, with which afterward two veins deſcending from the internal Jugular, are joined by an *Anaſtomoſis* or Inoculation. *Lumbares.*

Theſe propagations being thus ſent out, when the Hollow-vein has almoſt attained to the *Sacrum*, or Holy-bone, about the fifth Rack-bone of the Loins, it inclines under the great Artery, and is cut into two notable branches called *Iliaci*, [XX] which having gone a little way are again cleft into two others [Y and Z] of unequal bigneſs, of which one is called the inner, the other the outer. The inner is leſs, the outer larger and greater. But before they be ſo divided, they ſcatter two other propagations, the firſt of which [5] is commonly called *Muſcula ſuperior*, the upper Muſcle-vein, which is diſſeminated overthwart, through the Muſcles of the Loins, and *Abdomen* or paunch, from whence I would call it *Muſcula lumbalis*, the Muſcle-vein of the Loins: the other [6] is named *Sacra*, or the Holy-vein, becauſe it reaches ſome little twigs to the upper holes of the Holy-bone, for the nouriſhing of the ſaid bone and the ſpinal Marrow. The diviſion of the Trunk into the two Iliacal branches. *Muſcula ſuperior.* *Sacra.*

But from both the Iliacal branches many veins iſſue, before they go out of the *Peritoneum* or Rim of the Belly toward the Legs; and from the inner branch two. The firſt [7] ariſes from the out-ſide called *Muſcula media*, the middle Muſcle-vein; becauſe it is ſcattered into all the Muſcles of the Buttocks, and into their skin: For it carries aliment to all thoſe Muſcles, which are of the out-ſide, or Back of the bone *Ilium*, Hanch-bone, as alſo to the very joint of the Hip, and that for this cauſe it ought to be eſpecially taken notice of by them who would ſomewhat curiouſly conſider the cauſe of the ach in the Hip, or the *Sciatica*. I ſhould think that this vein may not be amiſs called *Clunæa* from its inſertion, becauſe it is implanted into the Muſcles called *Clunæi*, or Muſcles of the Buttocks. The other [8] grows out of the inſide, and is a notable vein, called *Hypogaſtrica*, or the vein of the water-courſe, from its diſtribution into almoſt all the parts of the *Hypogaſtrium*, or water-courſe. From this iſſues a branch named *Hæmorrhoidalis externa*, the outer Emroid-vein, becauſe if at any time it ſwells with a more fæculent bloud, or hot, or ſalt, it makes the outward Emroids of the Fundament. This affords twigs to the holes of the *Os ſacrum*, or Holy-bone, but beſtows greater branches upon the Muſcles of the *Rectum inteſtinum*, or the ſtrait Gut, as far as to the outer skin of the Fundament. There is alſo another branch ariſing from the ſame Hypogaſtrick-vein, which we call *Cyſticus*, the Bladder-branch, and is worthy of obſervation both in men and women; in men, becauſe it is ſpent upon the Bladder; but in women, becauſe in them being ſuſtained with a fat membrane, it goes with ſome twigs to the Bladder; but with more to the bottom of the Womb; and with more manifeſt ones to the Neck of it, by which veins alone ſome think that the monthly courſes flow in Virgins, and ſome alſo think the ſame in Women. But the monthly courſes do not only flow out by theſe branches, but by thoſe alſo which we told you were ſent from the ſpermatical branch, and which go to the bottom of the womb, not to the Neck. For the menſtruous blood is uſually purged out, whether in Virgins or women, every month; not only through the Neck, but eſpecially through thoſe paſſages of the Womb, called *Cotyledons*. Which we have ſhewn here at *Padua*, publickly in the Theater, the firſt year of our being Profeſſor, in the carkaſs of a certain Woman having her monthly courſes. For we ſaw that the Hypogaſtrick branches, and the ſpermatick veſſels with the Teſticles were filled with bloud, and that the Womb it ſelf did pour out a thicker blood, the little mouths of the veins in the inner part of the Womb lying open, and manifeſtly gaping. Yet I ſaw twice in others, that the menſtruous blood came out of the veins of the Neck only, not alſo out of the womb, and in another on the contrary that it flowed out of the Womb only. But the ordinary way is for women to be purged at them both, and not at one only, except when beſides the intent of nature obſtructions do ſeem to hinder their flowing. Propagations of the inner Iliacal branch. *Clunæi.* *Hypogaſtrica.* *Hæmorrhoidalis externa.* *Cyſticus.*

But we have obſerved, and ſeen divers times, whileſt we were about the cure of Ulcers in the privy members, and the neck of the Womb, that at what time the monthly courſes do flow, the mouth of the Womb gapes. I ſaw alſo then, that thoſe parts were dilated with a certain ſtinking moiſture, and that the neck of the Womb appeared much larger than it was wont to be at other times. And therefore no man need to wonder at that, which hath been obſerved by ſome Writers of our age, that in the time of their courſes theſe parts have been ſo widened in ſome, that being new married, although they were true Virgins, they have for this reaſon been accuſed, and thought to have been defloured. Wherefore if it happen, that any who are new married, doubt of their Wives virginity, becauſe they find the privy paſſage very wide, it will behove them to conſider, whether their flowers were not at that time upon them. Now at length the remainder of the inner Iliacal Trunk makes to the Share-bone, and taking to it a propagation of the outer Iliacal, together with which it makes one vein, and ſo paſſing through the *Peritoneum*, and hole of the Share-bone, it ſpreads it ſelf into the leg, and is extended almoſt beyond the middle of the Thigh on the inſide.

From the outer branch in like manner ſome veins iſſue: and firſt of all, that which is called *Epigaſtrica*, or vein of the lower Belly [9] which ariſes from the higher part of the branch, and is ſo named, becauſe it goes to the Muſcles of the *Epigaſtrium*, to wit, the rich Muſcles of the *Abdomen*. For paſſing with its chief branch out of the *Peritoneum* or Rim of the Belly, it climbs ſtrait up on both ſides under the right Muſcle, till it come near to the Navel, where it is joined by *Anaſtomoſis* with the deſcending Mammary-veins. But this *Anaſtomoſis* or inoculation is ſeldom found in men, but Propagations of the outer Iliacal branch. *Epigaſtrica.*

but in women it is very conſpicuous, from whence alſo *Galen Lib. de Diſſect. Ven. & Arter. Cap.* 8. witneſſeth, that great ſympathy betwixt the womb and the Breſts or Dugs is cauſed by theſe two veſſels. But the moſt learned *Hippocrates* has explained this ſympathy in many Aphoriſms of the fifth Section. For in the fiftieth Aphoriſm he ſays, If you would ſtop the courſes in a woman, apply a very great Cupping-glaſs to her Breaſts. And in the thirty ſeventh; If the Breſts of a great bellied woman, do of a ſuddain become ſmall, the child proves Abortive. And in the thirty eighth; if one of the breaſts of a great bellied woman become ſmall, one of the Twins, that ſhe goes with, proves Abortive; and that a Male, if the right Breaſt be ſmall; a Female, if the left; ſo the womb being diſeaſed, the Nipples become pale; and upon a Dropſie in the Womb they ſwell up. But there is a ſympathy alſo not only by reaſon of the veins, but alſo of the Nerves, that come from the ſixth conjugation. Whence we ſee, that if the Breſts of a Woman, or Virgin be handled, they are provoked to luſt; ſo that for this reaſon alſo thoſe Women, that have great Breaſts may be accounted more luſtful, as *Afra* is in *Martial.* But it is convenient to note concerning the original of this Vein, that very often it ariſes out of the Crural branch, which we ſhall by and by deſcribe,

Pudenda. but oftner out of the Iliacal. Another vein is the *Pudenda* [11] which ariſes from the inſide of the outer Iliacal branch, after it is come out of the *Peritoneum*, or Rim of the Belly, and it is called *Pudenda*, becauſe it is ſpent upon the privities of both Sexes. For in men it is diſtributed into the *Scrotum* or Cod, and into the skin of the Yard; but in women it is propagated to the Lips and skin of the privy paſſage, to the *Nympha* or wings, and other parts of it; but in both men and women to the Glandules, that lie about the leskes, whence ariſes that conflux of matter into theſe

Muſcula inferior. Glandules, in a peſtilent or venereous *Bubo.* Laſtly, the *Muſcula inferior*, or lower Muſcle-vein [12] is that which goes to the joint of the Hip, and is diſſeminated into the skin and muſcles thereabout, by reaſon whereof in my judgment by a ſtricter Appellation it might be better called *Coxendica*, or *Coxalis*, the Hip-vein.

CHAP. V.

Reckons up the propagations, and branches of the outer Iliacal branch diſſeminated through the Crus, *or great foot, that reaches from the lower part of the Buttocks to the end of the Toes.*

THe outer branch then of the Iliacal veins [Z] when it hath ſent forth the ſaid propagations, falls out of the Rim of the Belly, and is carried to the *Inguina* or leskes through the upper and inner region of the Hip-bone, through which the firſt and ſecond bending Muſcles of the Thigh do deſcend, and makes the Crural-vein [L]. The Hiſtory whereof that we may

The diviſion. of the Crural vein into a Trunk and branches. deliver in an eaſie method, we will divide it into Trunk, and Branches. But before the Trunk be cleft into its branches, it ſhoots out four propagations; the firſt of which is that they call *Saphena*, [13] and vein of the inner Ankle, becauſe it runs near thereunto; it is alſo commonly called by Phyſicians *vena tali*, but improperly, as we have ſaid above in our firſt Book. But it ariſes

Four propagations of the Trunk before its diviſion. from the inner ſide of the Trunk, preſently after its departure out of the *Peritoneum*, or Rim of the Belly, and having no Artery for its companion, runs ſtrait downwards under the skin, through the inſides of the Thigh and Leg; and when it is now come to the inner Ankle, it ſpreads it ſelf

Saphena. into the upper part of the Foot, and ſcatters a branch overthwart, from which afterward many

Four propagations of the vein *Saphena.* others ariſe, that are diſtributed in their order to every one of the Toes. This vein ſcatters other propagations by the way, but which are ſeldom found anſwerable one to another, either in number, or bigneſs, as we have already more than once intimated, that nature is found to ſport in the veins, but eſpecially in thoſe of the joints. the firſt [17] of theſe propagations, not far from the original of the vein it ſelf, is dealt into the upper skin of the inner Region of the Thigh, in two branches; of which the outer, which is the thicker, creeps through the fore, and outſide of the Thigh, under the skin; but the inner goes more inwardly, and ſpreads it ſelf into the rim of the Belly. The ſecond [18] is propagated, when the vein has now attained to the middle of the Thigh. The third propagation [19] ariſes about the knee, and brings forth two off-ſprings, one which is diſſeminated into the skin of the forepart of the Knee, by the *Patella* or Whirl-bone, but the other into the skin of the Back-ſide, where the bending of Ham is, about which it is rowled orbicularly. The fourth [20] is carried to the middle of the *Tibia* or Leg, with ſurcles forward, and backward, over againſt the *Saphena*, another vein [14] is brought forth from the outſide of the Trunk, but ſhorter than the vein *Saphena* is, and reaches outward, and overthwart into the skin, that covers the forepart of the Hip-bone, as alſo into the Muſcles of the ſame place which the

Iſchia. later Anatomiſts call *Iſchia.* Theſe propagations being brought forth, the Trunk afterward is drencht into the Muſcles that compaſs the bone of the Thigh, and ſets out a third propagation [15]

Muſcula. which they call *Muſcula* the Muſcle-vein; and there uſe to be two of them. For the outer, which is the leſs, ſends ſhoots to the ſecond, and fourth, extending Muſcles of the *Tibia* or Leg, together with the skin; the inner, and greater, affords twigs to the third extender of the Leg, and to almoſt all the Muſcles about the Thigh. After this the Trunk turning to the Backſide, and deſcending by degrees, ſcatters ſome other twigs into the membranes of the Muſcles, and by and by

Poplitæa. ſends out a fourth vein, which runs into the backſide of the Thigh, and is called *Poplitea*, the Ham-vein [16] much ſpoken of by writers of Phyſick, but eſpecially by *Hippocrates* the chief of them, who *6. Epidem.* 1. 5. commends much the opening of it in diſeaſes of the Kidneys. But it is oftentimes ſeated too deep to be cut without very great difficulty. I have learnt by frequent experience, that iſſues made in the *Sura* or calf of the Leg, to which this vein ſpreads it ſelf, have done a great deal of good in many diſeaſes. This vein, when it is propagated, ſometimes receives the addition of a Sprig from the inner branch of the Muſcle-vein; oftentimes alſo two propagations iſſue from the Trunk, one higher, and another lower, which afterward are united in their journey.

But

But preſently after it's riſen it ſcatters ſome branches into the skin of the Thigh, about the higher and hinder part of it; then it runs down directly through the middle of the Ham, or bending of the Leg, into the Calf, to which it diſtributes many Surcles, that run on with an uncertain courſe, ſome directly, ſome overthwart, ſome obliquely. Theſe little branches being thus diſſeminated, the vein paſſes on as far as to the *Talus*, or Cockall-bone, and there at length determines.

And this is the progreſs of the Crural-Trunk, and theſe the propagations which it ſcatters, before it be divided. For lying upon the bone of the Thigh, it ſo deſcends, and runs ſide-long near to it, that when it has attained to the Knee, it is carried betwixt the two loweſt, and hindmoſt head of the Thigh, in which place [Δ] it is cleft aſunder into two branches, an outer, and an inner one. But they are of unequal bigneſs, the outer being the ſmaller, and the inner the greater, but both of them [ΘΛ] are ſcattered through the Leg, and loweſt part of the Foot. The inner [Θ] in its deſcent ſends ſome propagations of the Muſcles that are placed on the backſide of the Leg, and eſpecially thoſe which make the Calf, but moſt of all to the inner part [21] of the *Gaſterocnemius externus*, or outward Calf-muſcle, and ſo afterward continuing its courſe downward, when it is come to the lower *Appendix* of the *Tibia* or Leg, and has beſtowed ſome ſhoots upon the skin, it is reflected under the inner Ancle [22] and runs out as far as to the great Toe. The outer [Λ] is preſently cleft into two leſſer branches, that are likewiſe unequal, of which the inner [Ξ] that is the greater, and lies deep, is wholly ſpent upon the Muſcles of the Calf, running all along directly betwixt the two heads of the *Gaſterocnemius externus*, or firſt moving Muſcle of the Foot, as alſo betwixt the *Gaſterocnemius internus*, or inward Calf-Muſcle, and the *Tibiæus anticus* or forward Leg-Muſcle, and at laſt betwixt the Muſcles that bend the Toes, diſtributing ſome ſurcles every where by the way to the Muſcles, through which it paſſes. When it comes to the mid-length of the Leg, it is again ſubdivided into an inner, and an outer branch. The inner of theſe diſtributes a twig near to the joint of the *Tibia* or greater Leg-bone, and the bone called the Cockall, deſcends with the Tendons of the Muſcles, and is divided into the great, the fore, and the middle Toes. The outer paſſes on near to the *Fibula*, or leſſer bone of the Leg, and when it comes to the Ligament which ties together the greater, and leſſer bones of the Leg, it ſhoots forth a branch, which perforating the Ligaments runs into the Foot, and is ſcattered into the Muſcles which bend the Toes of the Foot outward.

The diviſion of the Trunk into two branches.

But the outer and leſs branch [Π] of the Crural-vein goes from that diviſion of the outer branch, which is made near the Ham, to the upper *Appendix* of the *Fibula*, as alſo to the outer and hinder part of the *Tibia*, where ſcattering many little branches, it goes to the outer Ankle, and at laſt ends in the Foot.

And this is the univerſal Hiſtory of the Hollow and Gate-veins, where we have perfected the whole courſe of their diſtributions. It ſeems yet to remain, that we ſpeak of the Umbilical, and Arterious veins. But becauſe the Umbilical vein is nothing elſe but a more notable propagation iſſuing out of the Gate-vein; and in a man grown performs the office of a Ligament, rather than a vein, becauſe it keeps the Liver in its place; as the ſtories of them do witneſs, who upon the cutting off, or wounding of the Navil, have ſuddenly died, their reſpiration being hindered by the weight of the Liver falling out of its place, and pulling down the *Diaphragma* or Midriff with it; we thought it not worth our pains to make any more mention of it in this place. But if any one will obſtinately contend that it is a peculiar vein, with arguments fetcht out of his own Brain, we know no better counſel that we can give him, than to conſult better with his own ſenſe, or if he will contend further, to purge his head with Hellebore, that that dimneſs of the eye-ſight may be a little taken away. But we ſhall with more convenience make mention of the *Vena Arterioſa*, or Arterial-vein, in the following Book, when we ſhall explain the hiſtory of the *Arteria venoſa*, or venal Artery, becauſe they are very like one another, and therefore the ſame pains may ſerve them both.

AN

An Explanation of the Table of the VEINS.

This Table delineates the Hollow-vein, entire, and free from all parts. Wherein we have marked the Trunks and larger branches, with pretty great letters; but the propagations with little ones; and when they are at an end, with figures.

AD THE Aſcendent Trunk *of the Hollow-vein, the beginning whereof is about* A, *which notes the place, wherein the Liver ſhould ſtand in the proportion of this figure, the end about* D. *For it paſſes on undivided from the convex part of the Liver, about which it ſcatters little branches,*

aaa a a a *as far as to the Hollow of the Neck; but it ſcatters ſome propagations, three in number.* The

æ æ firſt *of theſe,* æ æ, *is called* vena Phrenica *the vein of the Midriff, which is diſtributed on both ſides into the Midriff and* Pericardium, *or Purſe of the Heart growing thereto, as alſo into the* Mediaſtinum *or partition of the Cheſt.*

b b Another *is* Vena Coronaria *the Crown-vein,* bb, *which embraces the baſis of the heart in manner of a Crown, diſperſing many Surcles to the point of it.* The third *is the vein* Azygos, *or without a mate,*

c c cc, *which iſſuing out from the right ſide of the Hollow-vein, about the heart, about the fifth Rack-bone of the Cheſt, goes down near to the right ſide of the Rack-bones, as far as to the ſecond almoſt of the Loins.*

ddd *There are ten propagations* d d d *from this, ſent to as many bony diſtances of the ribs which are called* Intercoſtales inferiores, *the lower veins betwixt the ribs.*

B *Shews how the Trunk* A D *is bowed toward the right ſide, becauſe of the ſituation of the heart.*

C *The orifice of the Hollow-vein reaching into the right ventricle of the heart.*

D *The diviſion of the Aſcendent Trunk about the Hollow of the Neck, into two branches* EE, *which they call* ſubclaviæ, *or the veins under the Collar-bones. From theſe ariſe many propagations, ſome iſſuing from the lower, others from the upper part of them.*

EE Out of the lower part *iſſue five.* The firſt *is called* Intercoſtalis ſuperior *the upper vein between*

e *the ribs,* e, *and ſcatters two Surcles* f f, *to the diſtan-*

f f *ces of the three upper ribs.* The ſecond *is* mamma-

g ria *the vein of the dugs,* g, *which deſcending under the breſt-bone, as far as to the ſtrait Muſcles of the* Abdomen, *is inoculated* 10, *with the Epigaſtrick vein climbing upward,* 9, *giving ſurcles to the griſtly diſtances of the true ribs, as alſo to the* Mediaſtinum, *and Muſcles that lie upon the Breſt.* The third *called*

h Mediaſtina, h, *is diſſeminated into the* Media-

i ſtinum, *or partition of the Cheſt.* The fourth ver-

tebralis, *or the vein of the Rack-bones,* i, *climbs up through the holes, that are bored in the tranſverſe proceſſes of the Rack-bones of the Neck, diſtributing ſprings to the Muſcles, that lie upon the Rack-bones.* The

l fifth *is called* Cervicalis *or the vein of the hinder part of the Neck,* l, *diſtributed into the Muſcles, ſeated on the lower part of the back ſide of the neck and on the upper part of the Cheſt.* Out of the upper part *iſſue three.* The firſt *is* Jugularis interna, *the inner*

m *vein of the Hollow of the Neck,* m, *which having ſent over ſmall ſprigs from it its outer branch to the Chops. and region of the Ear, is joined by the inner all the way to the* Arteria Carotis, *or ſleepy Artery, and is divided near to the ſkull into two branches called* En-

n cephalici *or of the Brain, by* Spigelius; *of which the* hindmoſt and greater, n, *having entred into the ſkull through the ſecond hole of the Nowl-bone, is in-*

oo *ſerted* o o *into the firſt* 1, *and ſecond* 2 *ſinus of the*

p *thick membrane. But* the formoſt and leſſer, p, *having entred through the ſeventh hole of the wedg-bone, is ſcattered through the ſides of the thick membrane.*

q The ſecond *is the outer Jugular-vein,* q, *which getting up by the ſides of the Neck is divided near to the*

r *Ears,* r, *into two branches; of which the* one *called*

ſ Profundus, ſ, *is variouſly diſſeminated into the Muſcles of the* Larinx *or throttle, and the bone called hyoides, as alſo into the Tongue, the Palat, and hollowneſs of the Noſtrils, and laſtly into the ſkull with*

t *three propagations, of which that which paſſes* t, *out of the forepart of the eye, through the ſecond hole of the wedg-bone, is very well delineated here.* The other

u *called* Subcutaneus, u, *firſt of all ſpreads its fore-*

x *branch* x, *into the Muſcles and ſkin of the Face, which joins with its fellow about the top of the noſe,*

y *and makes the Forehead vein* y, *then it iſſues out another hinder branch, which partly creeps upward along the temples* z, *and partly is carried behind the ears to*

α *the ſkin of the back part of the head.* α The third,

β Cervicalis ſuperior, *the upper vein of the Neck,* β *is propagated into the Muſcles behind on the back ſide of the neck. There are three* ſinus *or ſmall channels of the thick membrane of the brain; the firſt or right one*

ι *is marked with* 1, *the ſecond or left one with* 2, *the third*

2 *with* 3. *The hinder part of this, which is nearer to*

3 *the Nowl of the Head, is ſhadowed, but the fore part, which is next to the Forehead, is ſeen manifeſtly. From this ſinus many little veins, which they call* Ductus, *are reacht forth to both ſides.*

F *Here the ſubclavian vein takes on it the name of* Axillaris *or the vein of the Armpit, and is divided into two branches, the Cephalick* G, *and the Baſilick* I. *But before this diviſion it ſcatters two twigs:* the

γ *firſt called* ſcapularis interna, *or the inner vein of the*

δ *ſhoulder blade,* γ, *the other* Scapularis externa, *the outer blade vein* δ, *the Baſilick vein alſo* I, *before it*

ε *enters the Arm, propagates two;* one *called* Thoracica ſuperior, *the upper Cheſt-vein,* ε, *which is diſtributed through the inſide of the Pectoral Muſcle, and in women, through the Dugs:* the other *called*

ζ Thoracica inferior, *the lower Cheſt-vein,* ζ, *which deſcending along the ſide of the Cheſt, goes to the Muſcle called* Aniſcalptor.

G The Cephalick-vein, *which, before its diviſion,*

η *ſends away a ſprig,* η, *into the Muſcle* deltoides, *and*

θ *another* θ, *into the Muſcle of the Cubit.*

When the Cephalick vein comes to the joint of the Cubit, at the outer bunching forth of the Arm, it is cut

H *into three branches,* H, The firſt, ι, *or deep and middle*

ι *one goes to the Muſcles ariſing from the ſaid protube-*

κ. *ration.* The ſecond, κ, *or inner goes to the making*

λ *of the vein called* Mediana λ. The third μ, *or outer*

μ *is carried obliquely,* ν, *by the* radius *or leſſer bone of the Cubit to the outſide of the Arm, and ſo creeping on obliquely all the way, when it is come to the root of the wriſt, it is joined with a little branch of the Ba-*

τ *ſilick-vein,* τ, *and makes the vein called Salvatella.*

The Baſilick-vein, *which on the right hand is called* Hepatica, *or of the Liver, on the left* Lienaris, *of the Spleen. This before its diviſion ſends out a Surcle,*

o, *to the heads of the muſcles of the Cubit*; *and then another notable one* π, *which being carried down obliquely*, *beſtows its ſurcles upon the Muſcles that ariſe from the outer protuberation of the arm.*

K *The diviſion of the* Baſilick *Vein* K, *into two branches*, *the one called* Profundus *or the deep one*, *the other* Subcutaneus, *or branch under the skin. The deep one* L, *when it comes to the bending of the Cubit, is* L *divided into two*, M, *one of which called* Radieus N, M N *at the* Radieus *or leſſer bone of the Cubit*; *the other called* Cubiteus, O, *at the greater bone of the Cubit, goes to the hand.*

P Subcutaneus, *or the branch next under the skin* P, Q *near to the inner protuberation of the arm is divided*, R *Q, into two other, of which the inner* R, *together with the inner branch of the Cephalick* ϰ, *makes up the vein* Mediana λ, *which is likewiſe divided into two branches, the outer of which* ρ, *is called by ſome* Cephalica ρ *manus, and goes to the Thumb*; σ *the inner* σ, *to the fore and middle fingers: The outer* S, S *going to the wriſt, is joined toward the little finger with the outer branch of the Cephalick vein about* τ.

τ *The little valves, which are found in the veins of the joints, are handſomely cut out here, as it were to be ſeen through.*

T *The deſcendent Trunk of the Hollow-vein which be-*
V *gins about the Region of the Liver* T, *and ends about* υ *the fifth Rack-bone of the loins* V. *There are four twigs growing from this. The firſt* υ, *called* Adipoſa Φ *or fatty vein diſtributed to the membrane of the Kidneys. The ſecond* Φ *the emulgent going to the Kidney. The third*, præparans vas, *the preparing* χ *veſſel*; *the right one* χ, *ariſing out of the Trunk* TV, ↓ *the left* ↓ *out of the left Emulgent, both afterward go-*ω *ing into the Teſticles* ω. *The fourth is the three* Lum-444 *bares or loin-veins*, 444.

XX *The diviſion of the Deſcendent Trunk* V, *into the* Y *two Iliacal branches* XX, *both which are again divi-*Z *ded into two other, an inner one* Y, *and an outer* Z. *But before this diviſion two propagations are iſſued forth,* 5 Muſcula lumbalis, *or the Muſcle-vein of the loins* 5, 6 *and* Sacra, *or the Holy-vein* 6.

Y *The Inner Iliacal-vein, before it goes out of the* Peritoneum, *or rim of the belly, ſhoots out two propa-*7 *gations, the firſt called* Glutæa 7, 8 *and the ſecond* Hypogaſtrica 8. *The remainder of it paſſing through the* Peritoneum, *is ſpent upon the inſide of the Thigh.*

Z *The outer Iliacal vein likewiſe before its going forth of the* Peritoneum *ſcatters three propagations*; 9 *The firſt called* Epigaſtrica 9, *going into the Muſcles of the Epigaſtrium, and the ſtrait ones of the* Abdomen, *where they are joined by* Anaſtomoſis, *or inoculation* 10. 10 *The ſecond called* Pudenda, 11, 11 *ſpent upon the Privy Parts. The third* Coxalis, 12, 12 *upon the Muſcles of the Hip.*

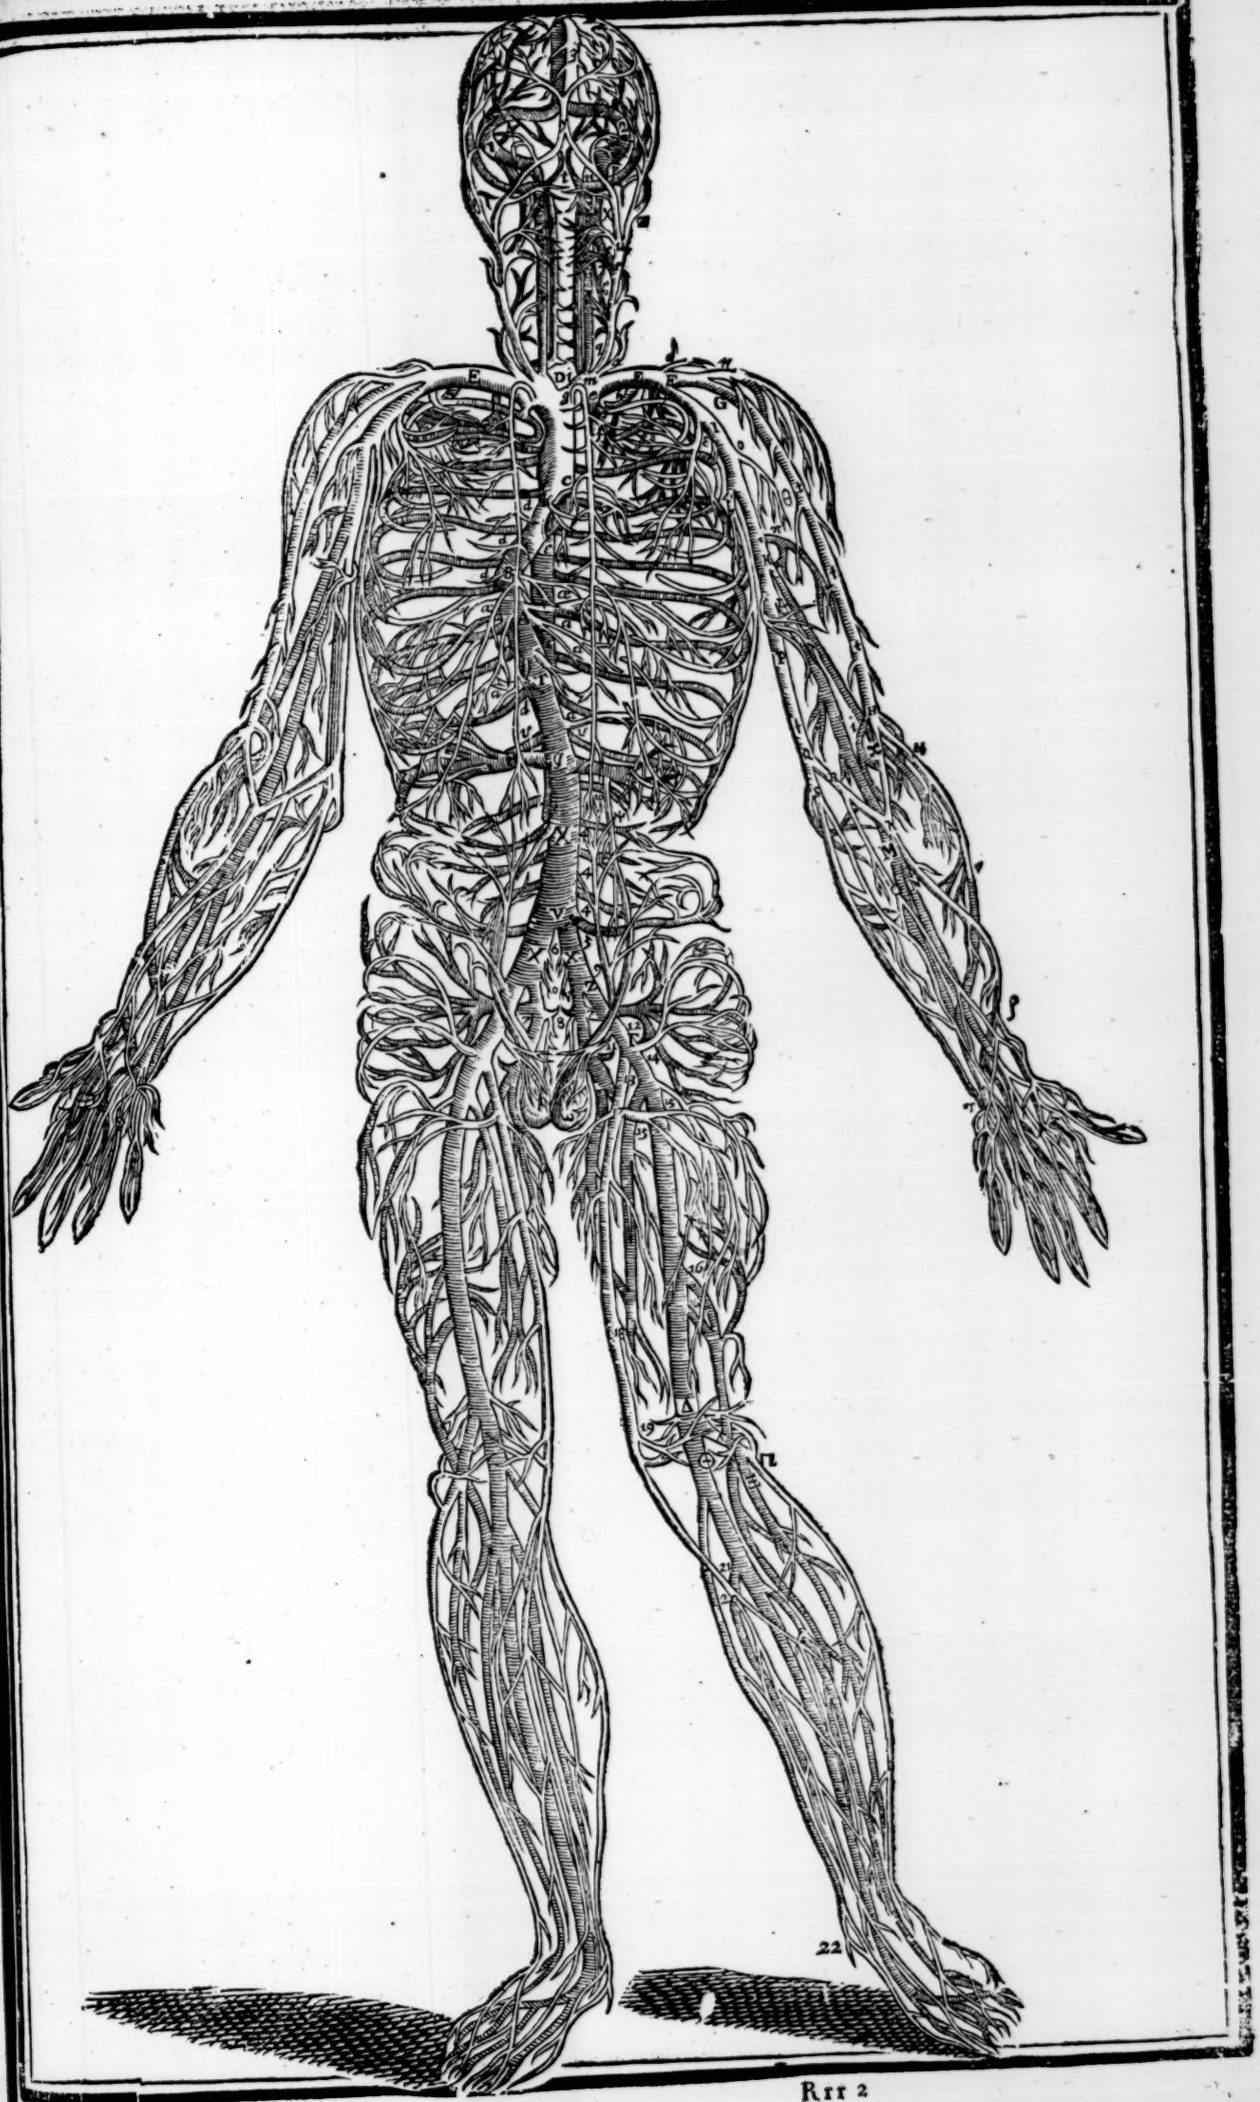
Here the outer Iliacal vein having paſt through the Peritoneum *or rim of the Belly enters the* Crus, *and* Γ *begins to be called the* Crural Trunk Γ, *that is undivided as far as to the lower heads of the Thigh. But it reaches forth four propagations before its diviſion. The firſt* 13, 13 *is called* Saphena, *which creeps through the inſide of the Leg, under the skin as far as* 14 *to the ends of the Toes. Another* 14, *called* Iſchia *is ſpread out into the skin upon the Hip-bone. The third* 15, 15 *named* Muſcula *is ſent to the Muſcles, which* 16 *extend the Leg. The fourth* 16, *named* Poplitea *is diſtributed into the Calf of the Leg.*

13 *The vein* Saphena *alſo ſcatters from it ſelf four*
17 *ſurcles, the firſt* 17, *into the upper part of the skin of*
18 *the inſide of the thigh: the ſecond* 18 *about the med-*
19 *dle of the thigh: the third* 19 *into the knee: the*
20 *fourth* 20 *is carried forward and backward to the middle of the Leg.*

Δ *The diviſion of the Crural Trunk near to the two*
Θ *lower heads of the thigh into an inner branch* Θ *and*
Λ *an outer one* Λ.

Θ *The inner diſtributes little branches to the Muſcles*
12 *of the Calf* 21, *and then runs down under the inner*
22 *ankle to the great Toe* 22.

Λ *The outer preſently is cleft into two branches*, *an*
Ξ *inner one* Ξ, *and an outer* Π. *That is ſpent wholly*
Π *upon the Muſcles of the Calf, this paſſes on near to the* Fibula *or leſſer bone of the Leg, through the outer and back ſide of the Leg.*



TRACT. II.
CONCERNING THE ARTERIES.

CHAP. I.

Shews the upper or aſcendent Trunk of the great Artery, with its propagations that are diſtributed through the Head.

THere is no controverſie among Writers of Anatomy concerning the number and original of the Arteries, but an unanimous conſent, that all the propagations, which are ſcattered throughout the body, take their riſe from one, which they call *Aorta*, and that this is derived out of the Heart. But the Heart conſiſting of two *ſinus* or cavities, a right and a left one; this great Artery grows out of the left *ſinus* or ventricle [A], where it is largeſt, and more hard, and griſly than elſewhere. But as ſoon as it is grown out, and before it fall out of the *Pericardium* or Purſe of the Heart, it preſently propagates two ſmall ſprigs [a a] one of each ſide, which they call *Arteriæ Coronariæ*, the Crown Arteries, becauſe together with the *Vena Coronalis*, or Crown Vein, they compaſs the *baſis* of the Heart in manner of a Crown, and from theſe many propagations are ſcattered downward all along the Heart. But they are more and greater about the left than the right ventricle, as we have alſo formerly ſaid concerning the Vein, becauſe the Heart needs a greater plenty of bloud on that ſide, as which beats with a perpetual and more violent motion, wherein more bloud is digeſted than the right *ſinus* or ventricle does: yet that propagation is bigger and longer, which ariſes out of the right ſide of the Artery: ſometimes alſo there is onely one, at whoſe orifice a little valve is found. Theſe propagations being thus diſſeminated, the Artery aſcends ſomewhat under the Trunk of the *vena Arterioſa* or Arterial vein, and pierces through the *Pericardium*, and having got above it, is cleft [B] into two branches, which becauſe of their natural greatneſs we will call Trunks; and becauſe one aſcends [C] and the other runs downward [Q] that ſhall be the aſcendent Trunk, this the deſcendent. Yet the deſcendent and lower one is bigger by much than the upper, becauſe that ſerves more parts than this: For the aſcendent one goes onely to ſome parts of the Cheſt, to the Head and Arms; but the lower to very many parts of the Cheſt, to all the loweſt belly and the legs. That therefore we may treat of the great Artery with more perſpicuity, we will firſt ſhew the aſcendent Trunk, and its progreſs through the Cheſt and Head; and after that its branches diſtributed through the arms. Then we will fall upon the deſcendent one, and explain the manner of its diſtribution through the Cheſt, and loweſt belly, and laſtly through the legs.

The original of the great Artery.

Arteriæ Coronariæ, the Crown Arteries.

The diviſions of the great Artery into two Trunks.

What parts both the Trunks nouriſh.

The order of that which is to be ſaid.

The Aſcendent therefore or upper Trunk of the *Aorta* [C], being faſtened to the *Oeſophagus*, or Gullet, climbs upward betwixt the rough Artery, and hollow Vein, and the *mediaſtinum* or partition of the Cheſt. Which ſituation of it they ought diligently to obſerve, who deſire to know the reaſon of that Aphoriſm, which is the four and twentieth of the fifth Section in *Hippocrates*: For ſays he, cold things, as Snow and Ice are enemies to the breſt, provoke Coughs, and cauſe eruptions of bloud, and diſtillations. Truly they are enemies to the breſt, becauſe whileſt they are ſwallowed down through the Gullet, they cool the rough Artery that lies next to it, together with the Gullet, which part being of it ſelf cold, does eaſily take harm from ſo violent a cold: hence the Cough, and other diſeaſes of the breſt follow one another in a long row. But iſſues of bloud happen in like manner, the great Artery being cooled, whereby the vital Spirits and the bloud are driven back to the Heart, and from thence are ſent up forcibly to the Head, which being ſtuffed, eruptions of bloud are cauſed by its dropping forth at the Noſtrils, as alſo Catarrhs and Diſtillations, it being driven down undigeſted to the inferiour parts. And hence alſo a reaſon may be rendered, why ſome upon drinking of cold water after vehement motions and exerciſe of body, have preſently been ſuffocated, the paſſion of the heart, and grievous ſwounings following thereupon. For the Artery being vehemently cooled, the bloud is congealed, as well that which was in the *Aorta* or great Artery, as that which abides in the Heart; from whence happen at firſt fearful ſymptoms, and then ſudden death. But we have ſeen in theſe men, that a vein being opened, the bloud hath come out thick, and cold, and with very great difficulty, whence alſo we have not found a more preſent remedy for them, than ſuch things, as by reaſon of the thinneſs of their parts have a power of diſſolving the clots of bloud. Hence alſo a reaſon may be given, why in burning Fevers the Tongue becomes black, and the diſeaſed can hardly ſwallow. For although it be true (which is the cauſe commonly aſſigned) that many vapours are ſent up from the whole body to the head; yet we may aſcribe a main cauſe of this blackneſs to the nearneſs of the Artery, which being ſet on fire and inflamed, procures much miſchief to the Gullet, and conſequently to the Tongue it ſelf.

But the aſcendent Trunk, whileſt it paſſes thus upwards, is divided into the two ſubclavian Arteries [DD], of which one runs to the right ſide, and the other to the left. They are called *ſubclaviæ* as long as they are in the Cheſt, for the ſame reaſon as the ſubclavian veins are ſo called, becauſe they run under the *claviculæ* or collar-bones: but as ſoon as ever they are fallen out of the cheſt, they change their name, and are called *Axillares* [E]. From both the ſubclavian Arteries, when they have attained to the firſt rib (for before that they ſend forth no propagations) many ſprigs iſſue out, as well from their upper as lower part. From the lower, iſſues the upper Intercoſtal Artery, or *Inter-*

The diviſion of the aſcendent Trunk into two branches.

The ſubclavian Arteries.

Intercoſtalis ſuperior, the upper artery between the ribs

Vertebralis, the artery of the rack-bones.

c ſtalis ſuperior [b], which being faſtned to the roots of the ribs, beſtows particular branches upon the diſtances of the four uppermoſt which run under the ribs, together with the veins, as far as to the griſles, from which propagations are diſperſed into the marrow of the back, and the neighbouring muſcles. From the upper part iſſues firſt that which is commonly called *Cervicalis*, or the Artery of the neck [c], but better *Vertebralis*, of the rack-bones, which ariſes more backward, and toward the bodies of the rack-bones, and aſcending obliquely, near to the ſeventh rack-bone of the neck, like the neck-vein, paſſes through the holes of the tranſverſe proceſſes, and upper rack-bones of the neck, where it ſhoots out many propagations which enter the ſpinal marrow through the common holes, at which the nerves go out. It ſends alſo a pretty company to the muſcles that are ſeated on the back-ſide of the neck, and aſcends to the nowl-bone together with the vein, through whoſe firſt notable hole, by which the ſpinal marrow deſcends out of the head, it enters the skull. After this it is joined with its fellow of the other ſide under the ſpinal marrow, which remains yet in the skull, and ſo runs ſtrait forwards, under the middle of the *baſis* of the brain; but when it hath now attained to the *ſella* or ſaddle of the wedg-bone, upon which the phlegmatick glandule lies, it is divided into two branches, a right and a left one, both which at the ſide of the ſaddle creep to the ſecond pair of nerves, where being broken on both ſides into an infinite number of ſurcles, they are diſperſed betwixt the firſt and ſecond pair of the nerves, and folden together with the thin membrane, make that complication of veſſels called *plexus Choroides*. The next is *arteria mammaria*, or artery of the paps [d], which being reflected under the breſt-bone (accompanied with the mammary vein) deſcends along its ſides, and when it comes to the griſle called *Enſi-formis*, or the breſt-blade, about the ſides thereof goes out of the cheſt, and running under the right muſcles of the *abdomen*, deſcends directly through the lower ſide of them, and at length near the navel, is joined by *anaſtomoſis* or inoculation [x] with the Epigaſtrick Artery plying upward [i]. But before it leaves the cheſt it ſcatters particular branches to the ſix diſtances betwixt the griſles of the ſeven true ribs, which branches determine together with the griſles. A third [e] is otherwiſe called *Muſcula* the Muſcle-artery, but might be better and more ſtrictly named *Cervicalis*, being it is diſſeminated into the Muſcles that are placed in the region of the neck, as far as to the *occipitium* or nowl of the head.

Mammaria, the artery of the paps.

Cervicalis, the artery of the neck.

Arteria axillaris.

Its branches before it enters into the arm.

From its lower part.

From its upper part one.

Theſe branches being ſent out, the ſubclavian artery goes out of the cavity of the cheſt, and getting above the firſt ribs tends obliquely to the arm-pit, and ſo makes the axillary artery [E] which afterward is ſpread into the arm. But before that it ſcatters ſome propagations, and from its lower part three, of which the firſt is *ſcapularis interna*, the inner-blade Artery [f] which goes to the muſcles on the hollow ſide of the ſhoulder-blade. Another is *Thoracica ſuperior*, the upper cheſt-artery [g], which goes to the pectoral muſcle, that leads the ſhoulder forward to the breſt, and the other muſcles that lie upon the breſt, and is a pretty big one. The third is *Thoracica inferior*, the lower artery of the cheſt [h], which is alſo a large one, and running down all along the ſide of the cheſt, is the greateſt part of it ſcattered into the broad muſcle called *Latiſſimus*, which moves the ſhoulder backward from the breſt. From the upper part of the axillary Artery ariſes one called *ſcapularis externa*, the outer blade-artery [i], which climbing up to the top of the ſhoulder is diſſeminated into the Muſcles that cover the gibbous ſide of the ſhoulder-blade. The remaining part of the axillary artery paſſes on in company of the Baſilick vein to the arm, upon all which it is afterward ſpent, of whoſe diſtribution we will ſpeak in the following Chapter.

The ſleepy Arteries.

The diviſion of them.

The outer, or branch of the face.

The inner, or branch of the brain.

The diviſion thereof into a leſſer and greater branch.

A ſubdiviſion of the greater.

That which remains yet of the aſcendent Trunk [L] being ſuſtained with the *Thymus* near to the upper part of the breſt-bone, is divided into two branches [MM] which they call *carotides* or *ſoporales*, the ſleepy arteries, becauſe they being obſtructed, or any way ſtopt, we preſently fall aſleep; of which *Valuerda* witneſſes in *Anatom. lib. 6. c. 11.* that *Realdus Columbus* made trial in a young man, among a great company of men. They are unequal in bigneſs, the right one being much thicker than the left, but they tend directly upward, being carried along the ſides of the neck, and faſtned to the rough artery, and to the internal jugular veins, by the benefit of a membrane, and when they are come to the cups, are divided into two branches [N] of which one is the outer, the other the inner one: that is the leſs, this is the greater. The outer [O] ſends propagations [†] to the cheeks and muſcles of the face; then when it is come to the ear, it is divided in twain; for one branch [r] of it goes to the back ſide of the ear, from which two branches under the ear enter the nether jaw through the firſt hole of it, that is ſeated at his proceſſes, and throughout the length thereof are diſſeminated into the roots of all the lower teeth, that which remains, going out at the ſecond hole, which is placed at the chin, is ſcattered into the lip. The outer branch [q] creeps through the Temples and fore-head, and is ſpent upon the muſcles of the face. The inner branch [P] of the ſleepy artery, or *arteria Encephalica*, the brain-artery, is carried into the chops; and having ſcattered ſome propagations to the tongue and throttle, is divided about the *baſis* of the skull, into two unequal branches, to wit, a greater and a leſſer one. The leſſer and hindmoſt [s] is carried together with the greater Encephalick branch of the internal Jugular-vein, to the back-ſide of the skull, enters through the ſecond hole of the *occipitium* or nowl-bone, and goes into the *ſinus* or canale of the thick membrane. The greater and more forward [t] having entered the cavity of the skull through a hole made on purpoſe for it in the temple-bone, and attained to the ſaddle of the wedge-bone, going every where under the hard membrane; firſt of all propagates a branch on both ſides into the ſide of the thick membrane, then in Beaſts ſcattering an infinite number of ſurcles makes the *Rete mirabile* or wonderful net, which indeed may be found in a Man too, but it is very little, and ſeems but a ſhadow in reſpect of that in Beaſts. Theſe ſurcles being thus placed it pierces through the thick membrane of the brain, and having got out of it, ſends another propagation out of the skull, through the ſecond hole of the wedge-bone to the eye and its muſcles, as alſo to the temple muſcle, that lifts up the lower jaw; and then going ſtraight up to the ſide of the phlegmatick glandule, it is divided into two branches, an outer, and an inner. The inner is joined with its fellow of the other ſide, and being joined they are waſted into many little arteries, which are diſperſed through the thin membrane, and the very

ſubſtance

ſubſtance of the brain, to the original of the optick nerves. The outer being reflected and ſuſtained with the thin membrane, goes into the forward ventricle of the brain; being divided into many ſurcles, which are united with thoſe little arteries which ariſe from the *vertebralis* or artery of the rack-bones; ſome with thoſe which the vertebral artery ſcatters through the *baſis* of the head under the brain, but others with thoſe which it diſſeminates through the thin membrane and ſubſtance of the brain, together with which they make the *plexus choroides*.

CHAP. II.

Declares the Hiſtoy of the Axillary Artery, being diſtributed through the Arm.

THe Axillary Artery therefore when it is come to the arm, taking the name of the Arm-trunk [FF] is carried in one undivided ſtock, beyond the bent of the cubit through the inſide of the arm, diſperſing ſome ſmall propagations on both ſides to the muſcles that lie on the inſide of the upper part of the arm. But it goes faſt by the inner or deep branch of the Baſilick Vein, as an unſeparable companion of it, whoſe conduct and ſteps it every where follows. But preſently falling down by the back-ſide of the upper part of the arm, where the muſcles which extend the cubit ſtick to it, it ſends forth two propagations [l and m] the lower of which is a very notable one, and ſo it is writhed back toward the bent of the cubit, and having attained thereunto it reaches out two ſurcles [nn] one of each ſide, ſo manifeſt, that the pulſe is there oftentimes evidently enough perceived. Then going under the bent of the cubit, through the inſide of it, and ſinking down betwixt the two muſcles that bend the ſecond and third bones of the four fingers, it is cut [G] into two notable branches, one of which is an outer, the other an inner one. The outer [H] is carried along the *radius*, or leſſer bone of the cubit (whence I call it *Radius*) and goes directly to the wriſt, in which place Phyſicians feel the pulſe, it being very manifeſt, by reaſon that the artery lies next under the skin. But not far from the root of the wriſt it ſhoots out a little branch [o] which runs under the tendons of the muſcles which extend the thumb, into the outſide of the hand, and is ſpent upon the muſcles, which are placed betwixt the firſt bone of the thumb, and that of the after-wriſt, which ſupports the fore-finger. This branch being propagated, going under the inner annular ligament of the wriſt, and the broad tendon of the palm muſcle, it is divided into three branches [ppp] like the vein and nerve that are its companions. The firſt of theſe goes to the inſide of the thumb, the ſecond to the inſide of the fore-finger, and the third to that of the middle. The firſt and ſecond are each of them parted into two branches; the third is undivided. The inner branch of the trunk of the arm [I] runs ſtrait along the *ulna* or greater bone of the cubit (and for that reaſon I call it *Cubitus*) and is diſperſed into the palm of the hand. But it is ſo hidden among the muſcles, that it is hardly perceived to beat, unleſs in lean folks; and therefore Phyſicians always lay their hands upon the outer branch when they feel the pulſe in the wriſt. But it paſſes on under the tranſverſe ligament of the wriſt, and the tendon of the palm muſcle, in company of a vein and nerve, and ſcatters two branches into the little finger, as many into the ring finger, and one into the outſide of the middle.

Brachialis teretes, the trunk of the arm.

The diviſion thereof into two branches.

The outer branch.

The inner branch.

CHAP. III.

Shews the Inferiour or Deſcendent Trunk of the great Artery, and the propagation thereof through the middle and loweſt Bellies.

WE have ſaid above, that the great Artery [A] as ſoon as it is gotten above the *Pericardium* or Purſe of the Heart, is divided [B] into two branches; of which one goes upward, the other deſcends to the parts below. We have already handled the upper branch; it remains that we explain the other alſo.

The deſcendent trunk thereof [Q] anſwering in proportion to the ſtock of a Tree, is carried down to the fifth rack-bone of the cheſt, and declining ſomewhat to the left cleaves to that ſide of the body of the rack-bones, and ſo deſcends leiſurely. When it has now paſt the midriff through that diviſion reſembling a ſemi-circle, which is betwixt the productions of the *ſeptum tranſverſum* or midriff, preſently it runs out by the rack-bones of the loins, leaning upon the middle of their body, till it come to the laſt of them, where near to the *Os ſacrum* it is divided [R] into two notable branches [SS] which with our Anatomiſts we will call *Iliacæ*, the Iliacal arteries from their ſituation. In this journey it ſcatters many propagations from it ſelf, which are very worthy to be diligently obſerved, becauſe from thence we may eaſily give a reaſon of many accidents in Diſeaſes. But they are in number eight, the Intercoſtal arteries, the two *Phrenicæ* or arteries of the midriff, the Cœliacal one, then the upper Meſenterick, the two emulgents, as many ſpermatical ones, at laſt the lower Meſenterick, and the *Lumbares*, or arteries of the loins. Of theſe the Intercoſtals are ſcattered, whileſt the trunk is yet in the cheſt; the reſt, whileſt it paſſes on through the loweſt Belly. But ſome of them accompany the branches of the gate-vein, as the Cœliacal, and both the Meſenterical arteries, others thoſe of the hollow vein, as the reſt. Now we will treat of theſe in order, begining from the Intercoſtals or arteries between the ribs, which are placed uppermoſt. Preſently therefore after the deſcendent trunk [Q] is iſſued forth, from its backſide it ſends over little branches on both ſides to the diſtances of the eight lower ribs, which they call *Intercoſtales inferiores*, the lower arteries between the ribs [uuu] in reſpect of the upper Intercoſtal, of which we have ſpoken above. Theſe aſſociating themſelves with the veins and nerves, of the ſame name, go ſtraight on by the lower ſide of the ribs; where peculiar *ſinus* or channels are cut out for them. But as the Intercoſtal veins reach in the true ribs onely to the griſles, but in the baſtard ones ſomewhat farther, to wit, to the ſides of the *abdomen*; ſo alſo the arteries end in them together with the bony parts of the ribs, but in theſe run out a little farther.

The deſcendent trunk.

Its progreſs.

Its propagations.

Intercoſtales inferiores, the arteries between the lower ribs.

farther. And theſe arteries ſend over ſome propagations through the holes of the nerves to the ſpinal marrow, and to the muſcles that lie upon the rack-bones of the back, juſt as we have ſaid the intercoſtal veins were propagated. But the uſe of them is to diffuſe the vital ſpirit, and the bloud to the muſcles betwixt the ribs, beſides which they have alſo another notable office, to wit, of carrying down the water and purulent matter that is gathered together in the cheſt, into the great artery, and from thence by the emulgent branches to the bladder. Although I am not ignorant that the moſt learned *Fallopius* and others, who have read before me in this moſt famous Univerſity of *Padua*, have ſhewn another way to their Auditors; by which either purulent matter or water might be conveyed forth by help of the kidneys, to wit, the vein *ſine pari*, or without a companion, a little branch whereof in the left ſide goes into the emulgent of the left kidney. But this way which we ſhew through the Intercoſtal arteries, is by much the ſhorter; that I paſs by this, that any matter heaped together may be more eaſily diſpatched away through the arteries than the veins. Nor needs any one here to be affraid leſt the vital ſpirits ſhould be infected from theſe excrementitious and ill humours, whereby the heart may incur fearful ſymptoms; when we willingly grant (which experience alſo hath often taught us) that whileſt the corrupt matter is emptied out by the urine, the ſick parties have often fallen into fits of ſwouning, and other diſeaſes; ſometimes alſo have died ſuddenly when the peccant humour hath been of too great a quantity, or too bad a quality, and hath offered ſo much violence to Nature, that the heat and ſpirits have been overcome therewith. But here a certain place in *Hippocrates* calls upon me to explain it, which has long and often troubled my mind. The place is in *Coacis prænotionibus*, where he ſays, They, who together with the heart have their whole lungs inflamed, ſo that it falls to the ſide, are deprived of motion all over; and the parties ſo diſeaſed lie cold, ſenſleſs, and die the ſecond or third day. But if this happen to the lungs without the heart, they live not ſo long: yet ſome alſo are preſerved. I have often thought with my ſelf, what ſhould be that ſympathy of the heart and lungs with the brain and nerves, that from the inflammation of thoſe parts, the Patient ſhould be ſo deprived of ſenſe and motion all over, when the ſame *Hippocrates* teacheth in the ſame place, that the diſeaſed ſuffer ſuch deprivation in that part, and livid ſpots appear on the outſide about the rib, whereabout the *Aortæ* (ſo he ſeems to call the lobes or diviſion of the lungs) being inflamed fall to the ſides. But if they be not much inflamed, ſo that they fall not down to the ſide; he ſays that there is a pain indeed all over, but no deprivation of ſenſe or motion, nor any ſpots appear. Having deliberated often with my ſelf, at length I came to be of this opinion; that there was no other cauſe, but the ſympathy betwixt theſe Intercoſtal arteries, and the marrow in the back-bone. This ſympathy ariſes from thoſe propagations which we told you paſt through the holes of the rack-bones of the cheſt into the back-bone. Wherefore if the lungs and heart be ſo mightily inflamed, that great plenty of bloud ruſh into the great artery, whereupon it ſwells, as alſo theſe veſſels betwixt the ribs, and conſequently thoſe ſurcles whieh go to the marrow of the back-bone; truly it cannot be, but that both the marrow and the nerves which iſſue out of it, be compreſt; from whence what elſe can follows but the reſolution of thoſe parts, into which thoſe nerves are implanted, and to which they impart the faculty of motion? This opinion ſeems to me to be wonderfully confirmed by a certain pretty obſervation, which the learned *Cornelius Gemma* hath in his Book, *De Hemitiræo Peſtilenti*. A certain ſtudious young man, ſays he, through the whole courſe of his diſeaſe, had his left eye leſs than the other. He was pained in the left ſide, eſpecially all the time the fit raged; but about the *criſis* or judication thereof, the artery of his left leg being ſwollen up was moved according to its length, that being to be ſeen by us it ſeemed to be turned upward and downward like a Rope pulled back. Who will not here willingly confeſs, that this matter was in the arteries, when the *criſis* was made by them? But from this that hath been ſaid a reaſon may be alſo given of another obſervation of *Galen*, which is *l.*4. *De locis Affect. c.*4. where he ſays thus: In a certain man who was troubled with a vehement inflammation of the lungs, as well the outer as the inner parts of his arm, from the cubit to the very ends of his fingers laboured with difficulty of ſenſe, and their motion alſo was ſomewhat impaired. In the ſame man alſo the nerves which are in the firſt and ſecond diſtances betwixt the ribs, ſuſtained harm. And a little after, This man was quickly reſtored to his health, to wit, a medicin being applied to the place from whence the nerves iſſue forth, near to the firſt and ſecond ſpaces betwixt the ribs. By reaſon of the ſame branches betwixt the ribs *John Valeriola*, the ſon of that Phyſician, whoſe obſervations we have, being yet a boy, ſuffered Convulſion-fits in a grievous Pleuriſie.

Their uſe.

The explanation of a place in *Hippocrates*.

2. *Phrenicæ*, the arteries of the midriff.

The arteries called *Phrenicæ* of the midriff, [xx] are two; one of each ſide, which ariſing out of the Trunk, preſently after it is come forth of the hollow of the cheſt, being divided into more branches, are ſcattered into the midriff, but eſpecially into the lower ſide of it, near to the rack-bones of the back. They ſprinkle ſome ſmall twigs alſo into the upper part, which afterwards go to the *Pericardium* or purſe of the heart, there where it grows to the midriff.

3. *Cœliaca.*

The *Cœliaca* or Stomach artery is but one, ſo called, becauſe it ſends over branches to the Κοιλία, that is, the Stomach. This being moſt like to the ſplenick branch of the Gate-vein, affords many branches to the Stomach, Liver, Bladder of Gall, Kall, the Gut *Duodenum*, the beginning of the *Jejunum* or empty Gut, a part of the *Colon* or Colick Gut, the Sweet-bread and Spleen. But it ariſes out of the fore-ſide of the body of the trunk, and being ſtaid up all the way by the upper part of the lower membrane of the Kall, is divided into two notable branches, but of unequal bigneſs; one of which goes to the right the other to the left: that is the leſs, this is the greater. The right branch therefore is joined with the deſcendent Gate-vein in the *Pancreas* or Sweet-bread, that is placed under the hinder part of the ſtomach, and leaning there upon the membranes of the Kall goes to the Liver; and its ſmallneſs is worth the taking notice of, if you look upon the largeneſs of the Liver, which the Ancients long ſince, and many at this day have made the Work-houſe of the Bloud. But it is inſerted in the hollow part, near to the trunk of the Gate-vein, and is ſo ſmall, becauſe that part of the Liver which entertains the roots of the Gate-vein, needed not a greater artery; but the other part which hath

The two branches thereof. The right branch.

hath the propagations of the hollow vein, receives great plenty of vital ſpirits ſent over from the heart through the hollow vein. Yet before it enters into the liver, it diſſeminates in the way many ſurcles, and thoſe partly from its upper ſide, partly from its lower: from the upper ſide two, firſt, that which I call *Pyloricus*, which ariſes in the midway, and being divided into many little branches is ſcattered into the backſide of the right orifice of the ſtomach. The outer is called *Cyſticæ gemellæ*, the Twin-arteries of the bladder of gall, which are two little branches, and go into the bladder of gall, and preſently are divided into many propagations. From the lower ſide likewiſe two ariſe. The firſt is *Epiplois dextra*, or the right kall-artery, which is implanted into the right ſide of the lower membrane of the kall, and part of the colick gut annexed thereunto. The outer is cleft into two branches, of which one is called *Inteſtinalis*, the gut-artery, paſſes on to the *duodenum*, and the beginning of the *jejunum*, or empty gut: the other named *Gaſtro-epiplois dextra*, the right ſtomach and kall-artery, ſomewhat larger than the former, turns down to the right ſide of the bottom of the ſtomach, and being ſupported by the upper membrane of the kall, iſſues out ſome ſhoots from the upper part to the fore and back-ſides of the ſtomach; but from the lower to that membrane of the kall upon which it leans.

Propagations from its upper part. 1. 2. From its lower part. 1. 2.

The left and greater branch is called *Arteria ſplenica*, the Spleen artery, which ſticking to the lower membrane of the kall and the glandules placed therein, paſſes on together with the Spleen-vein, to which it is faſtned, and in the like manner diſtributes its propagations to the Spleen. But in the way likewiſe it diſtributes branches from both parts of it: from the upper iſſues *Gaſtrica* the ſtomach artery, which reaches into the middle of the hinder part of the ſtomach, or that wherewith it leans upon the back, and aſcending from thence it compaſſes the left orifice of the ſtomach round about like a Crown, and diſperſes little twigs, partly upward to the end of the Gullet; partly downward, and thoſe greater and more numerous, into the ſtomach, and ſo it makes the *Arteria Coronaria* or Crown-artery, like to the Crown-vein, which ariſes from the Gate-vein, as we have ſaid in the fore-going Treatiſe. But from its lower ſide the Spleen-artery ſends out the *Epiplois ſiniſtra* or left Kall-artery, about that part wherewith it now attains to the Spleen, which runs out into the left ſide of the membrane of the lower part of the Kall. This artery preſently after its riſe, is cleft into two branches, which part very far aſunder from each other, from which many other arteries ariſe, that are all conſumed upon the ſaid membrane of the Kall, and the Colick gut that is tied thereto. Theſe branches being iſſued, the Spleen-artery draws nearer to the Spleen, and juſt like the vein of the ſame name, which accompanies it all the way, is cleft into two branches like the letter Y, one of which may be called the upper, the other the lower, which afterward entering by the hollow part of the Spleen are ſplintered into an infinite number of little ſprigs, ſo that there are five times more arteries there than veins. Whence it comes to paſs, that in inflammations of the Spleen, if you lay your hand to the left *Hypochondrium*, or place under the Griſle of the baſtard ribs, it ſeems to pant. But before this entery of the artery, the lower branch makes a notable *Anaſtomoſis* or inoculation with the lower branch of the vein, and propagates a twig to the lower membrane of the Kall. But from the upper branch iſſues one called *Gaſtro-epiplois ſiniſtra*, the left ſtomach and Kall-artery, which being faſtened to the upper membrane of the Kall, is derived into the left ſide of the bottom of the ſtomach, beſtowing little branches upon the fore and back-ſides of it, or alſo upon the upper part of the Kall. Another iſſuing from the upper branch, make the *vas breve arterioſum*, or ſhort arterial veſſel, carries, like the vein, its name-ſake, to the left ſide and orifice of the ſtomach. The uſe of the right branch which goes to the Liver, beſides the common one which it hath, is this, as often as the bladder of Gall is obſtructed, to carry down the choler to the Guts, and eſpecially to the *Colon*, into which ſome of its branches are implanted. Which is the reaſon, that in bloudy fluxes the Ulcers are almoſt always found in the great Guts, and eſpecially in the *Colon*, very ſeldom in the ſmall ones. For this artery, when either the Liver being over hot breeds abundance of choler, or the bladder of Gall is obſtructed receiving into it ſelf ſtore of choler, carries it directly over to the *Colon*, or Colick gut. In like manner the uſe of the left branch, or Spleen artery, beſides the common one, is to throw down choler, melancholy, and wheay humours, if at any time the Spleen abound with them to the Guts. Moreover by this ſame way the wateriſh humours in ſuch as have the Dropſie, are ſometimes committed either to the Guts, or to the Kidnies and Bladder. This ſame branch is that by which the drink paſſes ſo ſuddenly through the whole body, and by which ill humours are caſt out by Vomit. This ſame is the cauſe, that upon a full ſtomach we make little water, but more when the concoction therein is finiſhed. For the Stomach being much diſtended preſſes it, but that once empty, it can perform its office. This ſame branch teaches us that a ſlender diet is to be preſcribed to them who are to take Purges, that the way may be open for the Medicins, as well that by which the excrements are ſent over the Stomach, as that by which they are conveyed to the Guts. This ſame branch alſo, if you add the two Meſentericks, is the ſeat of the hypochondriacal Melancholy. For this diſeaſe ariſing from the obſtruction of the entrails which are contained in the loweſt belly, it is neceſſary that the arteries here ſhould ſuffer very much, which the very ſymptoms that happen in this diſeaſe, may ſufficiently inform us.

The left branch. Propagations from its upper part. From its lower part. Its diviſion. The uſe of the right branch. Why ulcers are more frequent in the great guts. The uſe of the cleft.

Meſenterica ſuperior, the upper artery of the Meſentery [y] ariſes a little below the Cœliacal, being diſtributed like the Meſeraick Vein (which is its companion) with numerous propagations in the guts called *Ilium* and *Jejunum*, as alſo that Region of the *Colon* which reaches from the hollow of the Liver as far as the right Kidney, and ſo for the moſt part into the upper part of the Meſentery. In which place it is to be obſerved, that the Artery ſometimes lies upon the Vein, ſometimes on the contrary the Vein upon the Artery, and ſo is carried betwixt the membranes of the Meſentery. But theſe Arteries in many places in the Meſentery have glandules, which were made for the free perſpiration of the veſſels, and eſpecially of the Arteries; whereby it comes to paſs, that theſe glandules labouring with a hard tumor or *ſcirrhus*, the veſſels are compreſt, and a pining away of the whole body follows thereupon.

4. *Meſenterica ſuperior.* An obſervation.

The Emulgent arteries [z] are two, one the right, and another the left one. Both iſſue out under the fore-mentioned Artery, where the firſt and ſecond rack-bones of the loins are coupled together by the ligament. But they ariſe out of either ſide of the trunk, although not directly over againſt one another,

5. *Emulgentes.*

ther, as alſo it is in the Emulgent veins, the right one being lower than the left. Theſe Arteries, when they come to the Kidney, are cleft into two branches, with which they are inſerted into the *ſinus* or channels of the cavity of the Kidnies, and like the Veins are conſumed in an infinite number of little Sprigs upon their ſubſtance. Their uſe, beſides the common one, is to purge out the whey, which is found in great plenty in the Arteries.

Their Uſe.

6. *Spermatica.* The Spermatical or Seed-Arteries [α] are likewiſe two, which ariſe out of the fore-part of the Trunk of the great Artery, their originals touching each other; for the left Artery iſſues not from the emulgent, as the left ſpermatical Vein does. Afterward in their deſcent they are made faſt to the Veins of their own ſide, and in men are carried through the proceſſes of the *Peritoneum* or Rim of the Belly to the Teſticles; but in Women, when they come ſomewhat near to the Teſticles, they are divided into two parts, one of which is carried to the Teſticles, the other to the bottom of the Womb. But the Arteries do ſo come to the Womb, that they onely water it at the ſides, and pierce not at all into the inner parts of it. Which truly came to paſs by the great providence of wiſeſt Nature, ſince it had not been ſo ſafe to have brought them down to the inner ſurface of the Womb, by reaſon that in the coming forth of the Child very great iſſuings of bloud would be cauſed, to the no ſmall danger of the Woman in Childbed, if the Arteries had been annexed to the Womb on the inſide. Hence alſo it is, that in the time of delivery they flow by little and little, not ruſhing down with violence.

7. *Meſenterica inferior.* *Meſenterica inferior*, the lower Artery of the Meſentery [δ], ariſes near to the *Os ſacrum*, or great bone, a little above the diviſion of the Trunk into the Iliacal branches, and goes into the left ſide of the *Colon*, and into the ſtrait Gut, deſcending with the hæmorrhoidal Veins to the very end of the Fundament, and making the hæmorrhoidal Arteries. It is queſtioned concerning the uſe of both the Meſentericks, whether beſides the common, they have any peculiar one. For *Galen* in his 4. Book of the Uſe of the Parts, ſeems to make mention of ſome other when he would have part of the *Chylus* to be attracted by them. And in the Book, Whether bloud be contained in the Arteries, in the fifth Chapter he ſays, If we divide the loweſt Belly, and the inner Membrane, we ſhall plainly ſee the Arteries in the Meſentery filled with Milk in Kids newly yeaned; but in living Creatures that are grown, full of ſomething elſe. In which words Anatomical experience teaches us, that not onely the Meſeraick Veins but Arteries alſo do manifeſtly draw the *Chylus* to them. Which being ſo indeed, it is altogether to be believed that the *Chylus* is either afterward tranſported by them into the Veins, or elſe turned into bloud by the Arteries themſelves. Nor will this ſeem wonderful to any one who ſhall conſider alſo that the Mothers bloud is conveyed through the Umbilical Arteries to the Child whileſt it is yet ſhut up in the Womb. But if the bloud which is received up by the Veins ought yet to be better worked, as any diligent inquirer into Nature will conclude it ought; truly that which is received by the Arteries will require to be ſo much the more exactly laboured, by how much the better it is than that of the Veins. But it is ſo laboured in the Arteries themſelves, and in the Spleen, being haled into the Cœliacal Artery and carried to the Spleen. And this is an excellent uſe of the Meſentericck Arteries, whileſt a man enjoys perfect health; beſides which we will add another alſo, as often as he leaves to be in health. For theſe Arteries take to them the excrements of the whole body, that they may carry them down to the Guts, in like manner as the Veins do, by which Nature doth both attract the *Chylus*, and likewiſe expell the noiſom humours out of the body, as choler, phlegm, and melancholy. Choler is thus expelled oftentimes in continual and intermitting cholerick Fevers, a ſolution whereof follows by a looſneſs: Phlegm is ſo expelled, as often as bloudy Fluxes happen to ſuch as have the Gout in the feet, which eaſe them of their pain, if the intent of Nature be advanced by the help of a wiſe Phyſician. Laſtly, Melancholy is conveyed out by both the Meſentericks, but eſpecially by the hæmorrhoidal branch: whence *Hippocrates* ſays, 6. *Epidem.* He which has the Emroids naturally, ſhall neither be troubled with the pain of the ſide, or inflammation of the lungs, nor with Felons or black puſtles, called *Terminthi*, nor with the Leproſie, Canker, or other diſeaſes. For there is a very great ſympathy betwixt the breſt and the hæmorrhoidal Artery, becauſe the Trunk out of which it ariſes, deſcending from the heart, preſently after it firſt iſſues from thence, propagates the intercoſtal branches. Moreover all black cholerick humors are purged by this means out of the whole body, that cankers and leproſie cannot be cauſed by them. From theſe voluntary purgings which nature it ſelf has found out, we may now judg of ſuch as are cauſed by the help of a Phyſician, and may be termed artificial. For an opinion of ſome men hath prevailed much in our age, that the body cannot be purged by clyſter, but only by thoſe medicines which are taken at the mouth. But I will not only believe, but alſo being taught it by experience can witneſs, that, if the Clyſters contain in them purging medicines, the whole body is very commodiouſly cleanſed. For the whole Colick-gut receiving the matter of the Clyſter, the vertue it ſelf of the medicine draws down the noiſome humors by the arteries out of the *Aorta* or great artery. Which being granted, we may give a reaſon (which we have ſeen very often) why Suppoſitories made of white hellebore produce the ſame ſymptoms, as are wont to be cauſed in them who have taken in white hellebore at the mouth. In like manner from hence we may fetch the reaſon why the belly is ſtrongly purged, the region about the navel being anointed with purging medicines. For the vertue of the medicine is attracted by the arteries, and by them afterward it purges. Theſe arteries are they by which the diſeaſe of the Colick is changed into the Gout, and on the contrary the Gout into the Colick, as we have it in *Hippocrates*, 6. *Epidem. Sect.* 4. where he ſays: One that was vexed with the pain of the Colick on the right ſide, had ſome eaſe whilſt the Gout held him; but this diſeaſe being cured, he was pained more. The reaſon whereof was this, becauſe that humor, which cauſed the Gout, was carried out of the joints to the colick-gut, whereby the Colick diſeaſe was increaſed. *Laurentius* inquiring into the cauſe of this, refers us to hidden and unknown paſſages, to which, it ſeems to me that we need not fly, if we ſay that the humors are brought out of the crural arteries into the Trunk, and out of this into the Meſenterick branches, and laſtly, out of theſe into the guts; for this is the

Its Uſe.

An obſervation.

Why anointing of the navel with ſuch things as purge looſens the belly.

How the Colick is changed into the Gout; and on the contrary.

ſhorteſt

ſhorteſt, and moſt convenient way. Nor is there any reaſon, that we ſhould be afraid of that pollution of the vital ſpirits, which they will object to us if the excrementitious humors paſs through the arteries; for this betrays their great ignorance as well in Anatomy as in ſolid Phyſick: and it would be very eaſie, if I would digreſs, to prove in this place, that a great part of the humors in our body flow down through the arteries. For in them the ſtrength of nature exceeds, and is more vigorous, that whenſoever it is provoked, it is moſt apt to expel; and the blood being ſtirred by their continual beating, as alſo by its own nature, makes all that is therein more fit to flow. And who will not believe that excrements are carried through the arteries, who conſiders the flowing down from the ſpleen, in which there being five times more arteries, than there are veins, truly it is neceſſary that that ballaſt of the ſpleen be carried out through the Arteries.

The four, *Lumbares* or loin-arteries [γγ] ariſe out of the backſide of the trunk of the great artery, all along as it paſſes through the region of the loins. They run through the common holes in the rack-bones of the loins, and to their marrow, and alſo into the neighbouring muſcles. And at the ſide of the marrow, after they have entred the rack-bones, they climb up on both ſides to the brain together with the veins of the loins. But they are all equally big, if you except thoſe two, which iſſue out near to the *Os ſacrum* or holy-bone, which are not only derived into the rack-bones to the marrow, and to the muſcles thereabout, but are alſo ſent overthwart throught he *Peritoneum*, and muſcle of the *Abdomen*. The two laſt are by ſome called *Muſculæ ſuperiores* the upper muſcle-arteries, and are diſtinguiſht from the *Lumbares*. And theſe are the arteries, which if we obſerve, we ſhall eaſily give the reaſons of many things, of which Phyſicians do ſtill diſpute very hotly; but eſpecially of that moſt difficult queſtion, which is controverted among Phyſicians, by what ways, and in what manner the colick ends in a palſie or in the falling ſickneſs. For we have the obſervation in *Paulus Egineta lib.* 3. *c.* 43. where he ſays: the colick, as it were by a certain peſtilent contagion, ended with many in the falling ſickneſs, with others in a reſolution of the joints or palſie, their ſenſe remaining; and they who fell into the falling ſickneſs, for the moſt part died; but they who fell into the palſie, were moſt of them preſerved; the cauſe of the diſeaſe being carried to another place in the ſolution. For the humor that cauſed the diſeaſe, came back out of the colick gut through the meſenterical arteries, from whence being afterward tranſported into the trunk of the great Artery, it came alſo to the *Lumbares* or arteries of the loins, which ſwelling with blood preſt together the neighbouring nerves, from which came the palſie in the feet. And this we have often obſerved, as well in our ſelves, as in others, eſpecially in former years, when theſe diſeaſes at *Padua* were Epidemical. Yet the Pallie is not always a perfect one, but often (as I am wont to call it) imperfect, becauſe the power to walk is not wholly taken away, but the diſeaſed ſtand on their feet with a great deal of difficulty. Many at that time being deceived in the knowledge of the diſeaſe, miſtaking this for a great weakneſs of body contracted by their ſickneſs, endeavouring to take it away by eating and drinking largely, but in vain. This alſo is the cauſe, why the Falling-ſickneſs, and Lethargies too, as we have oft-times ſeen, follow after the Colick, becauſe the matter being ſent over from the Meſenterick arteries to thoſe of the loins, may eaſily go from them into the brain, to which thoſe very veſſels are carried.

Lumbares.

How the Colick diſeaſe ends in a Palſie or Epilepſie

But the trunk of the great artery, when it is come to the laſt rack-bone of the loins, having taken its journey all the way, which we have ſhewed, under the hollow-vein at the left ſide, here gets above the vein, leſt it ſhould be worn away in that continual motion by the hardneſs of the holy-bone. But it is divided, no otherwiſe than the hollow-vein is into two notable branches [S.S.] which are called by Anatomiſts the Iliacal arteries, from their ſituation, and being carried downwards obliquely to the thigh reſemble the Υ of the Greeks turned upſide down. But they alſo juſt like the Iliacal veins, to which they are exactly anſwering, before they be implanted into the thigh, ſhoot out a pretty number of branches. But from the lower ſide of the artery before the Iliacal branches be divided, iſſue forth *ſacræ* the holy arteries, [ϑ] which are notable ones, and carried downward, leaning upon the holy-bone, paſs through the holes thereof, and run to the marrow and backſide of the bone. And through theſe alſo there is a way for the matter, that makes the Colick to cauſe the Palſie of the legs.

Sacræ.

After this a little below the diviſion of the Trunk, the Iliacal arteries are ſubdivided into two branches, one of which is the inner and leſs, the other outer and greater. *The leſs and inner* [T] iſſues out two propagations, one from its outſide, the other from its inſide. *The outer* [ε] is commonly called *Muſcula*, by us more directly *Glutæa* the muſcle of the buttocks, becauſe it runs down with its name ſake vein, betwixt the holy and hip bones, where they part one from another, and ſcatters many twigs into the muſcles which lie upon the *Os Ilium*, or hanch-bone, called *Glutæi*, or the muſcles of the buttocks; becauſe they are the authors of them.

The inner is called *Hypogaſtrica* [ζ] which is very notable, and large, and being carried directly down to the lower ſide of the holy-bone, it affords certain propagations in men to the bottom and neck of the bladder, as alſo to the ſtrait gut, which alſo may be called the Hæmorrhoidal arteries; but in women; to whom this branch is ſomewhat larger, it diſtributes a great number of propagations, beſides thoſe to the forenamed parts, into the lower region alſo of the bottom of the womb, and likewiſe into its neck. Hence we may gather the reaſon, why, if the womb reach to the middle of the hip, Convulſions are cauſed, as *Hippocrates* witneſſeth, *lib. de natura muliebri*. As alſo if the womb fall down to the hip, why the monthly flowers are ſuppreſt, and a pain is cauſed in the ſoftneſs of the ſides, and in the loweſt belly. For the blood which nature drives to the womb, cannot be laid in there, the arteries being preſt together with the falling down of it; ſo that neceſſarily flowing back, it fills the neighbouring veins and arteries, which ſwelling up cauſe theſe pains, for we have oft-times ſeen in diſſections, theſe veins ſo ſwoln, that they have been ſeven fold bigger then themſelves. Hence alſo a reaſon may be given of the thirty ſecond Aphoriſm of the fifth ſection in the ſame *Hippocrates*, where he witneſſeth, that a woman vomiting blood is rid of her diſeaſe upon the iſſuing

The diviſion of the Iliacal arteries into an inner and outer branch.

1. *Glutea.*

2. *Hypogaſtrica.*

issuing forth of her Terms. Which happening by the consent of all, by revulsion or attraction of the humour to a contrary part, and that not by the benefit of the Veins, because the veins of the Stomach arise out of the Gate-vein, but they of the Womb from the hollow one; there is no other sympathy to be sought for, than that which is caused by the Arteries, especially when the Hypogastrick or Artery of the lower part of the lowest belly is not far distant from the Cœliacal, or Artery of the Stomach. Hence likewise a reason will be given of the Aphorism that follows this, wherein he judgeth the *Hæmorrhagia* or abundant issuing forth of bloud at the nostrils to be profitable when the monethly Courses do fail. The remaining part of the lesser Iliacal Artery descends, and brings forth the Umbilical or Navel Artery [ϖ], which is carried down near to the length of the great Artery, and is tied with strong membranes to the sides of the bladder of urine. But it looses its hollowness in those that are once out of the womb. After this [θ] like the Iliacal vein which is joined to it, it goes through the hole of the share-bone or *Os pubis*, which before it be past, it takes to it a propagation issued from the outer Iliacal branch, and so goes out of the hole, and being departed from it spends it self, in like manner as the inner Iliacal vein does upon the muscles; partly those with which the hole is stopt; and partly those which arise from the share-bone. At length being terminated at the middle almost of the length of the thigh, the end of it meets [ο], and is united with the ends of the branches [ι], of the inner Muscle-artery of the Leg, of which we shall speak in the next Chapter.

Arteria umbilicalis.

Propagations of the outer or greater Iliacal branch.

1. *Epigastrica*, or the Artery of the upper part of the lower belly.

Pudenda, or the Artery of the Privy Parts.

The *greater* or outer Iliacal artery [V] produces likewise two propagations, the first of which [i] is called *Epigastrica*, which arising from the outside of it, a little before it passes through the *Peritoneum* or rim of the belly, is reflected upward, and ascends by the inside of the strait muscle, till about the Navel it be inoculated with the descendent Mammary Artery. The other [λ] is called *Pudenda*, which is a little inner propagation, being not divided into so many branches, as the vein of that name is. But it arises presently after the Artery is gone out of the *Peritoneum*, and being carried overthwart along the commissure or joining together of the share-bones, is spent at the privy parts upon the skin of the Yard. That which remains of this Trunk, goes into the *crus* [X] whereof we shall now speak.

CHAP. IV.

The Propagations of the outer Iliacal branch, which are distributed through the Crus, *or great foot, containing the thigh, leg, and foot.*

The Trunk of the Crural Artery and its propagations ere it be divided.

After that the outer branch [V] hath propagated the fore-mentioned branches, it departs out of the *Peritonæum* or rim of the belly, and at the groin is carried into the *Crus*, by the same way which the crural vein takes, under which it goes, and is joined in company therewith every where, and so it makes the Trunk of the Crural Artery [X] (as we will always call it). But presently after it hath got beyond the *Peritonæum*, it issues forth a propagation from the out-side, which is called *Muscula cruralis exterior*, the outer Muscle Artery of the *Crus*, which being carried downward is propagated into the Muscles that cover the fore-side of the bone of the thigh. Sometimes over against this, but oftner a little below, yet on the in-side another is brought forth, called

1. 2. *Muscula cruralis interna*, the inner Muscle-artery of the *Crus* [ ] which is distributed in many branches through the third bending Muscle of the thigh, called *Triceps*, and those on the inside of the thigh, as far as the Knee; the ends of which branches are joined with the end of the inner Iliacal Artery, which we told you descends through the hole of the share-bones to the *Crus*. These propagations being dispatched away, the Crural Trunk descends from the Groin, together with the crural vein; and is so bent backward near to the bone of the thigh, that when it is come to the ham, it stands betwixt hindmost heads of the thigh. For prudent Nature does always observe this, to carry down the Vessels about that side of the joint where the bending is, lest if they should go on that side whereon the joint is extended, they should be compress. But in the very mid-way as it were, as it runs down through the thigh, it sends out a propagation [π] which breaking into more surcles, runs out through the Muscles that are seated on the back side of the thigh, together with the ham-vein, and at length descending through the ham (whence it is called *Poplitea* the ham-artery) is distributed with many

3. 4. sprigs into the Calf of the leg. But whilest it stays in the ham it sends out a propagation [ρρ] on each side to the sides of the joint of the Knee, which then sinking deeper, are consumed partly in the joint it self, partly upon the Muscles called *Gasterocnemii* that make the Calf; from whence they are called *Surales*, the Arteries of the Calf.

After that the Crural Trunk lies in the Ham [Y], it sends forth a propagation from its out-side [σ] which runs down near to the *Fibula* or lesser bone of the leg, and is hid betwixt the Muscle that moves the foot outward, and the second bending Muscle of the Instep, and distributes it self into the rest, that lie on the fore-part of the leg, as far as they are fleshy, and till they begin to be contorted by the outer ankle. A little under this same another Artery [τ] is brought forth out of the back-side of the Trunk, which runs down as far as to the mixing together of the tendons of the Calf-muscles. Then another [υ] issues out of the same back-side of the Trunk, but under the second, which descending and passing through the transverse ligament, runs down by the top of the foot, and is diffused into the Muscles that move the toes outward. The remainder [Γ] of the Trunk is carried downward by the back-side of the leg, and about the inner ankle offers a surcle [φ] to the foot, which goes to the muscle of the great toe, and creeps through the top of the foot. But the Trunk it self lying hid among the tendons of the Muscles of the toes is cut [χ] into two branches; of which the inner [ψ] bestows two surcles upon the great toe; two upon the fore toe, and one upon the middle; the outer [ω] two upon the little toe, and two upon the toes next to it, on the lower side. But although the progress of the Arteries be for the most part such, as we have described, yet what we have said formerly of the Veins, that their distribution varies much, not onely according to the diversity of bodies, but also of sides in the body of the same man, is true also of the Arteries, which in divers men are diversly distributed.

An

An Explanation of the TABLE *of the* ARTERIES.

This Table compriſes the Delineation of the great Artery, entire and free from all the Parts.

A *THe large beginning of the great Artery, where it iſſues out of the left ventricle of the heart: but preſently after its riſe, and before it yet falls out of the* Pericardium *or purſe of the heart, it*

a a *ſhoots forth the two Coronary Arteries* a a, *which incompaſs the baſis of the heart in manner of a Crown.*

But preſently having paſt the Pericardium, *it is divided* B *into two trunks; one*

B C *of which is the aſcendent* C, *the other the deſcendent one* Q.

DD *The Aſcendent trunk* C, *is by and by divided into the two ſubclavian Arteries* D D, *both which when they have attained to the firſt rib, ſcatter many propagations, partly from the higher partly from the lower ſide.*

From the lower ſide iſſues Intercoſtalis

b ſuperior, *the upper Artery between the ribs* b, *communicating particular twigs to the diſtances of the four upper ribs.*

From the higher ſide iſſue three. The firſt

c *is* Vertebralis, *the Artery of the rack-bones* c, *creeping on by the tranſverſe proceſſes of the rack-bones of the neck, as far as to the ſkull. The ſecond* mammaria, *the Artery of the*

d *dugs* d, *which deſcending under the breſt bone, runs out as far as to the ſeat of the navel, and diſtributes ſprigs into the diſtances of the griſtles of the true ribs, and then into the muſcles that lie upon the breſt; at length about the navel it joins by* anaſtomoſis *or inoculatoon* x, *with the aſcending* Epigaſtrick *Artery* 1. *The third* Cervicalis, *or the Artery of the back ſide of the*

e *neck* e, *is propagated to the muſcles on the back ſide of the neck, as far as the nowl of the head.*

Theſe branches being iſſued out, the ſubclavian Artery goes to the arm-pit, and takes

E *the name of* Axillaris *about* E, *and ſo is diffuſed into the arm. Yet before it enters thereinto, it ſhoots out ſome twigs from both parts of it: from the lower three, of which*

f *the firſt* f, *is called* Scapularis interna *the inner blade Artery, becauſe it is ſpent upon the muſcles that cover the hollow ſide of the ſhoulder-blade. The ſecond is* Thoracica

g ſuperior, *the upper cheſt Artery* g, *diſperſed into the muſcles on the foreſide of the cheſt.*

h *The third* h, Thoracica inferior, *the lower Artery of the cheſt, which deſcending along the ſides of the cheſt, is inſerted into the muſcle called* Aniſcalptor, *that moves the upper part of the arm backward. Betwixt* g *and* h, *a little branch is placed, one of them which here are diſſeminated into the glandules of the arm-pit. From the upper part*

i *iſſues one* i, *called* ſcapularis externa, *the outer-blade Artery, being diſpoſed of into the*

FF *muſcles, on the outſide of the ſhoulder-blade.*

In this place the axillary Artery changes

G *its name, and is called* Brachialis, *the trunk of the Arm that is undivided as far as* G,

l m *ſcattering two twigs* l *and* m *into the muſcles that cover the bone of the upper part of the*

n n *arm on the back ſide; and two other* n n, *one of each ſide about the bending of the cubit.*

The parting in twain of the Brachial Artery under the bough of the cubit, into an

H I *outer* H, *and inner branch* I.

The outer branch of this diviſion, or Radius, *running ſtraight along the* Radius *or*

o *leſſer bone of the cubit to the wriſt, and diſtributing a branch* o *into the muſcles ſeated betwixt the firſt bone of the thumb and that of the* metacarpium *or after-wriſt, which ſuſtains the fore-finger, and then three other*

p p p *p p p; which are diſperſed into the firſt outer fingers, the thumb and the two fingers next thereunto.*

I *The inner branch or* Cubiteus *paſſing along the greater bone of the cubit, is at length conſumed in a double branch upon the two inner fingers, the ring-finger and the little one.*

L *The remaining part of the Aſcendent*

M M *trunk, which near to the upper part of the breſt-bone is cleft into two branches* M M *called* Carotides, *or the ſleepy arteries. Theſe tend directly upward by the ſides of the neck, and being come to the chops are divided into*

N O *two branches about* N, *one of which is the outer* O, *the other the inner* P.

† *The outer* Carotis *propagates twigs* † *to the* Buccæ *or cheek puffs, and to the muſcles of the face; but about the ear it is cut into*

q *two branches, a foremoſt one* q, *which is carried through the Temples; and a hinder one*

r r, *that is diſſeminated along the back ſide of the ear under the ſkin.*

P *The inner* Carotis, *going to the ſkull is*

ſ *divided near to the baſis thereof into two branches; of which the one and leſſer* ſ, *which goes into the* ſinus *on the ſide of the thick membrane, is cut off here, whereabout it ſinks*

t *into the ſkull: the other and greater* t *enters the ſkull through a peculiar hole bored for it in the temple bone.*

Q *The Deſcendent Trunk of the great Artery, reaching downward to the rack-bones of the back.*

From this before its diviſion at R, *many propagations are ſcattered, which we will now rehearſe in order.*

u u u *Firſt then are* Intercoſtales inferiores, *the lower arteries between the ribs* u u u, *diſtributed to the diſtances of the eight lower ribs, from which propagations are brought to the marrow of the back-bone, and to the muſcles that grow to the back and cheſt. After this the trunk paſſing on, diſtributes two*

x x *more, called* Phrenicæ, *the arteries of the midriff* x x, *becauſe they are diſpoſed of into the midriff. Then follows,* Cœliaca *or the ſtomach-artery. After that,* Meſenterica ſu-

y perior, *the upper artery of the Meſentery* y, *reaching out into the Guts* Jejunum *and*

. Ileum, *as alſo into that part of the* Colon *which reaches from the hollow of the Liver as far as the right Kidney. After this the*

z Emulgent Arteries z, *propagated to the*

kidnies. Then Spermaticæ, the Seed Arteries
α ries α, going to the teſticles, under which is
Meſenterica inferior, the lower Artery of
β the Meſentery β, departing into the left ſide
of the Colick, and into the ſtrait gut, and
γγγ making the hæmorrhoidal Arteries. Laſtly,
Lumbares, the Arteries of the loins γ γ γ,
which going to the rack-bones of the loins
joint by joint, are diſtributed into the peritoneum
or rim of the belly, and the muſcles
growing to the rack-bones.

R These branches being iſſued forth, the
trunk about the fifth rack-bone of the loins is
SS divided into two branches S S, called the Iliacal, both which are again broken into two
other, an inner branch T, and an outer one V.
But before this diviſion in the very parting in
twain of the trunk, ariſes ſacra, the holy
δ Artery δ, diſtributed into the holes of the Os
ſacrum, or holy bone, to the marrow thereof.

T The inner Iliacal Artery before it falls out
of the peritoneum, iſſues forth two propagations: from its outer ſide, that called Glu-
ε tæa ε, diſtributed into the muſcles of the but-
tocks; from its inner ſide, that called Hypo-
ζ gaſtrica ζ, going into the bladder and yard,
and in women alſo to the bottom of the womb.
After this it runs down, and ſends forth the
ηη umbilical arteries η η, that tend upward near
to the length of the great artery. The re-
θ mainder θ, taking to it a propagation from
the outer Iliacal Artery, ſlips down through
the hole of the ſhare-bone into the Crus, the
end of it joining about ο, with the inner muſcle
artery of the Crus ν.

V The outer Iliacal Artery likewiſe before it
is going forth of the peritoneum, produces
ι two. The firſt is called Epigaſtrica ι, digeſted into the muſcles of the Epigaſtrium, and
the ſtraight ones of the Abdomen, where it is
κ joined by inoculation κ, with the deſcending
mammary artery d. The other called Pu-
λ denda λ, goes to the privy parts.

X In this place the outer Iliacal artery having paſt the Peritoneum, enters the Crus,
and begins to be called the Crural Trunk,
which iſſues out more propagations. The
firſt is Muſcula cruralis exterior, the outer
μ muſcle artery of the Crus μ, that is propagated into the muſcles that cover the foreſide of
the thigh bone. The ſecond is the inner
ν muſcle artery of the Crus ν, digeſted through
the third bending muſcle of the thigh; and
thoſe muſcles that are on the inſide of the
thigh; the ends of it are joined with the ends
ο of the inner Iliacal artery about ο. The third
π is Poplitea, the ham-artery π, running out
into the muſcles, on the back ſide of the thigh.

ρρ The fourth is Suralis, the calf artery ρ ρ,
which is double, iſſuing out there, where the
crural trunk is hid betwixt the two lower
heads of the thigh, and ſpreading out on both
ſides into the joint of the knee, and the two
heads of the firſt extending muſcle of the
foot.

Y Here the great artery lies in the ham, where
it is divided into branches of unequal bigneſs.

σ A ſprig iſſuing from its out-ſide, and
reacht out to the fibula or leſſer bone of the
leg, betwixt the muſcle that moves the foot
outward, and the ſecond bending one of the
inſtep.

Z The trunk deſcending by the back ſide of
the leg.

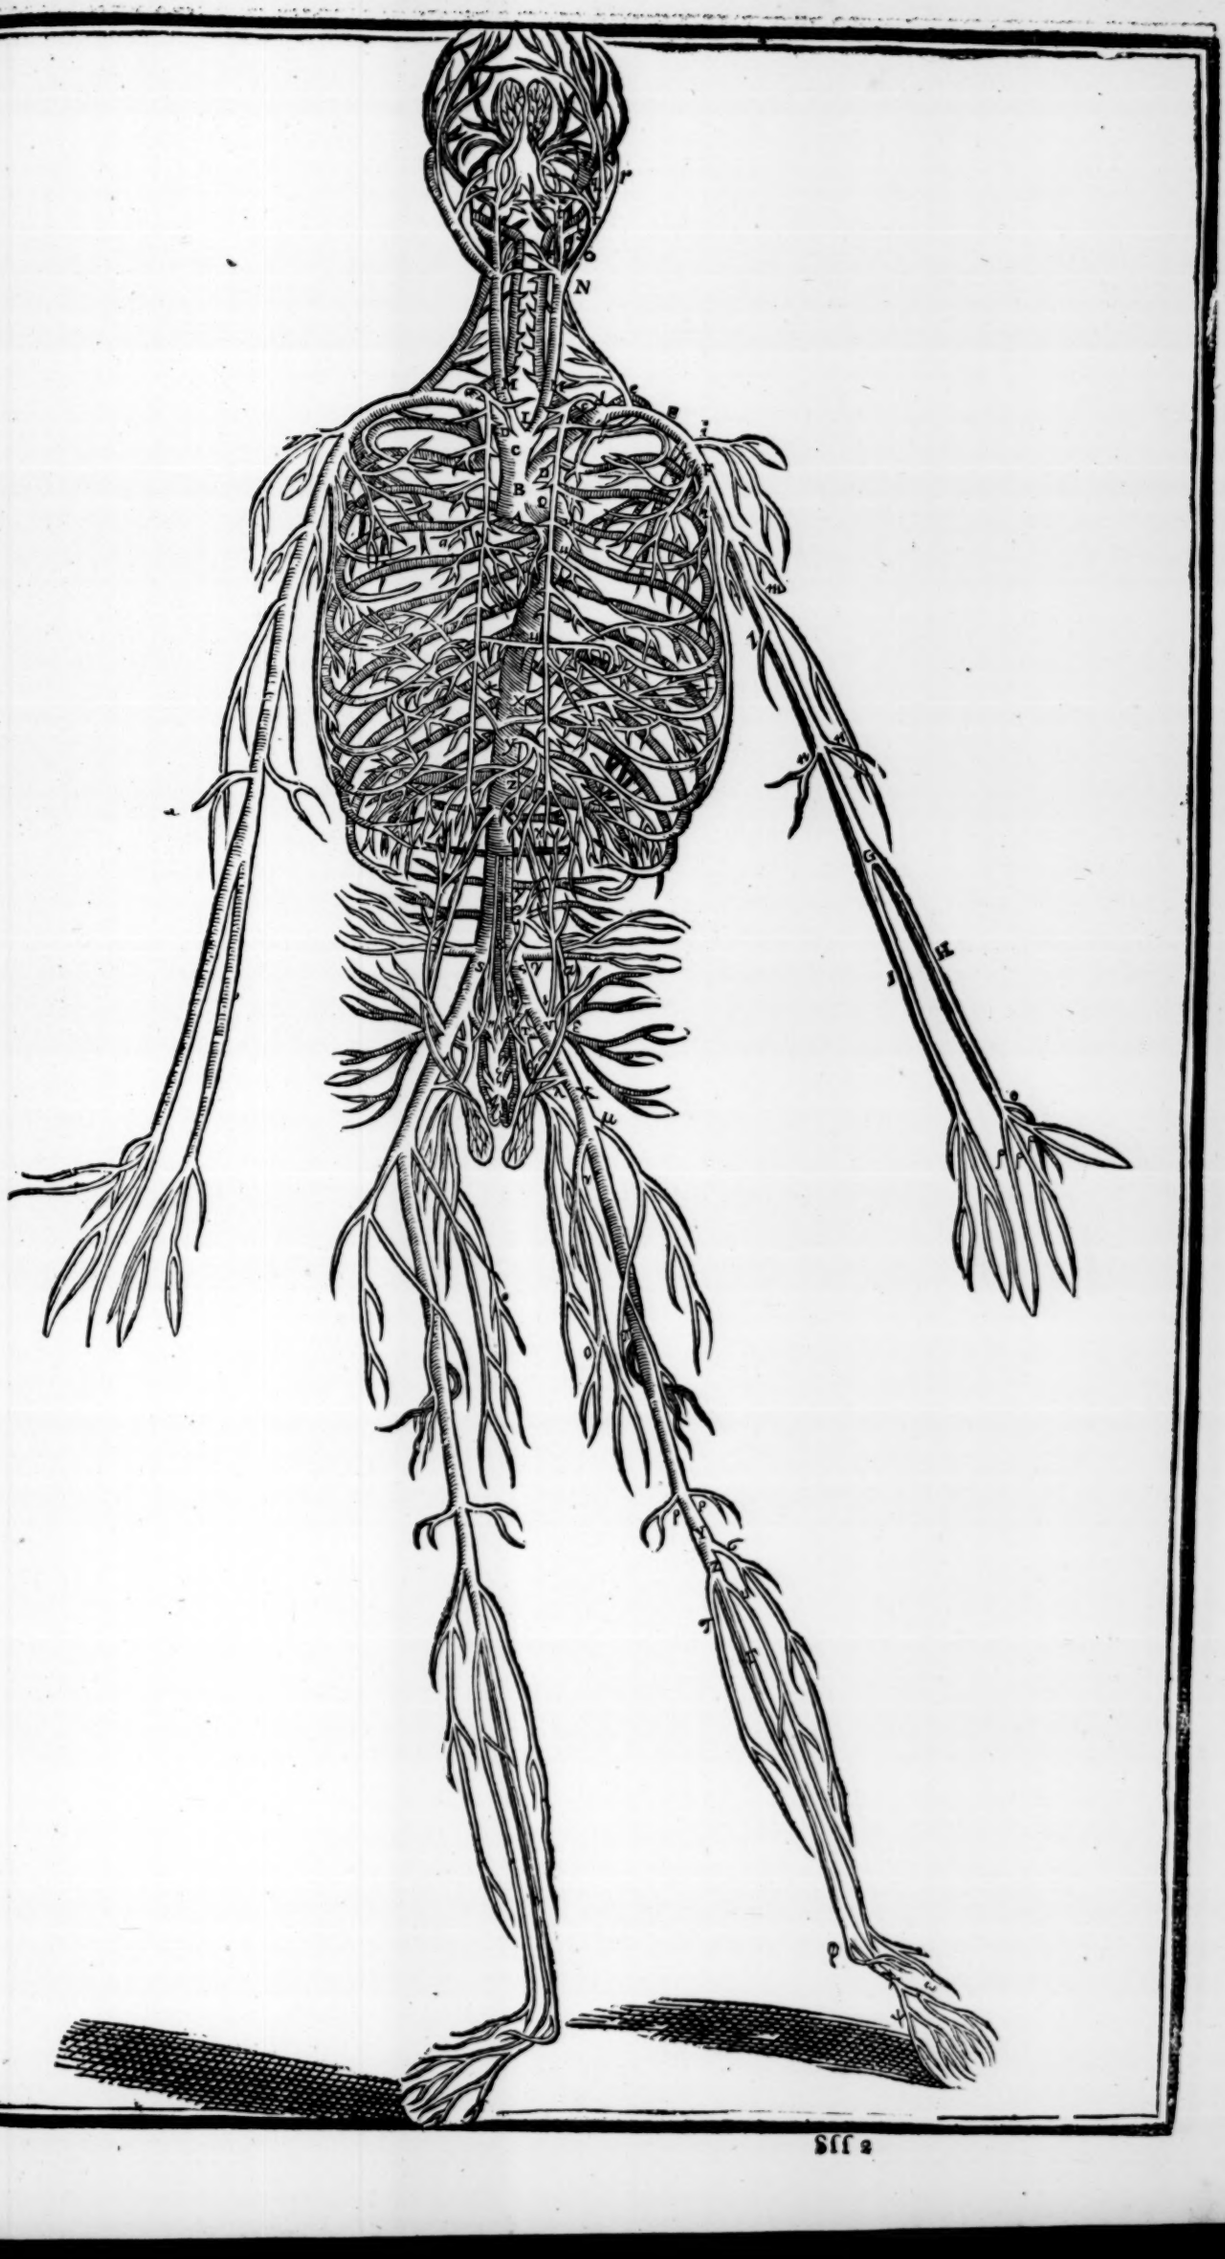
τ A higher branch iſſuing out of the back
ſide of the trunk.

υ A lower branch iſſuing out of the back
ſide of the trunk.

Γ The remainder of the trunk deſcending by
φ the leg, which offers a little branch φ to the
inner ankle.

χ The diviſion of the trunk χ, into an inner
ψ branch ψ, that is propagated to the great toe,
ω and the two next; and an outer ω, propagated to the little toe, and the two next to that.

The



TRACT. III.
CONCERNING THE NERVES.

CHAP. I.

Of the Nerves of the Brain.

AMong those eight Conjugations which arise from the Marrow of the Brain drawn out in length, whilest it is yet contained within the limits of the skull, that offers it self in the first place, which makes the *Optick Nerves*, that are so famous among all the Masters of Anatomy. For these are not onely the biggest, if thou look upon their thickness; but also without doubt the softest of all the Nerves of the body. But they arise out of the middle of the *basis* of the brain, on the fore-part, according to the opinion of the Ancients, but indeed, if the head be turned upside down in the dissection (which is the proper way) out of the beginning of the former trunks of the spinal marrow, that their original is as it were in the back part of the head, and presently each of them by little and little making towards its mate, they are united (not onely joined, as some would have it) over the saddle of the wedge-bone, and making one common square body, the marrow within them being mixed together. After that presently separating again, each of them is carried obliquely into the eye of its own side, entering the orb thereof through the first hole of the wedge-bone, and entering at the very centre of the eye. In this pair we may easily shew those two membranes, which are derived to the Nerves from the two Meninges of the Brain, as also the very inner marrowy substance, which comes from the body of the Brain. Yet the Nerve it self is not cleft into more branches, (as the other are) but lying hid makes the coats of the eye; and out of the thick membrane it forms that coat which is called *Cornea*, the horny one; out of the thin membrane that is called *Uvea*, the Grapy one; but out of the substance of the marrow the *Retina*, or Coat like a Net. For as soon as it is arrived at the centre of the eye, these membranes are displayed, and making a sphere contain the humours in them. These Nerves convey the faculty of seeing to the eyes; wherefore, they being obstructed, or compress, a blindness ensues. *Galen* hath ascribed holes to them, and *Herophilus* for the same reason called them Πόρος Ὀπτικὸς, the passages of the sight, teaching that there is a sensible hollowness plainly to be seen in them, whom for all that almost all Anatomists do contradict. But I have heretofore shewed in the University of *Padua*, and in a great Assembly of them, that there are certain passages continuing from the beginning of these Nerves, as far as to the place where they meet together, and presently after that vanish away toward the eye. And therefore I shewed that the Ancients may not onely be excused, but also that they writ the truth, especially when none of them have said that these passages were great, but onely such as did not altogether escape the sight, if one would make trial thereof in a great living creature, and by a clear light, and presently after it is killed. For *Galen* himself requires these three conditions, 7. *placit.* 4. and *lib. de oculis*, that one may see them. But before we depart hence, I will bring in some Problems, that besides the History it self, I may also shew the use of that which I say, especially when in our time they onely for the most part follow the study of Anatomy, who imploy their industry in the behalf of Physick. The first therefore shall be, what is the cause that many upon sneezing often (especially when they have provoked it for the nonce) have of a sudden fallen blind. This happens, either because the branches of the sleepy Arteries, which are so near to the Optick Nerves, that they touch, are filled, and being so, press together those Nerves; or else because a copious, and that a phlegmatick humour hath fallen out of the brain into the Optick Nerves, and obstructed them. I have seen those that have been blind through the first cause, sometimes cured by a Seton; But I never remember that any, in whom this arose from phlegmatick humours, have recovered, except one having the French Pox, who being anointed with Quicksilver, all the humors melting away, was restored to health. But it is not the part of a good and pious Physician to make use of those things, which being full of danger, may do more harm, if they prove hurtful, than they can procure good, if they be profitable. And truly it is better not to cure blindness, than to cause death, although often-times Rashness helps them, whom Reason helps not, as the most elegant of Physicians *Celsus* says elegantly. In the mean time in diseases of the eyes, they who practise Physick, may learn rather to administer those things which bring the phlegm out by the Palat, then to draw the noxious humours to the nostrils. That I may conceal besides the danger which they avoid, that more profit arises from the Medicins that void the phlegm out of the head through the mouth, which both long experience hath hitherto taught, and Anatomy persuades, when the Optick Nerves in their original are not far distant from the palat, but farther from the spongy bone; and it is a preternatural way, by which the humours are carried, as hath been already demonstrated by the learned *Vesalius*. Then it is disputed by what means the Eye can fall out of its orb, the Optick Nerve not being broke, whereof we may have very many histories. But it is not hard to give an answer, to wit, that the Nerves may be very much extended in length. Whilest therefore this Nerve receives much moisture in the inflammations of the eyes, it easily comes to pass that it is slackned; but the muscles themselves

Problems

1

2

ſwelling very much, when they can no longer be contained in the orb, leap forth out of it. For this falling forth of the eyes moſt commonly proceeds from inflammations: ſuch as are the ſtories of
3. the moſt learned *Vega*, who cured a Woman in this caſe by procuring the flux of the terms, and a young man by digeſting Ointments. But the queſtion is very worthy to be made mention of, and that gives me an occaſion to explain it, which I have read in ſome Authors, that ſuch as were before blind, upon receiving of a wound overthwart the fore-head, and ſome upon a great looſneſs of the belly ariſing on a ſudden, have received their ſight, and that preſently. The cauſe of their blindneſs was no other than the compreſſion of theſe Nerves proceeding from the neighbour-veſſels, to wit, the Veins and Arteries being ſwollen with bloud, which ſuch a wound preſently emptied. Wherefore I alſo ſometimes, and not without ſucceſs in that *ſpecies* of blindneſs which the Barbarians call *Gutta ſerena*, open the middle vein of the fore-head, out of which I draw bloud ſo long, till it ceaſes to run of its own accord.

The ſecond pair. Its original. The ſecond pair ariſes, as the ancient Anatomiſts ſay, from the ſides of the *baſis* of the fore-part of the brain, near to the original of the firſt pair. But the new diſſection ſhews, that it iſſues out at the inſide of the beginning of the ſpinal marrow, and that they are ſo united in their original, that they make one common angle, which is the cauſe why both the eyes are moved together to the ſame ſides. It is much ſmaller, if you compare it with the firſt pair, and harder, and goes out of the skull through the ſecond hole of the wedge-bone, which is ſomewhat long, and ſo it enters into the orb of the eye. By and by it is divided into many ſprigs, which go to the muſcle of the eye; and the firſt climbing up above the firſt pair or the Optick Nerves, is diſpoſed of into the two muſcles, as well that which lifts up the eye-lid, as that which lifts up the eye. Another very conſpicuous one is diſſeminated in many ſurcles into the muſcle which moves the eye inward. The third, no contemptible one neither, being divided firſt into two fibres, and by and by into more, is ſent into the muſcle that draws down the eye. The fourth, into the lower or leſſer of the oblique muſcle that rowls the eye about toward the outer angle; at length it iſſues out ſome thin fibres, which being joined with the firſt pair are diſtributed to the outer membranes of the eye, ſo that this ſecond pair is propagated onely to four muſcles of the eye, and to that which lifts up the eye-lid.

Branches. 1. 2. 3.

uſe. The uſe of this pair is to impart the faculty of motion to the muſcles of the eyes.

The third pair. Its original. Branches. 1. The third pair ariſes with a very ſmall Nerve out of the lower, and hinder part of the marrow of the brain, and runs directly forward under the *baſis* of the brain, being tied to the ſecond conjugation; together with which it enters into the Orb of the eye through the ſaid ſecond hole of the wedge-bone. By and by it is divided into four branches, of which the firſt offers a little branch to the upper and greater of the oblique muſcles of the eye, or that called the muſcle of the Pulley, and then falling out through the hole of the fore-head bone above the orb of the eye, in the skin and muſcle of the fore-head, which ought rather to be called the muſcle of the eye-brows. This

An obſervation. branch is diligently to be taken notice of; becauſe I have long ſince obſerved, that it being hurt with a ſlight wound, the eye-lid fell down, whileſt the muſcle of the eye-brow by reaſon thereof fell into a Palſie. I have ſeen alſo the ſame Palſie cauſed by cold and narcotick Medicins, ſomewhat unreaſonably applied for the procuring of ſleep. But hence alſo a reaſon may be rendered, why *Hippocrates*, *Prognoſtick* 1. reckons it among the ſigns of death in acute diſeaſes to ſleep with the eyes half open. For this is an ill ſign for that reaſon, becauſe it ſignifies that the Nerves are very much dried, and ſo the brain it ſelf, whence it comes to paſs that they who are ſo diſeaſed, for the moſt part ſuffering Convulſions afterward die. In ſome alſo a fore-runner of the Falling-ſickneſs is wont to ariſe from the ſame cauſe in the eye-lids, the eyes and the whole face, when this third pair is pluckt by the humours begetting the Falling-ſickneſs, and ſo a convulſion of the eyes and face is
2. cauſed. The ſecond branch is carried downward, and falls out through the hole of the fourth bone of the upper Jaw, which is under the orb of the eye, and preſently ſcattering into more propagations on the fore-part of the face, is ſpent upon the muſcles that move the upper lip and wing of the noſe outward, as alſo upon the lip it ſelf, and the gums of the teeth, called *Inciſorii*, or ſhredders. The third is ſent through the hole of the ſecond bone of the upper Jaw, behind the caruncle that is placed in the inner angle of the eye, to the wide cavity of the noſtrils, being ſpread throughout its coat, whereby it comes to paſs that it is endued with a very ſharp ſenſe, and being but lightly toucht cauſes ſneezing. The fourth goes out through that creviſe which is betwixt the firſt bone of the upper jaw and the wedge-bone, in the outer angle of the eye, or through the fourth hole of the wedge-

uſe. bone, and departs to the inner ſide of the temporal muſcle. The uſe of this pair is to convey the faculty of moving to the ſaid muſcles.

The fourth pair. Its original branches. 1. The fourth pair ariſes out of the marrow of the brain on the back ſide, goes out of the skull through the ſixth hole of the wedge-bone, and running ſtrait down, propagates three branches from it ſelf. The firſt is preſently after its going out of the skull, which being writhed ſometimes about in the manner of the tendrels of a Vein or Gourd, and united to two ſprigs of the auditory Nerve (of which we are to ſpeak next) afterwards diſtributes ſurcles to the temporal muſcle that lifts up the lower jaw, and that which moves it forward from the head, as alſo to the muſcles of the cheeks. After this the pair running farther down, iſſues forth a ſecond branch, which propagates ſurcles in order to the gums of the upper cheek-teeth called the grinders, and alſo to the teeth themſelves. The third branch iſſuing forth from the back-ſide of the Nerve, and entering the hole of the lower jaw-bone that is bored in the inner ſurface of it, at the original of the proceſſes, beſtows little branches in order to the roots of the teeth, and at length going forth through the fore-moſt hole in the outer ſurface is terminated in the lower lip, and skin of it. The remainder of this Nerve is ſpent upon the coat of the tongue near to the root, and gives it the power of diſtinguiſhing ſapors or taſting.

A Note. But note in this place, that theſe two pairs which we have now recounted, I ſay, the third and fourth are commonly reckoned for one by Anatomiſts, and that the third; but with this diſtinction, that they ſay this very pair ariſes with a double root; the one ſmaller, and the other thicker. They call

call that the ſmaller root, which we ſet down for the third pair; that the thicker, which we make the fourth. But we diſtinguiſh them, becauſe indeed they are not joined together, neither in their original, nor in their progreſs. But that which they account for the fourth pair, ſeems not to be diſtinguiſhed from the third; as *Valuerda* himſelf grants, *lib.7. Anatom.cap.4.*

The fifth pair iſſues out of the marrow of the brain drawn out in length, on that ſide whereon a part of the *cerebellum* or after-brain is joined to it, ariſing out of two Nerves, of which the one is ſofter, the other harder. Theſe go out of the membrane together, and enter the organs of hearing through the hole of the temple bone, that is bored in the ſtony proceſs thereof, being a large one and winding. After this that harder part goes forthwith to the fore-ſide, being carried through a peculiar channel, and returns backward again obliquely through the ſame bone, and departs into the firſt cavity of the inner ear. From thence being more reflected, it ſends forth two propagations, one higher, the other lower; but both paſs through their peculiar holes. The upper is carried through the tranſverſe hole of the ſame bone, through which alſo a little vein paſſes into the organ of hearing; and a little after it is come forth of it, it is joined with that branch of the fourth pair (as we have delivered, but as others commonly count the pairs of the third) which we told you was writhed about, like the tendrel of a Vine. The lower goes out through the third hole of the ſame bone, which is very narrow and winding; and being carried overthwart above the muſcle of the lower jaw, that moves it ſidewards, deſcends into the chops, having diſſeminated a pretty many propagations into the noſtrils. But forthwith it is joined with the propagation of the fourth pair, that reſembles the tendrel of a Vine, or that ſprig which goes to the tongue, from which it paſſes to the roots of the teeth and muſcles of the cheeks, as alſo to the skin that goes about the root of the outer, or little ear. Anatomiſts do believe, that by the means of the branch it comes to paſs, that they who are born deaf, are for the moſt part dumb alſo. But that ſofter part of this pair is carried together with the hard part; and when it is come to that firſt cavity of the inner ear, it is ſpread throughout it in manner of a membrane, and ſo it deſerves to be called the Auditory Nerve, as miniſtring all the ſpirits that ſerve for hearing.

The fifth pair. Its original. Its two parts. The harder. The ſoft part. Its uſe.

The ſixth pair ariſes ſomewhat more toward the lower and hinder part than the fifth, and not with one, but with many little Nerves ſevered from each other, which for all that are preſently joined together, although they do not cloſe ſo as to make one onely, but two diſtinct ones always, yet are they contained in one membrane, ariſing from the *Dura meninx* of the brain, which hath deceived many, ſo that they have accounted them for one. Being thus joined, they deſcend both together out of the skull, through the ſecond and third hole of the nowl bone; through which ſame the leſſer branch of the ſleepy Artery, and the greater of the Jugular vein enter into the skull. There being then two Nerves, the one in its egreſs inclines more to the fore-part of the ſaid hole, and is the leſſer of the two; the other to the hinder part, and is the greater. That preſently after its going forth of the skull, tends ſtraight downward to the muſcles of the tongue and chops, and to the parts placed in the mouth, upon which it is wholly conſumed.

The ſixth pair. Its original. The leſſer Nerve.

This on the contrary ſends its firſt propagation to the muſcles ſeated on the back ſide of the neck, eſpecially to the firſt muſcle of the ſhoulder-blade, called *Cucullaris* or the Cowl-muſcle, and then adhering to the ſeventh pair, and the aforeſaid Artery and Vein, by the benefit of certain membranes, it runs down to the ſide of the throttle, to whoſe muſcles, eſpecially thoſe ſeated in the inner cavity, it diſtributes ſurcles overthwart. Here many propagations of Nerves meeting together, and parting aſunder again, a certain texture is made, wherein knots are found not unlike to the glandules that are tied to the divarications of the veſſels; which was firſt obſerved by the moſt learned Anatomiſt *Fallopius*, who would have it reſemble the body of one alive. But the greater Nerve it ſelf going into the middle betwixt thoſe ſame veſſels which I ſpake of, is carried leiſurely from the throttle to the rough Artery, and running down at the ſide thereof, tends to the cheſt.

The greater Nerve, and its propagations.

But before it enters thereinto, it is divided over the hollow of the neck into two branches, of which one is the outer and leſs, the other the inner and greater. We ſhall now ſpeak briefly of the diſtribution and propagations of them, but ſo that being the right Trunk is diſſeminated into another manner than the left, we ſet down the Hiſtory of each by it ſelf; and firſt of the right, then of the left.

The branches of the greater Nerve.

The outer branch then of the right Nerve ſends out propagations preſently after the diviſion to the muſcle that bends the head, called *Maſtoideus*, as alſo to that of the bone *hyoides*, called *ſterno-hyoides*, and that of the *Larinx* or throttle, called *ſternothyroides*; after this it enters the cavity of the cheſt, and when it comes to the Axillary Artery, iſſues forth from its inſide ſometimes three, ſometimes two ſurcles, one under another, which are turned about the ſaid Axillary Artery, as it were an axel-tree, or (to ſay truly) a kind of pulley, and cloſing together make one Nerve, which being faſtned to the right ſide of the rough Artery, by the benefit of a membrane, runs back from the lower part thereof to the higheſt, and haſtes to the right ſide of the throttle, leaning upon a glandule which is placed at the root of the right ſide. Having paſt this, it is forthwith divided into many ſurcles, which are ſpent upon the muſcles of their own ſide, which are placed in the throttle, and have their heads downward, giving motion to them. And this Nerve is called *Recurrens*, the returning one from its progreſs, and is very famous among all, being ſo made by skilful Nature with great wiſdom, that it might be inſerted into the muſcles of the throttle, whoſe heads look downward, when all the Nerves that give motion, ought to be inſerted into the heads, and to look towards the end, not on the contrary. And becauſe the throttle is an organ of the voice, but the voice cannot be uttered without motion of the muſcles, that either open the cartilages of the throttle, or ſhut them; therefore theſe Nerves, which impart to the muſcles the power of moving and contracting themſelves, being either bound hard or cut off, it happens for that cauſe, that the voice is taken away. This may be very handſomely ſhewn in Dogs, or in a Hog, becauſe one continually makes a noiſe with barking, the other with grunting.

The propagations of the outer branch of the right Nerve.

1.

2.

The right recurrent nerve.

For

For one of theſe Nerves being cut off, half the voice is taken away; but both being cut, it is wholly loſt. The recurrent propagation being thus conſtituted, the outer branch running down obliquely
3. under the hollow of the neck, after that by the way it hath diſtributed ſurcles of an indifferent big-
4. neſs into the *Pleura*, or membrane of the ribs, and into the coat of the lungs, and given others to the
5. *pericardium* or purſe of the heart, and to the heart it ſelf, it deſcends farther within the duplication of the *mediaſtinum*, and near to the rack-bones is divided into two branches, which make the right Nerve of the left orifice of the ſtomach, are carried obliquely, and then piercing through the midriff, together with the gullet, to which for all that they afford never a branch, are conſumed upon the left orifice of the ſtomach, with many branches like a little Net, and ſo encompaſs it together with the left Nerve, that it ſeems wholly to conſiſt of Nerves. Hence there is ſo great a ſympathy of the ſtomach, not onely with the brain but with the heart alſo; that ſuch diſeaſes as pain the upper orifice, ſeem to be of the heart, and indeed ſo they are, the ſame heart ſuffering pain, beauſe of this Nerve being pained. And this is the true cauſe, to wit, the communion of this Nerve, not the nearneſs of both the entrails, as others ſay. The inner branch goes to the inner ſide of the root of the first rib of the cheſt, and cleaving to the Rack-bones under the *Pleura*, runs down through the roots of the reſt of the ribs, taking to it a little branch from every one of the intercoſtal Nerves that iſſue out of the back bone; then paſſing through the midriff with the Deſcendent Trunk of the great Artery it is carried as far as to the *Os ſacrum* or great bone, at the region whereof it iſſues out three propagations, which are diſtributed into the natural inner parts. The firſt goes to the lower membrane of the Kall, and deſcending through it is parted into three little branches, of which one is diſtributed to the right ſide of the ſame membrane, and to that part of the Colick gut that is joined into it: Another the leaſt of them, and a very ſmall one, to the guts *duodenum* and the *jejunum* about its beginning: the third to the bottom of the ſtomach on the right ſide, and to the upper membrane of the Kall, which is ſomething the larger. That which remains of this propagation
2. is ſpent upon the hollow part of the Liver and the bladder of Gall. The ſecond goes into the
3. right kidney, and the membrane thereof. The third, which is greater than either of the former, deſcending to the firſt rack-bone of the loins, reaches into the right ſide of the Meſentery and into the Guts that are tied thereto entering the center of the Meſentery in company of an Artery and a Vein. The remainder goes into the bladder, and in Women into the right ſide of the bottom of the Womb. But the outer branch of the left Nerve ſaving that in its deſcent it hath offered ſprigs both to the *Pleura*, or membrane inveſting the rib, and to the coat of the lungs, and that outwardly, as alſo to the purſe of the heart, and heart it ſelf inwardly, at that part of the Deſcendent Trunk of the great Artery, where it firſt iſſues out of the heart, and is bowed to the back bone, it ſends forth three ſurcles which returning to the ſaid Artery cloſe together into one Nerve, which is called *ſiniſter recurrens nervus*, the left returning Nerve, and in like manner as the right one, takes its progreſs upward, and is propagated into the muſcles of the *Larinx*, or throttle. After this it iſſues out a ſmall ſprig, which is diſtributed through the *baſis* of the heart, and coat of it in manner of hairs. Afterward the remainder deſcends inclining it ſelf obliquely to the right, and goes to the upper orifice of the Stomach, in the right ſide whereof it is diffuſed, as the right branch was before into the left ſide, being divided into many little branches in manner of a Net. From this a ſurcle is carried down along the upper part of the Stomach to the *Pylorus*, or lower orifice, which when it hath as it were interwoven with ſome ſprigs, it goes into the hollow of the Liver. The inner branch firſt of all takes to it propagations from the intercoſtal Nerves, and then paſſing through the midriff is divided into three. The firſt of them goes overthwart to the Spleen, and in the way ſhoots out two ſprigs; one, which is likewiſe ſent into the lower membrane of the Kall and part of the Colick gut, which is tied thereto; another into the left ſide of the bot-
1. tom of the ſtomach, and into the upper membrane of the Kall. The ſecond propagation goes
2. into the left ſide of the Meſentery, and the guts of that place; ſometimes alſo it iſſues ſprigs, which run out with the ſeminary veſſels through the proceſſes of the *Peritoneum*, or rim of the belly to the
3. teſticles. The third goes to the left Kidney, and the fat membrane thereof. The remainder of the
uſe. branch paſſes to the left ſide of the bladder and of the bottom of the Womb. The uſe of this pair is manifeſt enough, as being very notorious, when the outer branch beſtows little boughs upon the middle bowels, but the inner upon all thoſe of the loweſt belly, and the right branch upon thoſe of the right ſide, the left on thoſe of the left. Beſides this uſe it conduces by the returning branches alſo to the framing of the voice, by imparting the faculty of motion to the muſcles of the throttle.

The ſeventh pair. Its original. The ſeventh pair ariſes in the utmoſt part of the nowl-bone, where the marrow of the brain is ready to go out of the skull, and ſo is counted the hardeſt of all the Nerves that have their original within the skull. But it ariſes in ſome roots ſeparated from each other, which joining together on both ſides into one, it goes out of the skull through the fourth and fifth holes of the nowl-bone (which are planted betwixt that greateſt one, which opens a way for the deſcent of the ſpinal marrow, and that, at which the ſixth pair goes out) and preſently after its egreſs is involved in one common membrane with the ſixth pair, whence ſome not ſo diligently obſerving it, have believed that they were mixed one with another; and thus they deſcend together. When it comes to the root of the tongue, it diſtributes ſurcles into all the muſcles thereof, ſending over ſome alſo to certain muſcles of the bone *hyoides*, and of the throttle, as alſo to thoſe which take their beginning from the *appendix* called *ſtyloides*. The uſe of this conjugation is to carry down the faculty of ſenſe and motion from the brain to the muſcles of the tongue.

Its uſe.

The eighth pair. Its original. To theſe ſeven pairs, which are commonly ſo numbred, we add an eighth, which makes the Nerves of Smelling, by which a faculty is derived from the brain of apprehending the odors of things without. Theſe are commonly affirmed to ariſe out of the marrowy ſubſtance of the brain, in the *baſis* thereof, near to the firſt pair; but the new diſſection of the brain, and which is performed

performed by turning it upside down, hath taught us that they arise at the utmost sides of the brain, in that part which is above the holes of the ears, whereby it is manifest, that hitherto onely one half of them hath been shewn. They are very sharp at their original, and distant one from the other, but going forward by degrees, betwixt the uppermost and middle prominence of the brain, they grow thicker, and draw nearer one to another, and so at length they lie down above the *sinus* or cavities of the spongy bone within the skull. These are thrust into the mammillary processes of the brain: but *Galen* and *Marinus* (whom almost all Anatomists have followed) would not call them by the name of Nerves, although they altogether agree therewith in their colour, course, and use, because they neither have productions like the rest of the nerves, nor go out of the cavity of the skull: but truly they seem to me to commit no other a sophism than they who have expelled the teeth out of the number of the Bones, because they are not invested on the out-side with a membrane, as others are, although neither this makes any thing to the essence of the Bones, nor that to the essence of the Nerves.

CHAP. II.

Concerning the Nerves of the Spinal Marrow, properly so called, and first of those of the Rack-bones of the Neck.

The Spinal Marrow.

NAture, the wise Parent of all things, as she hath framed the Nerves, that they might serve for the carrying of the faculties and spirits that are generated in the brain, because the brain it self could not be diffused through the whole body: so when the same could not conveniently bestow Nerves upon all the parts, by reason of their too great distance, she made the Spinal Marrow, which is nothing else but the marrow of the after-brain and brain, extended through the long Conduit-pipe of the Rack-bones of the back. And therefore we having already viewed those Nerves which take their original from the marrow of the brain, whilest it is yet contained in the skull; it remains now that we take a view of them also which come from the spondyls of the Back-bone: But it is called Marrow, not that it hath any affinity by reason of its substance with the marrow of the bones, but because like Marrow it is contained within the Rack-bones; but the substance thereof is like that of the brain, which it self also *Plato* called Marrow; and it is named also the Spinal Marrow, or of the Back, to distinguish it from both those that are contained in the Back-bone, but either in the skull, as the brain, or in the hollowness of the bones, as that which is properly called Marrow. This substance is covered with two membranes, no otherwise than the brain it self is, from whence it takes its original, the one thick, the other thinner, which are invested with a certain third strong and membranous covering, that *Galen* thought to be the ligament of the Rack-bones. But it was made to that end, that it might distribute sense and motion to the Muscles and Membranes, to which those pairs of the brain do not reach. Therefore when there is a good number of Nerves arising therefrom, yet we shall easily reduce them to some certain *Classes* or Companies, if we say that they all make up thirty pairs, of which seven belong to the marrow whilest it is carried through the Rack-bones of the Neck; twelve whilest it is carried through those of the chest; five through those of the loins; and lastly, six to that which is contained in the holes of the *Os sacrum*, or great bone. But these Nerves go out through the holes of the Rack-bones, and either with a double original on the fore and hinder part, as it happens in the two first conjugations of the neck, and five of the great bone, which arise not from the sides, that is, from the right or left part, but issue forth two branches before and behind; or else with a single one, through the hole bored in both sides of the Rack-bones, as happens in all the rest of the pairs, in which one Nerve issues from the right side, the other from the left. But the first and second pair have a double beginning, lest if they should arise with a single one, that being somewhat thicker might have been hurt by the joints of the Rack-bones; or if the hole should be made larger, the Rack-bone (which was small enough of it self) should be liable to breaking. Therefore that both these evils might be avoided, the wise Opificer made a double beginning, one on the fore-part, another on the hinder. But the right branches go every where to the right side, the left to the left, and they are distributed on both sides after the same manner.

Why it is called Marrow.

It is wrapt up into two Membranes.

The Conjugations or Pairs of the Spinal Marrow.

The first Pair thereof [*tab.*1.*n.*1.] arises with its first and foremost propagation [*tab.*1.B] from the fore-part of the Spinal Marrow, and passes out betwixt the nowl-bone, and the first rack-bone of the neck, near to the sides of that round ligament, wherewith the Tooth-like process of the second rack-bone is tied to the fore-side of the nowl-bone, and so it is distributed into the Muscles over the neck and under the gullet that bend the neck. With the other and hinder propagation, [*tab.*2.*fig.*1.C] it likewise falls out through the hole, that is common to the nowl-bone, and first rack-bone of the neck, towards the hinder part, but with a double sprig, one of which being small is spent upon the lesser strait muscles and the upper oblique ones that extend the head; the other reaches out into the beginning of the muscle which lifts up the Shoulder-blade

The first pair of the neck.

The second pair [*tab.*1.2.] with its fore-branch [*tab.*1.D] (which is slenderer than the hinder one, though both of them seem small enough) arising from the fore-part of the Marrow, goes forth betwixt the first and second rack-bones at the side of the Tooth-like process, which branch is distributed into the Muscles that lie upon the neck, as well as the fore-branch of the first pair, which is wrapped together with it, and is almost wholly spent upon the skin of the face. With its hinder branch [*tab.*2. *fig.*1.E] it slips out through the sides of the backward process of the second rack-bone, but presently is cleft into two branches of unequal bigness, of which that which is the thicker [*tab.*2.*fig.*1.F.] tends from the fore-part to the hinder, where the Muscles seated on both sides of the hinder part of the neck do meet together, and there being mixed [*tab.*2.*fig.*1.G] with the third propagation of the third pair of the nerves, it runs out through the middle of the said muscles, returning from the hinder to the fore-parts, and so is distributed into all the skin of the head, as far as to the top of the Crown [*tab.*2. *fig.*1.H] as also to the ears. The other branch, which is the slenderer, is inserted into the great strait muscles, and the lower oblique ones, that extend the head. *Galen* makes mention of these branches

The second pair.

lib.

lib.4. de locis affect. which place we ſhall not think much to tranſcribe hither, it making very much to the illuſtration of the uſe of this kind of learning. Not long ſince, ſays he, they ulcerated the head of a certain man, by laying on medicins vehemently heating, thinking by this means his ſenſe, that was greatly impaired, might be recovered. But we cured this very man, having found out the ſeat of the diſeaſe as well from other accidents, as from the primitive or procatarctick cauſes. For we diligently examined him about every one of them, and found that this was one; when he had walked in much rain cauſed by a violent wind, his Cloak was wet about his neck, ſo that he felt himſelf affected with a vehement cold in that part; ſo then if you know that four Nerves aſcend from the firſt Rack of the back-bone to the head, from which the skin about it receives its ſenſe, you will eaſily find out the ſeat of the diſeaſe; that therefore being healed, the skin of the head was healed alſo, as having no primary diſeaſe.

The third pair. Its fore-branch.

The third pair [*tab.*1.3.] iſſues out of the common hole in the ſides, which is betwixt the ſecond and third Rack-bones, and preſently after it gets out, is cleft into two branches, of which the more forward one [*tab.* 1.I] is ſubdivided into four propagations. The firſt [*tab.*2. K] goes to the firſt bending muſcle of the neck, or the long one: the ſecond [*tab.*1. L] runs down, and being united with a ſprig of the fourth pair [*tab.*1. Q] ends in the muſcles that lie under the gullet. The third [*tab.*1. M] climbs up, and joining with the thicker branch of the ſecond pair but now mentioned [*tab.*2.*fig.*1. F] is ſpent upon the skin of the hinder part of the head. The fourth [*tab.*1.N] is imparted to the tranſverſe muſcles, or to the firſt pair of the extenders of the neck, and to that which lifts up the ſhoulder-blade, of which two muſcles, that tends in the tranſverſe proceſſes of the neck, this begins therein; and at length it is digeſted into the ſquare muſcle that draws down the cheeks, which is called by *Galen* πλάτυσμα μυώδες. The hinder branch [*tab.* 2.*fig.*1. O] is implanted into the ſecond pair of muſcles that extend the cheſt.

Its hinder branch.

The fourth pair. The fore-branch. Its propagations. 1. 2. 3. The hinder branch.

The fourth pair [*tab.*1.*numb.*†] iſſues out of the common hole of the third and fourth Rack-bones, and like the third pair is divided into two unequal branches. The more forward and greater [*tab.*1. P] is cleft into three other twigs, of which the firſt [*tab.*1. Q] is joined with another branch of the third pair [*tab.*1. L] and goes to the firſt long pair of muſcles that bend the neck. Another [*tab.* 1. R] goes to the tranſverſe muſcle, or firſt of thoſe which extend the neck, and to the firſt of the ſhoulder-blade, called *Cucullaris*, the Cowl-muſcle. The third [*tab.*1.S] being ſmaller than the other, and joined with a muſcle of the fifth pair, and another branch of the ſixth pair, near to the *mediaſtinum* or membrane that parts the cheſt in the middle, and above the *Pericardium* paſſes on downward, that out of theſe three principles the Nerve of the midriff may be made up. The hinder branch [*tab.* 2. *fig.* 1. T] goes toward the ſpine or ridge, under the muſcles which are placed thereabout, to which alſo it affords a good number of branches, and from thence being led downward between the muſcles on both ſides of the neck, it is carried to the ſquare muſcle that draws down the cheeks.

A queſtion.

In this place it is worth our labour to inquire what may be the reaſon, that they who are troubled with a Reſolution, or deprivation of motion in the whole body, have nevertheleſs the motion of their midriff for a while free: ſome make anſwer that this happens, becauſe, although no ſpirits are ſent over from the brain, yet they may be diffuſed out of the marrow of the back. But theſe men beg the queſtion, when we ſuppoſe that no ſpirits come from hence, becauſe we ſee that all the muſcles of the whole body, to which nerves are ſent from the marrow of the back, are reſolved or deprived of motion. Therefore I thought fit to ſeek out for another anſwer, and to ſay that the midriff hath two motions, one that is voluntary, which we uſe whileſt we breath ſtrongly; another natural one, when the fibres are extended and contracted of themſelves. A man therefore is preſerved by this natural motion, when we ſee that breathing is little, and weak, and as much as ſuffices that the lungs may be moved a little.

The fifth nerve. Its fore-branch.

The fifth pair [*tab.* 1. *numb.* 5.] goes out betwixt the fourth and fifth rack-bones, and like the two laſt foregoing, is cleft into two branches. The forwarder of them [*tab.*1. U] iſſues forth ſome propagations. The firſt [*tab.*1. betwixt U and 6] goes to the muſcles that bend the neck. Another [*tab.*1. X] together with propagations of the fourth and ſixth pairs, ſometimes alſo of the ſeventh, to wit, then when the branch of the fourth is wanting, deſcends near to the ſide of the gullet through the fore part of the Rack-bones of the neck, and is implanted into the midriff, and ſo makes the midriff Nerve. The third [*tab.*1. Y] is carried through the upper part and outſide of the arm, to the ſecond muſcle of the arm, to wit, that which lifts it up, called *Deltoides*, from whence little branches are ſent over to the firſt and ſecond, that is, to the cowl-muſcle, and the lifter up of the ſhoulder-blade. The fourth propagation [*tab.*1.b] at the neck of the ſhoulder-blade is cleft into two, of which the former [*tab.*1.c] goes into the muſcle *Deltoides* at that part where it ariſes from the clavicle or canal-bone: the latter and thicker [*tab.*1. d] is inſerted into the fourth pair of muſcles of the bone *hyoides*, called *coracohyoideum*, and from thence imparts a ſmall branch to the upper muſcle over the ſhoulder-blade called *ſuperſcapularis*, and to the muſcle *Deltoides*, where it ariſes from the ſpine of the ſhoulder-blade.

The hinder branch.

The hinder branch [*tab.*2. *fig.*1. e] is writhen toward the back-bone, and diſtributed in the ſame manner as the hinder branch of the fourth pair is.

The ſixth pair. Its fore-branch.

The ſixth pair [*tab.*1.*num.*6.] goes out under the fifth rack-bone, and in like manner as the other pairs are, is divided into two branches. The forwarder and greater [*tab.*1.f] after it hath propagated that ſprig, [*tab.*1.g] which we ſaid is joined with the fourth and fifth pair, [*tab.*1. S and X] to the making up of the nerve of the midriff [*tab.*1.i] paſſing on farther is united with the two next following pairs, the ſeventh of the neck, and the firſt of the cheſt, and is again ſeparated from them, and then again being joined with them it ſo weaves a certain net-like texture, from which nerves are iſſued forth, that go to the arm.

Its hinder branch.

The hinder [*tab.* 2.*fig.*1. l] is carried to the hind muſcles which extend the head and neck.

The ſeventh pair. The fore-branch.

The ſeventh pair [*tab.*1. *n.*7.] is derived from the marrow of the neck, and iſſues forth through the common hole of the ſixth and ſeventh rack-bones. The forwarder and greater branch thereof

[*tab.*

[*tab.*1. m] is joined preſently after its egreſs with the ſixth nerve of the neck, and the firſt of the cheſt, and for the greater part is carried with the reſt to the arm. The hinder leſſer branch [*tab.*2. *fig.*1. n.] goes to the muſcles, that lie upon the neck, and to the ſquare one, that draws down the cheeks.

CHAP. III.

Concerning the Nerves of the marrow of the rack-bones of the Cheſt.

TWelve Conjugations of Nerves iſſue forth from the ſpinal marrow, whileſt it runs through the rack-bones of the back, as the moſt learned *Veſalius* hath rightly opinioned, however there are but eleven holes bored in the twelve rack-bones thereof, as *Columbus* objected, becauſe the firſt pair paſſes out between the laſt rack-bone of the neck and the firſt of the back, wherefore it ought to be numbred rather among the pairs of the cheſt, than thoſe of the neck. All theſe conjugations after their egreſs are divided into two; and the one branch which is the greater, always bends forward; the other which is the leſs is bent to the hinder parts, and to the muſcles that lie upon the back.

The firſt pair then [*tab.*1. *num.*8.] of the nerves which iſſue forth from the marrow of the cheſt, goes out of the common hole of the ſeventh rack-bone of the neck and the firſt of the cheſt, in the ſame manner as the five pairs laſt mentioned do, and in like ſort alſo is forthwith divided into two branches. The forwarder and greater [*tab.* 1. o] is united [*tab.*1. p] partly with the ſeventh nerve of the neck, partly with the ſecond of the cheſt, in that manner which we have before explained; and ſo afterward is wholly conſumed upon the arms, excepting one propagation [*tab.*1. q] which ariſing at the beginning of it, is joined with the ſaid nerves, and runs into the fore-parts near the length of the firſt rib of the cheſt to the breſt-bone, beſtowing a ſprig upon the ſubclavian muſcle, after that being reflected upward is ſpent upon the muſcles, which take their original from the top of the breſt-bone: ſuch are the muſcle that bends the head called *Maſtoideus*; that which draws down the bone *hyoides* or *ſternohyoideus*, and the firſt of them which extend the buckler-like griſtle of the throttle, called *thyroides*, or the muſcle *ſternothyroideus*. But to the two laſt ſometimes branches are ſent over from the ſixth conjugation of the brain, and the third of the cheſt. The ſame branch alſo when it hath paſt the arm-pit, being ready to go to the arm, iſſues forth a certain other propagation from its hinder part, which goes to the muſcles ſeated in the hollowneſs of the ſhoulder-blade. The hinder and leſs branch [*tab.*2. *fig.*1. r] lies hid under the muſcles which grow to the rack-bones, and imparts ſome propagations to the ſecond bending muſcle of the neck, and to them which extend the head and neck; but when it hath attained to the ſpine of the ſeventh rack-bone, it goes overthwart to the lower ſide, and diſtributes ſurcles into the firſt muſcle of the ſhoulder-blade, or that like a Monks Cowl, and in the third of the ſame, called *Rhomboides*, as alſo into the upper of the hindmoſt ſaw-muſcles.

The firſt pair.

Its fore-branch.

Its hinder branch.

The ſecond pair [*tab.* 1. *num.*9.] breaks out betwixt the firſt and ſecond rack-bones of the cheſt, and is cleft likewiſe into two branches. The forwarder [*tab.*1. s] is united with the firſt pair of the cheſt; and thus the firſt and ſecond pairs of the cheſt are united by turns, with the fifth, ſixth, and ſeventh of the neck, that the one are not diſcerned from the other, but make a net not unlike to thoſe things which hang at Cardinals hats; from which afterward all the nerves that go to the arms, iſſue forth and take their original. This ſpreads out a branch [*tab.*1. t] which goes forward through the firſt diſtance betwixt the ribs, according to the courſe of the firſt rim, as far as to the breſt bone, making the firſt Intercoſtal nerve, from which ſurcles [*tab.*1. u] are diſtributed into the muſcles that lie upon the cheſt. The hinder branch [*tab.*2. *fig.* 1. x] hath the ſame diſſemination with that of the foregoing pair.

The ſecond pair.

The fore-branch.

The hinder one.

The other ten pairs [*tab.*1. *numb.* 10, 11, 12. *and ſo on to* 19 *incluſively*] of the nerves of the cheſt, obſerve the ſame manner both of their riſe and diſtribution. For they all iſſue out of the common holes of the rack-bones at the ſides, and preſently after their egreſs are cleft into two branches of unequal bigneſs, one of which is the forwarder and greater, the other the inner and leſs. The forward branches [*tab.*1. y] (which make the nerves between the ribs) are carried into the foreſide, and each of them affords a little branch in order according to its length, to the inner branch of the ſixth pair, which deſcends under the *pleura* to the roots of the rib. Theſe branches are joined with the intercoſtal Veins and Arteries, together with which they paſs along the rib of the fore-part through the *ſinus* or channel, which is cut out on the lower and inſide of the ribs. But they which belong to the true ribs, go on as far as to the breſt-bone; but they which belong to the baſtard ones, are carried into the fore-part of the *Abdomen* above the *Peritoneum* or rim of the belly. From theſe nerves many branches are diſſeminated into the muſcles between the ribs, not onely in the inner, but the outer ones alſo, as well into the other [*tab.*1. z] which lie upon the cheſt; ſuch as are the fourth and fifth muſcles of the ſhoulder-blade, or the two foremoſt Saw-muſcles, as alſo to the broad one, called *Latiſſimus* [*tab.*1. 6] that moves the arm backward from the breſt. In like manner a propagation goes from the fifth intercoſtal nerve, about the middle of the rib paſſing through the intercoſtal muſcle into the firſt pair of the muſcles of the *abdomen* [*tab.*1.] as alſo into the skin of the cheſt; and being divided in four parts is diſtributed into the pectoral muſcle that moves the arm forward to the breſt, and alſo into the skin, from which ſome ſprigs do afterward go to the nipples of the breſt [*tab.*1.] and impart to them a very ſharp ſenſe. The hinder branches [*tab.*2 *fig.*1.] go backward to the ſpine or ridge, between the muſcles going to the rack-bones, which have the charge of extending the cheſt. Yet are they not wholly ſpent upon the muſcles, but when they have now attained to the tops of the ſpines, they fall out between the muſcles of both ſides, whereabout they are joined one to another, and ſo afterward they give nerves to all the muſcles which ariſe out of the tops of the ſpines of the rack-bones.

The other ten pairs.

Their fore-branches.

Their hinder branches.

bones. Such are the first extending muscle of the head, called *Triangularis* or *Splenicus*; the third muscle of the shoulder-blade, or *Rhomboides*; the first of the shoulder-blade or *Cucullaris*; the third broad muscle that leads the arm away from the breast, called *Anisculptor*, and the hinder saw-muscle. A good number also of sureles are distributed into the skin of the back.

CHAP. IV.

Concerning the Nerves of the Marrow of the Rack-bones of the Loins.

FRom the spinal Marrow, whilest it is carried through the first of the Loins, although there be onely four holes, yet five pairs issue forth, the first being between the last rack-bone of the chest, and the first loins. But they go forth through the common holes, and being gone forth, are distributed in like manner as we have said of the Nerve of the chest; when from every one of them presently after its going out, one branch, and that the greater, spreads it self forward; the other and less, backward. The foremost branches run to the muscles of the *abdomen*, or outer and fore-part of the lowest belly; the hindmost to them which lie upon the spines of the rack-bones, and the bones without a name, from whence they impart some little branches also to the skin that covers the loins. But the fore-branches are knit together, the first with the second, the second with the third, the third with the fourth, and the fourth with the fifth in the same fashion as we have said the nerves of the arm were, whilest they make the net-like complication.

The first pair. The first pair then [*tab.*1. *num.*20.] as the rest do also, going out under the *Peritoneum* or rim of the belly, through the common hole of the rack-bones, which is betwixt the last rack-bone of the chest and the first of the loins, presently after its egress is cleft into two branches. The fore-branch, which is greater, goes into the fleshy parts of the midriff, and into the beginning of the first bending muscle of the thigh, called Ψόας.

Its fore-branch.

The hinder one. From this Nerve a certain surcle [*tab.*1.39.] takes its beginning, reaching out for the most part with the preparing artery to the testicle. The hinder branch [*tab.*2. *fig.*1.*num.*42.] sends propagations into the muscles that lie upon the back side of the rack-bones of the loins, such as are the first and third of them which extend the chest, that being called *Dorsi longissimus*, this *Sacrolumbus*; as also the muscles which extend the loins: but when they issue out from the tops of the spines, whereabout the said muscles are joined one to another, they run to the sides, and are implanted into the broad muscle that leads the arm outward from the breast, called *Latissimus*.

The second. The second pair [*tab.*1. *num.*21.] goes out under the first bending muscle of the thigh, called Ψόας, betwixt the first and second rack-bones of the loins. The fore-branch thereof is distributed to the second bending muscle of the thigh, that fills up the cavity of *Os Ilium*, or the hanch-bone, and the first bending one of the leg, called *Fascialis*, as also to the skin of the thigh. The hinder branch going out of the *Abdomen* is distributed to the three muscles that extend the thigh, or the *Glutæi*; and to that which extends the leg, called *Membronosus*, the membranous muscle.

The third. The third pair [*tab.*1.*num.*22.] issues forth likewise under the first bending muscle of the thigh, betwixt the second and third rack-bone. The fourth branch thereof passes over near to the hanch-bones, distributing two propagations; one which goes to the knee, and its skin; another [*tab.*1.51.] which accompanies the vein of the inner ankle, called *Saphena*. The inner branch is reflected and disseminated into the muscles which lie upon the loins.

The fourth. The fourth pair [*tab.*1.*num.*23.] is the greatest of all the Nerves of the loins, and being carried under the said muscle that bends the thigh, as also under the *Os pubis* or share-bone, accompanies the Crural Ven and Artery.

The fifth. The fifth and last pair [*tab.*1.*num.*24.] issues out betwixt the fourth and fifth rack-bones; the fore-branch whereof passes through the hole which is betwixt the hip-bone, the *Os pubis* or share-bone, and the *Os Ilium* or hanch-bone, and distributes some propagations to the two muscles that turn the thigh about, called *Obturatores*, others to the second and third bending ones of the thigh, and others to the muscles of the yard. The hinder branch goes into the muscles and skin upon the rack-bones.

CHAP. V.

Concerning the Nerves of the Marrow of Os sacrum, *or the great bone.*

The first pair. LAst of all from the Marrow which is contained in the rack-bones of the *Os sacrum*, the six last pairs of the nerves of the spinal marrow do issue forth. The first of these [*tab.*1. *num.*25.] goes out betwixt the last rack-bone of the loins and the first of the great or holy bone, in the very same manner as the rest that arise out of the rack-bones of the loins, and likewise after the same sort is divided into two branches. The fore-branch, although it be mixed with the crural nerves, sends yet a surcle [*tab.*1.43.] over near to the inner region of *Os Ilium*, and is dispersed into the muscles of the *abdomen*, and into the second bending one of the thigh. The hinder [*tab.*2.*fig.*1. *num.* 44.] is disseminated into the muscles that arise from the *Os Ilium*, or hanch-bone, and especially into the first of them that extend the thigh, or the greater *Glutæus*, as also into the skin of the buttocks.

The other five pairs. The other five pairs have something proper to themselves, so that before they go out of the bone, they are every of them double on each side, and so from every one of them a double branch is carried on each side, one to the fore-part, another to the hinder, The three uppermost of the fore-branches, as that of the first pair also, go to the *Crus*, or parts of the body below the buttocks: the two lowest go into the muscles of the fundament and bladder; and in women to the neck of the womb, in men to the yard; but in both sexes to the outer privy parts. The hinder branches are distributed to the muscles seated on the backside of the bones *Ilium* and *Sacrum*. Of this sort are the first and third

ex-

extending muſcles of the cheſt, or *Dorſi longiſſimus*, the long muſcle of the back, and *ſacrolumbus*, that which bends the loins called *ſacer*, and the broad muſcle that leads the arm away from the breſt; as alſo the three which extend the thigh, being the authors of the buttocks, and therefore called *glutæi*, the buttock muſcles. And this is the utmoſt end of the ſpinal marrow, which reaching into the rump bone, called *Os coccygis* is in this manner terminated: And this is the hiſtory of the thirty pairs of the Nerves which go out of the ſpinal marrow, which is diligently and accurately to be committed to the memory, that we may know to what place remedies ought to be applied, if at any time from ſome external cauſe, as by a fall from aloft, or a bruiſe, or ſome notable compreſſion any part ſhall have loſt either motion, or ſenſe, or both. For the remedies muſt be applied always to the beginning of that Nerve, not to the place in which the ſymptom is perceived.

CHAP. VI.

Concerning the Nerves which are diſtributed through the Arms.

THoſe Nerves being now enumerated, which are diſperſed through the muſcles of the three bellies, and the parts contained in them; it remains that we deſcribe thoſe alſo, which are propagated through the *artus*, or extreme parts of the body. Here we meet with them firſt which are diſtributed through the arms, whereof there are ſix pairs commonly ſet down by Anatomiſts ariſing from the fifth, ſixth, and ſeventh pair of the nerves that come out of the marrow of the neck, and from the firſt and ſecond of thoſe which iſſue out of the cheſt. Theſe nerves go out through the common holes of the rack-bones, on both ſides, and preſently after their going out are united one among another with their forwarder and greater branches, by and by are ſeparated one from another again, and joined again, and finally ſeparated, ſo that they ſeem to make out a certain net-like texture, which cannot be better likened than to thoſe ſtrings of Cardinals Hats. This implication of Nerves goes forth under the clavicle or collar-bone, about the place where the Axillary Veins and Arteries go out of the hollow of the cheſt, and from this all the Nerves of the arm take their original. But their riſe is very uncertain by reaſon of their being ſo knit together; wherefore we in our relation of them will rather follow the footſteps of other men than our obſervations, leſt we ſhould ſeem to affect new opinions raſhly, and without neceſſity.

The firſt Nerve then [*tab.*1.ε] which is carried to the arm, is a double propagation, namely the third and fourth of the fore-branch of the fifth pair of the neck. For the one branch [*tab.*1.Y] is carried to the ſecond muſcle of the upper part of the arm called *Deltoides*, and to the skin that lies upon it: the other [*tab.*1.b] goes toward the neck of the ſhoulder-blade, where it is cleft into two branches; the former of which [*tab.*1.c] goes into the muſcle *Deltoides*, where it ariſes from the collar-bone; the latter [*tab.*1.d] is inſerted into the fourth pair of the muſcles of the bone *hyoides*, called *Coracohyoideum*, and from thence affords a little branch to the upper ſuperſcapular muſcle, and the *Deltoides* at what place it ariſes from the ſpine of the ſhoulder-blade. This Nerve runs out through the hinder ſide of the arm; but the other five are carried through the arm-pit into the arm, and in the ſame are ſcattered into more branches. The firſt nerve of the arm.

The ſecond Nerve [*tab.*1.ζ] is thicker, and takes its original from that net-like complication, of which we ſpake; yet from what nerve, cannot be evident enough. This is carried down through the middle and fore-part of the arm, into which it enters under the firſt bender of the cubit, or the double-headed muſcle, at that part where its two heads are united one with the other, and where the tendons are inſerted both of the pectoral muſcle that leads the arm forward to the breſt, and of the *Deltoides* that lifts it up. Being hid then under this muſcle it ſends forth two propagations [*tab.*1.] one of each ſide, which enters into the two heads of the muſcle *biceps*; and after that about the middle of the length of the upper part of the arm, going under the ſame double-headed muſcle, it ſhoots forth another ſprig [*tab.*1. †] by means whereof it is joined with the third nerve; and from thence deſcending it diſtributes in its progreſs a ſurcle [*tab.*1.θ] from its out-ſide to the head of the longer of the two muſcles of the *radius* or wand that turns the palm of the hand downward. When it is come to the bending of the cubit, being led to the fleſhy membrane, near to the out-ſide of the tendon of the ſaid double-headed muſcle, it is diſtributed into the skin, being divided into two branches, of which one is the outer, the other the inner; that is the ſlenderer, this the thicker. The outer then [*tab.*1.ι] being carried down a good way with a branch of the Cephalick vein through the inſide of the cubit, is diſtributed [*tab.*1.λ] to the ſecond bone of the thumb. The inner branch [*tab.*1.κ] is ſubdivided under the common vein of the arm, or the middle one called *Mediana*, into two branches, the outer whereof [*tab.*1.] going on obliquely under the skin leaving the vein goes away toward the *radius* as far as to the wriſt: but the inner [*tab.*1.ν] being faſtened to the inner branch of the Cephalick vein, when it goes more obliquely in the region of the cubit is cleft into two ſpecial branches, of which one [*tab.*1.π] is diſtributed through the region of the leſſer bone of the cubit, the other [*tab.*1.ο] through the region of the greater bone to the wriſt, and from thence, that being paſt, into the skin of the inſide of the hand. The ſecond. Its progreſs. Its propagations. Its branches. The outer. The inner.

The hinder Nerve of the arm [*tab.*1.ρ] or the third, which is carried to the arm, lies next under the ſecond, and in like manner with it ariſes from that net-like texture. This Nerve, whileſt it paſſes through the arm-pit, before it hath yet attained to the arm, brings forth a propagation [*tab.*1.σ] which is diſperſed under the skin betwixt the pectoral muſcle that leads the arm to the breſt, and the muſcle *Deltoides* that lifts up the ſame. But when it hath firſt attained to the arm, it hides it ſelf under the muſcle *biceps*, or firſt bender of the cubit, and paſſing on downward together with the ſecond nerve, it ſends out a little branch [*tab.*1.τ] into the head of the ſecond bending muſcle of the cubit. After this deſcending it receives a branch [*tab.*1.υ] from the ſecond Nerve, by means whereof they are joined one with the other, and then it goes further through the fore-part of the arm unto the bending of The third.

the cubit, being always equally distant from the second Nerve, and is carried into the protuberation of the inside of the arm, and the fore-part thereof. When it hath past this, it issues forth many propagations [*tab.*1. Φ] which together with the branches that are derived from the fifth Nerve, which is carried through the hinder region of the same protuberation, are distributed into the muscles that are seated on the inside of the cubit, and arise from the inner protuberation of the arm: such are the two that bend the uttermost bones of the fore-fingers, and that which bends the third joint of the thumb. After this it sends out another propagation, which is carried down between the said muscles through the *radius* together with a vein and artery to the wrist; and passing through under the transverse ligament, scatters some small sprigs into the muscle that moves the thumb outward from the fingers, and the two that bend the first joint of the same. After this, when it is come to the palm of the hand, it is divided [*tab.*1. χ] into three branches; the first of which scatters two twigs into the thumb, the second as many into the fore-finger, the third sends one to the middle finger on the inside.

The fourth. The fourth Nerve [*tab.*2.*fig.*1. ↓] is the biggest of all them which are carried to the arm, as being almost thrice thicker then the rest. This arises as well as the other, from the net-like complication, and from thence is carried down through the arm, in like manner as the third is, lying deep every where among the muscles, having the basilick vein and axillary artery for its companions. But presently after it hath entered the arm, it derives many, but small sprigs [*tab.*2.*fig.* ω] into the heads of the muscles that extend the cubit; and before it is come to half the length of the upper part of the arm, it is contorted obliquely downward to the bone thereof, and passes on betwixt that and the muscles which extend the cubit. But before it be wholly reflected, it sends forth a furcle [*tab.*2.*fig.*1. Γ] from its inside, which goes betwixt the said muscles, as also the second of them that bend the cubit, and is spent upon the skin that clothes the inside of the arm, some fibres being propagated upward and downward. Having disseminated this propagation it goes by degrees through the hinder part to the outside of the arm, being carried through the cavity of the outer protuberation of the upper bone of the arm that is cut out in the back side thereof, where likewise it sends out a furcle [*tab.*2.*fig.*1. Δ] going to the skin, that covers the lower part of the outside of the arm; and then another [*tab.*2.*fig.* 1. Θ] which is distributed into the skin, as far as to the wrist. After that near to the joint of the cubit it is divided into two branches, an outer and an inner one, which being hid deep, and among the muscles, as the whole Trunk also, descend to the wrist. The outer branch [*tab.*2.*fig.*1. Λ] goes along the *radius* or wand, and when it is come to the wrist, passes through the transverse ligament on the outer part, and by and by is subdivided [*tab.*2.*fig.*1. Ξ] into two branches, of which one goes with a double sprig into the outside of the thumb, the other is spent partly upon the fore-finger, partly on the middle one. But the inner branch [*tab.*2.*fig.*1. Π] reaching along the cubit scatters more propagations; the first [*tab.*2.*fig.*1. Σ] into the first muscle that extends the fingers, the second [*tab.* 2.*fig.*1. Φ] into the second that extends the fingers; the third [*tab.*2.*fig.*1. Ψ] into the inner muscle that extends the wrist. But in its progress [*tab.*2.*fig.*1. Ω] it affords propagations to the three beginnings of the muscles that take their original from the *ulna*, or greater bone of the cubit. The remainder of it ends in the wrist, [*tab.*2.*fig.*1.31.]

Its propagations.

Its two branches. The outer.

The inner.

The fifth Nerve. The fifth Nerve [*tab.*1. *num.*32.] arising lower than any of the fore-mentioned, out of the same net-like complication, and being joined to the fourth, descends through the inside of the arm, between the muscles that bend and extend the cubit. This scatters no propagation from it self, but remains entire till it be come to the inner protuberation of the arm, at whose hinder cavity it is reflected, and is distributed afterward in the same manner with the third Nerve, which passes through the fore-side of the same protuberation. For both of them bestow propagations [*tab.*1.33] upon the muscles which grow out of the inner protuberation of the arm, and keep the inside of the cubit. It issues forth a propagation also [*tab.*1.34] which being carried through the *radius* or wand, goes between the muscles which bend the second and third joints of the fingers, and so to the palm of the hand, and sends out the first branch, which being parted into two, is implanted into the inside of the little finger; then another, which being also cut in two, goes into the ring-finger, and at last another that goes to the outer part of the inside of the middle finger. But from this same fifth Nerve, and from the outside near to the middle of the length of the *radius* or wand, there grows out a certain other furcle [*tab.*1.35] which being divided into three branches is disseminated into the outer-part of the middle, the ring finger, and the little one.

The sixth. The sixth Nerve [*tab.*1.*n.*36.] issues out of the lowest part of the net-like complication, and going through the arm-pit and inside of the upper part of the arm and of the cubit, under the skin it makes haste to the inner protuberation of the upper bone of the arm, disperſing many furcles in its way to the neighbouring skin [*tab.*1.37.37.] But as soon as it hath attained to this protuberation, it is cleft into many propagations, some of which lie under the branches of the basilick vein, some lie over, and so being carried under the skin, when they are come down to the wrist, they end [*tab.*1.38.]

CHAP. VIII.

Of the Nerves that are distributed through the Crura, *or Thighs, Legs, and Feet.*

THere are four pairs of Nerves which are propagated through the *Crura*. They arise from the three lower conjugations of the loins, and the four upper ones of the *Os sacrum*, or great bone, which after they are gone forth through the common holes of the rack-bones as well as the Nerves, which are distributed through the arm, make a certain complication like the meishing of a net, but far greater than that other. Nor are these Nerves of equal bigness, but the first [*tab.*1. *num.*46.] and the third [*tab.*1.56.] are small, wherefore also they reach but to the thigh; the second [*tab.*1.50.] is somewhat thicker and reaches to the leg, but the fourth [*tab.*1.61.] alone is thicker than the three other put together, and is carried down as far as to the utmost ends of the toes.

The

The first Nerve then [*tab.*1.46.] grows out of the higher part of the Net-like complication, where the third Nerve of the loins is joined with the fourth [*tab.*1.47.] But it is presently carried downward under the rim of the belly, to the thigh; lying upon the outside of the tendon of the first bending muscle of the thigh, to which when it is come, it sends out a propagation [*tab.*1.48.] which runs out through the skin on the fore-part of the thigh, as far as to the joint of the knee, and there ends, and affords surcles [*tab.*1.49.] to the first bending muscle of the leg, as also to the second and third that extend the same. The first Nerve.

The second Nerve [*tab.*1.50.] arises out of the same complication, and below the first, over against the connexion of the third and fourth rack-bones of the loins. This together with the crural Vein and Artery, (which are the outer Iliacal branches) descends through the groin into the thigh, which when it hath attained to, presently it issues forth a notable propagation [*tab.*1.51.] from its inside, lying upon the *saphena* or vein of the inner ankle, on the fore-part, all the way it goes under the skin through the inner parts of the *crus* to the great toe. But as the vein *saphena* it self distributes some sprigs in the way to the skin next to it, so also this Nerve sends out many propagations, of which that is the chief [*tab.*1.53.] which it gives to the fore-side of the knee. But the trunk it self [*tab.*1.54.] when it hath sent out this propagation, passes together with the trunk of the crural Vein and Artery into the thigh, and is scattered into the muscles seated on the inside of the thigh, especially [*tab.*1.55.] into the third bending one of the thigh, and the fourth extending one of the leg, and so afterward it is terminated above the knee. The second. The progress of the trunk.

The third [*tab.*1.*n.*56.] grows out of the complication under the second, over against the conjunction of the fourth and fifth rack-bones of the loins. This Nerve being carried down upon the second bending muscle of the thigh, called *Iliacus internus*, passes through the hole of the share-bone, and affords propagations [*tab.*1.57] to the two muscles that turn the thigh about, which they call *Obturatores*, the stoppers, to wit, of that said hole, as also to the two muscles that erect the Yard, which arise out of the bone of the hip. From thence like the two foregoing Nerves, it descends and distributes little Nerves into the skin that cloths the inner part of the thigh [*tab.*1.58] the remaining part [*tab.*1.57] lies deep, the chief propagation whereof [*tab.*1.60] is spent partly on the second, partly on the third muscle that bend the leg. The third.

The fourth Nerve [*tab.*1.*n.*61] is made up out of the fore-branches of the four upper pairs of the great bone being united together. By reason whereof it passes the rest, yea and all the Nerves of the whole body, not onely in thickness, but in hardness also, as being made of the last, that issue out of the spine, or ridge. This enters into the hinder part of the thigh through the cavity that is in the hinder part of the hip-bone. But presently it sends forth a notable propagation [*tab.*1.62] from its backside, which stays a pretty while under the first extending muscle of the thigh, or *Glutæus magnus* the great buttock-muscle, and from thence is dispersed into the skin that covers the buttocks, and the back-side of the thigh to the middle of its length. Then it sends other propagations [*tab.*1.63] on both sides, three for the most part to the heads of the third, fourth, and fifth muscles that extend the leg, and to the third bending one of the thigh. After this the trunk of the nerve descends among the muscles seated on the hinder part of the thigh near to the bone, as far as half the length thereof, and distributes another branch [*tab.*1.64] to that fleshy lump of the fifth bending muscle of the leg, called *Biceps*, which grows to it on the inside, after it hath gone beyond the middle of the thigh. From hence also other surcles proceed, which are distributed into the skin on the backside of the thigh. But the trunk it self proceeding farther on, at length attains to the the knee betwixt the two heads of the bone of the thigh, and imparts a small branch [*tab.*1.65] on each side into the first extending muscle of the foot, and the sole muscle called *Plantaris*, and by and by is divided [*tab.*1.66] in the inner cavity of the knee, or in the ham, into two unequal branches which are distributed along through the leg and foot. For there is not any Nerve which runs out through the leg, besides these two branches of the fourth, if you except onely that notable propagation, which being derived from the second Nerve, as we have said, descends in company of the Vein *Saphena* through the inner part of the *Crus*. The outer branch [*tab.*1.67] is the smaller, and goes toward that part where the upper *appendix* of the *fibula*, or lesser bone of the leg is joined with the *tibia* or greater bone thereof, scattering a propagation [*tab.*1.68] in the way which goes to the outer ankle under the skin, distributing in the mean time many sprigs to the skin. But the branch it self [*tab.*1.69] passes between the muscles seated on the foreside of the leg, and going through the long ligament of the *tibia* and *fibula*, or two bones of the leg, passes together with the tendons of the muscles that extend the toes under the transverse ligament, and disperses little branches to the sides of the upper part of the toes. The inner branch [*tab.*1.72] is carried down through the backside of the *Crus*, lurking betwixt the muscle of the sole of the foot, and the first of them that move the foot obliquely, as also the long bending muscles of the toes; and being joined afterward with the branch of the outer, which passes through the ligament, it goes to the sole of the foot, and distributes propagations into both the sides of the lower part of the toes. The progress of the trunk. Its division.

An Explanation of the two Tables of the Nerves.

The thirty pairs of the Nerves of the marrow of the Brain, whileſt it is carried through the ſpine or ridge, are expreſt in theſe two Tables, the preſent and the following one. We have inſcribed common Characters on both of them, though many alſo be peculiar to one; after which we have preſently ſet the number of the Table.

nn. 1. t. 1. &c. — THE firſt ſhews the rack-bones of the Spine and the Nerves that iſſue from thence on the foreſide; the ſecond on the back ſide.

8 as far as 7. The ſeven rack-bones of the neck.

20 as far as 19. The twelve rack-bones of the cheſt.

25 as far as 24. The five rack-bones of the loins.

to 30. The ſix bones of the Os ſacrum. Theſe ſame figures do ſtand for the pairs of the ſpinal marrow.

A tab. 1. & 2. — The ſeat of the ſpinal marrow, where it firſt enters into the rack-bones.

1. 1. B 1. C 2. — The firſt pair of the neck, whoſe forwarder propagations is B, the hinder C.

2. 1. D E 2. — The ſecond pair, whoſe fore-propagation is D, its hinder E; from this two branches grow out, the ſlender one marked with the letter E, the other thick one with F, which is mixed with a branch of the third pair M about G. But the courſe thereof to the skin of the crown, and back ſide of the head is marked with the letter H.

E 2. F G H — The third pair of the neck, whoſe fore-braneh I is divided into four propagations. The firſt K is implanted into the muſcles that bend the neck. The ſecond L is mixed with a twig of the fourth pair Q. The third M, is mixed with the thicker propagation of the hinder branch of the ſecond pair F. The fourth N is inſerted into the muſcles that are joined to the tranſverſe proceſſes of the rack-bones.

3. 1. I 1. K 1. M 1. N — The hinder branch O.

O 2. — The fourth pair of the neck, whoſe fore-branch P is cleft into three propagations. The firſt Q, joins with the ſecond propagation of the third pair L. The ſecond R goes into the tranſverſe muſcle of the neck.

4. 1. P Q 1. R 1. — The third S.

S 1. — The hinder branch T.

T 2. — The fifth pair of the neck, whoſe fore-branch V iſſues out ſome ſurcles. The firſt goes to the muſcles that bend the neck, being to be ſeen in the firſt table between V and the number 6. The ſecond X, making the greateſt part of the nerve of the midriff. The third Y goes to the muſcle Deltoides, of which there is a propagation a, which goes to the skin that covers the muſcles Deltoides and Biceps. The fourth b, at the neck of the ſhoulder-blade is cleft into two branches; one of which c, enters into the muſcle Deltoides, at what part it grows out of the collar-bone: the other d, is implanted into the ſame, in the place where it grows out of the ſpine of the ſhoulder-blade.

5. 1. V 1. X 1. Y a 1. b 1. c 1. d 1. — The hinder branch e.

e 2. — The ſixth pair of the neck, whoſe fore-branch f, when it hath propagated that ſurcle g, which with the fourth and fifth pair S and X, makes the nerve of the midriff, is joined with the two following h, and thus it makes up the nerve of the midriff i, ſo that this ariſes out of three ſurcles S, X, and g.

6. 1. f 1. g 1. h 1. i 1. — The hinder branch l.

l 2. — The ſeventh pair of the neck, whoſe fore-branch is m, its hinder one n.

7 1. m 1. n 2. — The firſt pair of the cheſt, whoſe fore-branch o, is united p, with the ſeventh pair of the neck and ſecond of the cheſt, ſpreading a propagation q, through the upper ſide of the firſt rib. The hinder branch r.

8. 1. o 1. p 2. q 1. r 2. — The ſecond pair of the cheſt, whoſe fore-branch ſends forth a ſurcle t, running out through the firſt ſpace betwixt the ribs, and ſending ſurcles u to the muſcles of the cheſt.

9 1. t 1. u 1. — The hinder branch x.

x 2. — The pairs of Nerves from the nineth to the twentieth, which have the ſame ſeries of propagations, and eſpecially to the diſtances of the ribs. The fore-branches of theſe [fig. 1.] are ſcattered into the muſcles ſeated on the fore-part of the cheſt, and partly into their upper region, as y, partly in their lower z, which in women go alſo to the breſts; and then they ſend other ſurcles into the heads of the oblique deſcending muſcles of the abdomen α, and into that which leads the arm from the breſt β, another goes to the nipple of the breſt γ. The hinder branches δ.

10, 11, 12. &c. to 19. inclusively 1. — The firſt nerve that goes to the arm, which is ſcattered into the skin of the outſide of the arm.

y 1. z 1. α 1. β 1. γ 1. δ 1. ε 1. ζ 1. — The ſecond nerve that goes to the arm, whoſe two firſt propagations ηη go to the two heads of the muſcle biceps: then it joins with the third nerve by a ſurcle †. Thirdly, it carries a propagation to the longer muſcle that turns the palm of the hand downward θ. But about the bending of the cubit it is divided into two branches, an outer, and an inner one κ. That deſcending along the radius or wand, is inſerted at the out-ſide of the ſecond joint of the thumb λ. This ν, is by and by ſubdivided into an outer μ, and an inner branch ν. This ν is again cleft in the region of the cubit into an outer branch ο, and an inner one π.

ηη 1. † 1. θ 1. ε 1. κ 1. λ 1. μ 1. ν 1. ο 1. π 1. ρ 1. — The third nerve entering the arm ρ, before it attains to the arm, ſcatters a ſprig betwixt the pectoral muſcle and Deltoides σ. By and by having entered the arm, it diſtributes another τ, into the ſecond muſcle that bends the cubit. After that, deſcending it receives a branch υ from the ſecond nerve; when it is paſt the bought of the arm, it is diſtributed into many ſurcles Φ, at length about the palm of the hand it is divided into three branches χ.

σ 1. τ 1. υ 1. φ 1. χ 1. Ψ 2. — The fourth Nerve entering the arm, which is the greateſt of all them that go to the arm, is not marked with any letters in the ſecond table, but in the third onely, leſt the ſecond ſhould be too much blurred with letters. This ſuddenly after it hath entered the arm, reaches out ſmall ſprigs ω into the muſcles that extend the cubit, then another into the inner skin, upwards and downward Γ, and another into the lower part Δ, and another Θ, which goes as far as to the wriſt. After this near to the bought of the arm it is divided into two branches, an outer one Λ, and an inner Π. That Λ about the tranſverſe ligament is again divided into two Ξ. This Π reaching all along the cubit ſends forth more propagations, the 1. Σ, the 2. Φ, the 3. Ψ. Then another in its

ω Γ Δ Θ Λ Ξ Π Σ Φ Ψ Ω 3. 1.

31 *its progreſs* Ω. *The remainder ends in the wriſt* 31.

58 1. *ther* 58 *to the skin. The remainder* 59 *lies deep*
59 1. *intangled in the muſcles whoſe chief propagation*
60 1. *is* 60, *which is implanted in the ſecond and third muſcles that bend the leg.*

The fourth, and that the thickeſt of all the
61 1. *Nerves of the* crus, *whoſe firſt branch is* 62,
62 1. *which is inſerted into the skin of the buttocks:*
63 1. *another* 63 *is diſtributed into the heads of the muſcles that ariſe from the* appendix *of the hip:*
64 1. *a third* 64 *is given to the fifth muſcle that bends*
65 1. *the leg; and others* 65 *go into the outer calf-muſcle, and that of the ſole of the foot. But about the lower heads of the thigh it is divided*
66 1. 66 *into two branches, to wit, an outer one* 67,
67 1. *and an inner* 72.
68 1. *The outer branch, a propagation whereof* 68 *is ſent under the skin that covers the outer part*
69 1. *of the leg and the outſide of the foot. But the*
70 1. *branch it ſelf* 69 *goes to the connexion of the leſſer bone of the leg with the greater; ſending*
71 1. *forth another ſurcle* 70 *to the fore-part of the leg under the skin: the remainder of it* 71 *reaches along the* fibula *or leſſer bone of the leg.*

72 1. *The inner branch, a propagation whereof*
73 1. 73 *goes through the inſide of the leg toward the calf, and inſide of the foot under the skin:*
74 1. *and then another* 74 *is ſcattered into the skin, eſpecially that which covers the calf: another alſo*
75 75 1. 75, 75 *goes into the fore-part of the leg through the ligament that joins the leſſer bone of the leg*
76 1. *to the greater, and afterward is ſpent on the up-*
77 1. *per ſide of the foot. The laſt propagation* 76 *runs out betwixt the inner and outer calf-muſcle. The remainder of the trunk goes by the inner ankle to the lower part of the foot, diſtributing two ſurcles apiece to the lower part of all the toes.*

The ſecond and third figures of the ſecond Table. Theſe two Figures do exhibit the Nerves of the arm and leg in a larger form than the firſt Table does, ſo that all which concerns thoſe Nerves, may be ſhewn more accurately herein. But they have common characters, and the ſame explanation of the ſame ſerves for both.
